ABOUT THE AUTHOR

Fomenko, Anatoly Timofeevich (b. 1945). Full Member (Academician) of the Russian Academy of Sciences, Full Member of the Russian Academy of Natural Sciences, Full Member of the International Higher Education Academy of Sciences, Doctor of Physics and Mathematics, Professor, Head of the Moscow State University Section of Mathematics of the Department of Mathematics and Mechanics. Solved Plateau's Problem from the theory of minimal spectral surfaces. Author of the theory of invariants and topological classification of integrable Hamiltonian dynamic systems. Laureate of the 1996 National Premium of the Russian Federation (in Mathematics) for a cycle of works on the Hamiltonian dynamical systems and manifolds' invariants theory. Author of 200 scientific publications, 28 monographs and textbooks on mathematics, a specialist in geometry and topology, calculus of variations, symplectic topology, Hamiltonian geometry and mechanics, computer geometry. Author of a number of books on the development of new empirical-statistical methods and their application to the analysis of historical chronicles as well as the chronology of antiquity and the Middle Ages.

[Overview of the e-Series](#)

[About the author](#)

[From the publisher](#)

[A Global Falsification of History. Foreword by Alexander Zinoviev](#)

[Preface by Anatoly Fomenko](#)

[1. Roman chronology as the foundation of European chronology](#)

[2. Scaliger, Petavius, and other clerical chronologers. The creation of contemporary chronology of the ancient times in the XVI-XVII century A.D.](#)

[3. The veracity of the Scaliger-Petavius chronology was questioned as early as the XVI century](#)

3.1. Who criticized Scaliger's chronology and where

3.1.1. De Arcilla, Robert Baldauf, Jean Hardouin, Edwin Johnson, Wilhelm Kammeyer

3.1.2. Sir Isaac Newton

3.1.3. Nikolai Alexandrovich Morozov

3.1.4. Recent publications of German scientists containing criticisms of Scaligerian chronology

3.2. The questionable veracity of the Roman chronology and history. The hypercritical school of the XIX century

[4. The problems in establishing a correct chronology of "ancient" Egypt](#)

[5. The problem in dating the "ancient" sources. Tacitus and Poggio. Cicero and Barzizza. Vitruvius and Alberti](#)

[6. Timekeeping in the Middle Ages. Historians discuss the "chaos reigning in the mediaeval datings." Peculiar mediaeval anachronisms](#)

[7. The chronology and the dating of Biblical texts](#)

[8. Difficulties and contradictions arising from the reading of old texts](#)

8.1. How does one read a text written in consonants exclusively? The vocalisation problem

8.2. The sounds "R" and "L" were often confused in the Middle Ages

[9. Problems in the Scaligerian geography of Biblical events](#)

9.1. Archaeology and the Old Testament

9.2. Archaeology and the New Testament

10. Ancient historical events: geographic localization issues

10.1. The locations of Troy and Babylon

10.2. The geography of Herodotus is at odds with the Scaligerian version

10.3. The inverted maps of the Middle Ages

11. A modern analysis of Biblical geography

12. The mysterious Renaissance epoch as a product of the Scaligerian chronology

13. The foundations of archaeological methods have been based on the Scaligerian chronology from the very beginning

13.1. The ambiguity of archaeological datings and their dependence on the existing chronology

13.2. The excavations of Pompeii. The dating of this town's destruction

13.3. The allegedly accelerated destruction of the "ancient" monuments

13.4. When did the construction of the Cologne Cathedral really begin?

13.5. Archaeological methods are most often based on Scaligerian datings

13.6. One of the numerous problems of the Scaligerian history – the problem of bronze manufacture before the discovery of tin

14. The problems and deficiencies of dendrochronology and several other dating methods

14.1. The consequent scale of dendrochronological datings does not extend further back in time than the X century A.D.

14.2. Sedimentary layer datings. The methods of radium-uranium and radium-actinium analysis

15. Are radiocarbon datings to be trusted?

15.1. The radiocarbon datings of ancient, mediaeval, and modern specimens are scattered chaotically

15.1.1. Libby's initial idea. The first failures

15.1.2. A criticism of the application of the radiocarbon method to historical specimens

15.2. The dating of the Shroud of Turin

15.3 Modern radiocarbon analysis of Egyptian artefacts demonstrates serious contradictions

16. Critical analysis of the hypotheses on which the radiocarbon method is based

16.1. W. F. Libby's initial idea

16.2. Physical basics of the radiocarbon method

16.3 The hypotheses that the radiocarbon method is based upon

16.4. The moment of the object's departure from the exchange reservoir

16.5. Radiocarbon content variations in the exchange reservoir

16.6. Variations in radiocarbon content of living bodies

17. Summary

18. Numismatic dating

What mainstream historians say about the New Chronology?

Bibliography

FROM THE PUBLISHER

The Issue with Chronology crowns 30 years of meticulous and extensive research performed by the eminent mathematician Anatoly Fomenko and his colleagues. This research started actually as an unbelievable byproduct of Russian-American competition in Moon exploration, when famous NASA scientist Robert Newton discovered a very strange phenomenon in lunar mechanics. This book is also the first volume in ***History: Fiction or Science?*** series, the fundamental oeuvre that exposes and expounds the numerous inaccuracies of the traditional version of history.

The series ***History: Fiction or Science?*** contains data and conclusions that aren't anything short of revolutionary. The alternatives offered to classical history are stunning, unorthodox to the extent of being labelled heretical by virtually every scholar of history, and daring enough to be considered preposterous at first sight, although this impression never lasts longer than it takes one to read a few pages attentively.

In *The Issue with Chronology* we are reminded of when the contemporary chronological scale was created and by whom, with the culprits named as the XVI-XVII century clergy that was in charge of all matters historical in that age. We also learn that the consensual model of history had prominent critics ever since its creation – among them such names as Sir Isaac Newton and Jean Hardouin, curator of Louvre and chief librarian of Louis XIV, the Sun King of France.

The author dissects every historical age and analyses the data from every source imaginable – Roman and Egyptian chronology take a good beating, and it goes rapidly downhill from there. Poggio Bracciolini and Petrarch take the blame for creating the legend of a mythical Classical Age that never was.

The Biblical events are moved a lot closer to us historically, as well as geographically (the Biblical Jerusalem being identified with the mediaeval Constantinople, for instance). The New and the Old Testament swap their positions on the chronological scale, both exposed as referring to mediaeval events. Our perception of history begins to change dramatically even before we're through with *The Issue with Chronology*.

controls the past.*

George Orwell, 1984

A Global Falsification of History

Foreword by Alexander Zinoviev

I familiarized myself with the works of A. T. Fomenko comparatively recently, and they impressed me greatly. What part of them struck me as the most stunning? First and foremost, it was the intellectual capacity observable behind them. The authors reveal a way of cogitating that manages to fuse austere logic with dialectic flexibility; this is truly a rare occurrence in the field of social studies. Reading the *œuvres* of A. T. Fomenko and his co-author G. V. Nosovski – occasionally several times over – was a veritable intellectual delight for yours truly. They flabbergasted me with their sheer disquisitive might as well as the research results which, in my opinion, can by rights be called *the greatest discovery in contemporary historical science* – what A. T. Fomenko and his colleagues had learnt over the course of their research was the fact that the entire history of humanity up until the XVII century is *a forgery of global proportions* (“old history” in their terminology) – a falsification as *deliberate* as it is *universal*. I shall be referring to this falsification as the first one. My sociological research of the great evolutionary breakpoint demonstrated that a new, blatant, global and premeditated falsification was already in full swing.

Prior to becoming familiar with the writings of Fomenko, I had already known that the falsification of the past was a rather common phenomenon inherent in human existence. However, I was neither aware of the scale of this fraud as described by Fomenko and his fellow scholars, nor of its social type. My assumption had been that the blatant falsification of history *on a planetary scale* that I discovered was the first one in what concerned the proportions and the ulterior motivation, as well as its historical role. Let us call it the second falsification of the same variety. It differs from the first in terms of pertaining to a different epoch. Its main subject is modern history and whatever historical period can be claimed as relevant to, and seen as fitting for, the purposes of this falsification. The second falsification also differs from the first one in its primary means and methods, which shall be described below.

One has to differentiate between the two kinds of falsification, the first one being the involuntary routine falsification of minor details that results from the mechanisms of gnosis and those of the actual description of historical events, or the entropy inherent in

the framework of humanity's historical memory. The second is the extraordinary, premeditated and complex falsification that has distinct social causes.

Let us consider the former kind first. We shall disregard the period preceding the epoch of literacy and symbolic systems. The mnemonic means available back then were less than meagre, which automatically diminished the arsenal of the hypothetical falsifiers. We shall turn to the era of literacy instead. It is common knowledge that historical events become immanentized in human language – and a statement uttered is a lie, as the old saying goes. We cannot fathom the unfathomable. What we end up doing is raking the vastness of history for tiny morsels of information and adding some of our own narrative in order to produce wholesome and coherent textual material.

The modern information technology does not affect the principles that the status quo relies upon. Let us introduce the concept of historical “atoms”, or particles that aren't subject to further division. One may well calculate that the verbal description of a single year of real history the way it really happened, including all manner of events, no matter how minute, would require the processing power of all the computers on the planet, with all people made computer operators. De facto, this technology serves as a powerful instrument of historical falsification. It allows for the possibility of *drowning a scientific approach to historical events in an ocean of meaningless facts*.

Furthermore, the description of actual historical events is done by humans, and not perfect divine entities. People are brought up and educated in a certain way and have a certain social standing, as well as egotistical goals and aims of their very own. All of this affects the way the information is processed. Over the course of time, the overwhelming majority of events are wiped away into oblivion without leaving the merest trace. They are frequently not even realized as events. The people's attitude to the past begins to alter as past events gradually drift into an altogether different observational and interpretational context.

Evolutionary process discerns between two kinds of events – preliminal and superliminal. The former kind does not affect the general character of evolution; the latter one does. However, humans, including specialists, fail to recognize the difference between the two. Everyone knows perfectly well how much attention is poured over rather insignificant individuals, such as kings and presidents, whereas *the really important events often don't even get so much as a passing reference*. This affects the relations between historical events so much that all sense of measure is often lost. Even if we are to suppose that all those who partake in the creation of historical records see veracity as their mission, the result of their collective efforts is often the rendition of

their own subjective views on history as opposed to what happened in reality. As centuries pass by, the stream of disinformation is fed by various sources and tributaries, which, in their multitude, produce the effect of impartial falsification of historical events. This stream also feeds on murky rivulets of countless liars and swindlers.

The false model of history serves its function for a certain while. However, humanity eventually enters a period when this distorted representation loses efficacy and stops serving its ends. This is where people are supposed to start searching for explanations and set out on their quest for a “truth”. However, there is the abstract scientific kind of truth, and the actual historical variety – that is to say, something that people regard, or will at some point start regarding as truth. The very word “truth” is confusing here. We shall be on safer ground if we are to consider the adequacy of having certain concepts of the past for the new needs that have manifested as a result of the historical process. These concepts stop being valid for satisfying these needs. One becomes aware of the necessity to update our view of the past in accordance with whatever the present stipulates. This awareness is the kind of craving that can only be satisfied by a “bona fide rectification” of history, which has to occur as a grandiose paradigm shift – moreover, it has to be a *large-scale organized operation*; one that shall result in an epochal falsification of the *entire history of humankind*. The issue at hand is by no means the falsification of individual observations of historical events, but rather the revision of the entirety of historical records describing the events which cannot be observed as a principle since they belong to the past. What we are talking about is not a mere change in the perception and interpretation of the same old existential phenomena – it is the adaptation of the character, which naturally used to refer to certain commonplace realities at some point, to the exigencies of people who have to live in an altogether different environment. Trained specialists are a *sine qua non* for this – people whose activity shall have to be organized in such a manner that their collective output will result in the creation of a coordinated historical Gestalt. What they really have to do is create exactly the kind of past that is needed for the present, making use of whatever available material presents itself.

The first global falsification of history as discovered and brilliantly related by Fomenko was based on an erroneous temporal and spatial coordinate system of chronological events (the chronological system and the localizations of events wedded thereto). The more recent and ongoing second global falsification of history is based on a system of erroneous pseudoscientific sociological concepts based upon ideology and aided greatly by the modern information manipulation technology. This is why I call the

second falsification conceptual and informational, or merely “conceptual” for brevity’s sake. Fomenko’s works describe the technology of building a false model of human history which uses the art of manipulating the temporal and spatial coordinates of events. Many thousands of specialists in false historical models are already working on this second falsification – their forte is the ability to misrepresent historical events while giving correct temporal and spatial coordinates and representing individual facts veraciously and in full detail. The actual falsification is achieved via the selection of facts, their combination and interpretation, as well as the context of ideological conceptions, propagandist texts that they are immersed into, etc. In order to describe the technology behind the second falsification with any degree of clarity at all, exhaustively and convincingly, one needs a well-developed scientific system of logistics and methodology, as well as sociological theory. I call such a system *logical sociology*; however, it is a thing of the future, which means that the second falsification of history shall continue in its present manner, with as much ease and impunity as the first. Tens and hundreds of years hence, a number of solitary researchers shall “excavate” the so-called “modern history” in very much the same manner as Fomenko (and his predecessors, including N. A. Morozov) have treated “old history”.

I would like to conclude with an observation concerning the exceptional scientific scrupulousness of the works of A. Fomenko and G. Nosovskiy. I have examined them from exactly this position many a time, and I have neither found a single ipse dixit statement, nor any categorical pontificating of any kind. The general narrative scheme they employ is as follows: the authors relate the consensual (*textbook*) historical concepts and then cite historical facts which either fail to concur to said concepts, or *contradict them explicitly*. Other authors who have noticed these inconsistencies are quoted. Then Fomenko and Nosovskiy put forth hypotheses which allow to find logically correct solutions for the problems under study. They keep on emphasizing and reiterating that the issue at hand is all about hypotheses and not categorical statements presented as the truth absolute. The readers are invited to take part in the solution of problems that arise as a consequence of the consensual chronological concept of history. I am amazed by the horrendous injustice of the numerous critics of Fomenko and Nosovskiy, who obviously distort their ideas, either failing to understand them completely or being altogether unfamiliar with their content. It is also quite astounding that whenever a publication occurs that voices ideas that bear semblance to those of Fomenko and Nosovskiy, but are a lot more *tame* and local, providing a lot less factual information, this publication is usually accepted with a great deal more benevolence. I

understand the psychological groundwork beneath this – Fomenko and Nosovskiyy have performed a *great scientific feat of epochal significance*, one that affects the sentiments and interests of too many people. Acknowledging this feat as such, or at the very least the mere fact of its creative relevance, obligates one to actions that are apparently beyond these people due to their incapacity and immaturity. The trouble with Fomenko and Nosovskiyy is that they have reached out too far and dealt the dominating historical discourse too heavy a blow.

Alexander Zinoviev

10 October 1999,

19 April 2001.

Alexander Zinoviev (1922–2006), Professor of the Moscow State University, logician, sociologist, writer, member of the Finnish, Bavarian and Italian Academy of Sciences, the Russian Academy of Polite Letters and several others. Laureate of the 1982 Alexis Tocqueville prize for sociology and the “Best Sociology Essay of 1979” prize, as well as a large number of European and international prizes for literature. Honorary citizen of several French and Italian towns and cities. The works of A. A. Zinoviev are published in more than 20 languages and considered international bestsellers. He read lectures on sociology in many European and American universities.

Preface by Anatoly T. Fomenko

The materials contained in this book correspond to the research that was started in 1973.

One might wonder why we should want to revise the chronology of ancient history today and base our revision on new empirical-statistical methods. It would be worthwhile to remind the reader that *in the XVI-XVII century chronology was considered to be a subdivision of mathematics*, prior to having gradually transformed into a field of historical studies considered complete in general, and only requiring minor eventual clarifications leaving the actual edifice of chronology intact. And yet we discover that the contemporary official version of the chronology of ancient history is full of prodigious contradictions and inconsistencies that deserve an attempt of partial clarification and rectification based on the methods of modern statistics at the very least.

One often hears the question about what could possibly motivate a mathematician into wanting to study a seemingly historical problem. The answer is as follows. My primary interests are those of a professional mathematician; they are thus rather distant from historical and chronological issues. However, in the early 70's, namely, in 1972-1973, I had to deal with the dates of ancient eclipses during my studies of one of the key problems in celestial mechanics (see [Chron1](#), Chapter2 for more details). It had to do with computing the so-called coefficient D'' in the Theory of Lunar Motion. The parameter characterizes acceleration and is computed as a time function on a large historical interval. The computations were performed by Robert Newton, a contemporary American astronomer and astrophysicist. Upon their completion, he had made the unexpected discovery of parameter D'' behaving in the most peculiar manner, namely, performing an inexplicable leap on the interval of VIII-X century A.D. This leap cannot be explained by conventional gravitational theory, and is improbable to the extent of making Robert Newton invent mysterious "extra-gravitational forces" in the Earth-Moon system that suspiciously refuse to manifest in any other way.

This inexplicable effect attracted the professional interest of the mathematician in me. The verification of R. Newton's work showed that his computations conformed to the highest scientific standards and contained no errors. This made the gap in the diagram even more enigmatic. A prolonged pondering of this topic led me to the idea of checking the exactitude of *datings* of the ancient eclipses that the D'' parameter computations

were based upon since they implicitly affected the result. This idea turned out to have been unprecedented for the scientists that had dealt with the problem previously. Robert Newton himself, an eminent expert in the field of astronavigation and theoretical dynamics of natural and artificial celestial bodies, trusted the ancient historical dates completely and attempted to explain the leap in the behaviour of parameter D'' from within his professional paradigm. That is to say, without the merest hint of the very idea of questioning ancient chronology. I was more fortunate in that respect: I found out that N. A. Morozov, a renowned Russian scientist and encyclopaedist, had analyzed the datings of ancient eclipses and claimed most of them to be in need of revision. This happened as early as the beginning of the XX century. He offered new datings for a large number of eclipses that were considerably more recent. Having obtained his tables, I repeated Newton's calculations using Morozov's dates in lieu of the consensual ones as input data. I was amazed to discover that the D'' graph altered instantly and drastically, transforming into a rather even horizontal line that had concurred with the conventional gravitational theory perfectly. The enigmatic leap disappeared along with the necessity to invent fictitious "extra-gravitational forces".

The satisfaction from having finished a body of scientific work successfully was accompanied by a sudden awareness of a very knotty point arising in this respect, one of great peculiarity and paramount importance. Namely, that of whether the consensual chronology of ancient history was to be trusted at all.

It was true that the new datings of many ancient eclipses offered by N. A. Morozov led to the equalization of the D'' function diagram, the elimination of a strange contradiction from celestial mechanics, and to the discovery of the conformance of an important parameter in the theory of lunar motion to perfectly normal patterns of behaviour.

It was equally true, however, that fitting something like the idea that the three ancient eclipses described in the *History* of the prominent ancient author Thucydides took place in the XI or even the XII century A.D. and not in the V B.C. as it is believed today into one's perception proved quite impossible. The issue here is that the dating of the "triad of Thucydides" can only correspond to these two astronomically precise solutions (see [Chron1](#), Chapter 2). The inevitable question that arose in this respect was that of which discipline had been correct in this case, astronomy or contemporary chronology.

I had to address several distinguished historians with this issue, including the ones from our very own Moscow State University. Their initial reaction was that of polite restraint. According to them, there was no point whatsoever in questioning the

consensual chronology of ancient history since all the dates in question can easily be verified by any textbook on the subject and were proved veracious a long time ago. The fact that the diagram of some parameter D'' started to look natural after revised calculations based on some flimsy new chronology was hardly of any relevance. Moreover, it would perhaps be better for the mathematicians to occupy themselves with mathematics and leave history to historians. The same sentiment was expressed to me by L. N. Gumilyov. I refrained from arguing with him.

The reply offered by the historians failed to satisfy me. Firstly due to the fact that chronology, being a problem of calculating dates, bears immediate relevance to applied mathematics. This includes astronomical calculations, the verification of their precision, calendar problems, the interpretation of old writings based on their frequency characteristics etc, and may present an extensive number of complex issues. Secondly, becoming familiar with the contemporary chronological tables soon proved that the ancient dates were quoted rather arbitrarily, with hardly any references at all given anywhere. At best, the first chronological tables get a quote – however, those were compiled *relatively recently*, in the XVI-XVII century. Delving deeper into the problem revealed that the version of chronology that we agree upon today wasn't the only one available historically. I found out that eminent scientists from various countries expressed the idea that ancient datings required a radical revision. I realized that the answer was the furthest thing from simple, and that shedding some light on the issue would require plenty of time and effort. This is how 1973 saw me commencing work in this direction, aided by colleagues – most of them professional mathematicians and physicists.

The research progressed rapidly. Over the years that passed since 1973 many points have been clarified and a great volume of interesting information obtained. A lot of it was published by myself and my colleagues in a number of books and scientific articles quoted in the bibliography. The first related publication saw light in 1980. It has to be noted that over the course of time our opinions on certain chronological problems have changed. Said alterations never concerned the general picture, but occasionally led to significant shifts in our perception of details. Today we feel that the empirical-statistical methods that our chronological research was based upon need to be formulated and coordinated again. This is how the books [*Chron1*](#) and [*Chron2*](#) came to existence.

[*Chron1*](#) is based on the first book I wrote on the subject – *Methods of Statistical Analysis of Narrative Texts and their Application to Chronology (Identifying and*

Dating Dependent Texts, The Statistical Chronology of Ancient History, The Statistics of Ancient Reports of Astronomical Events). It was published by the Moscow State University in 1990; a further revised and extended edition appeared in 1996 under the title *Methods of Mathematical Analysis of Historical Texts and their Applications to Chronology* (Moscow, Nauka Publishing, 1996). [Chron1](#) contains the entire material in a revised, extended, and coordinated form. It contains an extended version of two of my books: *Global Chronology* (Moscow, MSU, 1993) and *The New Chronology of Greece: The Mediaeval Age of Classics* (Moscow, MSU, 1996).

Certain important results that get briefly mentioned in [Chron1](#) and [Chron2](#) were achieved with the aid of outstanding scientists – Professor V. V. Kalashnikov, Doctor of Physical and Mathematical Sciences (Moscow State University and the National Research Institute for System Studies, Moscow, Russia), and the Senior Scientific Associate G. V. Nosovskiy, Candidate of Physical and Mathematical Sciences (the Department of Mathematics and Mechanics, Moscow State University) – experts in fields of probability theory studies and mathematical statistics. The formation of the author's concept of chronology is largely a result of his having collaborated with V. V. Kalashnikov and G. V. Nosovskiy for many years, and I would like to express my heartfelt gratitude to both of them.

I would like to state explicitly that over the period of time from 1981 and until presently our collaboration with G. V. Nosovskiy has been constant and very fruitful, as the two of us have published a number of what we consider to be milestones of the new chronology. The formulation of the main principles of reconstructing modern chronology and mediaeval history is a direct result of the work we have done together over these years, which adds particular importance to this period.

Let us briefly describe the structure of [Chron1](#) and [Chron2](#). The consensual versions of chronology, as well as those of ancient and mediaeval history, had evolved completely by the XVII century A.D. and appear to contain major flaws. Many prominent scientists are aware of this and have discussed it for quite a while (see [Chron1](#), Chapter 1). However, the creation of a new concept of history that would be free from inconsistencies proved a truly formidable task.

A group of mathematicians, most of them from the Moscow State University, commenced their research of the problem in 1974. The results were most captivating, and got covered in a number of monographs (see bibliography) and several dozens of publications in scientific periodicals. Let us emphasize that the new concept of chronology is based primarily on *applying methods of modern statistics* to the analysis

of historical sources and *extensive cybernetic computations*.

The main subject of the books [Chron1](#) and [Chron2](#) is the research of new *empirical-statistical methods* of finding dependencies in historical texts and derived procedures of *dating* historical events.

The task of *recognizing the difference between dependent and independent texts* is really one of *identifying images*. One encounters it in various scientific paradigms including applied statistics, linguistics, physics, genetics, historical source studies, etc. Finding *dependent* texts is of great utility as applied to studying historical sources where they may be traced to a *common original* that had been lost before our time. It is also very useful to be able to tell which texts are *independent*, or derived from non-correlating sources.

The very concept of *text* can be interpreted in a wide variety of ways. Any sequence of symbols, signals, and codes can be referred to as “text” – the sequences of genetic code in DNA chains, for instance. The common problem of finding *dependent texts* is formulated as follows: one has to find “similar fragments” in long signal sequences – that is, fragments of text that duplicate one another.

There is a multitude of methods used for the recognition of dependencies and the identification of “similar images” available today. We offer several new empirical-statistical methods. They might be of use in analyzing historical chronicles, manuscripts, and archive materials as well as in finding the so-called homologous fragments in texts of a significantly different, more general nature.

This book is divided into several parts or topics for the reader’s convenience. This should help us to securely differentiate between proven statistical facts and hypotheses. At the same time, one has to state that such topical division is rather artificial since the topics really have lots and lots of points in common.

The first topic

Solving the problem of statistical recognition of dependent and independent historical texts. Formulating new statistical models and hypotheses, as well as verifying them with extensive experimental material of actual historical chronicles. It turns out we’re able to acquire general verification of the models offered. In other words, we have managed to discover interesting statistical tendencies that define the evolution of textual information over a period of time, such as what really happens to the data contained in the manuscripts during their duplication, etc.

The discovery of these tendencies is our first result.

The discovered trends are used as basis for the formulation of new methods of dating the events described in the chronicles. This is achieved by statistical comparison of the chronicles and documents pertinent to the research with the ones possessing confirmed datings. The methods are verified by a large body of correctly dated materials. Their application to the chronicles and documents describing the events of the XVII-XX century appears to confirm the efficacy of these methods. Namely, the statistical datings that we got as a result of our research concur with the ones confirmed by traditional methods. The *a priori dependent* chronicle pairs turn out to be *dependent statistically* with the use of our methods. The ones that are *independent a priori* turn out to be *independent statistically* as well.

Experimental examination of veraciously dated chronicles describing the events of XVII-XX century A.D. led to the discovery of natural numeral coefficients that allow us to differentiate between *a priori dependent chronicles* and *a priori independent ones* in 1974-1979. Basically, these numbers are rather small for *a priori* dependent pairs and rather large for *a priori* independent ones. This means that nowadays we can compare arbitrary chronicles *X* and *Y* and find out whether their proximity coefficients are within the zone that refers to dependent chronicles or the one that refers to independent ones. It is needless to say that the boundaries of these zones were found experimentally.

The discovery of the hidden dependencies that define the evolution of information in rather large historical chronicles as well as the development and experimental verification of the new dating methods (currently comprising a total of eight) – is the *second principal result of our work*. The datings achieved by our methods cannot be regarded as finite, so we shall refer to them as “statistical datings” and nothing more. We shall occasionally drop the word “statistical” for the sake of brevity. The above is to say that we regard the empirical-statistical dates that we computed to be a result of applying statistical methods to historical materials. Nevertheless, the concurrence of these statistical datings with the ones verified a priori that we have discovered in the interval of XVII-XX century A.D. implies that our results are of an objective nature.

The second topic

It can also be referred to as *critical*. We analyze the traditional datings of events that occurred in ancient and mediaeval Europe, Asia, the Mediterranean countries, Egypt, and America. Bearing the reader’s convenience in mind, we have collected various materials here that can be found scattered across all kinds of scientific literature and are

known to specialists of various profiles, but *often remain beyond the awareness of the general public*. These materials illustrate serious difficulties that are presently inherent in the problem of scientific dating of historical events preceding the XIV century A.D.

We shall inform the reader of the fundamental research conducted by the prominent Russian scientist and encyclopaedist Nikolai Aleksandrovich Morozov (1854-1946), honorary member of the USSR Academy of Sciences, who was the first to have formulated the problem of confirming the ancient and mediaeval chronology with the means offered by natural sciences in its entirety in addition to having collected a great volume of critical materials and suggested a number of innovative hypotheses.

We shall also report the chronological research conducted by Sir Isaac Newton, who questioned many datings of historical events, and several other representatives of the critical current in history and chronology. We quote from eminent authorities in the fields of archaeology, source studies, and numismatics, and a variety of other well-known scientists, and extensively compare different points of view so that the readers could develop their own opinions of the problems in question.

The primary application of novel empirical-statistical methods is the analysis of dates of historical occurrences. This is why we were forced to analyze as many *dating versions* of events in question as we could find in this day and age. The issue here is that various ancient and mediaeval chronicles frequently demonstrate *significant discrepancies* in their datings of certain important events. Attempting to navigate in this chaos of mediaeval versions, we devote special attention to those reflected in the chronicles of XV-XVI century A.D. due to the fact that the chronologists of that epoch were closer in time to the events described than we are. Subsequent chronological versions of XVII-XX century are often revisions of *derivative* material, obscuring and heavily distorting the original mediaeval meaning.

Starting with XVI-XVII century A.D., the version of the chronology of ancient history that was created in the works of prominent mediaeval chronologists J. Scaliger and D. Petavius “rigidifies.” The main points of the official version of contemporary chronology coincide with those of Scaliger and Petavius. Hence we are to use the term “Scaligerian chronology” and refer to the consensual datings of ancient events as to “Scaligerian datings”.

We presume the reader to be more or less familiar with the traditional – Scaligerian *de facto* – chronology concepts familiar from school and university. We shall thus refrain from quoting the Scaligerian concept in detail, considering this knowledge to be in public domain. On the contrary, we shall be making a special emphasis on its

inconsistencies. Further on, we shall give a brief analysis of traditional dating methods: datings based on historical sources, archaeological datings, radiocarbon datings, dendrochronology, etc. It is expedient to allow the reader the evaluation of the veracity and the precision of these methods as well as their application areas.

The third topic

In 1975-1979 the author compiled a table entitled “*Global Chronological Map*”, which may be referred to as GCM for the sake of brevity. It may be regarded as a rather complete “Scaligerian textbook” of ancient and mediaeval history. All the principal events of ancient history with their dates according to Scaliger (the ones used today), lists of main historical characters, etc., were placed along the horizontal axis of time. All the key original sources that have survived with descriptions of contemporary life were quoted for each epoch. The resulting chronological map contains tens of thousands of names and dates. The physical space it covers amounts to several dozen square metres. This map proved itself a priceless encyclopedia and a great guide for the edifice of contemporary – Scaligerian *de facto* – ancient and mediaeval chronology. Due to the large volume of the material, it made its way into [Chron1](#) and [Chron2](#) with many expurgations, as small tables and diagrams.

The fourth topic

In 1974-1979, the entire arsenal of the new empirical-statistical dating methods was applied to the factual material collected on the map of the Scaligerian chronology. This was done by inspecting all manner of pairs of historical epochs and the key original sources pertinent to them. These chronicles were processed statistically and then compared in pairs, and eventually the dependence coefficients of compared historical texts were computed.

If such coefficients for the two compared chronicles *X* and *Y* proved to belong to *the same* numeric order as those of the *a priori dependent* chronicles from the “certainty interval” of XVII-XX century A.D., we called them *statistically dependent*. In this case, both correlating epochs (temporal periods) were marked on the map with *the same* arbitrarily chosen symbol such as the letter *R*.

If the proximity coefficient (or measure) of the two compared chronicles *X* and *Y* proved to belong to *the same* numeric order as those of the *a priori independent* chronicles from the “certainty interval” of the XVII-XX century A.D., we called them *statistically independent*. In this case, both correlating epochs (temporal periods) were marked on the map with *different* arbitrarily chosen symbols such as the letters *N* and *S*.

As a result of statistical research, pairs of statistically dependent chronicles and epochs pertinent to them were found and exposed in the “Scaligerian history textbook”. We called such chronicles and the sequences of events they described *statistical duplicates*.

We discovered that the results of using different empirical-statistical methods correlate very well. Namely, the chronicle pairs “statistically similar” according to one method turned out to be “statistically similar” according to all the others (if such methods were at all applicable to the chronicles in question). This result correlation is perceived as important.

It is vital that our empirical-statistical methods have found no unforeseen duplicates, or chronicles whose dependent nature we weren’t aware of *a priori*, on the interval of XVII-XX century A.D.

At the same time, the same methods found a large number of new statistically similar chronicles (duplicates) that were previously considered underived, independent in every sense of the word and ascribed to various epochs before the XVII century A.D., preceding the XI century in particular. The compilation of the Scaligerian chronological map and the discovery of statistical duplicates therein amount to the third principal result of this book.

The fourth principal result is the division of the Scaligerian chronological map into a sum of the four chronicle layers discovered by the author. These chronicle layers are nearly identical, but they are shifted in time in relation to each other. These shifts amount to significant amounts of time and their correspondent chronicle layers may be regarded as “short chronicles” of sorts. *A very rough description of “The Contemporary Scaligerian Textbook of Ancient and Mediaeval History” would be calling it a sum, or a collage, of four copies of the same short chronicle, statistically speaking.*

A criticism of the Scaligerian chronology and the description of the four statistical results mentioned above comprise the main part of the present book. Its other parts are of a hypothetical and interpretational nature. They aid the formulation of a possible answer to the naturally occurring question about the meaning of all the discovered empirical-statistical facts, and what the history was “really like”.

The fifth topic

This topic can be called interpretational. This is where we offer the hypotheses that may explain the trends we have discovered and the reasons why the “Scaligerian textbook of

history” might contain duplicates. Neither this material, nor the “truncated history textbook” that we offer are to be considered finite in any way. They may only be regarded as offering a possible version that requires a great body of work to be conducted by experts of various profiles, and maybe even special research facilities.

* * *

The author’s position on a significant number of points raised in [*Chron1*](#) and [*Chron2*](#) has formed as a result of interaction, collective research, and extensive discussions with specialists from a wide variety of fields, most notably, the field of mathematics and fellow mathematicians. Specifically, the new statistical models and the results we have achieved have all been presented and discussed over the span of the past twenty-plus years:

- the Fourth and the Fifth International Probability Theory and Mathematical Statistics Conferences in Vilnius, Lithuania, 1981 and 1985;

- the First International Bernoulli Society for Mathematical Statistics and Probability Theory Congress in Tashkent, Uzbekistan, 1986;

- the Multidimensional Statistical Analysis and Probabilistic Modelling of Real-Time Processes seminar by Prof. S.A. Aivazyan at the Central Institute of Economics and Mathematics of the USSR Academy of Sciences;

- several national seminars on Stochastic Model Continuity and Stability by Prof. V. M. Zolotaryov (The V. A. Steklov Mathematics Institute of the Russian Academy of Sciences) and Prof. V. V. Kalashnikov (The National Research Institute for System Studies);

- Controllable Processes and Martingales seminars by Prof. A. N. Shiryaev (V. A. Steklov Mathematics Institute of the Russian Academy of Sciences) and Prof. N. V. Krylov (Department of Mathematics and Mechanics, Moscow State University);

- Academician V. S. Vladimirov’s seminar at the V.A. Steklov Mathematics Institute of the Russian Academy of Sciences;

- Academician O. A. Oleinik’s seminar at the Department of Mathematics and Mechanics, Moscow State University;

- Academician A. A. Samarsky’s seminar at the USSR National Mathematical Modelling Centre.

The author would like to give thanks to all of the participants of the discussion, and the members of the audience.

The author also expresses his gratitude to the following members of the Russian Academy of Sciences for their kind support and collaboration: Academician E. P. Velikhov, Academician Y. V. Prokhorov, Academician I. M. Makarov, Academician I. D. Kovalchenko, Academician A. A. Samarsky, and Academician V. V. Kozlov, as well as Corresponding Member S. V. Yablonsky.

Thanks to fellow mathematicians, as well as mechanicians, physicists, chemists, and historians, most of them members of the Moscow State University faculty: Prof. V. V. Alexandrov, Prof. V. V. Belokourov, Prof. N. V. Brandt, Prof. Y. V. Chepurin, Prof. V. G. Dyomin, Cand. Sci. M. I. Grinchouk, Prof. N. N. Kolesnikov, Prof. V. V. Kozlov, member of the Russian Academy of Sciences, Prof. N. V. Krylov, Prof. A. S. Mishchenko, Prof. V. V. Moshchalkov, Prof. Y. M. Nikishin, Prof. V. A. Ouspensky, Prof. V. I. Piterbarg, Prof. M. M. Postnikov, Prof. Y. P. Solovyov, Prof. Y. V. Tatarinov, and Prof. V. I. Trukhin, as well as Prof. V. M. Zolotaryov and Prof. A. N. Shiryayev, Corresponding Member of the Russian Academy of Sciences, both members of the V. A. Steklov Mathematics Institute of the Russian Academy of Sciences; faculty members of the National Research Institute for System Studies of the Russian Academy of Sciences, Prof. V. V. Kalashnikov and Prof. V. V. Fyodorov; faculty member of the Central Institute Of Economics and Mathematics of the Russian Academy of Sciences, Prof. Y. M. Kabanov; faculty member of the National Institute of Scientific Research in Information Transfer Problems, Prof. A. V. Chernavsky; faculty member of the Moscow Oil and Gas Institute, Prof. I. A. Volodin; Prof. S. V. Matveyev, Chelyabinsk University Corresponding Member of the Russian Academy of Sciences; faculty member of the Kiev University, M. V. Mikhalevich, and Prof. V. V. Sharko, staff member of the Ukrainian Academy of Sciences Institute of Mathematics.

The author would like to express his heartfelt gratitude to all of them, along with S. N. Gonshorek for his collaboration and support.

Over various stages the participants of the New Chronology project included the representatives of a variety of scientific paradigms. In their midst: V. V. Bandourkin and Prof. D. Blagoevic (Belgrade University, Belgrade, Yugoslavia), Cand. Phys. Math. Sci. B. E. Brodsky, T. G. Cherniyenko, Y. S. Chernyshov, Prof. B. S. Darkhovski, Prof. I. V. Davidenko, D. V. Denisenko, Cand. Phys. Math. Sci. T. N. Fomenko, V. P. Fomenko, Cand. Tech. Sci. T. G. Fomenko, I. A. Golubev, N. Gostyev, Cand. Phys. Math. Sci. M. I. Grinchouk, Prof. V. D. Gruba, I. Y. Kalinichenko, Cand. Phys. Math. Sci. N. S. Kellin, G. A. Khroustaliyov, Prof. A. Lipkovsky (Belgrade University, Belgrade, Yugoslavia), Prof. A. S. Mishchenko, N. A. Milyakh, A. V. Nerlinsky, Cand.

Phys. Math. Sci. I. N. Nikitin, Prof. E. M. Nikishin, M. G. Nikonova, A. A. Onishchenko, Dr. Guillermo Peña Fera (Cuba, Spain), M.E. Polyakov, S. N. Popov, Prof. M. M. Postnikov, N. Z. Rakhimov, A. Y. Ryabtsev, D. K. Salakhutdinov, Prof. Y. N. Sergiyenko, Prof. Jordan Tabov (The Bulgarian Academy of Sciences Institute of Mathematics, Sofia, Bulgaria), Y. N. Torkhov, and Y. A. Yeliseyev.

The author would also like to thank Prof. V. K. Abalakin, V. V. Bandourkin, A. V. Bogdanov, M. A. Bocharov, Prof. R. L. Dobroushin, Prof. E. Y. Gabovitsch, Prof. M.I. Grossman, Prof. A. O. Ivanov, Cand. Phys. Math. Sci. V. Kossenko, Prof. Y. M. Lotman, Dr. Christoph Marx (Switzerland), Prof. A. A. Polikarpov, Prof. V. D. Polikarpov, Cand. Hist. Sci. S. A. Poustovoyt, Prof. M.L. Remnyova, Prof. S. N. Sokolov, and Prof. A. A. Touzhilin, for valuable discussions and insights.

Many thanks for the kind assistance of Professor Peter Gruber (The Technical University, Vienna, Austria) who proved to be most valuable indeed.

The author is indebted to all those who helped with statistical work on original sources, namely N.S. Kellin, P. A. Pouchkov, M. Zamaletdinov, A. A. Makarov, N. G. Chebotaryev, E. T. Kouzmenko, V. V. Bashe, B. A. Silberhof, M. Y. Stein, V. P. Fomenko, Cand. Tech. Sci. T. G. Fomenko, and Cand. Phys. Math. Sci. T. N. Fomenko.

Cand. Phys. Math. Sci. N. S. Kellin, Cand. Phys. Math. Sci. N. Y. Rives, Cand. Phys. Math. Sci. I. S. Shiganov, P. A. Pouchkov, M. Zamaletdinov, Cand. Phys. Math. Sci. S. Y. Zholkov, and A. V. Kolbasov have all provided much appreciated help with the creation of algorithms and programs, as well as statistical work on the material.

The author would further like to thank T. G. Zakharova, Director of the N. A. Morozov Museum at the Inland Water Biology Institute, RAS, the entire staff of the museum, as well as V. B. Biryukov for the exceptionally valuable help in archive studies related to N. A. Morozov and his scientific output they provided.

Starting in 1998, the development of the new chronology was aided by a number of specialists from a variety of unrelated fields and adhering to different cognitive paradigms. In 2001 and 2002 G. K. Kasparov voiced his support of the New Chronology in its critical part a couple of times, on the radio and the television; I wish to express my gratitude to him. I am also grateful to Professor A. A. Zinoviev (MSU), the eminent writer, logician and sociologist, for active support and fruitful discussions. My thanks also go to the IAELPS Academician M. K. Moussin, a merited employee of the oil and gas industry, and all the members of his family who actively took part in the “New Chronology” project. Special thanks to I. R. Moussina for her help in compilation of the Dictionary of Interlingual Parallelisms. The project development was greatly

helped by A. V. Podoinitsyn, the economist, and Prof. I. V. Davidenko, the geologist.

Disputes with various historians, philologists, and linguists have been a significant influence on the development of the new chronology.

The author is immensely grateful to the head of the Philological Department of the Moscow State University, Prof. M. L. Remnyova, for her kind assistance in allowing a reading of a special course in chronological problems and new mathematical methods in history and linguistics, which was read by G. V. Nosovskiy and the author, at the Philological Department of MSU in 1998. We would like to thank the Professor of the Philological Department, A. A. Polikarpov, who supervises the Laboratory of Computer Methods in Linguistics for his help in organizing this course and valuable discussions.

Thanks to the Freeborn Russia radio station (Moscow) for the informational support of the New Chronology project in 1998-1999, namely, a large series of special weeklies dedicated to our research. Y.S. Chernyshov brilliantly presented these programs. The second cycle of these programs appeared in 2001.

The author expresses gratitude to the dozens and dozens of people in complex chronological research, for their help and support.

A fond, special thanks to the author's parents, V.P. Fomenko and T. G. Fomenko, and his wife, T. N. Fomenko, Candidate of Physical and Mathematical Sciences, for the great and invaluable help in processing statistical materials and for their steady, unswerving support during all the years of robust and complex development of the new chronology.

I would like to re-emphasize that over the last couple of years our research has been getting active support of A. Zinoviev, the prominent thinker, logician, sociologist and writer. His support is all the more valuable to us since the period when it is being provided is that of the utmost controversy and difficulty in what concerns the acceptance of the New Chronology by the community of scientists. A. Zinoviev had pointed out the mechanisms used for the falsification of recent history (the XIX-XX century). His concept of "virtual reality" – the one created and deliberately planted for the distortion of one's perception of reality and the creation of "the official myth of the days of yore" concurs well with the results of our research which have helped to remove the veil obscuring the creation of the Scaligerian version of history in the XVI-XVIII century. Many of A. Zinoviev's ideas concerning the necessity of introducing the methods of modern constructive logic (including the logical methods created by himself) into sociology and history gain paramount actuality nowadays. The actual idea of translating our seven-volume work into foreign languages in order to increase the involvement of

foreign scientists into the discussion of ancient chronology, as well as the organizational initiative, belong to none other but him. We are most grateful to A. Zinoviev for his support and the numerous scientific disputes covering a great scope of issues including those relevant to chronology. We consider it a great honour and privilege to be able to commune with one of the most eminent thinkers of the XX-XXI century.

The present publication of the seven volumes of *Chronology* only became feasible due to the creation of a special project for the translation and publication of our works on chronology by Youri Filippov. One has to emphasize that the translation of such a great bulk of complex scientific material is a most grandiose endeavour per se. We would like to express our sincere gratitude to Y. N. Filippov for the gigantic amount of labour invested, and also to the translators and editors for their hard and highly professional work.

* * *

The book is dedicated to the memory of Nikolai Aleksandrovich Morozov, brilliant scientist, encyclopaedist, and author of the most profound ōuvres on chemistry, physics, mathematics, astronomy, and history. He was the first to have fully formulated the problem of finding scientific basis for ancient and mediaeval chronology using natural sciences, and obtaining fundamental results in this direction.

The author would like to express the wish for this seven-volume edition to provide an impetus for the development of new empirical-statistical methods of studying historical texts so that the problems of ancient chronology can be solved in their entirety.

*A. T. Fomenko,
March 2002*

1.

Roman chronology as the foundation of European chronology

“One often comes across accounts of a steel chisel found in the external masonry of the Great Pyramid of Cheops (Khufu, the beginning of XXX century B.C.); however, it is indeed most probable that said tool got there in a later age, when the pyramid stones were pillaged for building purposes.” – Michele Giua. *The History of Chemistry*. Moscow, 1975, page 27, comment 23.

Let us give a concise preliminary account of the current state of ancient and mediaeval chronology. The importance of chronology for historical science is all the greater since this discipline allows for the determination of the time interval between the historical event and the current era (provided it can be adequately translated into terms of contemporary chronology, that is to say, it is given a corresponding B.C./A.D. dating). Nearly all the fundamental historical conclusions depend on the dating of the events described in the source that is being studied. An altered or imprecise dating of an event defines its entire interpretation and evaluation. The current global chronology model has evolved owing to the labour of several generations of chronologists in the XVII-XIX century and has Julian calendar datings ascribed to all the major events of ancient history.

The datings of events referred to in some freshly discovered document are predominantly based on the Roman chronology, since it is considered that “all the other ancient chronological datings can be linked to our calendar via direct or indirect synchronisms with the Roman dates” ([72], page 77). In other words, Roman chronology and history are the “spinal column” of the consensual global chronology and history. This is why Roman history shall have to enjoy our very special attention.

2.

Scaliger, Petavius, and other clerical chronologers. The creation of contemporary chronology of the ancient times in the XVI-XVII century A.D.

The chronology of ancient and mediaeval history in its present form was created and, for the most part, concluded in a series of fundamental works of the XVI-XVII century that begins with the writings of Iosephus Iustus Scaliger (1540-1609), called “the founder of modern chronology as a science” by the modern chronologist E. Bickerman ([72], page 82). The mediaeval portrait of I. Scaliger can be seen on fig. 1.1. This is an etching from *Athena Batavia*, a book by Johannes Mercius ([35], page 25).

Fig. 1.1. Portrait of the chronologist Joseph Scaliger. The caption in [35] reads as follows: “Portrait of Iosephus Iustus Scaliger (1540-1609), the famous philologist and critic of the XVI-XVII century. Engraving from the book by Johannes Mercius titled *Athena Batavia*, page 167.” Taken from [35], ill. 8.

Scaliger’s principal works on chronology are as follows:

1. Scaliger I. *Opus novum de emendatione temporum*. Lutetiac. Paris, 1583 ([1387]).
2. Scaliger I. *Thesaurum temporum*. 1606 ([1387]).

For the most part, the body of Scaliger’s work was concluded by Dionysius Petavius

(1583-1652). The best-known book of the latter is titled *De doctrina temporum*, Paris, 1627 ([\[1337\]](#)). Figs. 1.2, 1.3, and 1.4 show the title page of his *Rationarium Temporum*, published in 1652 ([\[1338\]](#)), and the titles of the first two volumes.

Figs. 1.2, 1.3, 1.4. On the left: the title page of *Rationarium Temporum* by D. Petavius, published in 1652. Mark that the Latin letters *U* and *V* were identical in XVI-XVIII century texts. On the right: the titles of the first and the second volumes of *Rationarium Temporum*. Taken from [\[1338\]](#).

Gerhard Friedrich Miller (1705-1783) “revised” the Russian history and chronology in the XVIII century in accordance with Scaliger’s scheme. His portrait can be seen on fig. 1.5. See more about the endeavours of Miller and his German colleagues in [Chron4](#).

Fig. 1.5. Portrait of the German historian Gerhard Friedrich Miller (1705-1783). Taken from the *Russian Academy of Sciences Courier* ([\[129\]](#), page 880).

Let us mention the works of the XVIII-XIX century, which contain a great array of

factual chronological data, such as [\[1155\]](#), [\[1205\]](#), [\[1236\]](#) and [\[1275\]](#). They are of great value to us since they provide a snapshot of the state of chronology during the epoch of a greater proximity to Scaliger and Petavius. This material is thus of a more primordial nature, not “painted over” by latter cosmetic layers. It must be noted that this series remains incomplete as well as several other similar chronological works. To quote the prominent contemporary chronologist E. Bickerman: “*There has been no chronological research ever conducted that could be called exhaustive and conforming to modern standards*” ([\[72\]](#), page 90, comment 1).

Hence it would be correct to call the modern consensual chronology of the Classical period and the Middle Ages the Scaliger-Petavius version. We shall simply refer to it as “Scaligerian Chronology”. As it will be pointed out, this version wasn’t the only one existing in the XVII-XVIII century. Its veracity has been questioned by eminent scientists.

The ground-laying works of Scaliger and Petavius of the XVI-XVII century present the ancient chronology as a table of dates given without any reasons whatsoever. It is declared to have be on ecclesiastical tradition. This is hardly surprising, since “history has remained predominantly ecclesial for centuries, and for the most part, was written by the clergy” ([\[217\]](#), page 105).

Today it is believed that the foundations of chronology were laid by Eusebius Pamphilus and Saint Hieronymus, allegedly in the IV century A.D. On fig. 1.6 we have a mediaeval painting of Eusebius Pamphilus of Caesarea dated 1455 ([\[140\]](#), page 80). It is worth noting that Eusebius of Caesarea is painted wearing typically mediaeval attire of the Renaissance epoch. Most probably because he had lived in that period of time and not any earlier.

Fig. 1.6. “Eusebius of Caesarea, the Chronicler and the Companion of Constantine the Great. A fragment of the mural by Piero della Francesca in the Cathedral of St. Francisco (Frezzo, Italy). 1455” ([140], page 80). One should note that the gap between the Scaligerian dating of the life of Eusebius (the alleged IV century A.D.) and the time of the portrait’s creation exceeds a thousand years. This is most probably a result of a chronological shift by roughly 1053 years that transferred Eusebius of Caesarea, who lived in the XV century, into the phantom IV century. Taken from [140], page 80.

Despite the fact that Scaligerian history ascribes Eusebius to the IV century A.D., during the years 260-340 ([936], vol. 1, page 519), it is interesting to note that his famous work titled *The History of Time from the Genesis to the Nicaean Council*, the so-called *Chronicle*, as well as the tractate by St. Hieronymus (Jerome) weren’t discovered until very late in the Middle Ages. Apart from that, historians say that “the Greek original (of Eusebius – A. F.) is only available in fragmentary form nowadays, and is complemented by the ad libitum translation made by St. Hieronymus” ([267], page VIII, Introduction). Mark the fact that Nicephorus Callistus attempted to write the new history of the first three centuries in the XIV century, or “revise” the *History* of Eusebius, but “he could not do more than repeat that which was written by Eusebius” ([267], page XI). However, since the work of Eusebius was only published in 1544 (see [267], page XIII), that is, much *later* than the writing of Nicephorus, one has reason to wonder: Could the “ancient” Eusebius have based his work on the mediaeval tractate by Nicephorus Callistus?

On fig. 1.7 we can see a painting by Cesare Nebbia and Giovanni Guerra that was allegedly created in 1585-1590. According to historians, it depicts a scene “of St. Jerome and his pet lion visiting the library of Eusebius (whose *Chronicle* was translated by Jerome) in Caesarea” ([1374], page 45). What we see here, however, is a typically mediaeval scene of the Renaissance epoch, or maybe even the epoch of the XVI-XVII century. The library shelves are filled with books that look basically the same as those of the XVIII-XIX century, in hard covers with wide fastening straps. The artists of the XVI-XVII century have most probably painted recent mediaeval events and characters cast into the “dark ages” by later XVII-XVIII century chronologists of the Scaligerian tradition.

Fig. 1.7. Painting by Cesare Nebbia and Giovanni Guerra allegedly dating from 1585-1590. Depicts St. Jerome visiting the library of Eusebius Pamphilus in Caesarea. We see a typically mediaeval scene of the Renaissance epoch or, possibly, of an even later age. Modern history assures us that all of this happened about a thousand years earlier, in the alleged IV century A.D. Taken from [\[1374\]](#), page 45.

It is assumed that Scaligerian chronology was based on the interpretations of assorted numeric data collected from the Bible. Certain “basis dates” that were used as reference points originated as results of scholastic exercises with numbers. For instance, according to the eminent chronologist J. Usher (Usserius), the world was created on Sunday, 23 October 4004 B.C., in the small hours of the morning ([\[76\]](#)). Mind-boggling precision. One is to bear in mind that the “secular” chronology of the present days is largely based on the scholastic biblical chronology of the Middle Ages. E. Bickerman, a contemporary historian, is perfectly right to note that “the Christian historians have made secular chronography serve ecclesial history... The compilation made by Hieronymus is the foundation of the entire edifice of occidental chronological knowledge” ([\[72\]](#), page 82).

Although “I. Scaliger, the founding father of modern chronology as a science, had attempted to reconstruct the entire tractate of Eusebius”, as E. Bickerman tells us, “the datings of Eusebius, that often got transcribed erroneously in manuscripts (! – A. F.), are hardly of any use to us nowadays” ([\[72\]](#), page 82).

Due to the controversy and the dubiety of all these mediaeval computations, the “Genesis dating”, for instance, varies greatly from document to document. Let us quote the main examples:

5969 B.C. – the Antiochian dating according to Theophilus, see other version below;

5508 B.C. – the Byzantine dating, also known as “The Constantinople version”;
5493 B.C. – Alexandrian, the Annian era, also 5472 B.C. or 5624 B.C.;
4004 B.C. – according to Usher, a Hebraic dating;
5872 B.C. – the so-called “dating of the seventy interpreters”;
4700 B.C. – Samaritan;
3761 B.C. – Judaic;
3491 B.C. – according to Hieronymus;
5199 B.C. – according to Eusebius of Caesarea;
5500 B.C. – according to Hippolytus and Sextus Julius Africanus;
5515 B.C., also 5507 B.C. – according to Theophilus;
5551 B.C. – according to Augustine ([\[72\]](#), page 69).

As we can see, this temporal reference point, considered fundamental for the ancient chronology, fluctuates within the span of 2,100 years. We have only quoted the most famous examples here. It is expedient to know that there are about two hundred various versions of the “Genesis date” in existence. On fig. 1.8 you can see an ancient painting of the seventy Bible translators commonly referred to as “the seventy interpreters” today.

Fig. 1.8. Ancient miniature from the Ostrog Bible, allegedly dated 1581, showing the Bible's translators and interpreters, commonly referred to nowadays as "the 70 interpreters." It is assumed that they were responsible for dating Genesis to 5872 B.C. Taken from [623], page 165. Also see [745], Volume 9, page 17.

The "correct Genesis dating" issue was far from scholastic, and received plenty of attention in the XVII-XVIII century for good reason. The matter here is that many ancient documents date events in years passed "since Adam" or "since the Genesis". This is why the existing millenarian discrepancies between the possible choices of this

reference point substantially affect the datings of many ancient documents.

I. Scaliger together with D. Petavius were the first ones to have used the astronomical method for proving – but not examining critically, the late mediaeval version of the chronology of the preceding centuries. Modern commentators consider Scaliger to have ipso facto transformed this chronology into a “scientific” one. This “scientific” veneer proved sufficient for the chronologists of the XVII-XVIII century to put unquestioning trust in the largely rigidified chronological date grid that they had inherited.

It is very significant that Scaligerian chronology was initially created within the paradigm of the Western European Catholic Church, which had remained in its firm control for a great amount of time. A. Oleinikov wrote, “The mediaeval theologians often tried to calculate the age of the Earth interpreting assorted data contained in the Holy Writ.” On having studied the text of the Bible, *Archbishop* Hieronymus came to the conclusion that the world was created 3,941 years before the beginning of modern chronology. His colleague Theophilus, the *Bishop of Antiochia*, had extended this period to 5,515 years. St. Augustine had added another thirty-six years; whilst the Irish *Archbishop* James Usher, who had obviously nurtured a fondness for precise numbers, had made the assumption that the world was created in the early morning hours on 23 October 4004 B.C. ([616], page 8). Many eminent Western European chronologists of the XVI-XVII century were clergymen. I. Scaliger (1540-1609), for instance, was a theologian; Tischendorf (1815-1874), the founding father of paleography, was a Doctor of Divinity; Dionisius Petavius (1583-1652) – a Jesuit and an author of several theological works ([82], page 320, comment 5).

Their absolute trust in the infallibility of what the ecclesial chronology was telling them determined their entire Weltanschauung. Therefore, their attitude to the data offered by other disciplines was determined by whether or not it could serve the advocacy of this a priori assumption or the other, invariably based on the mediaeval ecclesial chronology that was later baptised “scientific”.

The fact that the clerical chronologists of the Occidental church had deified the endeavours of their predecessors of the XV-XVI century, excluded the very possibility of criticizing the foundations of chronology in any way at all, even minutely.

I. Scaliger, for instance, could not even conceive of such heresy as running a check on the chronological materials of the holy fathers (Eusebius and others): “Scaliger calls this work by Eusebius (the *Evangelical Preparation* – A. F.), *divine*” ([267], page VIII, Introduction). Trusting the authority of their predecessors unconditionally, the chronologists reacted at external criticisms very bitterly. The same I. Scaliger makes a

perfect demonstration of his attitude toward objective scientific criticisms in the following episode: “The eminent philologist Joseph de Scaliger, the author of the chronology that has received such high scientific acclaim, turned into a keen quadraturist” ([458], page 130). Let us remind that a “quadraturist” was someone who tried to build a square equalling a given circle (disc) in area, using nothing but a pair of compasses and a ruler. This mathematical problem is insoluble as a principle, which is proven by geometry. However, I. Scaliger had published a book where he claims to have proved the “true quadrature” – which solved the problem, “The best mathematicians of the epoch – Viète, Clavius... have tried their hardest to prove to him that... his reasoning was incorrect – all in vain” ([458], page 130). The point here is that Scaliger’s erroneous “proof” made the easy corollary about the perimeter of an equilateral polygon with 196 angles being greater than that of the circle *circumscribing* it, which is, naturally, quite absurd. Nevertheless, “Scaliger and his supporters, who had a habit of defending their opinions vehemently, didn’t want to acknowledge anything... replying... with maledictions and scornful epithets, and finally calling all the geometers complete ignoramuses in what concerned geometry” ([458], page 130).

One might imagine how these people reacted towards attempts of analyzing their version of chronology critically.

Few are aware that Scaliger and Petavius brought chronology to “perfection” and “absolutely precise datings” quoting the year, day, month, and sometimes even the time of day for all the principal events in history of humankind. For whatever reason, modern monographies and textbooks usually only quote the years of events according to Scaliger-Petavius, coyly omitting the month, day, and hour. It is verily a step backwards that deprives the chronology calculated in the XVII-XVIII century of its former splendour and fundamentality.

By the XIX century, the accumulated volume of chronological material had grown to the extent of inducing respect a priori by its sheer scale, so the chronologists of the XIX century saw their objective in making minor corrections and not much else.

The issue of veracity is hardly raised at all in the XX century, and the ancient chronology solidifies terminally in the very shape and form given to it by the writings of Eusebius, Hieronymus, Theophilus, Augustine, Hippolytus, St. Clement of Alexandria, Usher, Scaliger, and Petavius. To someone in our day and age, the very thought that historians have followed an erroneous chronology for about three centuries seems preposterous, since it contradicts the existing tradition.

However, as chronology developed, specialists encountered considerable difficulties

in trying to correlate the varied chronological data offered by ancient sources with the consensual Scaligerian version. It was discovered, for instance, that Hieronymus misdates *his own time* by a hundred years ([72], page 83).

The so-called “Sassanide tradition” separated Alexander the Great from the Sassanides by an interval of 226 years, which was extended to 557 by contemporary historians ([72], page 83). In this case, the gap exceeds 300 years.

“The Jews also allocate a mere 52 years for the Persian period of their history, despite the fact that Cyrus II is separated from Alexander the Great by 206 years (according to the Scaligerian chronology – A. F.)” ([72], page 83).

The basic Egyptian chronology has also reached us through the filter of Christian chronologists: “The list of kings compiled by Manethon only survived as quotations made by the Christian authors” ([72], page 77). Some readers might be unaware that “The Oriental Church avoided using the birth of Christ as a chronological point of reference since in Constantinople the debates about the date of his birth had continued well into the XIV century” ([72], page 69).

3.

The veracity of the Scaliger-Petavius chronology was questioned as early as the XVI century

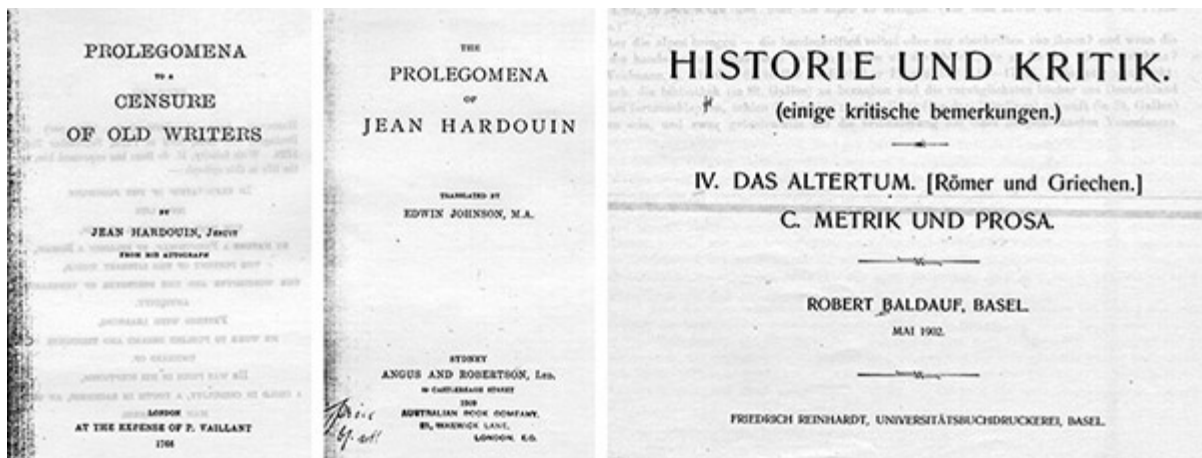

3.1. Who criticized Scaliger's chronology and where

3.1.1. *De Arcilla, Robert Baldauf, Jean Hardouin, Edwin Johnson, Wilhelm Kammeyer*

The doubts regarding the correctness of the consensual version aren't a recent phenomenon. They have quite a tradition behind them. N. A. Morozov wrote in particular that "the Salamanca University professor de Arcilla published his works *Programma Historiae Universalis* and *Divinae Florae Historicae* where he had proved that the entire history of the Classical Age was mediaeval in its origin. This is exactly the same point of view that was shared by the Jesuit historian and archaeologist Jean Hardouin (1646-1724), who considered the Classical literature to have been written in monasteries during the preceding XVI century...

The German Privatdozent Robert Baldauf wrote his *History and its Criticisms* in 1902-1903, proving that not only ancient history, but even that of the early Middle Ages, is a forgery of the Renaissance epoch and the subsequent centuries with the use of nothing but philological arguments" ([544], volume 7, pages VII-VIII, Introduction).

You can see the title page of one of Jean Hardouin's books in fig. 1.9, and that of its translation by Edwin Johnson in fig. 1.10. Fig. 1.11 shows us the title page of one of Robert Baldauf's writings.

Figs. 1.9, 1.10, 1.11. *L-R*: The title page from one of the books by J. Hardouin, 1776. The title page from J. Hardouin's book in Edwin Johnson's English translation, 1909. The title page from one of R. Baldauf's books, 1902.

The eminent English scientist Edwin Johnson (1842-1901), the author of several remarkable critical studies of ancient and mediaeval history, gave some severe and serious criticisms of Scaligerian chronology, fig. 1.12. The main conclusion that Edwin Johnson had arrived to after many years of chronological research, was formulated thusly: "We are a lot closer in time to the Greeks and the Romans than what the chronological tables tell us" ([1214], page XXX). Edwin Johnson called for a revision of the entire edifice of the ancient and mediaeval chronology! His principal works were published in the late XIX – early XX century ([1214] and [1215]).

Fig. 1.12. The title page from one of E. Johnson's books, 1904.

See more details concerning the research of Jean Hardouin, Robert Baldauf, and

Wilhelm Kammeyer in the work of E. Y. Gabovitsch (Karlsruhe, Germany) quoted in [Chron7](#), Appendix 3.

3.1.2. *Sir Isaac Newton*

“Isaac Newton (1642-1727), an English mathematician, mechanician, astronomer, and physicist, the creator of classical mechanics, member of the Royal Society of London since 1672 and its president since 1703 ... developed differential and integral calculus (independently from G. Leibnitz). He discovered light dispersion and chromatic aberration, researched diffraction and interference, worked on the development of the corpuscular theory of light, made a hypothesis that combined the concepts of waves and particles, built the reflecting telescope, formulated the principal laws of classical mechanics, discovered the Gravity Law, formulated the theory of movement of celestial bodies and the founding principles of celestial mechanics” (*The Soviet Encyclopaedic Dictionary*, Moscow, 1979, page 903). See fig. 1.13 for a portrait of Sir Isaac Newton.

Fig. 1.13. A portrait of Sir Isaac Newton. Taken from [\[336\]](#), Volume 6, inset between pages 646-647.

Sir Isaac Newton occupies a special place among the critics of the Scaliger-Petavius version. He is the author of a number of profound works on chronology where he relates his conclusions regarding the inaccuracy of Scaliger's version in some of its principal parts. This research remains rather obscure for the contemporary reader despite having provoked major controversy in the past. The main chronological works of Newton's are the following ([\[1298\]](#)):

1. *A short Chronicle from the First Memory of Kings in Europe to the Conquest of*

Persia by Alexander the Great;

2. *The Chronology of Ancient Kingdoms Amended* (fig. 1.14).

Fig. 1.14. The title page from the book by Sir Isaac Newton called *The Chronology of Ancient Kingdoms Amended. To which is Prefix'd, A Short Chronicle from the First Memory of Things in Europe, to the Conquest of Persia by Alexander the Great* (London: J. Tonson, 1728). Taken from [\[1298\]](#).

Newton made a radical revision of the ancient chronology based on natural scientific ideas. Some – very few – events were *added extra age*. This is true of the legendary voyage of the Argonauts, which Newton determined to have occurred in the XIV century B.C. and not in X B.C., as was believed in his time period. However, the dating of this event is rather vague in later chronological studies of other chronologers as well.

The new chronology offered by Sir Isaac is a lot shorter than the consensual chronology of Scaliger. Newton moved most of the events dated as preceding the epoch of Alexander the Great, forward in time, *closer to us*. The revision isn't as radical as that contained in the writings of N. A. Morozov, who had been of the opinion that the Scaligerian version of ancient chronology was only veracious starting in the IV century A.D. Let us mark that Newton did not go further in time than the B.C./A.D. mark in his research.

Contemporary historians have this to say about these works of Newton's: "They are

the fruit of forty years of labour, diligent research and a tremendous erudition. Basically, Sir Isaac Newton studied all of the major literary works on ancient history and all the primary sources beginning with ancient and oriental mythology” ([619], pages 104-105).

Modern commentators invariably come to the conclusion that Sir Isaac was wrong when they compare his conclusions to the consensual Scaligerian chronology. They say that:

“Naturally, without deciphered cuneiform and hieroglyphic writings, having no archaeological data due to the non-existence of archaeology in that age, bound by the presumed veracity of the Biblical chronology and the belief in the reality of what was told in myths, Newton’s errors weren’t measured in mere tens of hundreds of years – he was thousands of years off the mark, and his chronology is far from true even in what concerns the very reality of the events described. W. Winston wrote in his memoirs, ‘Sir Isaac often saw the truth in mathematics intuitively, without even needing proof... But this very Sir Isaac Newton compiled a chronology... However, this chronology isn’t any more convincing than the most ingenious historical novel, as I have finally proved in my refutation thereof. O, how weak, how utterly weak even the greatest of the mortals can be in some regards’ ” ([619], pages 106-107).

What did Sir Isaac suggest exactly? Basically, he had analyzed *the B.C. chronology* of Ancient Egypt and Ancient Greece. He must have lacked the time for the analysis of more recent epochs, since this tractate only got published in the last year of his life.

For instance, the contemporary consensual version of chronology ascribes the first years of reign of the Egyptian Pharaoh Menes to approximately 3000 B.C. ([1298]) Newton suggested that this event could be given a date as recent as 946 B.C. ([1298]) Thus, the shift forward in time comprises about 2000 years.

Nowadays the myth of Theseus is dated to the XV century B.C. However, Sir Isaac claimed that these events took place around 936 B.C. ([1298]) Hence, the shift of dates forward that he suggests amounts to roughly 700 years.

The famous Trojan War is dated to roughly 1225 B.C. today ([72]), but Newton claims this event to have occurred in 904 B.C. ([1298]) The shift forward here is one of approximately 330 years. Et cetera.

Newton’s main conclusions may be encapsulated as follows: He moves a part of the history of Ancient Greece about 300 years forward in time, closer to us. The history of Ancient Egypt, covering a span of several hundred years according to Scaliger, that is, 3000 B.C. and on, is moved forward in time by Newton and compressed into a time period as short as 330 years, namely, 946 B.C. – 617 B.C. Newton also moves some fundamental dates of the “ancient” Egyptian history about 1,800 years forward in time ([1298]).

Sir Isaac Newton only managed to revise the dates preceding 200 B.C. His observations were of a rather eclectic nature, and he could not find any system in these apparently chaotic re-datings.

We shall also briefly relate the publication history of Newton's work as told by the book [\[1141\]](#), which may lead one to certain conclusions. Newton seemed to have been wary of the plethora of complications that the publication of his tractate on chronology could lead him to. This work of his had commenced many years before 1727. The book had been re-written numerous times up until his death in 1727. It is noteworthy that the *Short Chronicle* wasn't intended for publication by its author; however, the rumours of Newton's chronological research had spread far enough, and the Princess of Wales expressed a wish to familiarize herself with it. Sir Isaac gave her the manuscript on the condition that no third party should learn of it. The same happened with Abbé Conti (Abbot Conti), who started to lend the manuscript to interested scientists upon his return to Paris.

As a result, M. Freret translated the manuscript into French and added his own historical overview to it. This translation eventually reached the Paris bookseller G. Gavellier, who wrote Newton a letter in May 1724 eager to publish his writing. Having received no answer, he wrote another letter in March 1725, telling Newton that he would consider Sir Isaac's taciturnity as acquiescence for the book's publication, with Freret's comments. No reply was given to that, either. Then Gavelier asked his friend in London to get a reply from Newton personally. Their meeting took place on 27 May 1725, and Sir Isaac answered in the negative. But it was too late. The book had already been published under the following title: *Abrégé de Chronologie de M. Le Chevalier Newton, fait par lui-même, et traduit sur le manuscrit Anglois (With observation by M.Freret)*. Edited by the Abbé Conti, 1725.

Sir Isaac received a copy of the book on 11 November 1725. He published a letter in the *Philosophical Transactions of the Royal Society* (v. 33, 1725, page 315), where he accused the Abbé of breach of promise and publication without the author's consent. When Father Souciet started his attacks in 1726, Sir Isaac had announced the preparation of a more voluminous and detailed work on ancient chronology for publication.

All of these events took place shortly before Newton's death. He had sadly lacked the time for the publication of a more in-depth book, and none of its traces remain in existence. Sir Isaac died in 1727, leaving his research of ancient history unfinished.

Could all this complicated history of the *Short Chronicle*'s publication be explained

by Newton's fear of groundless attacks? What was the reaction to the publication of his book?

The mid-XVIII century press saw a multitude of responses. Most of them were made by historians and philologists, and had voiced such negative opinions as “the blunders of the honoured dilettante” in regard to Newton's work. Only very few articles appeared that expressed support of his opinion. After the initial wave of responses subsided, the book was de facto hushed up and withdrawn from scientific circulation.

In the XIX century, François Arago, the author of the revue ([\[30:1\]](#)), presumed Newton's chronological research unworthy of more than the following rather flippant remark: “By and large, Newton failed to come up with correct judgments in everything excepting mathematics and its applications... Apart from his theological opuses, the chronology that he compiled is there to confirm our opinion – the very chronology that Freret refuted immediately upon publication.” Most probably, Arago decided not to get involved in the issue, and quoted Freret's opinion without thinking twice about it.

Cesare Lombroso tries to bring the issue to conclusion in his notorious *Genius and Insanity* in the following manner:

“Newton, whose mind amazed the entire humanity, as his contemporaries rightly state, was yet another one to have gone senile in his old age, although the symptoms in his case weren't quite as grave as those of the geniuses listed above. That must have been the time when he had written his *Chronology, Apocalypse and Letter to Bentley*, obscure, involved writings, quite unlike anything that he had written in his youth” ([\[462:1\]](#), page 63).

Similar accusations would later be addressed at N. A. Morozov, another scientist bold enough to revise chronology. They sound most peculiar in a scientific discussion, and, as we think, mask the inability to reply substantially.

3.1.3. Nikolai Alexandrovich Morozov

S. I. Vavilov wrote the following about N. A. Morozov:

“N. A. Morozov managed to combine his selfless revolutionary devotion to his people with a completely amazing dedication to scientific work. This scholarly enthusiasm and this completely unconditional passionate love for scientific research should remain an example to be followed by all scientists, young and old” (Sergei Ivanovich Vavilov, *Essays and memoirs*, Moscow: Nauka, 1981, page 284).

The first researcher of our time who had raised the issue of providing scientific basis for the consensual chronology in its fullness and quite radically was Nikolai Alexandrovich Morozov, figs. 1.15, 1.16., 1.17. On fig. 1.18 we can see a monument to N. A. Morozov, and on fig. 1.19 – his museum home in the town of Borok in the Yaroslavl region.

Fig. 1.15, 1.16, 1.17, 1.18. *L-R*: Portraits of N. A. Morozov, the first one dated 1878. Monument to N. A. Morozov on his grave in Borok, in the Yaroslavl Region. Taken from [\[687\]](#) and [\[583\]](#).

N. A. Morozov (1854-1946) was an eminent Russian scientist and encyclopaedist whose fortune was far from easy.

Morozov's father, Peter Alexeyevich Shchepochkin, was a rich landowner and belonged to the old aristocratic Shchepochkin family, see fig. 1.20. N. A. Morozov's great-grandfather was a relation of Peter the Great. N. A. Morozov's mother was a simple serf peasant, Anna Vasilievna Morozova, whom P. A. Schepochkin married, after signing her liberty certificate. The church didn't confirm the marriage, and so the children received their mother's surname.

Figs. 1.19, 1.20, 1.21. *L-R*: The museum home of N. A. Morozov in Borok. Taken from [\[583\]](#), page 223. Peter Alexeyevich Shchepochkin, father of N. A. Morozov. Anna Vasilievna Morozova, mother of N. A. Morozov. Taken from [\[141\]](#), pages 6-7.

At the age of twenty, N. A. Morozov joined the libertarian Narodnaya Volya movement. In 1881 he was sentenced for incarceration in Schliesselburg for life, where he had studied chemistry, physics, astronomy, mathematics and history, all on his own. In 1905 he was let free, having spent 25 years in gaol. After having received his freedom, he had immersed himself in a vast body of scientific and pedagogical work. His *Memoirs* are of the greatest interest, see fig. 1.22. Many authors wrote about N. A. Morozov – his literary biography, for example, was written by M. A. Popovsky ([\[675\]](#)).

Fig. 1.22. The title page of the *Memoirs* by N. A. Morozov.

After the October revolution, Morozov became Director of the Lesgaft Institute for Natural Scientific Studies, where he had done the major part of his famous research in ancient chronology with the use of natural scientific methods, supported by enthusiasts and the staff of the Institute.

After N. A. Morozov left his Director's office, the Institute was completely reformed, possibly with the objective of casting the important historical research conducted there by N. A. Morozov and his group into oblivion.

N. A. Morozov was made Honourable Member of the Russian Academy of Sciences (which became the USSR Academy of Sciences in 1925), decorated with the Order of Lenin and the Red Banner of Labour. More about the body of his prominent work in chemistry and several other natural sciences can be read in such publications as [\[146\]](#), [\[147\]](#), [\[582\]](#), [\[583\]](#) and [\[584\]](#). The official reference book of the USSR Academy of Sciences published in 1945 ([\[811\]](#)) lists the Honourable Members the Academy had in 1945. There were just three – N. F. Gamaleya, N. A. Morozov, and J. V. Stalin ([\[811\]](#), pages 37-38). Nikolai Alexandrovich Morozov is described as follows: “Elected in 1932, known by his works on a variety of astronomical, meteorological, physical, and chemical problems. Merited Scientist of the Soviet Republic of Russia. Honorary member of the Muscovite Society for Natural Studies. Lifelong member of La Société Astronomique de France. Lifelong member of the British Astronomical Association” ([\[811\]](#), page 37).

In 1907, N. A. Morozov published a book titled *Revelations in Storm and Tempest* ([\[542\]](#)) where he analyzed the dating of the New Testament Apocalypse and came to

conclusions that contradicted the Scaligerian chronology. In 1914, he published *The Prophets* ([543]), which contains a radical revision of the Scaligerian datings of the Biblical prophecies. In 1924-1932, N. A. Morozov published the fundamental work *Christ* in seven volumes ([544] see figs 1.23 and 1.24). The initial name of this opus had been *The History of Human Culture from the Natural Scientific Point of View*. It contains detailed criticisms of the Scaligerian chronology. The important fact discovered by Morozov was that the consensual Scaligerian chronology is based on an unverified concept.

Figs. 1.23, 1.24. The cover and the title page of the first volume of N. A. Morozov's oeuvre titled *Christ*, 1927, Moscow-Leningrad: The State Publishing House.

Having analyzed a great body of material, N. A. Morozov put forth and partially proved the fundamental hypothesis that Scaliger's chronology had been expanded arbitrarily as compared to reality. This hypothesis was based on the "repetitions" that N. A. Morozov had found, namely, the texts that apparently described the same events, but are dated differently and considered unrelated in our time. The publication of this work caused vivid discussions in the press, and its repercussions can be found in contemporary literature. There had been a number of rational counter-arguments, but the critical part of *Christ* remained undisputable in its entirety.

Apparently, N. A. Morozov had been unaware of the similar works of Sir Isaac Newton and Edwin Johnson that were all but forgotten by his time. This makes the fact that many of Morozov's conclusions coincide with those of Newton and Johnson all the more amazing.

However, N. A. Morozov raised the issue as a much wider and more profound one, having encompassed the entire period up to the VI century in the frame of critical analysis, and found the need for a radical revision of datings. Despite the fact that N. A. Morozov had also failed to discover any sort of system in the chaos of altered datings that arose, his research was performed on a higher qualitative level than Newton's analysis. N. A. Morozov was the first scientist to have possessed the clear understanding of the necessity of revising the datings of mediaeval events as well as those belonging to "ancient history". Nevertheless, N. A. Morozov did not go further than the VI century A.D. in time, considering the consensual version of the chronology of the VI-XIII century to be basically correct. We shall yet see that this opinion of his turned out to have been gravely erroneous.

Thus, the issues raised in our works are hardly new. The fact that they recur century after century, and get voiced ever louder, shows that the problem in question does exist. And the fact that the independently suggested alterations of the ancient chronology – those of I. Newton, E. Johnson, and N. A. Morozov – are close to each other in principle is a clear witness that the solution to the problem we're studying lies somewhere in this direction.

It is worthwhile to give a brief account of the creation of Morozov's *Christ*. His ideas met vehement opposition as early as during the publication stage. N. A. Morozov had to address Lenin as the Head of State personally in 1921 and ask him for support. V. I. Lenin had delegated the study of this issue to A. V. Lunacharsky. Let us quote Lunacharsky's reply dated 13 April 1921:

"From Lunacharsky to Lenin,

13.IV.1921,

Dear Comrade Lenin,

I have received your request in re Morozov's book *Christ* signed by Comrade Gorbunov. It would please me greatly to delegate this matter to the editing board responsible for such matters. I, for one, am familiar with the work in question. It is a perfectly preposterous thing that uses a ridiculous demonstration to prove the date of the solar and lunar eclipses that the Gospel refers to as having accompanied the Crucifixion and occurred on Friday, that Christ had lived in the fifth century and not in the first, and uses this data to deny the existence of such historical characters as Julius Caesar, who turns out to have really been identified as Julian the Apostate, Augustus, etc., also suspecting the falsification of the writings of Cicero, Horace, etc., as really referring to the Middle Ages, etc., etc.

I like and respect Morozov a lot, but this book is so bizarre that its publication shall definitely bring harm to the name of the author and the State Publishing House.

If serious science treated Morozov's demonstration concerning the Apocalypse with great suspicion, the book *Christ*, in its turn, can be regarded as completely absurd and based on the same scientific one-sidedness.

If you consider this reply of mine not to be competent enough, I'll be glad to hand the book over to specialists for consideration.

THE STATE PUBLISHING HOUSE OF THE USSR (1922) 271-272

'The People's Commissar A. Lunacharsky' ([488], pages 271-272).

Shortly afterwards, having met N. A. Morozov personally and witnessed the detailed scientific report that the scientist had made during their meeting, A. V. Lunacharsky had radically changed his mind about the book and sent the following missive to Lenin as early as 12 August 1921, in complete contradiction of his previous letter:

"From Lunacharsky to Lenin,
12 August 1921.

To the State Publishing House, with a copy to be delivered to the Committee of People's Commissars.

Although I could not familiarize myself with the actual manuscript of Comrade Morozov's voluminous opus *Christ and His Time*, an oral report of its contents made by the author and a demonstration of several tables made me consider its publication as a matter of considerable importance, one that is to be addressed as soon as possible.

Since the work is rather large (three volumes, fifty sheets all in all), and seeing as how we still haven't emerged from the state of acute paper crisis, I would offer the Petersburg branch of the State Publishing House to cut the edition down to 4,000 copies at least, in order to get it published without delay.

People's Commissar of Education Lunacharsky" ([488], page 308).

The comment of the editors is also noteworthy:

"The contradiction between the two Lunacharsky's letters to Lenin dated 13 April and 12 August respectively can be explained by the fact that Lunacharsky had revised his initial reply. The complete collection of Lenin's works *erroneously* states that Lunacharsky expressed a negative opinion of Morozov's work later on calling it non-scientific in vol. 53, page 403, comment 145" ([488], page 310).

Nevertheless, the first volume of *Christ* took three more years to be published in 1924. Morozov had to request support from the government yet again. This time it took the participation of F. E. Dzerjinsky. Here is a fragment of F. E. Dzerjinsky's letter to Morozov dated 14 August 1924:

"Dear Nikolai Alexandrovich,

...I am prepared to provide any assistance you may need in order to get your writing published – just tell me what I have to do exactly, what obstacles need to be removed and what people I need to talk to.

I will be most glad if I manage to be of use to you in any way at all.

14/VIII. Kindest regards, F. Dzerjinsky".

All of the above notwithstanding, in 1932, after the publication of the seventh volume of *Christ*, Morozov's opponents had finally succeeded in stopping the publication of his further materials on the topic.

3.1.4. Recent publications of German scientists containing criticisms of Scaligerian chronology

In the period since the publication of our works on chronology, which started to appear in 1980, several German scientists have also published the rather interesting results of their research containing a critical analysis of the Scaligerian chronology. The first of these publications appeared in 1996; the ones we consider the most noteworthy are those written by Uwe Topper ([\[1462\]](#) and [\[1463\]](#)), as well as Heribert Illig's *Was There Really a Charlemagne?* ([\[1208\]](#)) which claims that many documents which we ascribe to Charlemagne's epoch today are really more recent forgeries, and builds a hypothesis that one needs to withdraw about three centuries from the mediaeval history, including that of Charlemagne's age.

It has to be said that the chronological obtruncation suggested by Heribert Illig is of a local nature; Illig and his colleagues are of the opinion that the contradictions they noticed in the Scaligerian history can be resolved by minor corrections, such as subtracting 300 years from the history of mediaeval Europe. Our works demonstrate the deficiency of such local expurgations; what we claim is that the entire edifice of the Scaligerian chronology needs a cardinal revision in all that concerns the times preceding the XIII-XIV century A.D.

The veracity of the Scaligerian chronology of "ancient" Egypt is questioned in *When Did the Pharaohs Live?* by Gunnar Heinsohn and Heribert Illig. One has to mention that the authors fail to make so much as a passing reference to the scientific œuvres of N. A. Morozov which were published in the early XX century. Morozov's epic body of work entitled *Christ*, which was published in 1924-1932 and questioned the entire chronology of "ancient" Egypt, pointed out the numerous "collations" of Egyptian dynasties and reasoned the necessity of a substantial concision of the "ancient" Egyptian history. Alack and alas, there are no known translations of Morozov's works except for the *German* text of the *Revelations in Storm and Tempest*. Despite our numerous appeals, Heribert Illig and his colleagues still refuse to recognize the existence of Morozov's research; it was only recently that the alternative History Salon presided over by Professor E. Y. Gabovitsch finally managed to get the name of N. A. Morozov mentioned in German scientific debates.

We should also point out Gunnar Heinsohn's *Assyrian Rulers Equalling Those of Persia* ([\[1185\]](#)), where certain parallels are drawn between the comparative "ancient" histories of Assyria and Persia. However, Heinsohn fails to raise the possibility of transferring the events of that age into the mediaeval epoch, leaving them in the "antediluvian" historical period, which we believe to be a mistake.

The suggestively titled *C-14 Crash* by Christian Blöss and Hans-Ulrich Niemitz

([\[1038\]](#)) is also interesting and contains a voluminous body of evidence used by the authors to question the feasibility of using the radiocarbon analysis method (in its current state, at least), as well as the dendrochronological method, for the dating of historical artefacts with any degree of proficiency. Also see the bulletin [\[1491\]](#).

3.2. The questionable veracity of the Roman chronology and history. The hypercritical school of the XIX century

Let us give a brief account of the situation with the Roman chronology, which has played a leading role in the global chronology of the antiquity. Fundamental criticisms of the tradition commenced as early as the XVIII century, in the Academy of Scriptures and Fine Arts that was founded in Paris in 1701 and two decades later hosted extensive discussions about the veracity of the entire Roman tradition (Pouilly, Freret, etc). The accumulated materials provided the basis for the more in-depth criticisms of the XIX century.

One of the prominent representatives of this important scientific current, later dubbed *hypercriticism*, was the well-known German historian Theodor Mommsen, who pointed out the discrepancies between various accounts in such passages as:

“Despite the fact that Tarquin the Second had already been an adult by the time his father died, and that his reign had started thirty-nine years after that, he got inaugurated as a *young lad*.

Pythagoras, who had arrived in Italy almost an entire generation before the exile of the kings (which is supposed to have happened around 509 B.C. – A. F.) is nevertheless supposed to have been a friend of Numa Pompilius” ([\[538\]](#), page 876).

Historians are of the opinion that Numa died around 673 B.C. The discrepancy here reaches a century at least. To carry on quoting from T. Mommsen:

“The state ambassadors who went to the city of Syracuse in the year 262 since the foundation of Rome, had conversed with Dionysius the Senior, whose reign started *eighty-six years later*” ([\[538\]](#), page 876).

What we see is a deviation of about eight decades.

The Scaligerian chronology of Rome is constructed upon a most flimsy foundation indeed. The time interval between different datings of the foundation of Rome, which is a date of the greatest importance, is as large as 500 years ([\[538\]](#), page 876, or [\[579\]](#), pages 23-24).

According to Hellanicus and Damastus, who are supposed to have lived in the IV century B.C., and whose opinion on this matter was later supported by Aristotle, Rome had been founded by Aeneas and Ulysses, and named after the Trojan woman Roma

([\[579\]](#), pages 23-24). Several mediaeval authors concurred with this as well; in Jean de Courcy's *Chronique de la Bouquechardière (Global Chronicle)*, we see a miniature notably named "Trojans Founding Cities: Venice, Cycambre, Carthage, and Rome" ([\[1485\]](#), pages 164, 165). The miniature can be seen in fig. 1.25. One has to remark that it represents a mediaeval scene, and that the two Trojan kings who have arrived to inspect the building site are wearing warm fur hats with ear-flaps, qv in figs. 1.26 and 1.27.

Fig. 1.25. Ancient miniature from Jean de Courcy's *Global Chronicle* (*Chronique de la Bouquechardière*), titled "Trojans Founding Cities: Venice, Cycambre, Carthage, and Rome". The Trojan War and the foundation of the Italian Rome are thus made practically simultaneous, although Scaligerian chronology separates these events by 500 years.

Taken from [1485], ill. 201.

Figs. 1.26, 1.27. Close-ups of the miniature. A curious detail is the warm fur hat with ear-flaps on the head of one of the Trojan kings.

Thus, the foundation of Rome occurs immediately after the Trojan War which both Aeneas and Ulysses took part in. But in the consensual chronology of Scaliger, the interval between the Trojan War, which allegedly took place in the XIII century B.C., and the foundation of Rome, which is said to have occurred in the VIII century B.C., is 500 years. This means one of the following:

- the foundation of Rome took place 500 years later than it is generally thought;
- the Trojan War occurred 500 later; or
- the chronographers are deliberately lying about Aeneas and Ulysses founding Rome.

Also, what happens to Romulus in this scenario? Could Romulus have been another name of Ulysses? A lot of questions arise, as you can see, and they only increase in number once we start delving further in.

A propos, according to a different version, the city was named by Romus, the son of Ulysses and Circe. Could this mean that Romus (or Remus, the brother of Romulus) was the son of Ulysses? This would be impossible within the paradigm of Scaligerian chronology, naturally.

The historian B. Niese has the following to say about it:

“Rome, as well as many other Italian cities, was considered to have been founded by the heroes of Greece and Troy that wound up in those parts – there is a variety of legends to prove it. The most ancient one, which was quoted by Hellanicus and Damastus as early as the IV century B.C., and later by Aristotle, claims that the City was founded by Aeneas and Ulysses, and received its name from the Trojan woman Roma... Another version

suggests Romus, the son of Ulysses and Circe, to have been its founder” ([579], page 23).

Let us reiterate that there are about 500 years separating this date from the consensual one.

Such tremendous fluctuations in the determination of a date as important as that of the Foundation of the City (Rome) affect the datings of a great number of documents that use it as a temporal reference point. The well-known *History* by Titus Livy is one of them. Actually, the identification of the City with the Italian Rome is one of the hypotheses of the Scaligerian chronology. The possibility that the City can be identified as the famous *Rome upon the Bosphorus*, or Constantinople, also known as *Czar-Grad*, or the City of the Kings, cannot be excluded.

By and large, historians are of the opinion that “the traditional Roman history has reached us via the works of a mere handful of authors, the most fundamental one doubtlessly being the historical opus by Titus Livy” ([719], page 3). It is believed that Titus Livy was born around 59 B.C., and described a 700-year period of Roman history. 35 books survived out of the original 144. The first publication of his writings took place in 1469, and was based *on a manuscript of unknown origin currently lost* ([719], page 3). The discovery of a manuscript with five more works occurred in Hessen some time later ([544]).

T. Mommsen wrote:

“In what concerns... the global chronicle, everything was a lot worse... The development of the historical science gave hope for traditional history to be verified by documents and other dependable sources, but the hope was buried in complete frustration. The more research was conducted and the deeper it went, the more obvious the difficulties in writing a critical history of Rome became” ([539], page 512).

Furthermore, Mommsen tells us that:

“...the numeric inveracities have been systematic in his works [referring to Valerio Anciate – A. F.] until the contemporary historical period... He [Alexander Polyhistor – A. F.] gave an example of putting the missing five hundred years that had passed since Troy fell and until Rome had been founded into chronological perspective [we have to remind the reader that according to a chronological version that differs from the consensual, Rome was founded immediately after the Fall of Troy ([579], pages 23-24) – A. F.] ...having filled this period with a list of ghostly rulers, just like the ones that were used widely by the chronographers of Egypt and Greece; apparently, he was the one who brought the kings Aventinus and Tiberinus, as well as the Albanian clan of Sylvians, into existence. The descendants didn’t miss their opportunity to invent first names and periods of reigning – they even painted portraits for better representation” ([539], pages 513-514).

These criticisms are also reviewed by Niese ([579], pages 4-6).

Theodor Mommsen was far from being the only scientist to suggest the revision of these most important dates from the “ancient times”.

A detailed account of what the historians later labelled the “ultra-sceptical stance” – the version questioning the veracity of the chronology of the “Regal Rome,” as well as our entire knowledge of the first five centuries of Roman history can be found in [92] and [498]. The problems inherent in making the Roman documents concur with the chronology of Scaliger are related in [1481].

According to the historian N. Radzig:

“The matter here is that the Roman manuscripts have not survived until our times, so all of our presumptions are based on whatever the Roman annalists have to tell us. But even here... we run into major difficulties, the principal one being that even the annalist material is represented very poorly” ([719], page 23).

The Great Annals of Rome have perished ([512], pages 6-7). It is assumed that the Roman *fasti* gave yearly chronological lists of all the civil servants of ancient Rome. These tables could theoretically provide for a trustworthy chronological skeleton of sorts.

However, the historian G. Martynov inquires:

“How do we make this all concur with the *constant controversy* that we encounter in almost every text of Livy, in the names of the consuls, their frequent omission, among other things, and a *complete laissez-faire attitude to the choice of names?* ... How do we make it correspond with the names of the military tribunes? *The fasti are literally mottled with errors and distortions that one cannot make heads or tails of.* Livy himself was already aware of how *flimsy* this foundation of his chronology had been” ([512], pages 6-7, 14).

G. Martynov sums up with the following:

“Neither Diororus nor Livy possess a correct chronology... we cannot trust the *fasti*, which tell us nothing about who was made consul in which year, or the cloth writings that led Licinius Marcus and Tubero to *contradictory conclusions*. The most trustworthy documentation is the kind that becomes identified as *much more recent forgeries* after in-depth analysis” ([512], pages 20, 27-28).

It is thus somewhat disconcerting to hear the modern chronologer E. Bickerman assure us of the following: “Since we possess full lists of Roman consuls for 1050 years... the Julian dating for each one of them can be deduced easily, given that the ancient datings are veracious” ([72], page 76). The close-tongued implication is made that we possess a definite trustworthy Julian dating of the foundation of Rome, despite the fact that the 500-year fluctuations of this date affect the entire consul list, as well as the whole history of “ancient” Rome based on this list.

The actual monograph of E. Bickerman ([72]) also sadly fails to contain so much as a hint of a *justification* for the fundamental dates in the “ancient” chronology. Instead of relating the dating basics, the book just offers a number of individual examples that explicitly or implicitly refer to the *a priori known* scheme of the consensual Scaligerian

chronology.

4.

The problems in establishing a correct chronology of “ancient” Egypt

The significant discrepancies between the chronological data offered by the ancient sources and the global chronology of the ancient times as devised in the XVII century arose in other areas as well. For instance, the establishment of the Egyptian chronology presented some substantial difficulties, since a great many documents contain chronological contradictions. Let us examine the correlation between the classical *History* by Herodotus, and the Scaligerian chronology.

For instance, in his consecutive and coherent account of Egyptian history, Herodotus calls Cheops *the successor* of Rhampsinitos ([163], 2:214, page 119). The modern commentator will immediately “correct” in the following manner: “Herodotus creates confusion in chronology of Egypt – Rhampsinitos (Ramses II) was a king of the XIX dynasty (1345-1200 B.C.), whereas Cheops belonged to the IV (2600-2480 B.C.)” ([163], page 513, comment 136).

The discrepancy here equals 1200 years, no less. Just think of what the figure implies and of its sheer value: *twelve hundred years*. Let us carry on. According to Herodotus, Asychis was succeeded by Anysis ([163], 2:136-137, page 123). Modern commentary is also rash to tell us that “Herodotus *leaps* from the end of the IV dynasty (about 2480 B.C.) to the beginning of the Ethiopian reign in Egypt (about 715 B.C.)” ([163], page 514, comment 150).

The leap is one of 1800 years. *Eighteen hundred years!*

In general, it turns out that “The chronology of kings given by Herodotus does not concur with that found in the fragments of Manetho’s list of kings” ([163], page 512, comment 108). As a rule, the chronology of Herodotus is much shorter than the Scaligerian version. The time intervals between kings according to Herodotus are often thousands of years shorter than corresponding periods as given by Manethon.

The *History* of Herodotus contains a great number of “minor errors”, those of 30-40 years; however, they only come to existence as a result of attempts to fit his *History* into the Scaligerian chronology. We quote a few of the numerous examples of such occurrences. The modern commentator tells us that “Herodotus confuses king Sesostris with the king Psammetix I” ([163], page 512). Also: “Pittacus could not have met

Croesus in 560 B.C. [by the way, Herodotus does not indicate the date in such terms – A. F.], since he died in 570 B.C.” ([163], page 502). Another event related by Herodotus is commented upon thusly: “It is an error made by Herodotus... Solon could not have met Croesus” ([163], page 502).

But how can this be true? Herodotus devotes an entire page to relating the interactions between Croesus and Solon ([163], 1:29-31, page 19). Scaligerian chronology, on the other hand, tells us no such interactions ever took place.

The commentators also accuse Herodotus of dating solar eclipses incorrectly ([163], pages 504, 534); and so on, and so forth.

We should note that the choice of one chronological version from several contradicting ones is far from simple. There had been a conflict between the so-called *short* and *long* chronologies of Egypt that were developed in the XIX century. The short chronology is the one currently used, but it still contains a great many deep contradictions which remain unresolved.

The most prominent German Egyptologist, H. Brugsch, wrote:

“When the reader inquires about whether any epochs and historical moments concerning the Pharaohs can be considered to possess a finite chronological assessment, and when his curiosity makes him turn to the tables compiled by a great variety of scientists, he will be surprised to find himself confronted with a large number of opinions on the chronological calculations of the Pharaoh era belonging to the representatives of the newest school. For instance, the German scientists date the ascension of Menes, the first Egyptian Pharaoh, to the throne as follows:

Boeckh dates this event to 5702 B.C.,
Unger – to 5613 B.C.,
Brugsch – to 4455 B.C.,
Lauth – to 4157 B.C.,
Lepsius – to 3892 B.C.,
Bunsen – to 3623 B.C.

The difference between the two extreme datings is *mind-boggling*, since it amounts to 2079 years... The most fundamental research conducted by competent scientists for the verification of the chronological sequence of the Pharaohs’ reigns and the order of dynastical succession, had also proved the necessity of allowing for *simultaneous* and *parallel* reigns that would greatly reduce the summary reigning time of the thirty Manetho’s dynasties. Despite all the scientific discoveries made in this area of Egyptology, the numeric data condition remains extremely unsatisfactory to this day [late XIX century – A. F.]” ([99], pages 95-97).

The situation hasn’t improved to the present day. Modern tables date the beginning of the reign of Menes differently, to “approximately 3100 B.C.,” “roughly 3000 B.C.,” etc. The fluctuation span for this date amounts to 2700 years. If we consider other opinions – those of the French Egyptologists, for instance ([544], vol. 6), the situation becomes even more complex:

Champollion gives the dating as 5867 B.C.,
Lesueur – as 5770 B.C.,
Mariette – as 5004 B.C.,
Chabas – as 4000 B.C.,
Meyer – as 3180 B.C.,
Andrzejewski – as 2850 B.C.,
Wilkinson – as 2320 B.C.,
Palmer – as 2224 B.C., etc.

The discrepancy between the datings of Champollion and Palmer equals *three thousand six hundred forty-three years*. No commentary is needed, really.

We discover that, generally, “Egyptology, which had poured some light over the perpetual darkness that had covered the ancient age of Egypt, only came into existence 80 years ago,” as Chantepie de la Saussaye wrote at the end of the XIX century ([965], page 950). He also said that “*it has been the private domain of a very few researchers ... alack and alas, the results of their research have been popularized in too much haste...* Thus, many *erroneous views* had come into existence, which resulted in the inevitable sobering when Egyptology became a lot less vogue and the *excessive trust* in the results of the research *was lost...* To this day, the construction of the Egyptian chronology remains impossible” ([966], pages 97-98; [965], page 95).

The situation with the list of kings compiled by Sumerian priests is even more complex. “It was a historical skeleton of sorts, one that resembled our chronological tables... But, sadly, this list was of little utility... By and large, the chronology of the king list makes no sense,” according to the prominent archaeologist L. Wooley ([154], page 15). Furthermore, the “*dynastical sequences have been set arbitrarily*” ([154], page 107).

We see that the great antiquity ascribed to these lists today contradicts modern archaeological information. Let us give just one example that we consider representative enough.

Telling us about the excavations of what we consider to be the most ancient royal Sumerian sepulchres, dated roughly to the *third millennium before Christ*, Wooley mentions a series of findings of golden toiletry, which “was of Arabic origin and belonged to the early XIII century A.D., according to one of the best experts in the field.” Wooley patronizingly calls the expert’s mistake “a forgivable one, since no one had thought such advanced art could have existed in the third millennium before Christ”

([\[154\]](#), page 61).

Unfortunately, the development of the entire critical concept and the propagation of the hypercritical current of the late XIX – early XX century froze, due to the sheer lack of objective statistic methods at the time, ones that could provide for the independent and objective verification of the previous chronological identifications.

5.

The problem in dating the “ancient” sources. Tacitus and Poggio. Cicero and Barzizza. Vitruvius and Alberti

The framework of the global Scaligerian chronology was constructed as a result of the analysis of the chronological indications given by the ancient sources. It is natural that the issue of their origin should be of interest in this respect. Modern historiography manifests the paucity of evidence in what concerns the genesis of such “ancient” manuscripts. The general observation is made that the overwhelming majority of these documents surfaced during the Renaissance epoch that allegedly superseded the “dark ages.” The discovery of manuscripts often happened under circumstances that forbade the analysis which could allow the critical dating of such findings.

In the XIX century two prominent historians, Hochart and Ross, published the results of their research proving that the famous “ancient” Roman *History* by Cornelius Tacitus was really written by the well-known Italian humanist Poggio Bracciolini ([\[21\]](#), [\[1195\]](#), and [\[1379\]](#)). The publications occurred in the years 1882-1885 and 1878; readers may turn their attention to [\[21\]](#), which covers this problem exhaustively. We should just note that we deem the *History* by Tacitus to be an edited original – that is, a partial forgery and not a complete one. However, the events related therein have been misdated and transposed far back in time.

The history of the discovery of Tacitus’ books really provokes a great many questions ([\[21\]](#)). It was Poggio who discovered and published the opuses of Quintillian, Valerius Flaccus, Asconius Pedianus, Nonius Marcellus, Probus, some tractates by Cicero, Lucretius, Petronius, Plautus, Tertullian, Marcellinus, Calpurn Seculus, etc. ([\[21\]](#)) The circumstances of these discoveries and their datings have never been related in detail. See more about the history of Tacitus’ books in [Chron1](#), chapter 7.

In the XV century famous humanists such as Manuel Chrysolorus, Gemisto Pleton, Bessarion of Nicaea and some others, came to Italy. They were the first ones to familiarize Europe with the achievements of the “ancient Greek thought.” Byzantium gave the West almost all of the known “ancient” Greek manuscripts. Otto Neugebauer wrote that “the major part of the manuscripts that our knowledge of the Greek science is based upon consists of Byzantine copies made 500-1500 years after the death of their authors” ([\[571\]](#), page 69).

According to Scaligerian history ([\[120\]](#)), the entire bulk of the “Classical ancient” literature only surfaced during the Renaissance. In most cases, detailed analysis shows us that the obscurity of the literature’s origins and the lack of documentation concerning its passage through the so-called “Dark Ages” leads one to suspect that none of these texts had really existed before the dawn of the Renaissance ([\[544\]](#)).

For instance, the oldest copies of the so-called incomplete collection of Cicero’s texts are said to have been made in the IX-X century A.D. However, one instantly finds out that the original of the incomplete collection “had perished a long time ago” ([\[949\]](#)). In the XIV-XV century there is a surge of interest in Cicero, so:

“Finally, about 1420 the Milanese professor Gasparino Barzizza... decided to undertake a rather precarious endeavour of filling the gaps in the incomplete collection with his own writings for the sake of consequentiality [! – A. F.]. However, before he could finish this volume of work, a miracle occurred: a forlorn manuscript with the complete text of all the rhetorical works of Cicero’s becomes unearthed in a parochial Italian town by the name of Lodi... Barzizza and his students eagerly embrace the new discovery, arduously decipher its ancient [presumably XIII century – A.F.] script, and finally produce a readable copy. Subsequent copies constitute the actual ‘complete collection.’... Meanwhile, the irrecoverable happens: the original of the collection, the manuscript of Lodi, becomes abandoned since no one wants to confront the textual difficulties it presents, and finally gets sent back to Lodi, *where it disappears without a trace*: nothing is known of what happened to the manuscript since 1428. The European philologists still lament the loss.” ([\[949\]](#), pages 387-388)

Incidentally, the reverse or so-called Arabic reading of the name Barzizza gives TsTsRB without vocalisations, which is close to the consonant root of the name Cicero, TsTsR.

Figs. 1.28 and 1.29 show two ancient miniatures from a book by Cicero that was allegedly published in the late XV century ([\[1485\]](#), page 162). In fig. 1.28 Cicero is portrayed from the left, writing the tractate *On the Old Age*. In fig. 1.29 Cicero is depicted from the right side, penning out the tractate *On Friendship*. We see a typically mediaeval setting. Cicero and his interlocutors are wearing mediaeval clothes, which means that the author of the miniatures (in the XV century or later) apparently didn’t doubt Cicero to have been his historical contemporary.

Fig. 1.28. Ancient miniature allegedly dating from the XV century, depicting the “ancient” Cicero as a mediaeval writer. Modern commentary: “Cato, with Scipio and Lelius standing in front of him. Cicero can be seen on the left, working on his tractate *On the Old Age*” ([1485], page 163). The entire setting is typically mediaeval. Taken from [1485], page 195.

Fig. 1.29. Ancient miniature allegedly dated XV century depicting the “ancient” Cicero and other “ancient” characters in a typically mediaeval setting. The modern commentary reads: “Lelius (on the left), Ennius, and Scaevola (centre); Cicero is seen composing his tractate *On Friendship*” ([1485], page 163).

De vita XII Caesarum by Caius Suetonius is also only available as relatively recent copies. All of them hail back to the only “ancient manuscript” ([760]), that is presumed to have been in Einhard’s possession in the alleged year 818 A.D. His *Vita Caroli*

Magni is supposed to represent a diligent copy of the biographical schemes of Suetonius today ([760], pp. 280-281). The original document, known as the *Fulda Manuscript*, did not reach our time, and neither did the first copies ([760], p. 281). The oldest of Suetonius' copies is hypothetically the IX century text that was only brought to light in the XVI century. Other copies are dated to the post-XI century epoch in the Scaligerian chronology.

The fragments from *De viris illustribus* by Suetonius also appeared very late. The alleged dating of the latest fragment is the IX century A.D.:

“This manuscript was discovered by Poggio Bracciolini in Germany in 1425... The Hersfeld Manuscript did not survive (nothing but several pages from the Tacitus part remained), but about 20 of its copies did – those were made in Italy in the XV century.” ([760], page 337)

The dating of the “ancient” sources was performed in the XVI-XVII century out of considerations that are perfectly nebulous to us nowadays.

De Architectura by Vitruvius was discovered as late as 1497 – according to N. A. Morozov ([544], vol. 4, page 624), the astronomical part of the book quotes the periods of heliocentric planetary circulations with the utmost precision! Vitruvius, an architect who is supposed to have lived in the I-II century A.D., knew these periods better than Copernicus the astronomer! Furthermore, his error in what concerns the circulation of Saturn differs from the modern value of the period by a ratio of 0.00007. The error ratio for Mars is 0.006, and a mere 0.003 for Jupiter, q.v. in the analysis ([544], vol. 4, pages 625-626).

We should mark the magniloquent parallels between the books of the “ancient” Vitruvius and those of Alberti, the prominent humanist of the XV century ([18]), see fig. 1.30. One cannot fail to notice a certain semblance of the names Alb(v)erti and Vitruvius, bearing in mind the frequent inflexion of the sounds “b” and “v.” Alberti (1414-1472) is known as a prominent architect, the author of the fundamental theory of architecture that is very similar to the theory of the “ancient” Vitruvius ([18], pages 3-4). As well as the “ancient” Vitruvius, the mediaeval Alberti was the author of a voluminous tractate that included mathematical, optical, and mechanical knowledge, as well as from his theory of architecture.

Fig. 1.30. Leon Battista Alberti. Self-portrait. Bronze medallion from around 1430. Washington, National Gallery.
Taken from [\[18\]](#), page 160.

The title of the mediaeval opus of Alberti's, *The Ten Books on Architecture*, >coincides with its "ancient analogue" by Vitruvius. Nowadays it is supposed that the "ancient" Vitruvius had been "his ultimate ideal that he emulated in the creation of his tractate" ([\[18\]](#), page 152). Alberti's volume is written "in an archaic manner," accordingly. The specialists have long ago compiled tables comparing fragments of the works by Alberti and Vitruvius which sometimes coincide word for word. Historians explain this fact in the following manner: "all of these numerous parallels... unveil the Hellenistic-Roman atmosphere that his thoughts evolved in" ([\[18\]](#), page 89).

So, the book of the "ancient" Vitruvius fits into the mediaeval atmosphere and ideology of the XV century A.D. absolutely organically. Furthermore, the majority of Alberti's mediaeval constructions are "an emulation of the ancient style" ([\[18\]](#), pages 165, 167, 173). He creates a palace "made to resemble a Roman amphitheatre in its entirety" ([\[18\]](#), page 179).

So, the leading mediaeval architect fills Italian towns with "ancient" edifices that are nowadays considered an emulation of the Classical age – but this by no means implies they were considered as such in the XV century. The books are also written in the manner that will be made archaic much later. *It is only after all of this*, in 1497 A.D., that the book of the "ancient architect Vitruvius" appears, occasionally coinciding with a similar book of the mediaeval Alberti word for word. One feels that the architects of the XIV-XV century did not consider their endeavours to be an "emulation" of the Classical Age – they *were* the Classical Age. The emulation theory was to evolve much later, in the works of the Scaligerite historians, who were forced to explain the numerous parallels between the Classical Age and the Middle Ages.

One observes a similar situation with scientific literature. It would be expedient to remind the reader of how the acquaintance of the European scientists with the works of

Euclid, *Archimedes*, and *Apollonius* occurred, since, as we can see, the Middle Ages were the time when the “revival” of the “achievements of ancient science” took place.

M. Y. Vygotsky, an expert in the history of science, writes that “*not a single solitary copy of Euclid’s Elements has reached our times... the oldest manuscript we know of is a copy made in 888 ... there is a large number of manuscripts that date from the X-XIII century*” ([321], page 224). Fig. 1.31 shows a page from a deluxe edition of Euclid’s *Geometry* dated 1457 ([1374], page 103). It contains a picture of a “panoramic view of Rome.” It is most remarkable that the book by the “ancient” Euclid contains a picture of the *mediaeval* Rome and not the “ancient” one. One can clearly see a *Christian Gothic cathedral* right in front. The commentators say that “such Christian monuments as Ara Coeli are depicted here” ([1374], page 103). One gets a clear implication that Euclid was really a mediaeval author.

Fig. 1.31. A panoramic view of Rome from the “ancient” *Geometry* by Euclides, from an edition allegedly dated 1457. We see mediaeval Rome, a Gothic Christian cathedral, etc. Taken from [1374], page 103.

I. G. Bashmakova, an expert in the history of mathematics informs us that even before the publication of the Latin translation of the *Arithmetica* by the “ancient” Diophantus, the European scientists “have been using the algebraic methods of Diophantus, remaining unaware of his works” ([250], page 25). I. G. Bashmakova assesses the situation as “somewhat paradoxical.” The first edition of the *Arithmetica* is dated to 1575 A.D. If Ptolemy’s *Almagest* was instantaneously continued by Copernicus – let us remind the reader that the surge of interest in the *Almagest*’s publication immediately preceded the era of Copernicus, q.v. in detail in [Chron3](#) – Diophantus’ opus must have been continued by Fermat (1601-1665).

The history of both manuscripts and printed editions of the “ancient” Archimedes follows the pattern already known to us. According to I. N. Veselovsky, all of the

modern editions of Archimedes have been based on the *lost* manuscript of the XV century, and the Constantinople palimpsest that was found as late as 1907. It is assumed that the first manuscripts of Archimedes reached Europe quite late, in 1204. The first translation is supposed to have been made in 1269, and the complete text found in 1884 – *the XIX century*. The first printed edition allegedly appeared in 1503, and the first Greek edition – only in 1544. The “works of Archimedes entered scientific circulation after that” ([40], pages 54-56).

On fig. 1.32 you can see an ancient portrait of Archimedes from his book *Opera* dating to the alleged XV century. We see a typical mediaeval scientist in his study. The commentators couldn’t fail to have marked this: “The study is represented in the Renaissance fashion” ([1229], page 87).

Fig. 1.32. Ancient miniature depicting the “ancient” Archimedes as a mediaeval scientist. Vatican, Biblioteca Apostolica Vaticana, Urb. Lat. 261, fol. 1r. Taken from [1229], page 87.

Conical Sections by the “ancient” Apollonius was not published until 1537. Furthermore, “Kepler, who was the first to discover the significance of conical sections (ellipses) in astronomy, didn’t live to see the publication of the complete works of Apollonius. The next three books... were first published in a Latin translation [a

translation yet again! – A. F.] in 1631.” ([\[740\]](#), page 54)

So, the body of work of the “ancient” Apollonius only got to be published in its entirety after the discovery of the objects that this “ancient” tractate deals with, in Kepler’s epoch.

By the way, could the works of “the ancient Apollonius” just be an edited version of the *Pole* Copernicus? The name Apollonius is almost identical to *Polonius* – a *Pole*, a *native of Poland*, or *Polonia*. The astronomer Copernicus (1473-1543) was the immediate precursor of the astronomer Kepler (1571-1630).

6.

Timekeeping in the Middle Ages. Historians discuss the “chaos reigning in the mediaeval datings.” Peculiar mediaeval anachronisms

The Scaligerian chronological version was far from being the only one. It competed with versions that were significantly different. Bickerman mentions the “chaos reigning in the mediaeval datings” ([72], page 73). Furthermore, the analysis of ancient documents shows us that old concepts of time were substantially different from modern ones.

“Before the XIII-XIV century the devices for time measurement were a rarity and a luxury. Even the scientists didn’t always possess them. The Englishman Valcherius... was lamenting the lack of a clock that afflicted the precision of his observations of a lunar eclipse in 1091.” ([1461], page 68)

“The clocks common for mediaeval Europe were sundials, hourglasses, and water clocks, or *clepsydrae*. However, sundials only were of use when the weather was good, and the *clepsydrae* remained a scarcity” ([217], page 94). In the end of the IX century A.D., candles were widely used for timekeeping. The English King Alfred took them along on his journeys and ordered them to be burned one after the other ([217], page 94). The same manner of timekeeping was used in the XIII-XIV century, in the reign of Charles V, for instance.

“The monks kept count of time by the amount of holy book pages or psalms they could read in between two observations of the sky... For the majority, the main timekeeping medium was the tolling of the church bells” ([217], page 94). One is to bear in mind that astronomical observations require a chronometer that possesses a second hand, while we learn that “even after the discovery and the propagation of mechanical chronometers in Europe, they *had been lacking the minute hand for a long time*” ([217], page 95).

It has to be said that the ultra-sophisticated chronological Cabbala developed in the Middle Ages contradicts this imprecision of temporal observation. For instance:

“The very periods used for measuring time on Earth... acquire an entirely different duration... when used for measuring the Biblical events... Augustine equalled every Genesis day to a millennium [! – A. F.], thus attempting to define the duration of the history of humankind.” ([217], pages 109-110)

Such an “inherent trait of the mediaeval historiography as its anachronistic propensity”

is of importance to us.

“The past is described in the same categories as the contemporary epoch... the Biblical and the ancient characters wear mediaeval attire... a mediaeval moralist ascribes “courteousness” to the ancient Romans, which was a purely knightly virtue... The epochs of the Old and the New Testament are not put in a direct temporal sequence... The fact that the portals of mediaeval cathedrals portray Old Testament kings and patriarchs together with the ancient sages and evangelical characters unravels the anachronistic attitude to history like nothing else... In the end of the XI century the crusaders were certain they came to punish the actual executioners of the Saviour, and not their offspring.” ([217], pages 117-118)

This fact is significant enough, and we shall come back to it later on.

Modern historians base their observations on the Scaligerian chronology, believing that the mediaeval authors had “*attained a state of great confusion in what concerned both concepts and epochs*” due to their alleged ignorance, and that they had confused the ancient Biblical epoch with the Mediaeval one. Mediaeval painters, for instance, kept portraying the Biblical and the “ancient” characters in typically mediaeval costumes. However, another point of view is also viable, one that differs from the traditional “love for anachronisms” explanation. Namely, that all of the statements made by the mediaeval chronographers and artists may have reflected reality, and we consider them to be anachronistic because we follow the erroneous Scaligerian chronology.

The Scaligerian chronological version only managed to immortalize one mediaeval chronological concept out of many. Other versions previously coexisted with the consensual chronology.

For instance, it was assumed that the Holy Roman Empire of the German nation in the X-XIII century A.D. *was the immediate descendant* of the “ancient” Roman Empire that is alleged to have existed in the VI century A.D., according to the Scaligerian version ([270], vol. 1, page 16). Mark the repercussions of the discussion that appears very odd in our time: “Petrarch... made the statement that he was supposed to have based on a number of philological and psychological observations, that the privileges granted by Nero Caesar to the *House of Austrian Dukes* [in the XIII century A.D.! – A. F.] – were fake. It needed proof in those days” ([270], vol. 1, page 32).

For the modern historian [270], the thought that the “ancient” Caesar and Nero were the contemporaries of a mediaeval Austrian house of dukes that had only commenced its reign in 1273 A.D., that is, about 1200 years after Caesar and Nero – is naturally a preposterous one. However, as we see, the mediaeval opponents of Petrarch were of a different opinion, since it “needed proof” qv above.

E. Priester makes the following observation in re the same notorious documents: “All

the interested parties were perfectly aware that the documents were blatant and shameless forgeries [such is the modern interpretation of the fact – A. F.], and nevertheless politely shut their eyes on this circumstance” ([691], page 26). An abnormally large number of “anachronisms” that transpose ancient events into the epoch of the XI-XIV century is contained in the mediaeval German chronicles and texts. Detailed reference may be obtained from [469].

The reader must be accustomed to believing the famous gladiator fights only occurred “in the distant ancient age”. This is not the case, however. V. Klassovsky in [389], having told us of the gladiator fights in the “ancient” Rome, proceeds to add that *these fights took place in the mediaeval Europe of the XIV century as well!* For instance, he mentions the gladiator fights in Naples around 1344 A.D., which were attended by Johanna of Naples and Andrew of Hungary ([389], page 212). These mediaeval fights *ended with the death of one of the fighters*, exactly the way they did in the “ancient” times ([389]).

7.

The chronology and the dating of Biblical texts

The datings of religious sources are virtually woven out of obscurity and confusion. The Biblical chronology and datings are of a very vague nature, since they are based on the authority of late Mediaeval theologians. The historians write the following:

“The true history of the origins of the books comprising the New Testament also fails to concur with the one backed by the church... The order of the New Testament books [some of them – A. F.] that is used nowadays is the direct opposite of the one set by the ecclesial tradition... The real names of the authors of mediaeval books... remain unknown.” ([444], page 264)

As we shall learn, the consensual point of view about the Old Testament books *preceding* those of the New Testament also causes many doubts, and contradicts the results obtained by modern empirical-statistical dating methods. One should also consider the issue of the age of the Biblical manuscripts that have reached our time. They turn out to be of mediaeval origin.

“The oldest more or less complete copies of the [Greek] Bible are the manuscripts of Alexandria, Vatican, and Mt. Sinai... All three manuscripts are dated [palaeographically; that is, with such an ephemeral concept as handwriting style used as a basis – A. F.] to the second half of the IV century A.D. The codex language is Greek... The least is known about the Vatican codex – nobody knows how the artefact manifested in Vatican around 1475... The Alexandrian codex is known to have been given to the English king Charles I by the Patriarch Cyril Lucaris in 1628...” ([444], pages 267-268)

The codex of Mt. Sinai was only discovered in the XIX century by K. Tischendorf ([444], pages 268-270).

So, the three oldest codices of the Bible only surface after the XV century A.D. The reputation of their antiquity was created by the authority of K. Tischendorf, who had based his research on the style of handwriting. However, the very idea of palaeographical dating apparently *implies the existence of a known global chronology* of other documents and thus cannot be regarded as an independent dating method in any way. What we know for certain is that the history of these documents can be traced as far back as 1475 A.D.; in other words, no other more or less complete “ancient” Greek Bibles exist [444].

Among separate Biblical books, the oldest ones are considered to be those of Zechariah and Malachi, dated to the alleged VI century A.D., also palaeographically ([444]). “The most ancient Biblical manuscripts are in Greek” ([444], page 270).

There are no Hebraic manuscripts of the Bible predating the IX century A.D. (!) in existence, although those of a more recent time, primarily the middle of the alleged XIII century A.D., are kept in many national libraries. The oldest Hebraic manuscript is a fragment of the Books of Prophets, and it is dated to 859 A.D. One of the two second oldest manuscripts “is dated to 916 A.D. and contains the Books of the Prophets; the other is dated to 1008 A.D. and contains the text of the Old Testament.” ([444], page 270)

However, the first manuscript was dated to 1228 by the scribe. The so-called Babylonian punctuation of letters given here allows this text to be dated by the Seleucid Era, which gives us 916 A.D. However, there are no serious foundations for such a statement, and it is hence possible that the dating was given in years since Christ ([543], pp. 263-264), in which case the manuscript would belong to the XIII century and not the X.

The oldest Hebraic document containing the complete Old Testament can be ascribed to the alleged year 1008 A.D. ([444], page 270).

It is supposed that the Biblical canon was agreed upon by the Laodician Council in 363 A.D., but no edicts of this council remain in existence, and the same concerns the previous councils [765], page 148. The canon was really made official by the new Trident Council called in 1545, the epoch of the Reformation, and continued until 1563. In fig. 1.33 we can see a painting of one of the council’s sessions by Titian.

Fig. 1.33. The Trident Council (1545-1563). A painting by Titian. Kept in the Louvre, Paris. Taken from [328], page 238.

A great many books were destroyed by the edict of the Trident Council – the ones considered apocryphal, namely, the *Chronicles of the Judaic and Israeli Kings* ([765]). *We shall never be able to read these books*, but there is one thing that we can be perfectly certain of. They were destroyed, since they had described history differently from the books approved by the winning faction of Scaligerite historians. We should emphasize that “there were a lot more apocryphal opuses, than those... certified canonical” ([471], page 76), and that most biblical datings are wholly dependent on palaeography, which means that they are based upon the a priori chronological knowledge of the Scaligerian school and would change automatically if a chronological paradigm shift occurred.

Let us give an important example: “In 1902 the Englishman Nash purchased a fragment of an Egyptian papyrus manuscript whose dating cannot be agreed upon by the scientists to this day” ([444], page 273). The final agreement was made that the text corresponds to the beginning of our era. Later on, “after the discovery of the Qumran Manuscripts, the comparison of the handwriting styles in both Nash’s papyrus and the Manuscripts allowed for the determination of a greater antiquity of the latter” ([444], pages 272-273). Thus, one papyrus fragment whose dating “cannot be agreed upon” pulls a whole lot of other documents after it. Nevertheless, the “dating of the [Qumran – A. F.] scrolls provoked major dispute amongst scientists (the dating range was given from the II century and until the epoch of the Crusades)” ([471], page 47).

The “early A.D.” dating is considered proven after 1962, when a radiocarbon research of the Qumran manuscripts was conducted. However, as we shall mention again later on, the radiocarbon method is really unsuitable for the dating of specimens whose age falls into the span of 2-3 millennia, since the ensuing datings cover too wide a time range (this may reach as wide a span as 1-2 thousand years, for specimens whose age reaches 1-2 thousand years).

Although [444] dated the Qumran Manuscripts to 68 A.D., the American historian S. Zeitlin categorically insists on “the *mediaeval* origin of these texts” ([444], page 27).

We shall give a more detailed account of matters concerning the Biblical manuscripts in [Chron6](#).

8.

Difficulties and contradictions arising from the reading of old texts

8.1. How does one read a text written in consonants exclusively? The vocalisation problem

The datings of other Biblical fragments that we possess today also need attentive additional analysis.

Attempts to read most of the old manuscripts, such as the Biblical and the Ancient Egyptian ones, often confront historians with severe difficulties.

“The first steps of our research into the primordial language of the Old Testament bring us to the fact of paramount importance, which is that written Hebrew neither had signs for vowels originally, nor any other signs to replace them... The books of the Old Testament were written in nothing but consonants.” ([765], page 155)

The situation is typical. Ancient Slavonic texts, for instance, also come as chains of consonants, often even lacking the vocalisation symbols and separation of individual words from one another – just an endless stream of consonants.

Ancient Egyptian texts also contained nothing but consonants.

“The names of the [Egyptian – A. F.] kings... are rendered [in modern literature – A. F.] *in a perfectly arbitrary manner*, à la primary school textbook content... There is a plethora of significant variations that defy all attempts of classification, being a result of *arbitrary interpretation* [! – A. F.] that became tradition.” ([72], page 176)

It is possible that the scarcity and the high cost of writing materials made the ancient scribes extremely frugal, and the vowels were eliminated as a result.

“It is true that if we take a Hebraic Bible or a manuscript nowadays, we shall find a skeleton of consonants filled with dots and other signs that are supposed to refer to the missing vowels. Such signs were not included in the ancient Hebraic Bible... The books had been written in consonants exclusively, and filled with vowels by the readers to the best of their ability and in accordance with the apparent demands of common sense and oral tradition.” ([765], page 155)

Imagine how precise the kind of writing that consisted of nothing but consonants would be today, when the combination BLD, for instance, could mean blood, bled, bold, build, boiled, bald, etc.; RVR could stand for river, rover, or raver, etc. The vocalisation aleatory quotient in ancient Hebraic and other old languages is exceptionally high. Many

consonant combinations may be vocalised in dozens of ways ([765]). Gesenius wrote that “it was easily understood how imperfect and unclear such writing method had been” (quoted in [765]).

T. F. Curtis also noted that “even for priests the meaning of the scriptures remained extremely doubtful and could only be understood with the aid of the tradition and its authority” (quoted in [765], p. 155). Robertson Smith adds that “the scholars had no other guide but the actual text, that was often ambiguous, and oral tradition. They had no grammatical rules to follow; the Hebraic that they wrote in often allowed for verbal constructions that were impossible in the ancient language” (quoted in [765], page 156). Scaligerian history considers this status quo to have prevailed for many centuries ([765]).

It is furthermore assumed that “this paucity of the Hebraic Bible was only remedied in the VII or VIII century of our era,” when the Massorets had processed the Bible and “added... symbols that stood for vowels, but they had no other guides but their own intuition and very fragmentary oral tradition, and this fact is known perfectly well to every expert in the Hebraic language” ([765], pages 156-157).

Driver points out that:

“Since... the Massorets and their efforts in the VII and VIII centuries, the Jews have started to protect their holy books with the utmost zeal and vigour when it had already been too late to mitigate... the damage done to them in any way. The result of this overzealous protection had been the immanetization of the distortions that had been made equal to the original text in authority.” (Text given by [765], page 157.)

“The common opinion used to be that the vowels were introduced to the Hebraic text by Ezra in the V century B.C. ... When Levita and Capellus proved this wrong in the XVI and XVII century France, demonstrating that the vowels have only been introduced by the Massorets, the discovery made a great sensation in the entire Protestant Europe. Many were of the opinion that this new theory might lead to the complete dethronement of religion. If the vowels weren’t received in an Epiphany of divine inspiration, being merely a human creation, and a relatively recent one, at that, how could one rely on the text of the Holy Writ?... The debate that followed had been amongst the most heated in the history of the new Biblical criticism, and had carried on for over a century. It has finally ended when the veracity of the new opinion was acknowledged by everyone.” ([765], pages 157-158)

If such fierce disputes flared up around the Biblical vocalisations in the XVI-XVII century, could this mean these very vocalisations were *introduced very recently*? Could this have happened in the XV-XVI century? And since this vocalisation version was far from the commonly accepted version, it had to encounter opposition, which may have been quite vehement. It was only much later that the Massoret deciphering of the Bible shifted (by Levita and Capellus?) into the VII-VIII century A.D. so as to give the Biblical text the authority of antiquity.

The situation with the Koran must have been similar. We are informed that:

“Arabic writing... becomes developed further in the middle of the VII century, when the first transcription of the Koran took place (651 A.D.). The additional diacritic marks on, above, or beneath the letter were introduced in the 2nd half of the VII century for differentiating between similarly written letters, for... vowels and doubled vowels.” ([485], page 41)

Other sources tell us that the vocalisations were only introduced in the second half of the VIII century by Al-Khalil Ibn Ahmed ([485], page 39). Could all of this activity have taken place in the XV-XVI century?

8.2. The sounds “R” and “L” were often confused in the Middle Ages

We shall give some direct evidence of the fact that the sounds “R” and “L” were often subject to flexion. Amsterdam, among others, is a city whose name was affected by such instability and was called AmsteRdam, AmsteLdam, Amstelodami, etc. ([35], page XLI). We should mention another interesting fact here. Fig. 1.34 shows the title page of a book on navigation published in Amsterdam in 1625. The name of the city is already given as Amsterdam, the way it is written today – however, the old engraving that one sees on the same page gives the *old* name in a rather peculiar spelling – *AmsteLRedam*, q.v. in fig. 1.35. Both consonants are present here, and a bizarre combination of sounds is achieved as a result. This reminds us that the names of many European towns and cities had remained unstable until fairly recently, when they became immanentized in the printing press epoch. Numerous other examples of this phenomenon are given below.

Fig. 1.34. The title page from a book published in Amsterdam and dated 1625. The city is called AmsteRdam, spelt with an “R”. However, in the ancient engraving that we see on the same page, we see the name AmstelRedam, with both sounds that were often mistaken for each other included (“R” and “L”). Taken from [\[1160\]](#), page 287.

Fig. 1.35. Close-up of a fragment of the engraving, with Amsterdam spelt in a rather curious manner, “AmstelRedam.”

9.

Problems in the Scaligerian geography of Biblical events

9.1. Archaeology and the Old Testament

The vocalisations of quotidian lexemes may not be all that important to our purposes, but the consonant sequences used for names of cities, countries, and rulers definitely are. Hundreds of different vocalisations were spawned, some of which were arbitrarily localized in the Middle East due to the hypothesis that binds Biblical events to that area exclusively.

The archaeologist Millar Burroughs expresses his unswerving trust in the correctness of the Scaligerian geography, writing that “in general... archaeological work doubtlessly gives one a very strong confidence in the dependability of the Biblical indications” (quoted in [\[444\]](#), page 16). One of the modern archaeological authorities, the American William Albright, wrote, albeit hazily, that “one should not doubt that archaeology [in reference to the excavations in modern Palestine – A. F.] confirms just how substantially historical the Old Testament tradition is” (quoted in [\[444\]](#), page 16; also see [\[1003\]](#), [\[1443\]](#)). However, Albright concedes that the situation with Biblical archaeology was so chaotic in the beginning of the 1919-1949 period that the varying views on chronological issues could not have reached any sort of convergence at all, and that “under those circumstances one really could not have used the archaeological data concerning Palestine for illustrating the Old Testament” (quoted in [\[444\]](#), page 16).

The one-time Director of the British Museum, Sir Frederic Kenyon, categorically insists that archaeology has refuted “the destructive criticism of the second half of the XIX century”. W. Keller even published a book titled, suggestively enough, *And Yet the Bible is Right* ([\[1219\]](#)), which tries to convince the reader of the veracity of the Scaligerian interpretation of Biblical data.

However, here is some information from the eminent archaeologist L. Wright, also an avid supporter of the theory that the Scaligerian localizations and datings of the Biblical events were correct:

“The overwhelming majority of findings neither prove nor disprove anything; they fill the background and provide a setting for history... Unfortunately, many of the works that can be understood by the average reader have been written with excessive zeal and desire to prove the Bible correct. *The evidence is misused for making erroneous and semi-correct conclusions*” (quoted in [\[444\]](#), page 17).

The pioneers of archaeology in Mesopotamia were C. J. Rich, A. H. Layard, and P. E. Botta in the XIX century – however, in order to get their research subsidized, they had to advertise their findings in a sensational manner, associating their findings with Biblical towns in a rather arbitrary manner.

But the accumulation of material evidence resulted in a significant quandary. Actual facts show that none of the Old Testament books have concrete archaeological proof of their Scaligerian dating and localization. In the XX century L. Wooley, the prominent archaeologist, performed excavations of a town that he tried to identify as “the Biblical Ur.” However, it turned out that “unfortunately, one cannot give satisfactory chronological datings of the episodes [concerning the Biblical Abraham – A. F.] within the span of the second millennium of Middle Eastern history ([\[1484\]](#), [\[444\]](#), page 71).

The Scaligerian history insists that all the events concerning the Biblical patriarchs occurred precisely and exclusively on the territory of the modern Mesopotamia and Syria. Nevertheless, it is immediately acknowledged that “as to what concerns the identity of the patriarchs Abraham, Isaac, and Jacob, one can just reiterate that the information obtained as a result of the most fruitful excavations in Syria and Mesopotamia was extremely meagre, *or simply nonexistent*” ([\[1484\]](#), [\[444\]](#), page 77).

One might wonder just how justifiable it is to search for traces of the Biblical patriarchs in modern Mesopotamia.

Furthermore, Scaligerian history is of the opinion that all of the events involving the Biblical Abraham and Moses occurred on the territory of modern Egypt. It is evasively stated that:

“The historical intensity of this tradition *is not confirmed archaeologically*, but its historical plausibility is, together with an account of the circumstances that may have been the setting of the patriarchs’ biography.” ([\[444\]](#), page 80)

We are also warned that:

“One is to be cautious in one's use of cultural and social indications for dating purposes: since we have the principal concepts in what regards the era of the patriarchs, one needs to possess a certain flexibility in the fixation of chronology.” (quoted in [\[444\]](#), page 82)

As we shall soon see, this flexibility may stretch as far as hundreds and even thousands of years.

W. Keller proceeds to tell us that “Egypt remains indebted to the researchers. *In addition to the fact they found nothing about Joseph, neither documents nor any other traces of his time have been discovered*” [\[1219\]](#). Egypt remains “in debt” in

what concerns Moses as well ([444], page 91). In this case one may wonder yet again about the possibility of Biblical events having taken place in a different country – not necessarily bound to the territory of modern Egypt.

The archaeologist Albright, an avid supporter of the Scaligerian interpretation of the Bible, has nevertheless got to agree with the fact that “the previous concept of the Exodus to Haran from the Chaldaean Ur found *no archaeological evidence* except for the actual city” (quoted in [444], page 84).

Furthermore,

“It turned out that the very location of Mount Sinai is unknown. Another complication is that the Bible often states Mount Horeb to have been the place where the Revelation was given. If we are to take the Biblical description of the natural phenomena accompanying said procedure seriously, one has to presume the mountain to have been a volcano... The problem is that the mountain called Sinai nowadays *has never been a volcano*.” ([444], page 133)

Some archaeologists place Sinai in North Arabia, claiming that it was located in Midian, near Kadesh ([444], page 133). But *none of these mountains were volcanoes, either*.

The Bible says that “...the Lord rained upon Sodom and upon Gomorrah brimstone and fire from the Lord out of heaven” (Genesis 19:24). Scaligerian history locates this event somewhere in modern Mesopotamia. “The first idea that one gets in this respect is *the assumption of a volcanic eruption. But there are no volcanoes in this area*” ([444], page 86). It seems natural to search for these cities in some area that *does* have volcanoes. However, the search is still conducted in Mesopotamia with great effort and no results whatsoever. And finally a “solution” is reached: the southern part of the Dead Sea appears to conceal some debris resembling tree trunks under a 400 metre layer of very salty water of poor transparency ([444], page 86). This has sufficed for the American archaeologist D. Finnegan, as well as W. Keller after him, to claim that “the valley of Siddim,” together with the charred remains of both cities, had submerged ([444], page 86).

The Bible scholar and historian Martin Noth states explicitly that there is no reason to ascribe the destruction of the cities found by the archaeologists in Palestine, to the Israeli invasion in search of the so-called “Promised Land” ([1312]). As it was noted above, from the archaeological point of view the entire Scaligerian interpretation of the conquest of Canaan by Joshua, the son of Nun, becomes suspended in thin air ([1312], [1486]). Are we conducting our search for the Biblical Promised Land in the correct place? Could the troops of Joshua have been predominantly active elsewhere?

It is further written that:

“No archaeological proof of any Biblical report of the ‘Epoch of the Judges’ exists to this day. All the Judges’ names contained in the Old Testament aren’t known from any other source and weren’t found on any archaeological artefacts from either Palestine or any other country. This concerns the names of the first kings Saul, David, and Solomon.” ([444], page 158)

Scaligerian history convinces us that Noah’s Ark had moored to Mount Ararat in the Caucasus. Werner Keller ([1219]) assures us that the Armenian village of Bayzit still keeps the legend of a shepherd who saw a large wooden vessel on the Mount. The Turkish expedition of 1833 mentions “some ship made of wood that was seen over the southern glacier.” Keller proceeds to tell us that in 1892 a certain Dr. Nuri was leading an expedition in search of the sources of the Euphrates, and saw a fragment of a ship on the way back which was “filled with snow and dark red on the outside.” The Russian aviator officer Roskovitsky claimed to have seen the Ark’s remnants from his aeroplane during the First World War. Czar Nikolai the Second is supposed to have commanded an entire expedition there, which had not only seen, but also photographed, the remains of the Ark. The American historian and missionary Aaron Smith from Greenborough, an expert in the problem of the Great Deluge, wrote a history of Noah’s Ark mentioning 80 thousand publications on the topic. Finally, a scientific expedition was arranged. In 1951 Smith spent 12 days on top of Mount Ararat with 40 of his colleagues. They found nothing. Nevertheless, he made the following claim: “Even though we *failed to find so much as a trace of Noah*, my trust in the Biblical tale of the Deluge had only become firmer; we shall yet return” (quoted in [444]). In 1952 the expedition of Jean de Riquer obtained similar results. This somewhat anecdotal account here merely scratches the surface of the problem of geographical locations that is so acute for Scaligerian chronology, as it were.

Herbert Haag in his foreword to Cyrus Gordon’s *Historical Foundations of the Old Testament* credits the author with the following:

“His aim isn’t apologetic, which makes him quite unlike other authors that drown the book market in paperbacks attempting to “prove the Bible” by jumbling together all sorts of sensationalist “proof” received from ancient Oriental sources.” ([444], page 18)

Various museums, institutes, and universities send expeditions to the Middle East for “Biblical excavations.” Great sums of money are invested in such excavations, and a great many special societies and funds have been founded with the sole purpose of conducting archaeological research in the Scaligerian “Biblical Countries.” The first one of these institutions was the Research Fund of Palestine founded in 1865; currently

there are about 20 similar organizations in existence ([\[444\]](#)). Among them we find the American Institute for Oriental Studies, the Jerusalem Affiliate of the Vatican Institute of Bible Studies, and the Israeli Research Society. No other region of the planet has been studied by archaeologists with such intensity as the Scaligerian “Biblical” territories. A great variety of literature is published on this subject as well – special magazines, monographs, atlases and albums for the popularization of Biblical archaeology.

The Biblical topic is often given priority at the expense of other archaeological issues. The prominent Soviet historian who studied the antiquity, Academician V. V. Struve, has got the following to say about it:

“The excavations in Egypt and Babylonia were only of interest to the bourgeois science since they could be linked to Palestine. In order to find the funding needed for the excavations, the historians had to prove that an ancient copy of the Bible could be unearthed as a result of their research, or the sandals of Moses, mayhap, and then the monies were provided instantly.” ([\[444\]](#), page 44)

The following example is very representative. In the early XX century a tablet archive was found in the city of Umma, Mesopotamia. But since Umma isn’t mentioned in the Bible, and no enthusiastic entrepreneur could identify it as some Biblical town, the excavations in Umma were stopped, and the archives scattered without even being studied. The tablets were sold to Parisian collectors for one franc per piece ([\[444\]](#)).

“Archaeology as well as historical science in general can find no proof to the Biblical legend about the Egyptian slavery of the Jews” ([\[444\]](#), page 102). The Egyptologist Wilhelm Spielberg tells us that “what the Bible reports about the plight of Israel in Egypt isn’t any more of a historical fact than the accounts of Egyptian history related by Herodotus” (quoted in [\[444\]](#), page 103). V. Stade wrote that “anyway, it is clear that the research concerning the Pharaoh under whose rule Israel moved into Egypt and left it represents nothing but the juggling of names and dates void of all meaning” (quoted in [\[444\]](#), page 103). Let us repeat our question: could an altogether different country be described by the name of Egypt?

The Bible lists a great many geographical locations that the People of Israel visited during their 40 years of wandering after the Exodus from “Egypt.” The archaeologists still fail to find these locations where the Scaligerian history places their Biblical descriptions. Wright says that “few sites on the way to Mount Sinai can be identified with any degree of certainty” (quoted in [\[444\]](#), page 128). V. Stade wrote that: “checking the itinerary of Israel has as much sense as, say, tracking the way of the Burgundians’ return from King Etzel as described in the *Nibelungenlied*.” The Egyptologist W. Spielberg quotes this statement, saying that “we can still sign under

every word of Stade's" and that "the depiction of events following the Exodus, the listing of the sites where stops were made, the crossing of the desert – *all of this is fiction*" (quoted in [444], page 132). Many sites that were considered to have been on the itinerary of the Israelis were excavated thoroughly and intensively for a long time now. No traces have ever been found!

The Biblical account of the destruction of Jericho is well known. One of the Arabic settlements in the Middle East had been arbitrarily identified as the Biblican Jericho whose walls were destroyed by the sounds of the horn. The settlement has been subject to thorough excavations since the endeavours of Sellin, Watzinger, and Garstang in late XIX century. There were no results. In 1952 an Anglo-American archaeological expedition led by Kathleen Kenyon ventured to continue Garstang's research. No justifications for identifying the excavated town as Jericho have ever been found. Wright wrote that "the information received about Jericho was called disappointing, and it is true: not only is it hard to interpret the Biblical tale of Jericho, one cannot so much as trace the outline of the tradition's history... The Jericho issue is more problematic today than ever" (quoted in [444]).

The Bible says that after Jericho the Israelis destroyed the city of Ai. The site where this city was supposed to have been located according to the "calculations" made by the historians has also been subject to fundamental research. Yet again, the results have failed to satisfy. The German archaeologist and specialist in Biblical history Anton Jirku ([1213]) expresses his grief over the futility of the "Jericho" excavations, and proceeds to describe those of "Ai" as afflicted by "an even greater discrepancy between the report of the conquest of Ai that ensued and the results of the excavations" (quoted in [444], pages 145-151).

According to the Bible, the capital of Judaea in the reign of king Saul was the city of Gibeah. The historians have given birth to a hypothesis identifying it as the ruins excavated in the Tell el-Ful Hill six kilometres to the north of modern Jerusalem. However, it is conceded that "not a single inscription was found in town, and no clear evidence that the ruins belong to Saul's palace or a tower that he built" ([444], page 158). But had Saul's palace really been built there?

Conclusion: Archaeological research shows that the books of the Old Testament have no archaeological proof of their localization and dating as suggested by the Scaligerian tradition. Thus, the entire "Mesopotamian" Biblical theory becomes questionable.

9.2. Archaeology and the New Testament

The traditional localization of the events described in the New Testament isn't in any better condition. The lack of archaeological proof of the Scaligerian localization of the New Testament is explained by the fact that "Jerusalem was destroyed in the years 66-73, and that the Jews had been forbidden... to come anywhere near the city" ([444], page 196). Scaligerian history is of the opinion that Jerusalem can be located at the settlement that the locals call El Kuds, whose site used to be perfectly barren before, also known as Aelia Capitolina. It was after the passage of some time that "the ancient Jerusalem" was reborn here. The "historical remnants of Biblical times" shown to tourists today, such as the Wailing Wall, etc., do not hold up to even minimal scientific criticism, in full absence of historical and archaeological proof.

Fig. 1.36 shows an ancient miniature, allegedly dating from 1470, that depicts the pillaging of Jerusalem by the Syrian king Antiochus Epiphane ([1485], pages 164, 165). As we can see, the mediaeval author of the miniature didn't hesitate to represent Jerusalem as a typically mediaeval town with Gothic buildings and towers, and all the warriors wearing mediaeval plate armour.

Fig. 1.36. Ancient miniature allegedly dated to 1470 from Jean de Courcy's *Global Chronicle* (*Chronique de la Bouquechardière*). We see Jerusalem pillaged by the Syrian king Antiochus Epiphane. Jerusalem is pictured as a mediaeval Gothic town. There is an Ottoman crescent on the spire of one of the towers. Taken from [\[1485\]](#), ill. 200.

One must emphasise that other versions exist apart from the Scaligerian. The Catholic Church, for instance, has been claiming the “very house” that Virgin Mary had lived in and where “Archangel Gabriel appeared before her” to have been located in the Italian town of Loreto since the XIII century, which means that the Catholic version transfers a part of evangelical events to Italy. The earliest document concerning the “Loreto house” is the bull issued by Pope Urban VI dated to 1387. In 1891 Pope Leo XIII issued an encyclical “in celebration of the 600 years of Loreto’s Miracle.” Thus, the “miracle” is dated to XIII century A.D. Historians mark that “Loreto remains a holy pilgrimage place for the Catholics to this day” ([\[970\]](#), p. 37).

A. Y. Lentzman tells us the following in re the search of St. Peter’s sepulchre, for instance:

“In 1940, the excavations sanctioned by Pope Pius XII were commenced under the Vatican crypts, and their peak fell on the post-war years... In the late 1940’s a solemn statement was made by the press, especially the Catholic press [since the excavations must have been expensive – A. F.], that *not only the burial spot of the Apostle Peter was found, but his remains as well*... An objective analysis of the results of Vatican excavations demonstrated all of these claims to have been false. Pope Pius even had to make a radio announcement on the 24 December 1950 where he had acknowledged “the impossibility of making any veracious claims about the unearthed human bones belonging to the Apostle.” ([\[471\]](#), pages 45-49)

The location of the town of Emmanus near which Jesus is said to have appeared before his disciples after the Resurrection defies all attempts of being determined. The place of the Transfiguration of Jesus, Mount Tabor, also remains impossible to locate. Even the location of Golgotha is doubted by historians.” ([\[444\]](#), page 201).

Seeck in his *Geschichte des Untergangs der antiken Welt* (History of the Ancient World’s Decline, III, 1900) wrote that “we have no intention... of picturing his [Christ’s – A. F.] earthly destiny... all the issues of the origins of Christianity are so complex that we are glad to have the opportunity and the right to leave them well alone” (quoted in [\[259\]](#), page 46). A convenient stance, and one that has got absolutely nothing to do with science.

The archaeologist Schwegler sums up in the following way: “This is where the tragedy begins for the believer whose primary need is to know the place on Earth where his Saviour had lived and suffered. But it is the location of the place of his (Christ’s) death, that remains covered in impenetrable darkness, if we’re to think in archaeological categories.” (quoted in [\[444\]](#), page 202)

Apparently, there is no possibility of determining the location of the cities of Nazareth and Capernaum, as well as that of Golgotha etc., on the territory of modern Palestine. ([444], pages 204-205)

We shall quote the following noteworthy observation to sum up:

“Reading the literature related to Evangelical archaeology leaves a strange impression. Tens and hundreds of pages are devoted to the descriptions of how the excavations were organized, what the location of the site and the objects relevant to the research looked like, the historical and Biblical background for this research, etc.; and the final part, the one that is supposed to cover the result of the research, just contains a number of insubstantial and obviously embarrassed phrases about how the problem was not solved, but there’s still hope, etc. It can be said categorically and with all certainty that *not a single event described in the New Testament has any valid archaeological basis for it* [in Scaligerian chronology and localization – A. F.]... This is perfectly true in what concerns the identity and the biography of Jesus Christ. There is no proof for the location of any of the places where the evangelical events are traditionally supposed to have occurred.” ([444], pages 200-201)

We ask yet again: is it correct to search for the traces of the events described in the New Testament in the Middle Eastern Palestine? Could they have taken place somewhere else?

10.

Ancient historical events: geographic localization issues

10.1. The locations of Troy and Babylon

The correct geographic localization of a large number of ancient historical events is truly a formidable task. Naples, for instance (whose name merely stands for “New Town”) is reflected in the ancient chronicles as the following cities:

1. Naples in Italy, existing to this day.
2. Carthage, also translating as “New Town” ([938], page 13, B, 162-165).
3. Naples in Palestine ([268], page 130).
4. The Scythian Naples (see the collection of the State History Museum of Moscow).
5. New Rome a.k.a. Constantinople or Czar-Grad, which could also be referred to as “New Town”.

Thus, if a chronicle is referring to an event that occurred in Naples, one has to devote all of one’s attention to making sure one understands which town is meant.

Troy may be seen as yet another example. One of the consensual localizations for Homer’s Troy is near the Hellespont straits. Schliemann used this hypothesis for solemnly baptizing as “Troy” the 100×100 metre excavation site of a minuscule ancient settlement that he had discovered near the Hellespont ([443], page 107). Actually, the very localization of Hellespont itself is highly controversial. See [Chron2](#) for more details.

The Scaligerian chronology and history tell us that Homer’s Troy met its final fate of destruction and utter desolation in the XII-XIII century B.C. ([72]). However, we know that the Italian town of Troy played an important role in mediaeval history, particularly in the well-known war of the XIII century. This town still exists ([196]).

Many Byzantine historians of the Middle Ages refer to Troy as an *existing mediaeval town*, among them Nicetas Aconiatius ([934], Volume 5, page 360), and Nicephorus Gregoras ([200], Volume 6, page 126).

According to Titus Livy, Troy and the entire Trojan region were located in Italy ([482], Volume 1, pages 3-4). He tells us that the surviving Trojans landed in Italy soon after the fall of Troy, and that the place of their first landing was called Troy.

“Aeneas... wound up in Sicily; his fleet sailed thenceforth, and came to the Laurentian

region. *This place is called Troy as well*” ([482], Volume 1, pages 3-4, Book 1, No. 1).

Several mediaeval historians *identify Troy as Jerusalem*, for instance ([10], pages 88, 235, 162, 207). This fact embarrasses modern historians greatly, leading them to such comments as: “Homer’s actual book somewhat suddenly turns into an account of the devastation of Jerusalem” [in a mediaeval text describing Alexander’s arrival in Troy – A. F.] ([10], page 162).

Anna Comnena, a mediaeval author, somewhat unexpectedly locates Jerusalem in Ithaca, the island where Ulysses was born ([419], Volume 2, pages 274-285). This is most peculiar indeed, since it is known perfectly well that modern Jerusalem isn’t located on an island.

Another name for Troy is Ilion, while Jerusalem is also known as Aelia Capitolina ([544], Volume 7). Aelia and Ilion are rather close phonetically. It is possible that *the same city* was called Troy and Ilion by some, and Jerusalem and Aelia by others. Eusebius Pamphilus writes that somebody “referred to the small Phrygian towns, Petusa and Timion as ‘Jerusalem’” (quoted in [544], page 893).

The facts quoted above demonstrate the fact that the name of Troy had multiplied in the Middle Ages, and had been used for referring to different cities. Could an archetypal mediaeval original have existed? Scaligerian chronology contains information that allows the construction of the hypothesis that Homer’s Troy was really Constantinople, or Czar-Grad.

Apparently, the Roman emperor Constantine the Great took into account the wish of his fellow townsmen and “had initially chosen the *place where the ancient Ilion, the fatherland of the first founders of Rome, had been located*”. This is what the prominent Turkish historian Jalal Assad tells us in his *Constantinople* ([240], page 25). Historians proceed to tell us that Constantine “changed his mind” afterwards, and founded New Rome nearby, in the town of Byzantium. But it is a known fact in Scaligerian history that Ilion is another name for Troy.

What we encounter here may well be a remainder of the fact that the same town located on the Bosphorus had been referred to by different names: Troy, New Rome, Czar-Grad, Jerusalem. It might also be true that since Naples means New Town, it was the name that had been used for New Rome as well.

Let us mention the fact that southern Italy used to be called the Great Greece in the Middle Ages (Eusebius Pamphilus) ([267], pages 282-283).

Nowadays it is assumed that the city of Babylon was located in modern Mesopotamia. Some of the mediaeval texts hold a cardinaly different opinion. The

well-known book *Serbian Alexandria*, for instance, locates Babylon in Egypt. Moreover, it tells us that Alexander the Great died in Egypt as well – according to the Scaligerian version, this event took place in Mesopotamia ([10], page 255).

Furthermore, we see that “Babylon is the Greek name of the settlement that had been located opposite the pyramids [the Tower of Babel? – A. F.]... *In the Middle Ages it had been a frequently used name for Cairo*, whose suburb this settlement eventually became” ([464], page 45). The name Babylon can be translated, as well as the names of many other cities, and thus may have been used for referring to other locations.

Eusebius tell us that Rome used to be called Babylon ([267], page 85). Furthermore, “the Byzantine historians [in the Middle Ages – A. F.] often called Baghdad Babylon” ([702], page 266, comment 14). Michael Psellus, the author of the alleged XI century refers to Babylon as one would to an existing town – not a destroyed one ([702], page 9).

In fig. 1.37 we can see an ancient miniature dating from 1470 depicting “ancient” Babylon as a typically mediaeval Gothic town ([1485], pages 164, 165). The Tower of Babel is being constructed on the right. The “ancient” king Nimrod is also portrayed as a mediaeval knight in plate armour. Modern commentators deem this to be a fantasy bearing little semblance to reality: “on the left we see Babylon presented as a *fantasy Gothic town with elements of Muslim architecture*. The giant in the centre is Nimrod. The construction of the tower of Babel is pictured on the right” ([1485], page 164). It is most probable, however, that this is not a fantasy. The artist had been perfectly aware of what he was painting, and the picture reflects mediaeval reality.

Fig. 1.37. Ancient miniature allegedly dated to 1470 from Jean de Courcy's *Global Chronicle* (*Chronique de la Bouquechardière*). We see the "extremely ancient" King Nimrod in the "ancient" Babylon, which is depicted as a Gothic mediaeval town with elements of Muslim architecture. Taken from [1485], ill. 199.

10.2. The geography of Herodotus is at odds with the Scaligerian version

Let us quote some examples from Herodotus, who plays a key role in the Scaligerian chronology. He claims the African river Nile to be parallel to Ister, that is nowadays identified as the Danube (and, oddly enough, not Dniester) ([163], page 492). This is where we find out that "the opinion that Danube and Nile were parallel reigned in the *mediaeval Europe* until as late as the end of the XIII century" ([163], page 493). Thus, the mistake of Herodotus proves to be mediaeval in its origins.

Herodotus proceeds to tell us that "the Persians inhabit all of Asia to the very Southern Sea that is also called the Red Sea" ([163], 4:37, page 196). According to consensual geography, the Southern Sea is the Persian Gulf. Giving a description of the peninsula that contemporary historians identify with the Arabian peninsula, Herodotus

writes that “it begins near the Persian land and stretches to the Red Sea” ([163], 4:39, page 196). Everything appears to be correct here. However, this contradicts the opinion of those historians who identify the Red Sea mentioned by Herodotus as the Persian Gulf ([163]). This is why modern commentators hasten to “correct” Herodotus: “Red Sea stands for Persian Gulf here” ([163], Appendices, Part 4, comment 34).

Let us continue. The Red Sea in its modern interpretation may indeed “reach further up than the Persians” according to Herodotus ([163], Volume 4:40), but only meeting one condition, namely, that the map used by Herodotus was *inverted* in relation to the ones used nowadays. Many mediaeval maps are like that, with North and South swapped (qv below). This makes the modern historians identify the Red Sea as the Persian Gulf ([163], Appendix, Part 4, comment 36), although the Persian gulf is “below” the Persians in this case, or to the East of them, but doesn’t reach “further up” at any rate.

Historians identify the same sea mentioned by Herodotus in 2:102 as the Indian Ocean ([163], Appendix, Part 2, comment 110). What we observe here is the inversion of the East and the West. Could the map that Herodotus had used have been an inverted one, then?

In book 4:37 Herodotus identifies the Red Sea as the South Sea, q.v. above. This proves to be the final straw of confusion for the modern commentators who try to fit Herodotus into the Procrustean geography of the Scaligerian school, and the maps used nowadays. They are forced to identify the Red (Southern) Sea as the Black Sea! See book 4:13, [163], Appendix, Part 4, comment 12. We see yet another inversion of the East and the West in relation to the Persians.

Thus, identifying the geographic data as offered by Herodotus with the Scaligerian map runs us into many difficulties. The numerous corrections that the modern historians are forced to make show us that the map that Herodotus had used may have been inverted in relation to the modern ones, which is a typical trait of *mediaeval* maps ([1468]).

As we can see, the commentators have to make a conclusion that Herodotus uses different names to refer to the same seas in his

History. If we’re to believe the modern historians, we have to think that Herodotus makes the following identifications: Red Sea = South Sea = Black Sea = North Sea = the Mediterranean = the Persian Gulf = Our Sea = Indian Ocean ([163], Appendix, comments 34, 36, 110, etc.).

The mentions of the Crestonians, the town of Creston, and the region of Crossaea sound most peculiar coming from an allegedly ancient author ([\[163\]](#), 1:57, page 27; 5:3, page 239; 5:5, page 240; 7:123, page 344; 7:124, pages 344-345; 7:127, page 345; 8:116, page 408; page 571). One constantly gets the feeling that he is referring to the mediaeval *crusaders*. “Cross” and “Crest” are the roots one most often associates with the Middle Ages. Just how veracious are the datings of the events related by Herodotus?

The unbiased analysis of Biblical geography yields many oddities as well ([\[544\]](#)).

10.3. The inverted maps of the Middle Ages

Modern maps place the East on the right, and the West on the left. However, we find that the opposite is true for many mediaeval maps – all of the sea charts of the alleged XIV century had the *East* on the *left*, and the *West* on the *right*, qv in the atlas [\[1468\]](#). Some of these old inverted charts from Genoa can be seen in figs. 1.38, 1.39, 1.40 and 1.41. These charts may have been used by either traders or the military fleet.

Fig. 1.38. An old inverted map of the Black Sea. This is a so-called “portolano” by the Genoese Pietro Vesconte, allegedly dating from 1318 ([\[1468\]](#), page 3). Several points on the coast of the Black Sea are marked. The centre of

the map says Pontus Euxinus. The North is at the bottom, the East on the left. The East used to be referred to as *Levant*, see [1468], page 37, which means “situated on the left”. There are traces of the name remaining in the German language, among others, where the Middle East is still called *Levant*. See [573], page 333. The Crimean peninsula, it will be observed, is “upside down” in comparison to its location on modern maps. Taken from [1468], map 3.

Fig. 1.39. An old inverted map of a part of the Mediterranean. A portolano by the Genoese Pietro Vesconte, allegedly dating from the XIV century. The North is at the bottom, the East on the left. This is probably the reason why the East used to be referred to as *Levant*, or “located on the left.” Taken from [1468], map 4.

Fig. 1.40. An old inverted map of Spain and a part of Africa. Africa is on top, and Spain at the bottom. Thus, the North is at the bottom, and the East is on the left. Another portolano by Pietro Vesconte, allegedly dating from the XIV century. These maps most probably date from the XV-XVI century. Taken from [\[1468\]](#), map 8.

Fig. 1.41. An old inverted map of England and France. France is on top, and England at the bottom. The East is on the left. A portolano of the Genoese Pietro Vesconte, allegedly dating from the XIV century. Taken from [\[1468\]](#), map 10.

The word *levant*, for instance, still means “oriental” in French. The Middle East is also often referred to as *Levant* in German ([\[419\]](#), page 733). This may be a reflection of the fact that the Orient was on the left of the maps (*leviy* means “left” in Russian, and the adverb for “on the left” is *sleva*). It is possible that the Russian word *leviy* was adopted by some of the Western European languages in order to refer to the Orient. See our Parallelism Glossary in [Chron7](#).

Why did the old maps, and sea charts in particular, have the East on their left, and the West on their right? The reason may have been that the first seafarers of Europe would sail forth from the seaports located on the European coast of the Mediterranean, as well as the Black and Azov seas, and so they had to move *from the North to the South*. The South was therefore in front, and the Northern coast behind them. A ship captain sailing into the Mediterranean from the Bosphorus would look at the approaching African coast. Thus, the *East* was *on the left*, and the *West* was on the right.

This is why the first sea charts of both the traders and the military put the East on the

left. It made sense to put that which lay in front on the top of the map. Thus, the way one looks at the map corresponds with the direction of one's movement.

11.

A modern analysis of Biblical geography

The fact that many Biblical texts clearly refer to volcanic activity has been well known to historians for a long time. The word Zion is widely known; theologians interpret it as “pillar” ([544], Volume 2). Identifying Zion as Sinai and Horeb is common in both theology and Bible studies. Hieronymus in particular noted that: “it appears that the same mountain is called by two different names, Sinai and Horeb” ([268], page 129). I. Pomyalovsky wrote that: “the Old Testament often identifies it [Mt. Horeb – A. F.] as Sinai” ([268], page 326). “Mount Zion” can be translated as “The Pillar Mountain” ([544], Volume 2). The Bible explicitly describes Mount Sinai/Zion/Horeb as a volcano, q.v. below. In this case “The Pillar Mountain” makes sense in the way of referring to *a pillar of smoke* above the volcano. We shall be referring to God as the Thunderer below, following the interpretation suggested in [544], Volume 2.

According to the Bible,

“the Lord said unto Moses, Lo, I come unto thee in a thick cloud... upon mount Sinai... when the trumpet soundeth long, they shall come up to the mount... there were thunders and lightnings, and a thick cloud upon the mount, and the voice of the trumpet exceeding loud... And mount Sinai was altogether in smoke, because the Lord descended upon it in fire: and the smoke thereof ascended as the smoke of a furnace, and the whole mount quaked greatly. And when the voice of the trumpet sounded long, and waxed louder and louder, Moses spake, and God answered him by a voice.” (Exodus 19:9, 19:11, 19:13, 19:16, 19:18-19)

Also: “And all the people saw the thunderings, and the lightnings, and the noise of the trumpet, and the mountain smoking” (Exodus 20:18). In fig. 1.42 we can see an ancient engraving from a 1558 Bible (*Biblia Sacra*) ([544], Volume 2, page 210, illustration 94). The mediaeval painter portrays Moses ascending a fiery mountain.

Fig. 1.42. Moses ascending a fiery mountain. An ancient illustration from a Bible allegedly dating from 1558 (*Biblia Sacra*). Taken from [\[544\]](#), Volume 2, page 210, ill. 94.

Furthermore:

“The day that thou stoodest ... in Horeb ... and the mountain burned with fire unto the midst of heaven, with darkness, clouds, and thick darkness. And the Lord spake unto you out of the midst of the fire; ye heard the voice of the words, but saw no similitude; only ye heard a voice.” (Deuteronomy, 4:10-12)

The destruction of the Biblical cities of Sodom and Gomorrah has long been considered a result of a volcanic eruption. The Bible says that “the Lord rained upon Sodom and upon Gomorrah brimstone and fire from the Lord out of heaven... and, lo, the smoke of the country went up as the smoke of a furnace” (Genesis 19:24, 19:28).

On Albrecht Dürer’s engraving “Lot Fleeing with his Daughters from Sodom” we can see a volcanic eruption destroying the Biblical cities of the plain in a fountain of fire and stones (fig. 1.43).

Fig. 1.43. Albrecht Dürer's engraving titled "The Destruction of Sodom and Gomorrah." What we see here is a powerful volcanic explosion, as one might expect, destroying the Biblical cities of the plain. Taken from [\[1234\]](#), engraving 40.

Let us turn to the Lamentations of Jeremiah that contain a description of the destruction of Jerusalem. It is assumed to be an account of the destruction of the city by a hostile army; however, the text contains many fragments such as "How hath the Lord covered the daughter of Zion with a cloud in his anger ... and remembered not his footstool in the day of his anger! The Lord hath swallowed up all the habitations ... he burned ... like a flaming fire, which devoureth round about" (The Lamentations of Jeremiah, 2:1-3).

Then we encounter the following in the chapters 3 and 4 of the Lamentations:

"I am the man that hath seen affliction by the rod of his [God's – A. F.] wrath; he hath led me, and brought me into darkness, but not into light... he hath broken my bones... *he hath inclosed my ways with hewn stone*, he hath made my paths crooked... he hath also broken my teeth with gravel stones, he hath covered me with ashes... thou hast covered with anger, and persecuted us: thou hast slain, thou hast not pitied. Thou hast *covered thyself with a cloud*... the stones of the sanctuary are pored out... the punishment... is greater than the punishment of the sin of Sodom... their [the survivors' – A. F.] visage is blacker than a coal... The Lord hath accomplished his fury; he hath poured out his fierce anger, and hath kindled a fire in Zion, and it hath devoured the foundations thereof." (The Lamentations of Jeremiah, 3:1-2, 3:4, 3:9, 3:16, 3:43-44, 4:1, 4:6, 4:8, 4:11)

Theologians insist all of this is metaphorical; however, a literal reading of the text divulges an account of the destruction of a large city by a volcanic eruption. The Bible refers to volcanic activity quite often; here's a list of all such references, compiled by V. P. Fomenko and T. G. Fomenko:

Genesis 19:18, 24, Exodus 13:21, 22, Exodus 14:18, Exodus 20:15, Exodus 24:15, 16, 17, Numbers 14:14, Numbers

21:28, Numbers 26:10, Deuteronomy 4:11, 36, Deuteronomy 5:19, 20, 21, Deuteronomy 9:15,21, Deuteronomy 10:4, Deuteronomy 32:22, The Second Book of Samuel 22: 8-10,13, The First Book of the Kings 18:38, 39, The First Book of the Kings 19:11, 12, The Second Book of the Kings 1:10-12,14, Nehemiah 9:12,19, The Book of Psalms (Psalm 11, verse 6, Psalm 106, verse 17), (Psalm 106, verse 18), Ezekiel 38:22, Jeremiah 48:45, The Lamentations of Jeremiah 2:3, The Lamentations of Jeremiah 4:11, Isaiah 4:5, Isaiah 5:25, Isaiah 9:17,18, Isaiah 10:17, Isaiah 30:30, Joel 2:3,5,10.

Seeing these descriptions as referring to Jerusalem in Palestine and the traditional Mount Sinai is very odd indeed, since *Mt. Sinai located on the modern Sinai Peninsula had never been a volcano*. Where did the events really take place, then?

It suffices to study the geographic map of the Mediterranean region ([\[440\]](#), pages 380-381, 461) to see that there are no volcanoes on the Sinai Peninsula, and there aren't any in either Syria or Palestine. There are zones of Tertiary and Quaternary volcanic activity, but one encounters those in the vicinity of Paris as well. There has been no volcanic activity recorded in documented history (the post-A.D. period).

The only relevant geographic zone that possesses powerful volcanoes active to this day is the area including Italy and Sicily, since there are no volcanoes in Egypt or anywhere in the north of Africa ([\[440\]](#)). We are looking for:

1. A powerful volcano that was active in the historical epoch;
2. A destroyed capital near the volcano (see the Lamentations of Jeremiah);
3. Two more destroyed cities near the volcano, Sodom and Gomorrah.

There is just one volcano in the entire Mediterranean area that fits these criteria – *Vesuvius*. It is one of the most powerful volcanoes active in the historical period. The famous Pompeii – a capital? – and two destroyed cities: Stabia (Sodom, perhaps?) and Herculaneum (Gomorrah?). The names do possess a slight similarity.

N. A. Morozov was of the opinion that the origin for the name Sinai given to Vesuvius is the Latin word *sinus* (or *sino* in Old Latin) – “mountain with bowels,” and Horeb has its origins in the Latin word *horribilis*, “horrible.” In [\[544\]](#) we can see the results of an interesting research that Morozov conducted concerning the Biblical text as read without vocalisations, and considering the localization of Mount Sinai/ Horeb/Zion in Italy.

Let us quote several examples. The Bible says, “the Lord our God spake to us in Horeb, saying, Ye have dwelt long enough in this mount: turn you, and take your journey... to the land of the Canaanites (CNUN)” (Deuteronomy, 1:6-7). Theologians vocalise CNUN as Canaan, and localize it in a desert near the Dead Sea coast, but another vocalisation is possible: CNUN – Cenoa, as a variant of Genoa (the area of

Genoa in Italy). Apart from that, the word Canaan sounds like (the land of the) Khans.

The Bible gives the direction as “to the land of CNUN (the Canaanites), and unto LBNUN” (Deuteronomy 1:7), that is commonly vocalised as “Lebanon” – however, LBNUN is also often used for “white,” and may have been used to refer to Mont Blanc – the White Mountain, literally. The land of the Canaanites may mean the same as the Khan’s land, or the Land of the Khan.

Furthermore, we see “unto the great river, the river PRT” in Deuteronomy 1:7. PRT is localized as Euphrates; however, what lies beyond Mont Blanc is the river Danube with its large tributary *Prut*.

The Bible says, “when we departed from Horeb, we went through all that great and terrible wilderness” (Deuteronomy 1:19). The famous Flegrean Fields that are located near Vesuvius (Horeb) fit this description perfectly – large areas of scorched land full of small volcanoes, fumaroles, and layers of lava.

According to the Bible, the Israelites “came to KDSH V-RNAE” (Deuteronomy 1:19). KDSH V-RNAE is vocalised as “Kadesh-barnea” – however, the town in question may well be Cadiz upon the Rhone ([544], Volume 2, page 166). Cadiz on the Rhone might be another name of the modern Geneva – or indeed the Bulgarian city of Varna.

Further in the Bible we see, “and we compassed mount Seir many days” (Deuteronomy 2:1). Theologians left the word “Seir” without translation; if we translate it, we shall get “The Devil’s Mountains” ([544], Volume 2, page 166). A mountain by this name exists near Lake Geneva – Mount Diableret, “The Devil’s Mountain.”

The *sons of Lot* encountered on the way may well be the Latin population (LT without vocalisations) ([544], Volume 2, page 167).

The River Arnon (ARNN) is mentioned in Deuteronomy 2:24. This may well be the Italian river Arno!

The Israelites “Went up the way to Bashan” according to Deuteronomy 3:1. The town of Bashan is often mentioned by the Bible. Amazingly enough, a town by the name of Bassano still exists in Italy.

The Bible proceeds to mention that “the king of Bashan came out against us... to battle at Edrei” (Deuteronomy 3:1). This is clearly a reference to Adria (near the Po estuary). As for Po itself – ancient Latin authors (see Procopius, for instance) often refer to it as “Jordan” (Eridanus) ([544], Vol. 2). The name concurs with the Biblical JRDN perfectly well ([544], Vol. 2, page 167).

According to the Bible, “there was not a city which we took not from them,

threescore cities” (Deuteronomy 3:4). Indeed, many large towns were located in this area in the Middle Ages – Verona, Padua, Ferrara, Bologna, etc.

The Bible mentions the land “from the river of Arnon (Arno, ARN) unto mount HRMN (Hermon)”, q.v. in Deuteronomy 3:8. However, the HRMN mountains can also be vocalised as the German mountains.

“For only Og king of Bashan remained... his bedstead [coffin here – A. F.] was a bedstead of iron; is it not in Rabbath of the children of Ammon?” (Deuteronomy 3:11). Rabbath is Ravenna, and the coffin of Og [Goth?] is the sepulchre of Theodoric the Goth located in Ravenna! Theodoric is supposed to have lived in 493-526 A.D., so this Biblical text could not have appeared before the VI century A.D., even in Scaligerian chronology.

The Israelites are supposed to have stopped at TBRAE, or “the place Taberah” (Numbers 11:3). Bearing the previous identifications in mind, we can recognize the Italian river Tiber in this name. Furthermore, CN is Siena (to the south-east from Livorno), the Biblical Hebron (HB-RUN, Genesis 23:2) is possibly Gorgo du Rhone ([544], Volume 2, pages 229-237). The slopes of Monte Viso are called Jebus (VUZ) in Judges 19:10. The city of Rome is called Ramah (RAMA) in Judges 19:13. All the quotes are from the authorized version of the Bible, and there are many more examples.

It is thus possible that a part of the events described in the Bible, namely, the journey of the Israelites led by Moses, and their subsequent conquest of the “Promised Land” with Joshua, took place in Europe, and particularly in Italy (as opposed to Palestine).

The localization of the “ancient” states mentioned in the Bible also raises a vast number of questions. The Bible often mentions the Phoenician towns of Tyre and Sidon; since we now allow for possibilities of mediaeval interpretations of many Biblical names, one cannot fail to notice the similarities between the names of Venetia and Phoenicia – they may well be the same name if we consider the usual rules of flexion. One comes up with the hypothesis of *localizing the Biblical Phoenicia as the mediaeval Venice*.

Indeed, the Bible describes the “ancient” Phoenicia as a powerful nation of seafarers that reigned over the entire Mediterranean, with colonies in Sicily, Spain, and Africa. “Ancient” Phoenicians traded extensively with faraway lands, as can be seen in the book of Ezekiel, chapter 27. All of these Biblical criteria are met by the mediaeval Venetian republic, a well-known and powerful state.

The Scaligerian history claims the principal Phoenician towns to have been the modern Tyre and Sidon (Saida). Do these towns fit their Biblical descriptions of

lavishness and splendour? A XIX century volume of sailing directions for seamen ([494]) tells us the following about Saida:

“The town had 1600 inhabitants in 1818... There is a small bay to the south... A small pier that is barely visible in our day used to belong to a small harbour that is now completely covered by the sands... Plague often rages fiercely here... One finds no traces of former splendour in Saida nowadays... There’s a reef on the south end, and it’s very shallow in the north... The depth between the town and the island is uneven... The passage is narrow, and the bottom is full of stones. A large ship’s boat cannot come close to the shore, which makes it impossible to replenish water supply here” ([494], quoted in [544], Volume 2, page 637).

The town is located in the estuary of a river that isn’t navigable by ships. Its main means of survival in the XIX century had been the local gardens. Strategically speaking, Saida’s location is perfectly hopeless. It used to belong to virtually everyone during the crusades epoch; there are no records mentioning it as a large independent trade centre ([544], Volume 2).

All of this contradicts the Biblical descriptions of the greatness of Sidon and Phoenicia. The situation with Tyre is similar ([494], [544], Volume 2). Evidently, the Bible is referring to other locations.

The mysterious Renaissance epoch as a product of the Scaligerian chronology

The Scaligerian chronology is very fond of the renaissance motif, appealing to the archetypal recurrence of the Classical Age.

The ancient Plato is supposed to have been the founding father of Platonism. His teaching allegedly falls into oblivion for centuries to come, and is revived by the famous Neoplatonist Plotinus, allegedly in 205-270 A.D. The similarity of his name to that of his teacher is purely accidental, of course. Then Neoplatonism perishes as well, in order to be revived again in the XV century A.D. by another famous Platonist – Gemisto Pleton, whose name is also identical to that of his teacher as a result of sheer coincidence. The mediaeval Pleton is supposed to have revived the “ancient” Platonism, having been an avid advocate of “the ancient sage Plato.” Furthermore, it is only in the XV century that Plato’s manuscript was unearthed ([\[247\]](#), pages 143-147). This is precisely the epoch of Gemisto Pleton.

Pleton founds “Pleton’s Academy” in Florence in the image of the “ancient” Plato’s Academy ([\[247\]](#)). A. A. Vasiliev writes that “His [Pleton’s – A. F.] sojourn in Florence... had been one of the most important periods for Italy when it was importing the ancient Greek science, and Plato’s philosophy in particular” ([\[675\]](#), Volume 3, Pt. 2; [\[120\]](#)).

Both Plato and Pleton write Utopian works. Gemisto Pleton is reported to have been the author of the famous *Tractate on the Laws*, which sadly failed to reach us in its entirety. However, the full text of Plato’s tractate by the same title did. Pleton, who lived in the XV century, also suggests the construction of an ideal state, with his programme being extremely close to Plato’s. Plotin, who had allegedly lived in 205-270 A.D., is yet another one to have hoped the Emperor would aid the foundation of the city of Platonopolis in Campagna (Italy again), where he had planned to introduce communal aristocratic institutions à la Plato ([\[122\]](#), Volume 4, pages 394-397).

Many prominent ecclesial leaders have historical doppelgangers in Scaliger’s chronology. Eusebius in his *Historia Ecclesiastica* ([\[267\]](#)) makes many references to a certain Bishop Victor who played a key role in the so-called Easter Dispute, or the introduction of the Paschalian rules ([\[267\]](#), page 306). There is indeed an Easter dispute

known to history and associated with the name of Victor, as reflected in the term “The Paschalian Cycle of Victor” ([76], table 17). However, this dispute and Victor’s lifetime are ascribed to 463 A.D., whereas Eusebius who reports this is supposed to have lived in the III-IV century A.D. The Scaligerian chronology would appear to be inverted.

Furthermore, in [267] Eusebius tells us of a famed Dionysius who formulated the rules for celebrating Easter, having linked it to the Spring Equinox and the “suffering of the Saviour.” According to Eusebius, Dionysius is supposed to have died in the 12th year of Gallienus, which is 265 A.D. in the Scaligerian chronology. It is most remarkable that another well-known scientist by the name of Dionysius existed in the VI century A.D. – namely, Dionysius Exiguus (Dionysius the Little). He is supposed to have conducted an in-depth study of the Paschalian problem, and deduced the date of Christ’s birth for the first time. Apart from this, he calculated the advent of Easter for many years ahead, affixing it to the Spring Equinox ([76], table 18). We have two eminent scientists by the name of Dionysius who studied the Paschalian problem and the relation of Easter to the vernal equinox, both following Victor who already possesses a duplicate of his own. However, they are separated by a period of three centuries according to Scaligerian chronology. This is evidently a mistake; there was only one Dionysius whose double existed on paper exclusively. Actually, we are to acquaint ourselves with yet another Dionysius the Little, who must have been the prototype of both. We are referring to Dionysius Petavius who lived in the XVII century.

We see strange duplicates in the Scaligerian history of the famous *Res Romana* as well ([5]). F. Schupfert writes that:

“The series of prominent Roman lawyers ends with Erennius Modestine who died in 244 A.D. After that, the entire discipline of law enters a lethargic phase to be revived in nine hundred years by Erennius [who was the double of Erennius in activity as well as the name – A. F.]... It suddenly resurrected in the entirety of its primordial grace... in Bologna.” ([879], page 187)

The mediaeval Irnerius (“ancient” Erennius?), the founder of the school, started lecturing in Roman Law around 1088 A.D., “reviving” it after an alleged nine-century period of oblivion. He is also supposed to have “collected” the ancient codices of Justinian.

There are two famous Homers in Scaligerian history: the ancient poet and the mediaeval Angilbert Homer who is supposed to have belonged to Charlemagne’s court in the IX century A.D. “He must have received his academic name Homer for his poetical works,” suggests G. Weber. “Very few poetic works of Angilbert have reached

us” ([\[122\]](#), Volume 5, page 391). This *mediaeval Homer* had been “an important member of the circle of scientists that existed in the Aachen court of Charlemagne” ([\[122\]](#), Volume 5, page 391).

It has to be noted that Charlemagne is in no way a personal name as we tend to think today; most probably, it used to mean “The Great King.” The question of who exactly was referred to in that manner deserves a special study, and we shall return to it below. In fig. 1.44 we can see a portrait of Charlemagne painted by Albrecht Dürer in the XVI century.

Fig. 1.44. Charlemagne’s portrait (he allegedly reigned in 742-814). Albrecht Dürer, 1514. The portrait is kept in the German Museum, Nuremberg. Taken from [\[328\]](#), page 25, ill. 3.

Nowadays the “ancient Roman” count of time by ides and calends is assumed to have gone out of use in the VI-VII century A.D. Nevertheless, the mediaeval chronographers of XIV century A.D. appear to have been unaware of this fact, using the “long-forgotten” ides and calends wherever they saw fit ([\[229\]](#), p. 415).

There’s a large number of such odd doubles in the Scaligerian history. We are not claiming they prove our statements; one may indeed find a large number of isolated

coincidences. What we emphasize is the global nature of these duplicates and parallels, fitting the general scheme of chronological shifts which cover sequences of *hundreds of years* “side by side” and “following each other” for hundreds of years to come.

One of the principal indications of the mediaeval origins of many ancient documents is the very existence of a Renaissance Epoch when all of the ancient scientific disciplines, philosophy, arts, and culture in general are assumed to have been revived. The “resplendent Classical Latin” degrades into a rough and clumsy lingo that only manages to regain its former splendour in the Renaissance epoch. This “revival” of Latin and Classical Greek begins in the VIII-IX century A.D. the latest ([335], page 23).

The famed mediaeval troubadours begin to use the plots that the historians call “a masquerade of classical recollections” in the alleged X-XI century. The “history of Ulysses” (Odyssey) appears in the XI century as a “mediaeval remake” of the “well-known Classical story” complete with knights, belles dames, jousting tournaments, etc.; in fact, all the elements that shall later be considered integral to a “Classical” plot, ([335], pages 83-84).

“The troubadours were proudly claiming the story [of the Trojan War – A. F.] to have been an original one, *it had neither been told nor written by anyone before...* The troubadours’ primary concern was the Trojan War, it had almost been a native story for them” ([335], pages 85-86). The Francs considered themselves descendants of the Trojans, while the alleged VII century author Fredegarius Scholasticus refers to King Priam as a representative of the previous generation ([335], pages 85-86).

Furthermore, “The voyage of the Argonauts became confused with the Trojan War... when the crusader conquerors [apparently, the mediaeval prototypes of the “ancient” Argonauts – A. F.] had set forth in the direction of faraway Asian lands” ([335], pages 85-86). In mediaeval texts the ancient Alexander the Great “compliments the French” ([335], pages 85-86).

Certain Slavonic texts of the Middle Ages use the name Parizh (the Russian name for the city of Paris) in order to refer to Paris, the abductor of Helen when they speak of the “ancient” Trojan War. Could it have referred to somebody from Paris? The following is said, for instance: “Parizh called himself Alexander and deceived Helen” ([10], page 234, comment 76). The same mediaeval texts often demonstrate the flexion of P and F spelling Parizh as Farizh.

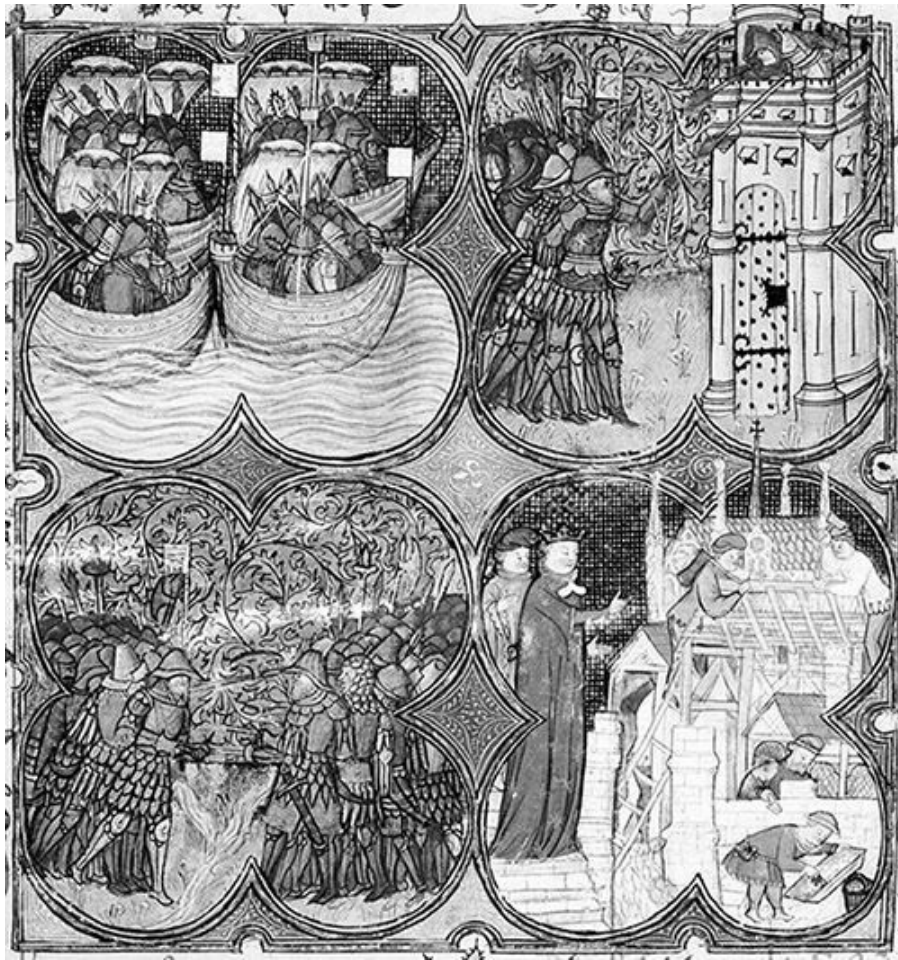

Fig. 1.45. An old miniature from the book titled *Les Grandes Chroniques de France*, Paris, allegedly dating from the early XV century. The siege of Troy is on top, and the foundation of Paris at the bottom. The miniature illustrates the Trojan origins of the French, with the “ancient” Greeks and Trojans portrayed as mediaeval knights wearing heavy plate armour identical to that of the knights founding Paris at the bottom of the miniature, also mediaeval. Taken from [\[1485\]](#), ill. 115.

On fig. 1.45 we see an ancient miniature from the *Great French Chronicle* dated to the alleged XV century that depicts the Trojan origins of the Franks. Modern commentary is as follows:

“The miniature illustrates the idea that the French can trace their ancestry back to Francion, the son of Hector and grandson of the Trojan king Priam. This is why we see the foundation of Paris directly under the picture of the fall of Troy.” ([\[1485\]](#), page 104)

So, Troy barely has the time to fall when Paris is founded! The “ancient” Troy is also represented as a mediaeval city here.

Scaligerian chronology reckons that the so-called apocalyptic nations of Gog and Magog mentioned in the Bible disappeared from the historical arena in the early Middle Ages. However, reading modern commentary to the mediaeval *Alexandria* ([\[10\]](#)) we find out that “The names Gotti and Magotti must be a repercussion of the apocalyptic

nations of Gog and Magog identified as the memories of *the Goths and the Mongols* (the Book of Revelation, XX, 7), who were well known in the Middle Ages” ([10], page 248, comment 165).

The pressure of Scaligerian chronology and all of these oddities brings historians to the conclusion that:

“The Middle Ages were the time when all idea of chronological consequentiality had been lost: monks with crosses and thuribles at the funeral of Alexander the Great, Catilina attending mass... Orpheus becomes a contemporary of Aeneas, Sardanapal a Greek king, and Julian the Apostate – a Papal chaplain. Everything acquires a *hue of fantasy* in this world [this perplexes the modern historian greatly – A. F.]. The most blatant anachronisms and *the strangest fancies* coexist peacefully.” ([879], pages 237-238)

All these facts, and thousands of others, are rejected by historians, since they contradict the consensual chronology of Scaliger and Petavius.

Christian saints and “ancient pagan characters” can be seen side by side on mediaeval Gothic cathedrals, q.v. in fig. 1.46 which shows the sculptures of Aristotle and Pythagoras together with the Christian saints from the western façade of the Chartres Cathedral. The historians try to explain this chronological heresy in a rather vague manner: “Aristotle and Pythagoras... the two pagan philosophers on a Christian cathedral symbolize the importance of scientific knowledge” ([930], page 169).

Fig. 1.46. The sculptures of the *ancient Pagans* Aristotle and Pythagoras from the Chartres Cathedral, near the *Christian saints*. The western façade, allegedly dating from 1145-1170. “Aristotle and Pythagoras actually represent music and dialectic”. Similar proximity of “ancient” and mediaeval characters is common in the bas-reliefs and murals of Christian temples in Europe and Russia. Taken from [930], page 169.

The oldest biography of “the ancient” Aristotle is dated to 1300 A.D. The manuscript’s condition “rapidly deteriorates; certain places which could be read perfectly well in the XIX century are a great effort to make out nowadays” ([300], page 29). All of this despite the fact that, according to Scaligerian chronology, certain manuscripts whose age exceeds a thousand years are still perfectly legible, and their parchment remains in a excellent condition, q.v. in [Chron6](#), Chapter 2. Historians are most probably right in their estimation of manuscript destruction rate – many old texts may be well-preserved precisely because they really are not quite as old as we think them to be.

Presumably, “the best Greek codices of Aristotle’s works belong to the X-XII century” ([300], page 206). The “ancient” argument between the philosophies of Plato and Aristotle is revived in the XV century when Pleton and Scholarius, a devotee of Aristotle, engage in a similar dispute. This is yet another odd mediaeval duplicate of ancient events.

The history of Europe’s first acquaintance with the works of Aristotle wasn’t studied until the XIX century ([300]). It is written that “Aristotle’s philosophy had remained in a state of stagnation and taciturnity... only... 1230 years since the birth of Christ... the Latin population learnt of the philosophy of Aristotle” (quoted in [330], page 230). We would also like to quote the opinion of contemporary historians on this issue, namely, that “the mediaeval authors had a penchant of referring to texts that they often were altogether unacquainted with” ([333], page 117).

In the Middle Ages “the somewhat barbaric shape... of the dispute between the realists and the nominalists... really represents the *renaissance* of the two immortal schools of idealism and empiricism... Nominalism and realism... signified a *rebirth* of the teachings of Plato and Aristotle in the XII century” ([335], pages 167-168). It is also assumed that the originals of Plato’s and Aristotle’s works were unknown in Europe in that epoch ([335]). Weren’t yet written, perhaps?

Yet another chronological duplicate: “antiquity” = Middle Ages. “Three of the four principal philosophical systems of the Classical age were represented in the mediaeval science” in XII-XIII century Paris ([335], page 175). “The collision of realism... and nominalism... gave birth to scepticism at last... Another system that was the latest to have appeared in Greece had also seemed imminent... namely, that of mysticism” ([335], page 175). Indeed, mysticism soon becomes “revived” by Bonaventura ([335]).

Thus, the evolution of mediaeval philosophy faithfully mirrors even the minute details of the development of its predecessor. Let us present this information as a table:

1. Realism	1. Idealism
2. Nominalism	2. Empiricism
3. Pleton – the initiator of the revival of Platonism	3. Plato – the founder of Platonism
4. Scholarius – the initiator of the revival of Aristotelism	4. Aristotle – the founder of Aristotelism
5. Confrontation between the two schools	5. Confrontation between the two schools
6. Confrontation between Pleton and Scholarius	6. Confrontation between the Platonists and the Aristotelists
7. The naissance of scepticism	7. The naissance of scepticism
8. Mysticism evolves after the three schools	8. Mysticism evolves after the three schools
9. A total of four principal mediaeval schools of thought	9. A total of four principal Classical schools of thought.

A long time before the “discovery” of the “ancient” manuscript of *The Golden Ass*, the entire “ass topic” had been well-developed by the mediaeval troubadours ([335]). The “Classical ass story” that surfaced as late as the Renaissance is a *logical conclusion* of the entire *mediaeval* cycle. One has to note that long before the discoveries of the “Classical” originals all of the main plots they contain had been developed by the troubadours, the “ancient” originals being in fact subsequent chronologically as well as structurally ([335], pages 142-143).

Long before the discovery of the “ancient” fables of Aesop, similar tales were told in the Middle Ages, in the alleged XI-XIII century ([335]).

An important fact to note is that the ancient people didn’t have fixed names in the modern sense; what they used instead were *aliases* which had explicit meanings in the original language. The aliases characterized a person in some manner; the more remarkable qualities a person had, the more aliases he or she would be likely to possess. B. L. Smirnov says that “one seldom finds a name that would mean nothing” ([519], Volume 6, page 526, comments 126, 31. Also see J. Frazer’s works [917], [918], [919], [920]). For instance, the chroniclers could refer to an emperor by the alias used in their own region, and so different chronicles referred to the same rulers by different names.

The Egyptian Pharaohs used to have different names before and after their coronation. As multiple coronations would take place in different regions, the list of names kept growing. These aliases usually translate as “The Mighty,” “The Fair,” etc.

The father of a Roman consul who lived in the alleged year 169 B.C. had 13 names; his son had 38 ([872], page 101). The Torah scholars quote 94 names for the Biblical god ([544], Volume 6, page 978).

The same phenomenon was typical in Russian history. “Czar Ivan III was also known as Timothy; Czar Basil III was known as Gabriel... Prince Dmitri (who had been killed in Uglich) was called Uar; one name was secular, and the other ecclesial” ([586], page 22). The name Uar most probably simply meant “Czar.”

Nowadays we tend to assume that mediaeval names differed significantly from the “ancient” ones. However, the analysis of a number of texts shows us that ancient names were in use throughout the Middle Ages. Nilus of Sinai, who is supposed to have died in 450 A.D., writes to his contemporaries addressing them with typically “ancient” names – Apollodorus, Amphiction, Atticus, Anaxagoras, Demosthenes, Asklepiodes, Aristocles, Aristarchus, Alciviades, Apollos, etc. ([836]). Many of the names considered “exclusively ancient” nowadays were still in use in Byzantium in the XII-XIV century. Georgius Phrantz uses the following names in his *History* (1258-1476): Antioch, Argo, Amorius, Hermetian, Demetrios, Dionysius, Dioscorus, Epidaurus, Calliope, Cleope, Kritopulos, Laconicus, Macrobius, Minos, etc. – typical ancient names worn by people of the XIII-XV century.

Handwritten books remained in existence for a long time after the invention of the printing press. They were made in large quantities in the XV-XVIII century all across Europe ([740], pages 13, 25). In the Balkans, “handwritten books managed to compete with the printed ones” as recently as in the XIX century ([740], page 26). Apart from a few exceptions, the entire Irish literature of the VII-XVII century “only exists in the handwritten form” (quoted by [740], page 28). Up until 1500 A.D., 77 percent of all printed books are supposed to have been in Latin, possibly due to the fact that Romanic fonts were easy to make. Other fonts made their way into the printing practice extremely slowly. Diacritic signs were difficult to make, as well as the ones used for stresses, vocalisations, etc. This is why “the scribes remained without competition in what concerned copying the Greek, Arabic and Hebraic manuscripts” for centuries after the invention of the printing press ([740], page 57).

This may be the reason why many Greek, Arabic and Hebraic manuscripts considered “very ancient” really pertain to the epoch of printing. Among them are many classical texts, Tischendorf’s Biblical codices, etc.; see [Chron6](#), Chapter 2.

It appears that the region richest in handwritten books dating from the epoch of printing was Greece – the country that is considered to have a very long ancient history,

one that gave the world a large number of “ancient manuscripts.” Historians tell us that “due to the lack of publishing houses in Greece, *books were copied manually*” ([740], page 106). One wonders how many handwritten books of the XV-XIX century were to be declared ancient later on.

The following information clearly demonstrates the lack of a solid scientific foundation under the very concept of palaeographical dating - that is, dating by the “handwriting style.” It turns out that “the creation of the deluxe Greek codices with the texts of ancient authors was ordered by humanists and philanthropist collectors” ([740], page 109). Let us repeat the question: how many of these mediaeval codices were later declared extremely ancient?

One might suggest a method that allows the differentiation between real manuscripts and handwritten copies of printed books, namely, comparing the misprints in the printed versions with the handwritten errors, since during the manual copying of printed literature most misprints would get copied as well.

The foundations of the Scaligerian chronology had been laid by the analysis of *written sources*. A secondary analysis of these datings free from a priori hypotheses about the antiquity of the documents, may lead to the discovery of serious contradictions, as we have demonstrated.

13.

The foundations of archaeological methods have been based on the Scaligerian chronology from the very beginning

“HOW COME THERE WAS NO BATTLE?” The results of excavations conducted by the Swiss anthropologist Georg Glovacki in Italy proved sensational. The scientist discovered that there was no military action conducted in the area where the troops of Hannibal had allegedly defeated the Roman legions in the battle of Cannes. A study of the barrows showed that the remains belong to the victims of the XIII century plague epidemic, and not to Roman soldiers, as everyone was accustomed to thinking.

Sovetskaya Rossiya, 28 November 1984.

13.1. The ambiguity of archaeological datings and their dependence on the existing chronology

The reader may inquire about the state of affairs concerning other methods of dating historical sources and artefacts used nowadays. Modern archaeologists speak of the “ignorant diggers” of the previous centuries in pained tones, since many artefacts have become defaced in the search for valuables. The archaeologist Count A. S. Ouvarov excavated 7729 mounds in the Vladimir-Suzdal area. A. S. Spitsyn has the following to say about it: “when the items [found in the excavations of 1851-1854 – A. F.] came to the disposal of the Rumyantsev museum, they were a chaotic pile of materials with no markings whatsoever, and no one could tell which mound this or the other object had belonged to. The grandiose excavations of 1851-1854... shall be mourned by the scientists for years to come” ([19], pages 12-13). Nowadays the excavation methods are a lot more advanced – however, applying them to “ancient” excavations is an impossibility since these have already been conducted by the “diggers” of the past ([389]).

The basics of archaeological dating methods are as follows: “the best way of deducing the age of a given European culture is finding out which Egyptian dynasty this European tribe traded with” ([390], page 55). The findings of Mycenae-made Greek vessels in the Egyptian mounds of the 18th-19th dynasties allow the archaeologists to consider the dynasty and the culture as contemporaries. Similar vessels are found later on in Mycenae together with a particular kind of pin that is later also found in Germany near some urns. A similar urn is found near Fanger, together with a different kind of pin, which resembles the one found in Sweden, in the so-called Barrow of King Bjorn,

which can thus be dated as a contemporary of the 18th-19th Egyptian dynasties ([390]). However, it turns out that King Bjorn's Barrow "could not have belonged to Bjorn, king of the Vikings [a well-known mediaeval character – A. F.] since it predates his time by about two millennia" ([390], pages 55-56).

Firstly, one fails to understand what criteria of similarity have been used here. Secondly, and a lot more importantly, all of these methods are heavily dependent on the a priori datings of the "ancient" Egyptian Pharaoh dynasties. This method, which is also known as "the dominoes method," and all similar ones are based on pure unadulterated subjectivism, and, principally, on Scaligerian chronology. Newly-found artefacts such as vessels are compared to similar findings dated in accordance with the consensual chronology. The alteration of the chronological scale automatically alters the chronology of the new archaeological findings. An erroneous chronology completely invalidates all such methods.

It is little wonder that the archaeologists investing their trust in such methods are constantly confronted with bizarre facts. It appears that "in certain remote parts of Europe one encounters the coexistence of things whose prototypes in the East are *separated from each other by centuries*" ([390], pages 55-56).

Furthermore, L. S. Klein ([390]) firmly denies all connexions between King Bjorn's Barrow and the mediaeval Bjorn, king of the Vikings. This method tells us only that Bjorn's Barrow is contemporary to the 18th-19th Egyptian dynasties; it tells us nothing about the possible datings of these actual reigns, which may well be mediaeval, along with Bjorn the Viking.

"The first schemes of Egyptian chronology were based on the work of Manethon... who had compiled the list of the Pharaohs [allegedly in the III century B.C. – A. F.] and grouped them into 30 dynasties, having added up all the years of reigns [and assuming that their reigns have all been consecutive – A. F.]. *The figures he got proved formidable*. Flinders Petrie, L. Borhardt, and other Egyptologists had estimated the duration of the history of Ancient Egypt to equal 5-6 thousand years. This is how the "long" chronology of Egypt was born, the one that had been prevalent for a long time. E. Meyer and his followers had developed the so-called "short" chronology as an alternative. The problem is that *the Pharaohs, and their entire dynasties, often reigned simultaneously* (as co-rulers) in different parts of the country. Manethon was making the assumption that the state had been a monolithic one under a single ruler, and so *he had lined all of the Pharaohs into a sequence and thus considerably extended the entire history of the state*" ([390], pages 54-55).

We should add that the “short” chronology of Egypt is still way too long, and should really have been called “a slightly shorter chronology.”

As we have already mentioned in reference to the data provided by the Egyptologist Heinrich Brugsch, the so-called “short” chronology is also based on ethereal foundations. We learn that its creator, E. Meyer, “has based his deductions on the annual records and entries referring to memorable events made by the Pharaohs themselves. However... this chain of knowledge has reached us as *separate links, with many gaps and distortions*” ([390], pages 54-58). This is why attaching the archaeological material to the “Egyptian scale” does not solve the problem of absolute (or indeed even relative) dating.

13.2. The excavations of Pompeii. The dating of this town’s destruction

The excavations of the “ancient” town of Pompeii are a perfect illustration to the problems that arise in the dating of archaeological materials. First and foremost, it isn’t clear *which year’s eruption* destroyed it. Apparently, the XV century author Jacopo Sannazaro wrote: “We were approaching the town (Pompeii), and could already see its towers, houses, theatres and temples, *untouched by the centuries* [?! – A. F.]” (quoted in [389], page 31). It is assumed, however, that the town of Pompeii has got destroyed and completely buried after the eruption of 79 A.D. This is why the archaeologists have to interpret Sannazaro in the following manner: “in the XV century some of the buildings of Pompeii were already emerging from the debris” ([389], page 31). It is thus assumed that Pompeii had been covered by a thick layer of earth, since the ruins of the town were only found in 1748, and the discovery was purely accidental. Herculaneum was discovered in 1711 ([389], pages 31-32). Nowadays the history of the discovery of Pompeii is related after the documented recollections of that epoch as follows: “during the construction of a canal on the river Sarno (1594-1600), the ruins of an ancient town were found. *Nobody had the merest notion* it might be Pompeii... Methodical scientific excavations were started as late as 1860 by Giuseppe Fiorelli. However, his method of work was far from the usual scientific standards” ([433], page 49).

The excavations were indeed conducted in a barbaric manner. “Nowadays it is hard to estimate the damage done by the sheer vandalism of that time... if somebody thought a picture or a figurine wasn’t artful enough or visually pleasing, it would become destroyed and thrown away as trash. Sculpture fragments had been sold as souvenirs, often as statuettes of saints” ([434], pages 224-225). Some of these “Christian

forgeries” may have been mediaeval originals that did not fit the Scaligerian chronology, and hence wound up sold as souvenirs instead of becoming part of a museum’s collection.

If one’s cogitation is to be confined within the paradigm of the Scaligerian chronology, the artistic level of the artefacts found in Pompeii is very high indeed – be it frescoes, inlays, or statues. The state of science is also deemed advanced enough to *correspond to that of the Renaissance epoch*. One of the findings was a sundial with uniform hourly divisions, which were considered a high level of precision even towards the end of the Middle Ages. This finding was analyzed by N. A. Morozov. An “ancient” picture of a part of such a device that had been found on a villa near the town of Pompeii can be seen in fig. 1.47.

Fig. 1.47. “Ancient” mural from the Boscoreale villa near Pompeii. “We can distinctively see a terrestrial globe shown in an approximate perspective. The object was also related to the sundial” ([1177], ill. 4, inset between pages 106-107). Taken from [1177], plate 4.

V. Klassovsky wrote that “a set of surgical instruments has been discovered that is all the more noteworthy since some of the items have been previously supposed to belong to the modern times, *discovered and introduced by the scientific avant-garde of the operative medicine*” ([389], page 126).

Some of the graffiti art found on the walls of Pompeii is *clearly mediaeval in its*

origin. For instance, the picture of a *hooded henchman* ([\[389\]](#), page 161, qv in fig. 1.48). We see a mediaeval henchman that drags his victim (a man in a cape) onto a scaffold with a rope. V. Klassovsky tells us this is a “copy from a drawing made on plaster with some sharp object.” Another drawing that is definitely worthy of our attention is that of a mediaeval warrior wearing a helmet *with a visor* ([\[389\]](#), page 161, see fig. 1.49). These two drawings are but a small part of the Pompeian graffiti that is explicitly mediaeval in its content (qv in the illustrations to [\[873\]](#)). One should mark the illustration that one sees on page 44 of [\[873\]](#) (fig. 1.50). Nowadays we are told that it portrays “ancient” gladiators ([\[873\]](#), page 44). However, what we see is clearly *a mediaeval knight with a visor on his helmet*. This is well-known military equipment of the Middle Ages.

Fig. 1.48. A picture found on a Pompeian wall. We see a hooded mediaeval henchman, dragging a caped figure by a rope onto a wooden scaffold. Taken from [\[389\]](#), page 161.

Fig. 1.49. A picture of a mediaeval knight wearing a helmet with a visor, found in “ancient” Pompeii. Taken from [\[389\]](#), page 161.

Fig. 1.50. Pictures of the Nero epoch painted on the wall of an “ancient” Pompeian residence. The “ancient” gladiators are depicted as mediaeval knights here; one can clearly see helmets with visors, which were invented in the Middle Ages. Taken from [389], page 44.

V. Klassovsky sums up his general impression of the excavations of Pompeii as follows: “I have been amazed many a time... to find that *ancient Pompeian artefacts often prove to be spitting images of the objects of a much later epoch*” ([389], page 133).

We also find out that, according to Klassovsky, many of the famous Pompeian inlays bear *an amazing resemblance* to the *mediaeval* frescoes of Rafael and Giulio Romano in composition, colouring and style ([389], page 171, comment A). To put it simply, they look like mediaeval frescoes. An example of such an inlay can be seen in fig 1.51, ([389], page 172, table XII). This is assumed to be the ancient battle of Alexander the Great and the Persian king Darius (on the right). The inlay was discovered in 1831 and is now in the domain of the National Museum in Naples ([304], Volume 1, pages 232-233).

Fig. 1.51. An “ancient” Pompeian inlay showing the battle of Alexander and Darius at Issa. Modern drawn copy.
Taken from [\[389\]](#).

V. Klassovsky’s comment runs as follows:

“On the floor of the triclinium one sees the famous mosaic from coloured stone, which now crowns the collection of the museum in Naples. The colouring and the technique are unparalleled, the composition may well be compared to the best works of Raphael and Giulio Romano... It is most remarkable indeed that there should be a semblance between the work of the anonymous ancient artist and Raphael’s ‘Battle between Constantine and Maxentius’ in style and the composition of the main group. Certain decorations of the Roman thermae of Titus bear amazing resemblance to some of Raphael’s frescoes as well [sic!].” ([\[389\]](#), page 171)

The Scaligerian history as followed by Klassovsky tries to convince us that all these works of “ancient” art were created in the I century A.D. the latest, and have remained buried until very recently, when the excavations of Pompeii finally began. Raphael, Giulio Romano and other artists of the Renaissance are supposed to have created paintings strongly resembling these “ancient originals” without even having seen them. All of this is highly suspicious. The hypothesis that we put forward is as follows: *Pompeii is a mediaeval town of the Renaissance epoch*. It has been destroyed by one of the relatively recent eruptions of the Vesuvius. The “ancient” Pompeian artists were contemporaries of Raphael and Giulio Romano, hence the stylistic semblances. Pompeii might have been destroyed and buried by ashes during the well-known eruption of the Vesuvius that occurred in 1500 ([\[389\]](#), page 28), or even by the eruption of 1631. See more in [Chron2](#), Chapter 2.

Most of the Pompeian graffiti cannot be used for dating purposes, such as quotidian announcements, slang, etc. However, some of the inscriptions explicitly contradict the Scaligerian chronology. One of them can be found in [\[389\]](#), and was translated by N. A. Morozov as follows: “The hunt and the decorations of *Valentis Nero* Augustus the Holy, son of the Holy D. Lucretius Valentis the Immanent, the 28th of March.” We run into a

contradiction between the Scaligerian history and actual inscriptions discovered as a result of excavations. An emperor with the double name of Valentis-Nero is mentioned here, whereas in Scaligerian chronology these names belong to two different emperors separated by about 300 years.

A longer version of the same “ancient” announcement referring to the pageants of 6-12th April can be seen in [\[873\]](#), No. 73 (see fig. 1.52). The translation offered by V. Fyodorova in [\[873\]](#), page 74, *separates* Nero from Valentis, as we had expected. We had no opportunity of checking the authority of both translations.

Fig. 1.52. “Ancient” gladiators wearing mediaeval helmets with visors. Pompeian artwork, close-up of a fragment. Taken from [\[389\]](#).

Artefacts of *the Christian epoch* have been found in the “ancient” town of Herculaneum. In fig. 1.53, for instance, one can see a Christian chapel discovered during the excavations of Herculaneum with a large cross on the wall.

Fig. 1.53. A rare picture of a Christian tabernacle unearthed in the “ancient” Herculaneum (Italy).

13.3. The allegedly accelerated destruction of the “ancient” monuments

The archaeologists of the XX century have noticed a rather odd tendency. The overwhelming majority of the ancient monuments report deterioration in their condition that allegedly started two or three hundred years ago (from the moment their study began, in other words), and has become more intense than during the preceding centuries and even millennia. The examples are widely known: the Theatre of Epidauros, Parthenon, the Coliseum, the palaces of Venice, etc. ([\[228\]](#), [\[144\]](#), [\[207\]](#), [\[456\]](#)). Here’s another example in the form of an article from the *Izvestiya newspaper*, 31 October 1981:

“**A sphinx in peril.** The famous figure of the El Giza sphinx in Egypt has stood steadfast for five millennia. However, pollution has afflicted it terribly. A large piece of the sculpture (a paw) has fallen off. The reasons for this are as follows: high humidity, salty ground, and, primarily, the accumulation of sewage around the sphinx that isn’t filtered in any way at all.”

It is nevertheless supposed to have stood for five thousand years without any problems whatsoever.

This condition of deterioration is usually explained by the “negative effect of modern industry” ([\[144\]](#), [\[456\]](#)). However, as far as we know, there has been no quantitative

research conducted to this day, as to whether or not modern industry afflicts ancient constructions made of stone. One logically assumes all of these buildings to be a lot more recent than what the Scaligerian chronology tells us. They are subject to erosion, and have a constant natural destruction rate, which is rather high.

13.4. When did the construction of the Cologne Cathedral really begin?

Nowadays we are being told that the construction of the famous Cologne Cathedral carried on for *several centuries*. It is assumed that the construction began in the IV century ([\[1015\]](#), page 3). After that, the cathedral has allegedly been rebuilt many times, and nothing remained from the “original cathedrals” whatsoever. The construction of the Gothic cathedral is supposed to have commenced in 1248 – some sources even mention the exact date as 15 August 1248 ([\[1015\]](#), page 6). It is further assumed that the construction was “finished for the most part” by the XVI century, circa 1560 ([\[1015\]](#), page 8). After that, this gigantic mediaeval cathedral has allegedly undergone minor renovations, but, by and large, its shape remained unaltered (see fig. 1.54).

Fig. 1.54. The Cologne Cathedral as it is today. Cologne, Germany. Taken from [\[1017\]](#), photograph 3.

How valid is this point of view? When was the cathedral that we can see today really

constructed? Is the construction that we see truly mediaeval, dating from the XIII-XVI century for the most part?

In fig. 1.55 we can see a schematic drawing from a technical brochure that demonstrates which parts of the cathedral are mediaeval, and which ones were built over the last two centuries. The full name of the brochure is *Gefahr für den Kölner Dom. Bild-Dokumentation zur Verwitterung. Auszug aus dem Kölner-Dom-Lese- und Bilderbuch. Professor Dr. Arnold Wolff. (The Dome of Cologne in danger. Graphic documents on weathering.)* It was originally addressed to professionals specializing in the preservation and restoration of stone constructions. It was printed in Cologne, and can be obtained inside the cathedral.

Fig. 1.55. The chronology of the Cologne Cathedral masonry. Taken from the technical brochure titled *The Danger to the Cologne Cathedral. An Illustrated Documentary of the Erosion. Excerpt from the Illustrated Textbook on the Cologne Cathedral (Gefahr für den Kölner Dom. Bild-Dokumentation zur Verwitterung. Auszug aus dem Kölner-Dom-Lese- und Bilderbuch)* by Professor Dr. Arnold Wolff. We obtained the brochure in the Cologne Cathedral. (1 – 1248-1560; 2 – 1829-1875; 3 – 1842-1863; 4 – 1845-1880; 5 – 1904-1939; 6 – 1845-1875; 7 – 1826-1972; 8 – 1952.)

According to the scheme, the oldest part of the masonry, that which belongs to the years 1248-1560, is represented by horizontal shading. The rest – shown by seven other kinds of shading, such as diagonal, dotted. etc. – was constructed a lot later, *after 1826!*

Amazingly enough, the oldest part of the masonry (horizontal shading) *amounts to a small part of the modern edifice*. Really, it only covers half of the cathedral's foundation, and even this small mediaeval fragment is not whole, since it consists of two parts that are pretty distant from each other (qv in fig. 1.55). The rest of the masonry – that is, *the major part of the entire modern edifice* – only appeared in the early XIX century. The absence of masonry dating to 1560-1825 is particularly suspicious. Does it mean that there were no works at all conducted in 250 years, or that they did not affect the structure of the cathedral in any way worthy of mentioning?

What German historians and architects are telling us in this manner is that *the cathedral that we see today was essentially built in the XIX century!* By what criteria does Scaligerian history call it a mediaeval cathedral, in that case? Someone might say that despite the fact that the cathedral was built in the XIX century, it should still faithfully represent the mediaeval original that has stood there ever since the XIII century.

We would like to ask about the groundwork for this hypothesis. Are there any *genuine* mediaeval graphical representations of the Cologne Cathedral before the XVII century? Apparently, there are *none*. The same brochure by Arnold Wolff contains an engraving dated 1834/1836 that depicts the cathedral pretty much the way it is nowadays. The album [\[1017\]](#) contains what appears to be the oldest picture of the cathedral on page 21 – dating from 1809. We consider all of this to mean that the construction of the cathedral *in its present form* has only commenced in the XIX century, which is proven by the masonry scheme as shown above. The cathedral was built between 1825 and 1835 for the most part, and the engraving dating from 1834/1836 reflected the final stages of the cathedral's construction. There were renovations done in the XIX-XX century, but no major changes.

There were some traces of an ancient building on the site of the modern cathedral, since some mysterious masonry dating from 1248-1560 is present on the scheme. However, this very scheme explicitly tells us that this mediaeval masonry was used as building material for the XIX century construction. Let us study fig. 1.55 yet again. The lower part of the left tower is made of stones dating from the XIX century laced with layers dating from the XIII-XVI century. The upper part of this tower is a construction of the XIX century, and the same is true for the other tower. The old mediaeval building that had stood on the place of the modern cathedral was deconstructed in the XIX century, its masonry used as construction material for the new edifice.

We would like to pose the following questions to the historians and the

archaeologists:

1. Are there any genuine mediaeval pictures of either the Cologne cathedral or its predecessor that had existed before the XVII century?
2. Does the modern Cologne cathedral bear any resemblance to the mediaeval cathedral that had stood on the same site before the XVIII-XIX century? Our hypothesis is that if there has really been a cathedral here, it was significantly different from the modern one – a great deal smaller, for one thing.
3. Why are there no traces of masonry dating to the period between 1560 and 1825 in the walls of the modern Cologne cathedral? Doesn't this mean that the construction really commenced in the XIX century on the spot that had been previously occupied by a building of smaller proportions dating from the XIII-XVI century? One should also question the reasons for dating the old masonry to the XIII-XVI century; these stones may well belong to the XVII-XVIII century. Another enquiry that we find worthy of making concerns the methods used by modern archaeologists for dating masonry fragments. How can they be certain that a given stone was used for the construction of a cathedral wall in the year that they consider to be the correct dating, and not some other?

We conclude with a general observation concerning the unnaturally prolonged construction of many historical buildings of mediaeval Europe. According to Scaligerian history, they were built *very slowly indeed*, for centuries on end. The Strasbourg cathedral is a perfect example. It used to be the tallest building in Europe. We are now being told that its construction began in 1015, and ended as late as 1275 ([415], Volume 1, page 333). That makes 260 years. The Erwin von Steinbach tower allegedly took 162 years to build. The historian Kohlrausch makes the logical conclusion that “the entire edifice [of the cathedral – A. F.] *took 424 years to build*” ([415], Volume 1, page 333) – almost half a millennium!

Kohlrausch also couldn't have missed the unnaturally procrastinated construction of the Cologne cathedral. Apparently realizing the necessity of explaining such unnaturally extended terms, he offers the following as a theory: “The Cologne cathedral, whose construction began... in 1248... and lasted for 250 years. Such tardiness can be explained by the fact that its stones bear a great amount of artwork” ([415], Volume 1, page 333). As we are beginning to understand, artwork has got absolutely nothing to do with the matter at hand – it is the erroneous Scaligerian chronology that has arbitrarily extended the construction period into several centuries.

13.5. Archaeological methods are most often based on Scaligerian datings

The modern methods of archaeological dating rely on the Scaligerian chronology to a great extent, and may often lead the researcher to great errors, which are blatantly obvious in some cases. Let us give a few examples.

The excavation of a barrow that was “dated with absolute certainty” to the epoch of Kiev Russia (the alleged IX-XII century), according to the “archaeological method,” occurred relatively recently. However, *nineteenth century coins* were found in the same barrow, among the bones. This is mentioned in the article by the Byelorussian historian Zaikovsky published in 1997 in the 12th issue of the *Almanach of History and Archaeology* on page 83. It is clear that the coins could not have made their way into the barrow by chance. Is there an explanation? As a matter of fact, there is, and a simple one at that. The “ancient” barrow belongs to the XIX century. And there is nothing surprising about it, since the pagan church also known as “Romish” had existed in Russia and Byelorussia until the XX century, complete with specific burial rites. The centre of the Romish church had been in the Byelorussian village of Romy. In the XIX century it had possessed an archbishop, more that a hundred parishes, and a special language used by priests in sacraments. There is a XIX-century volume containing a detailed description of this old Russian pagan church.

Another example. A different barrow is being excavated, and the archaeologists make another “perfectly certain dating” that ascribes it to the Bronze Age. The ground under the barrow had been virgin until the hole that preceded the barrow had been dug. Some *XVIII century* ceramics were found in this hole; it could only have got there during the burial. This is yet another case of archaeologists using “scientific methods” for the dating of a XVIII century mound to the Bronze Age, or the time when the rather inexperienced humanity could not have fathomed the intricacies of iron metallurgy. But the XVIII century was a period when both iron and steel were already known quite well. This barrow only got dated to the *Bronze Age* since it hadn’t contained any steel or iron items.

In the cases described, the barrows contained objects that contradicted their initial datings. If there are no such objects, the archaeologists date the barrows “scientifically” to times immemorial. The very method of “archaeological dating” appears extremely flawed and wholly dependent on the a priori known *Scaligerian chronology*.

13.6. One of the numerous problems of the Scaligerian history – the problem of bronze manufacture before the discovery of tin

Many chemists and metallurgists have been reporting the following peculiar circumstance for quite a while, namely, that no bronze could possibly be manufactured in the Scaligerian “ancient” Bronze Age. Professor Michele Giua, “a prominent and versatile specialist in organic synthesis, as well as the chemistry of explosives and plastics” ([245], from the cover annotation), the author of an in-depth work titled *The History of Chemistry*, writes the following (basing his logical construction on Scaligerian chronology, naturally):

“Copper... had been known from the prehistoric times not just in its free state... but also as bronze, an alloy of copper and tin. During the prehistoric epoch known as *Bronze Age*, bronze was used for the manufacture of various utensils, jewellery, weapons etc. However, the issue of ancient tin metallurgy remains extremely nebulous. Metallic tin had not been known in the Bronze Age; *nevertheless, it must have been used for the manufacture of bronze*. All we can do is *assume that a metal of a higher fusibility was manufactured* as a result of fusing copper with some minerals rich in tin content. Thus, copper was discovered earlier than tin, whose metallurgy is a lot more complex. However, the fact that *bronze was discovered earlier than tin* does not clarify numerous other problems of ancient history.” ([245], pages 17-18)

The picture is perfectly clear. As we can see, the fact that tin metallurgy is more complex than that of copper is common knowledge. Hence bronze, being a fusion of copper and tin, *must have* appeared after the discovery of the latter. Scaligerian history has it the other way round – bronze is supposed to have been discovered before tin, in the Bronze age. This contradiction inherent in Scaligerian chronology can be explained by the fact that the chronologers of that school were neither chemists nor metallurgists. How were they to know that the compilation of a history textbook requires that the description of the discovery of tin should precede that of the invention of bronze? However, the historians of the XVII-XVIII century were driven by altogether different considerations, neither caring much for tin, nor indeed for science itself. None of them would consider consulting with a chemist. As a result, “ancient” Greek heroes happily hack at each other with bronze swords that need tin for their manufacture, which had not yet been discovered in that epoch. Modern chemists are naturally confused by such historical tableaux, and are earnestly questioning the reasons for the existence of such oddities in Scaligerian history of chemistry and metallurgy.

Our explanation is a very simple. The Bronze Age falls within the epoch of the XIV-XVI century, when tin had already been discovered (after copper, of course). Consider

the allegedly ancient bronze idols from Luristan currently in the Louvre's possession, qv in fig. 1.56. Michele Giua cites them as examples of "ancient" bronze art. However, these artful Bronze Age figurines were most probably made in the XV-XVII century.

Fig. 1.56. "The Bronze Idols from Luristan," allegedly extremely ancient ([\[245\]](#), page 19). Kept in the Louvre in Paris. These artefacts most probably date from a much more recent period. Taken from [\[245\]](#), page 19.

The same applies to the "ancient" bronze girandole that has received the dating of V century B.C., also from the Louvre's collection, that we see in fig. 1.57. It may well be an item made in the XVI-XVIII century.

Fig. 1.57. A bronze figurine, presumably "very old," dated to the V century B.C. This scone most probably belongs to

a much more recent age, namely, the XVI-XVIII century. Taken from [\[1237\]](#).

14.

The problems and deficiencies of dendrochronology and several other dating methods

14.1. The consequent scale of dendrochronological datings does not extend further back in time than the X century A.D.

The *dendrochronological* method is one of the modern dating methods claiming to be capable of dating historical artefacts independently. It is based on the assumption that the yearly growth of tree rings is uneven. Annual ring thickness rates are supposed to be roughly similar for the trees of the same kind that grow in similar conditions.

In order to make this method fit for actual dating, one has to construct a reference scale of annual ring thickness for trees of a particular kind for a historical period of sufficient length. Let us call this graph a dendrochronological scale. If such a scale is constructed, it might aid one in the attempt at dating archaeological findings containing wooden pieces. One has to determine the timber type, saw off a sample, measure the thickness of rings, build a diagram and try to find out whether it concurs with any part of the reference scale. One should also consider the question of what deviations of compared diagrams can be ignored safely.

However, the European dendrochronological scales only reaches several centuries back in time, which does not allow for the dating of “ancient” constructions.

“Many European scientists have started to experiment with the dendrochronological method... however, obtaining results appeared a very complex task. *The oldest trees in the European forests are only 300-400 years old...* Deciduous trees have *vaguely defined* rings which are hard to study and most reluctant to tell the researcher anything about the past... Quality archaeological material proved extremely scarce, against all expectations.” ([616], page 103)

American dendrochronology is in better conditions, since it is based on Douglas fir, mountain pine and yellow pine ([616], page 103). However, this region is far away from the zone of “ancient history.” Furthermore, there is always a large number of ignored factors, such as the weather conditions for the period in question, soil quality, humidity level fluctuation for the area in question, its geography, and so on. All of them affect the growth rate of the rings significantly ([616], pages 100-101). It is most important that the creation of dendrochronological scales was based on *the existing*

Scaligerian chronology ([\[616\]](#), page 103). Thus, any alteration of the chronology of documents should *automatically* alter these scales, whose independence is thus greatly compromised.

It appears that the dendrochronological scales for Europe and Asia only reach several centuries back from our age. We shall give a more detailed account of the contemporary state of such scales for Italy, the Balkans, Greece, and Turkey.

Let us refer to a diagram of *dendrochronological dating scales* for those countries that reflects the state of affairs in this area as of spring 1994 (fig. 1.58). This diagram was kindly provided by Professor Y. M. Kabanov (Moscow). He took part in a conference in 1994 where the American Professor Peter Ian Kuniholm made a report on the modern state of dendrochronology, presenting this rather noteworthy diagram that had been compiled in the Malcolm and Carolyn Wiener Laboratory for Aegean and Near Eastern Dendrochronology, Cornell University, Ithaca, New York, USA.

Fig. 1.58. The modern condition of the dendrochronological scales. One can observe that they are considered to extend until as late as the X century A.D. uninterrupted. The “scale” pertinent to earlier epochs is merely an assortment of unrelated fragments.

In fig. 1.58 we can see fragments of dendrochronological scales for different kinds of timber: oak, box, cedar, pine, juniper, and conifers in general.

All of these scales have a very obvious gap around 1000 A.D. Thus, none of them can be continued without intervals further back in time than the X century A.D.

All of the earlier fragments of dendrochronological scales as shown on the diagram cannot be used for independent datings, since their attachment to the time axis is wholly

dependent on the Scaligerian chronology, which had served as a basis for the dating of several individual “ancient” pieces of wood.

A piece of wood found in a Pharaoh’s tomb thus gets the dating of some distant millennium before Christ due to “historical considerations” based on the Scaligerian chronology. After that, other “ancient” pieces of wood are linked to the one that has already been dated. These attempts occasionally succeed, which results in the construction of a fragment of the dendrochronological scale around the first piece of wood. Relative datings of ancient findings within this fragment may be correct. However, their absolute dating, that is, the placement of this fragment on the time axis, is *wrong*. The reason is that the first dating was based on the erroneous Scaligerian chronology.

Let us return to the basics of the dendrochronological methods. In theory, the dendrochronological scale is supposed to grow, beginning with the current period and extending into the past. This implies

the collation of ring thickness scales of different specimens. What is the principle of this collation?

A modern source [\[1055\]](#) gives an in-depth analysis of the problem on page 341. It turns out that the method used is a combination of mathematical statistical methods and “visual” subjective assessments. Hence, the boundary between dated and undated dendrochronological scales becomes very vague.

The book [\[1055\]](#) tells us rather frankly that:

“If we can find a collation position whose diagrams concur with those of the traditional chronology to the best of our certainty and knowledge, the new specimen is considered dated. If we fail to discover such a collation position, the specimen remains undated, although even in this case a dendrochronologist can point out one or more collation methods whose concurrence is ‘good,’ but not ‘perfect’ (in his opinion). Needless to say, *the Dendrochronological Society has to agree on what is to be considered perfect concurrence.*” ([\[1055\]](#), page 341)

Dendrochronology is thus affected by subjectivity and arbitrariness. Different dendrochronological datings have different veracity. The veracity of a dendrochronological dating depends on the certainty of the collations on the dendrochronological scale. Dubious collations cast the shade of ambiguity over the entire scale. The book [\[1055\]](#), page 341, uses a special term for referring to such datings, namely, “the grey zone” (with white zone referring to certain datings, and the black one, to the total absence of datings of any kind).

The recently published book by Christian Blöss and Hans-Ulrich Niemitz subjects the dendrochronological method to some very sharp criticisms that leave no stone unturned

([\[1038\]](#)).

14.2. Sedimentary layer datings. The methods of radium-uranium and radium-actinium analysis

The Scaligerian chronology implicitly or explicitly affects the scale graduations of methods, even the rough physical ones supposed to give the absolute age of objects.

A. Oleinikov tells us that:

“Over the eighteen centuries that have passed since the time of the Roman invasion [in reference to the territory of the modern Savoy – A. F.], the weathering processes have created a 3 mm erosion layer on the walls near the quarry’s entrance. Comparing the thickness of this 1800-year-old layer [according to the Scaligerian chronology – A. F.] to the 35-cm erosion crust that covers the glacier-polished hills leads one to believe that the Ice Age left these latitudes about 216 thousand years ago... The proponents of this method have been well aware of the difficulty of obtaining a referential scale for something like erosion speed... it differs for various climates: the same type of rock erodes at varying speeds in the tropics and beyond the Arctic Circle. Erosion speed also depends on the temperature, humidity, rainfall and sunshine. This means that every biospheric zone requires the compilation of special scales and diagrams; besides, one cannot be certain that the weather conditions have remained unaltered since the exposure of the layer that we’re interested in.” ([\[616\]](#), pages 34-35)

There were many attempts of deducing absolute age by the speed of sedimentary layer formations. They didn’t lead anywhere, which is perfectly understandable.

Oleinikov tells further that:

“The research in this direction has been conducted by the scientists of many countries; however, the results failed to meet the expectations. It became apparent that *similar types of rock erode at different rates even under similar conditions, and establishing a regular pattern of these processes is hardly possible at all*. For instance, ancient documents [a reference to the Scaligerian chronology yet again! – A. F.] tell us that the Egyptian Pharaoh Ramses II reigned about 3000 years ago. The buildings that were constructed in his lifetime are now covered by a three metre layer of sand. This means that about a metre of sand accumulated every millennium. At the same time, certain areas of Europe have a *millenarian* rate of three centimetres of sediment, whereas for the firths in the South of the Ukraine this is an *annual* rate.” ([\[616\]](#), page 39)

The development of other methods was attempted as well. “The radium-uranium and radium-actinium methods are valid for the time interval of 300 thousand years. They are convenient for the datings of geological formations when the required precision does not exceed 4-10 thousand years” ([\[616\]](#), page 70). However, this isn’t precise enough for the ends of historical chronology, and cannot contribute to it in any substantial manner at all.

15.

Are radiocarbon datings to be trusted?

15.1. The radiocarbon datings of ancient, mediaeval, and modern specimens are scattered chaotically

15.1.1. Libby's initial idea. The first failures

The most popular method claiming the capability of dating ancient artefacts independently is the radiocarbon method. However, the accumulation of radiocarbon datings has exposed the difficulty of the method's application.

According to Oleinikov, "Another problem had to be considered. The intensity of the atmospheric radiation is affected by many cosmic factors. The radioactive carbon isotope production rate should also vary, and one needs to find a method that would take these variations into account. Apart from that, over the period when highways and industrial plants have been introduced by the civilization, a gigantic amount of carbon from the combustion of wood, coal, oil, turf, oil-shales and their products emanated into the atmosphere. How does this atmospheric carbon affect the production of its radioactive isotope? In order to get veracious datings, one has to introduce complex corrections into calculations that reflect the changes in the content of the atmosphere over the last millennium. *This issue, as well as a number of technical difficulties, casts a shadow of doubt over the precision of many radiocarbon datings.*" ([616], page 103)

W. F. Libby, the author of the method, wasn't a historian, and did not question the veracity of the Scaligerian datings, which had been used for the justification of his method according to his book. However, the archaeologist Vladimir Miloicic has proved this method to give random errors of 1000-2000 years, while its "independent" dating of the ancient specimens faithfully follows the datings offered by the consensual chronology. Naturally, there can be no talk of "proof" here ([391], pages 94-95).

Let us quote some rather meaningful details. As we have already noted, W. F. Libby had a priori been certain of the veracity of Scaligerian datings. He wrote that they "... had no contradictions with the historians in what concerned ancient Rome and Egypt. *We did not conduct anything in the way of extensive research related to this epoch* [sic! – A. F.], since its chronology in general is known to the archaeologists a lot better

than whatever our methods could estimate, so the archaeologists were doing us a favour providing specimens [which are actually destroyed, being burned in the radiocarbon measurement process – A. F.]”([478], page 24).

This confession of Libby’s tells us a lot, since the deficiencies of Scaligerian chronology directly concern the regions and epochs that he and his team “*did not research extensively enough.*”

We can see that the Scaligerite archaeologists were most reluctant about letting the radiocarbon method enter the “certainty epochs” of Scaligerian history for fear of embarrassing discoveries. Archaeologists have naturally got no objections against applying this method to the undocumented prehistory since nothing capable of compromising consensual chronology can possibly be found there.

In what concerns the several reference measurements that were conducted on ancient artefacts, the situation is as follows. The radiocarbon dating of the Egyptian collection of J. H. Breasted “suddenly discovered the third object that we analyzed to have been contemporary,” according to Libby. “It was one of the findings... considered... to belong to the V dynasty [2563-2423 B.C., or roughly four millennia before our time. – A. F.]. *It has proved a heavy blow indeed*” ([478], page 24).

Why could it have been such a blow? The physicists appear to have restored the veracious dating of the Egyptian specimen, proving the old one to have been wrong. What’s the problem with that?

The problem is of course the simple fact that any such dating would prove a menace to the Scaligerian chronology. Carrying on in that vein would lead Libby to compromising the entire history of ancient Egypt.

The specimen that Libby had been careless enough to have claimed as modern had to be *called a forgery* and disposed of ([478], page 24), which is only natural since the archaeologists could not have possibly let the heretical thought of the XVI-XVII century A.D. (considering the method’s precision) origin of the “ancient” Egyptian finding enter their minds.

“The evidence that they [the proponents of the method – A. F.] use for proving the veracity of their method is rather insubstantial, with all the indications being indirect, the calculations imprecise, and the interpretation ambiguous, the main argument being the radiocarbon datings of the specimens whose age is known for certain used for reference... Every time referential measurements are mentioned, everybody quotes the results of the first referential datings that were obtained *for a very limited number of specimens* [sic! – A. F.]” ([391], page 104).

Libby recognizes the absence of substantial referential statistics. Together with the *millenarian* dating deviations mentioned above (explained as a consequence of a series of forgeries), we may thus question the very validity of the method as used for dating specimens belonging to the period that we're interested in, covering the two millennia preceding our century. This discussion does not concern the applicability of the method for geological purposes, however, where millenarian deviations are considered insubstantial.

W. F. Libby writes that "there was no deficiency in materials belonging to the epoch preceding ours by 3700 years for checking the precision and the dependability of the method" ([478], pages 24-25). However, there is *nothing* here to compare radiocarbon datings to, since there are no dated written documents dating from those epochs. Libby also informs us that his historian acquaintances "are *perfectly certain* of the veracity of the datings referring to the last 3750 years, however, their certainty does not spread as far as the events that precede this era" ([478], pages 24-25).

In other words, the radiocarbon method has been used most extensively for the period of time that doesn't allow the verification of the results by any other independent method, which makes life a lot easier for the historians. The example that we quote below is most typical.

"The radiocarbon datings of the three inscription-bearing plaques found in Romania have put archaeologists in a quandary... The ashes that they were found in prove them to be 6000 years old at the very least. Could the discovery of literacy have happened in a rural community in Europe and not in the urban and highly-developed Sumerian civilization? [Such an awful lot of space for the flight of exalted fantasy – A. F.] The scientists consider this probability to be very low... There have been many theories put forward for the explanation of this discovery that apparently refuted the reigning opinion on the origins of written language. Some of the archaeologists, without doubting the scientific principles of the radiocarbon method have suggested *the method to be error-prone due to the effects of factors that haven't been studied as of yet*" ([478], page 29).

Could it be that the errors of the method are rather insubstantial and allow for an approximate dating of the specimens belonging to the last two or three millennia? The state of affairs appears to be a graver one. The errors of radiocarbon dating are too great and too chaotic. They can amount to several millennia in what concerns contemporary and mediaeval objects (q.v. below).

In 1984 the *Technology and Science* magazine had published the results of the radiocarbon method-related discussions from the two symposiums in Edinburgh and Stockholm (No 3, page 9):

"Hundreds [sic!] of analysis examples were quoted with dating errors ranging from 600 to 1800 years. In Stockholm the scientists lamented the fact that the radiocarbon method appears to produce the greatest distortions

when applied to the history of ancient Egypt in the epoch preceding ours by 4000 years. There are other examples, some of them pertaining to the history of Balkan civilizations... Specialists have reached solidarity in their opinion that the radiocarbon method remains ambiguous due to the impossibility of proper calibration, which renders it unacceptable since it gives no calendar datings.”

15.1.2. A criticism of the application of the radiocarbon method to historical specimens

According to L. S. Klein, the radiocarbon datings “...have confused the archaeologists greatly. Some of them were characteristically overzealous... to follow the advice of the physicists... These archaeologists hastened to reconstruct the chronological schemes [which implies they aren’t constructed firmly enough – A. F.]... The first archaeologist to have opposed the radiocarbon method was Vladimir Miloicic, who... attacked the practical usage of radiocarbon datings, and... criticised the very theoretical foundation of the physical method sharply and bitterly... The comparison of individual measurements of modern specimens with their average value allowed Miloicic to support his scepticism with a series of brilliant paradoxes.

The shell of a *living* American mollusc has the radioactivity index of 13.8 as compared to the average value of 15.3, which makes it 1200 years old. A *live* North African wild rose flower with the radioactivity of 14.7 has been dead for 360 years, according to the physicists... as for the Australian eucalyptus with a radioactivity of 16.31, it isn’t likely to exist anywhere in the next 600 years. A shell from Florida with a value of 17.4 shall only appear in 1080 years...

Since in the past radioactivity wasn’t distributed any more evenly than it is now, similar fluctuations and errors may afflict ancient objects as well. A prime example is the result of the radiocarbon dating of a mediaeval altar fragment from Heidelberg... which demonstrates that the wood used for the repair of the altar hadn’t existed at that time... In the Iranian Welt cavern the lowest layers were dated to 6054 B.C. (give or take 415 years) and 6595 (give or take 500 years) before Christ, whilst the layer on top was dated to 8610 B.C., give or take 610 years. The upper layer is thus 2556 years older than the lower, which is clearly an impossibility. There is a vast number of similar examples...” ([391], pages 94-95)

Thus, the radiocarbon dating method can only be used for the approximate datings of objects whose age amounts to dozens of millennia, when the error rate is *comparable with the actual specimen age* reaching one-two or more thousand years.

Live molluscs have been dated with the radiocarbon method, and proved to be 2300 years old as a result, which is perfectly preposterous (qv in *Science* magazine, No. 130,

dated 11 December 1959). The radiocarbon dating deviation amounts to twenty-three hundred years here.

A few more examples of relatively recent radiocarbon datings made around 1970-1971:

1. No. 225 of *Nature* magazine dated 7 March, 1970 reports the results of analyzing the C-14 content of organic material contained in the mortar of an English castle which is known to have been built 738 years ago. The radiocarbon dating gave the age of 7370 years as a result, being *6500 years off the mark*. The radiocarbon dating deviation amounts to six millennia and a half. One wonders whether there was any point in quoting decades with such precision.
2. The radiocarbon analysis of seals that have just been shot defined their age as 1300 years, i.e. dating mistake of 1300 years. Seals mummified 30 years ago have been dated as 4600 years old, with a dating error of 4570 years. Quote from the *Antarctic Journal of the United States*, No. 6, 1971.

The above examples demonstrate that radiocarbon dating can make the specimens thousands of years older than they really are. As we have seen, there are examples of the opposite, when the specimen is dated as belonging to the distant future.

One shouldn't wonder about radiocarbon analysis making mediaeval objects fabulously old.

Let us return to L. S. Klein's review. He writes that: "Miloicic suggests to cease the tendentious "critical" editing of the radiocarbon datings, which is constantly done by the physicists, and calls upon their patrons the archaeologists to do away with the "critical" censorship that axes the publication of the complete result. He appeals to both physicists and archaeologists to publish all of the results of their research without filtering out the dates that strike them as improbable. He also tries to convince the archaeologists to stop the practice of familiarizing the physicists with the age of the finding, and not giving them any figures until they publish theirs! Otherwise, after such editing, which reflects the private viewpoints of the researchers themselves, the dating is bound to be subjective, so the study of the concurrence between historical and radiocarbon datings becomes impossible.

Thus, in Groningen, where the archaeologist Becker has been a supporter of the short [European – A. F.] chronology, radiocarbon datings are usually recent, whereas in Schleswig and Heidelberg, where Schwabedissen and others have been proponents of the longer version of chronology, these datings are usually a lot more ancient." ([391],

pages 94-95)

We think that no commentary to the above is required.

We may be told that the radiocarbon method may have attained a higher level of precision over the last couple of years. This may be true concerning the theory and the actual measurements. The question is, however, whether these improved methods are used in modern archaeological practice, and if so, what results are obtained in this manner. *Do the new radiocarbon datings concur with Scaligerian chronology?* Let us quote a relatively fresh example.

15.2. The dating of the Shroud of Turin

The reports of the radiocarbon dating of one of the most famous Christian holy objects – the Shroud of Turin, qv in figs. 1.59, 1.60, 1.61 – caused a great resonance in 1988. According to the traditional version, this piece of cloth bears the image of the body of crucified Christ and dates from the I century A.D., which is supposed to make it about two thousand years old. However, radiocarbon datings have given a different dating: roughly XI-XIII century A.D. The radiocarbon analysis has been conducted in three laboratories – in Oxford University, Arizona University, and the Swiss Technological Institute in Zurich ([\[769\]](#), page 80).

Fig. 1.59. Photograph of the celebrated Shroud of Turin ([\[387\]](#), pages 16-17).

Fig. 1.60. A fragment of the Shroud. Taken from [\[46\]](#). Also see [\[1055\]](#), page 138, ill. 7.1, as well as [\[358\]](#), pages 16-17.

Fig. 1.61. Negative and positive images of the Shroud of Turin ([358], pages 16-17).

A scientific work specifically dedicated to the radiocarbon dating of the Shroud of Turin claims the linen fabric that the shroud is made of to be produced between 1050 and 1350 A.D. ([1055], page 141). The authors cite the results of the Shroud's radiocarbon analysis performed in the laboratory of the Oxford University ([1055], page 140). The laboratories of Arizona and Zurich have given more recent datings, 1304 and 1274 (with the error rates of 31 and 27 years) respectively ([769], page 82).

These results have proved shocking for many. "In September 1988... a report appeared telling of the analysis and the fact that it *gave a certain dating of the shroud's fabric which turned out a thousand years more recent than the alleged date of Christ's death... even if the Shroud is dated as a XI century artefact...*" ([46], page 25). The author ceases the discussion of the dating after this, and begins to ponder the veracity of Christ's image as seen on the Shroud.

One arrives to the following conclusions:

1. Either the Shroud of Turin is a forgery;
2. the radiocarbon datings can contain errors of several centuries or even millennia;

3. or the Shroud of Turin is original, but dated to the XI-XIII century A.D. If this be the case, it is natural to ask about the century that Christ's lifetime pertains to. Could it really have been the XII?

We discuss the radiocarbon dating of the Shroud in our book entitled "King of the Slavs". The second half of the XII century turns out to be the most likely dating.

As we demonstrate in our book entitled "King of the Slavs", the radiocarbon dating of the Shroud (the middle of the XII century) concurs with other independent datings of Christ's lifetime. In particular, he must have been born in 1152 and crucified in Czar-Grad in 1185. We must note right away that our attitude towards the results of radiocarbon datings is highly critical (we shall discuss the reasons at length below). However, the situation with the dating of the Shroud is somewhat different. The specimens of its fabric were dated by a number of different laboratories, which makes the results of this research somewhat more plausible.

The radiocarbon dating of the Shroud of Turin to the XI-XIII century A.D. made the historians rather worried, and provoked a series of attempts to refute the result. A. Agureyev, the ITAR-TASS correspondent, had made a report from New York in 1998 that can be found printed in the

Gudok newspaper dated 4 April 1998. This report stated that the radiocarbon dating of the shroud "contradicts the Biblical tradition. However, according to the scientists of the University of Texas, their Italian colleagues *should not have used the radiocarbon analysis system*". The Shroud could allegedly "have fallen prey to a fungus" in the XI-XIII century; this may have affected the radiocarbon dating. "However, the scientists have no opportunity of conducting further research, since the Catholic church refused to provide any more specimens, and even insisted on the return of all of the ones that were at scientists' disposal" (same source).

Since the results of the radiocarbon dating of the Shroud gave results that contradicted the Scaligerian dating of the life of Jesus Christ, the radiocarbon method had to be exposed to public attention. The protection of the Scaligerian dating of Christ's life had been provided by the publication of new facts important enough to considerably aggravate the dubiety of the radiocarbon method in what concerns its applicability to historical chronology, already great enough. Let us quote some of the critical materials belonging to the proponents of the Scaligerian chronology ([\[358\]](#)). The publication belongs to Rev. Gleb Kaleda, a prominent geologist, Professor, and Doctor of Sciences. Also see [\[717\]](#) for critical material.

"There are several other factors, either local or planetary, that affect the

concentration of C-14 in the atmosphere, hydrosphere, and organic matter, thus complicating and limiting the use of the radiocarbon method in chronology.

a) Natural or artificial radiation. Neutrons released in nuclear and thermonuclear reactions, as well as cosmic rays, turn N-14 into C-14. The atmosphere content of C-14 had *doubled* in the period between 1956 and August 1963. A *drastic increase* in C-14 content began after the thermonuclear explosions in 1962.

...

d) The local effect of volcanic gases on C-14 content had been described by L. D. Sulerzhitsky and V. V. Cherdantsev ([\[717\]](#)).

In a number of cases radiochronological age calculations give *results that are clearly absurd* and contradict the entirety of accumulated geological and palaeontological data. In such cases “absolute chronological figures” are to be ignored as blatantly erroneous. *The discrepancies between geochronological definitions using different isotope methods may reach a factor of 10x.*

In 1989 the British Science and Technology Council analysed the precision of the radiocarbon method (see the 8th issue of the *New Scientist* magazine for 1989). 38 laboratories from all across the world were involved in the research. All of them received specimens of wood, turf, and carbonate salts whose age had only been known to the organizers of the experiment, and not to actual analysts. Only seven laboratories (of thirty-eight! – A. F.) reported satisfactory results; *others proved wrong by factors of 2x, 3x and higher.* The comparison of the data received by different researchers that used various analysis methods has shown that the causes of the dating errors were not limited to the imprecision of a specimen’s radioactivity estimation as it had been assumed; apparently, the technology of preparing specimens for analysis had also served as an entropy agent. The diagnostic errata are caused by the calefaction of specimens as well as some methods of preliminary chemical processing. *Everything points at the necessity of using the radiocarbon dating method with the utmost caution*” ([\[358\]](#), pages 14-16).

In 1997 the German authors Christian Blöss and Hans-Ulrich Niemitz have published a book titled suggestively enough *C-14 Crash* ([\[1038\]](#)). They have collected a great body of *modern* material demonstrating rather convincingly the fact that *the radiocarbon method in its current form cannot serve as a valid basis for absolute datings of historical artefacts.*

More on the subject can be seen in the bulletin [\[1491\]](#) that contains the following critical publications of 1991-1995 that interest us:

1. Christian Blöss and Hans-Ulrich Niemitz (1996), *Der Selbstbetrug von C14-Methode und Dendrochronologie*;
2. Hans-Ulrich Niemitz (1995), *Die “magic dates” und “secret procedures” der Dendrochronologie*;
3. Herbert Illig (1991), *Dendrochronologische Zirkelschüsse*.

As we can see, radiocarbon dating might prove more or less effective in analyzing objects whose age is measured by tens and hundreds of millennia. The errors of tens and thousands of years naturally inherent in the methods are of minor importance here, although this is far from obvious. However, the mechanical use of the method for the dating of objects no older than two thousand years, which is the historical epoch that interests us most in what concerns the reconstruction of the true history of documented civilization, appears perfectly impossible without being preceded by extensive and detailed statistical research and calibrations employing specimens of known ages. As far as we know, no such research has ever taken place, so there are no referential statistics. There is also no knowledge of whether improving the method's precision is a possibility at all. Also see [\[718\]](#).

Other physical dating methods do exist; unfortunately, the spectrum of their applicability is considerably more limited than that of the radiocarbon method, and their precision is also insufficient for the historical epochs relevant to our ends. For instance, in the early XX century some scientists proposed to define the ages of buildings by the shrinkage of their foundations or the deformation of columns; however, no steps have been made in this direction due to the impossibility of calibrating this method and estimating the real shrinkage and deformation speed.

Two more methods have been suggested for dating ceramics: the archaeomagnetic method and the thermoluminescent method. However, they have calibration issues of their own. The archaeological datings offered by these methods for the Eastern Europe, for instance, are limited to the Middle Ages.

Let us return to the Shroud of Turin for a second in order to put forth the following hypothesis concerning the nature of the alleged human figure that one sees on the Shroud's fabric. One shouldn't exclude the possibility that an embalmed body had really been wrapped in this linen at some point. Let us recollect that the “ancient” Egyptians had the practice of wrapping a body up in several tight layers of cloth saturated with various elixirs. This may have resulted in a “carbon copy” of a body on the fabric of the cloth which was later removed for some reason, and stored with great care. See our book entitled “King of the Slavs” for more details.

15.3 Modern radiocarbon analysis of Egyptian artefacts demonstrates serious contradictions

We shall once again consider the alleged reliability of the radiocarbon method used for supporting the traditional version of the “ancient” history, particularly Egyptian, as reflected in a fundamental and detailed article published by the Manchester Museum in England in 1979 as part of the project named “The Mummies of the Manchester Museum” ([1196]). This most remarkable material was recommended to us by Professor A. Kravtsevich from the Alberta University Department of Mathematics, Edmonton, Canada.

The topic of the article is a dating that had amazed and confused the authors of the article ([1196]). The radiocarbon dating of the mummy #1770 from the Manchester Museum collection attributed the mummy’s bones to 1000 B.C., whereas the cloth that the mummy has been wrapped in received the dating of 380 A.D. The discrepancy between the datings of the mummy and the cloth equals some 1400 years, although the dates should be equal. The cloth may be somewhat older than the mummy if an old cloth had been used by the embalmers, but it couldn’t possibly have belonged to a later age.

According to the authors of the article, this gap of nearly a millennium and a half cannot be explained by the possible errors of the radiocarbon dating, the way it is usually done today. That is why they had to come up with the rather amusing “explanation” that the old mummy was exhumed after fifteen hundred years, and re-wrapped in a *new* cloth, and then restored to its rightful place as though it had remained unperturbed all the while.

We think this to be perfectly preposterous. Our take is that we encounter yet another imprecision of the actual method of radiocarbon dating which is apparently affected by effects of an undefined nature leading to great discrepancies in datings of 1,500 years, for instance (see the examples of the greatly misdated modern specimens cited above, with the fluctuation amplitude reaching up to two millennia).

The authors of the article also confess to the fact that at the very dawn of the radiocarbon method “*ancient*” *Egyptian specimens* were used for its calibration, *with their dates taken from history textbooks* ([1196], page 137). Here’s a verbatim quote: “the use of the method commenced in 1948 in Chicago University and was initiated by Professor W. F. Libby... the Egyptian chronology played a great role in the naissance of the method, since Egyptian specimens, such as wood or charcoal, among others, have been used as standards for the known historical dates” ([1196], page 137). Thus, the

radiocarbon scale used nowadays had initially been made largely dependent on the Scaligerian chronology of the “ancient” Egypt, and therefore needs to be revised.

16.

Critical analysis of the hypotheses on which the radiocarbon method is based

(This section contains quotations from works by A. S. Mischenko, Doctor of Physical and Mathematical Sciences from the Moscow State University Department of Mathematics and Mechanics, a prominent scientist of the V. A. Steklov Mathematics Institute of the Russian Academy of Sciences, nominated State Premium of the Russian Federation Laureate in 1996, a specialist in topology and geometry, functional analysis, differential equations and their applications.)

16.1. W. F. Libby's initial idea

A better representation of the modern problems most frequently encountered in the archaeological application of the radiocarbon method requires that we return into the 50's and the 60's for a close study of the foundations that the edifice of historical and archaeological applications is based upon. The matter is that the first steps of the method's creation and development led to a large number of natural complications, many of which *afflict it to this day, and lead to further error aggravation*. Also see the book [\[1038\]](#), and the article [\[1491\]](#) recently published in Germany. These complications need to be addressed again in order to attract the attention of *the physicists* to the necessity of a fresh analysis of the foundations of this method's archaeological applications, especially considering what we learn about Scaligerian chronology.

The actual concept of radiocarbon dating belongs to W. F. Libby ([\[1250\]](#)). “Shortly after the end of WW II, the American Willard Frank Libby published the results of the discovery that made him world famous, the laureate of the Guggenheim Award and the Nobel Prize. Studying the interaction between artificially produced neutrons and nitrogen atoms, Libby came to the conclusion (1946) that the nuclear reactions observed in his experiments should also occur naturally – that is, the neutrons produced by the atmosphere of the Earth should become absorbed by nitrogen atoms and transform into ^{14}C , the radioactive isotope of carbon. Minute amounts of this radioactive carbon mix with the stable isotopes of carbon, ^{12}C and ^{13}C , taking part in the formation of carbon dioxide molecules that are subsequently consumed by plants, and animals (including humans) further up the food chain. Such molecules should be present in the tissues as well as the effluvia of living bodies. The discovery of mild radioactivity of the miasma

emanated by Baltimore sewage in 1947 was the first proof of the correctness of Libby's estimations. The radioactivity of growing trees, seashells etc was estimated in the following two years, 1948-1949. As well as any other radioactive element, the radioactive carbon isotope has a constant hallmark decay rate. Its global concentration would keep on diminishing by a factor of two every 5568 years, according to Libby, if it hadn't been for the constant generation of ^{14}C in the atmosphere that keeps the supply regular. The amount of ^{14}C lost equals the amount gained.

The death of a living organism excludes it from this process and makes it stop accumulating carbon from air (plants) or food (animals). The radioactivity of a dead organic body (a corpse, piece of wood, charcoal) keeps on falling – at a constant rate, which is an important fact.

Therefore it suffices to measure how much the overall radioactivity of a dead organism has decreased in comparison to the living ones in order to determine the time when this organism stopped refreshing its cells – the date when a tree was cut down, a bird was shot, or a human has died. This is naturally far from being an easy task, since the radioactivity of carbon as found in natural conditions is very weak (even before the death of an organism – *one ^{14}C atom per every 10 billion atoms of regular carbon*). However, Libby had developed the means and the techniques of measurement and numeric conversion that led to the naissance of the radiocarbon method of dating ancient objects” ([390], pages 52-53).

Let us now consider the basics of this method, particularly [390], [391], [1250], [1080], [986], [110], [1081], [1082], [1480], [414], [1431], [1432], [1433], [1025], [1124], [1473], [567], [480], and [478].

16.2. Physical basics of the radiocarbon method

Cosmic rays produce neutrons as they pass through the atmosphere of Earth. The density of the neutron current depends on the altitude. The results of density measurement of this current with aerostatic probes can be seen in fig. 1.62 on graph A ([986], page 138). The measurements were conducted in the state of New Jersey, USA, and belong to the period preceding 1955. The peak of neutron content falls on the height of approximately 40 thousand feet (12 kilometres). Close to the actual surface of Earth, the neutron current density drops to zero. This leads us to the following two conclusions:

Fig. 1.62. Atmosphere neutron density as a height function. Taken from [\[986\]](#), page 138.

1. Neutrons are generated in the stratospheric layers of the atmosphere, thus being secondary cosmic ray particles that are born with the passing of the primary cosmic rays through the atmosphere.
2. All of these neutrons immediately engage in nuclear reactions, and only a minute part of them reaches the surface of the Earth.

Graph B in fig. 1.62 reflects the dependence of the neutron current on the height of 30 thousand feet on the geomagnetic latitude ([\[986\]](#), page 139). The measurements were conducted before 1955. This graph makes one think that the primary particles of cosmic radiation that give birth to neutrons are charged and reflected by the magnetic field of the Earth. It is significant that the neutron current density in the latitudes of 50 degrees (the latitude of Paris, Prague, Kiev and Kharkov) is *three times higher* than measured at the latitudes of 20-30 degrees (the Red Sea coast, the north coast of Africa).

The atmospheric neutron generation rate per minute equals roughly 6×10^{20} neutrons/min, with error rate equalling 25% ([\[986\]](#), p. 139). Thus, every minute $4.5 \times 10^{20} - 7.5 \times 10^{20}$ neutrons are generated on planet Earth. These neutrons collide with the atoms of atmospheric nitrogen and oxygen and react with them. The probability rate of a neutron reacting with a nitrogen atom is supposed to be a few thousand times higher

than such for oxygen atoms ([986], pp. 139-140). Neutrons of low energy levels (heat neutrons) engage in ^{14}C radioactive carbon reactions for the most part:

The section of this reaction comprises roughly $1.7 \times 10^{-24} \text{ cm}^2$. See [986], page 140. Fast neutrons may react in two more ways:

However, compared to the section of the reaction (1), their sections are very small. The reaction (3) results in the production of tritium ^3H that has a half-life period of 12.5 years and transforms into He^3 , a stable helium isotope. The speed of tritium ^3H generation is estimated to equal 1% of that of ^{14}C generation.

M. J. Aitken writes the following in his monograph titled *Physics and Archaeology*: “A relatively small amount of neutrons reaches the surface of the Earth ... and it would be *reasonable to suggest* (? – A. F.) that every neutron produced by the cosmic rays creates a radiocarbon atom, hence the speed of neutron generation equals that of radiocarbon production. This amounts to roughly 7.5 kilos of radiocarbon per year” ([986], page 104). Radiocarbon C^{14} decays according to the formula:

The half-life period equals approximately 5600 years, so 1% of radiocarbon decays in about 80 years. It is thus easy to estimate that the amount of ^{14}C that is constantly present on Earth equals about 60 tonnes, with the error rate comprising about 25%, that is, 45 to 75 tonnes.

The generated radiocarbon mixes with other elements in the atmosphere, and is assimilated by oceans and living beings. The carbon propagation sphere is called the carbon exchange reservoir. This includes the atmosphere, the biosphere, sea surface and ocean depths, qv in fig. 1.63 ([986], page 30). The numbers on this picture refer to the carbon content in one part of the carbon reservoir or the other, with atmosphere carbon content equalling 1. The part of carbon that escapes the reservoir as oceanic sediment is not shown on the diagram. “We use the term *radiocarbon age* in order to refer to the

period of time between the point that the object ceases to be part of the exchange reservoir and the moment the ^{14}C measurements are conducted” ([110], page 32).

Fig. 1.63. The structure of the carbon exchange reservoir.

16.3 The hypotheses that the radiocarbon method is based upon

In theory, the radiocarbon age measurement concept is a simple one. It suffices to know:

- 1) The radiocarbon volume for the moment of the object's departure from the exchange reservoir;
- 2) the exact half-life period of radiocarbon ^{14}C .

After that, provided the specimen volume is sufficient, one has to measure the current radiocarbon content, and calculate the time elapsed since the moment that the object stopped taking part in carbon exchange by simple subtraction and division. However, this seemingly simple idea encounters a number of serious complications in practical application. We should also note right away that any *diminishing* of the relative ^{14}C content in the specimen for any reason at all leads to the *increase of its alleged age*.

16.4. The moment of the object's departure from the exchange reservoir

So, what does “the moment of the object's departure from the exchange reservoir” actually mean? *The first hypothesis* of Libby's is that this moment should coincide with the time of the object's death. However, despite the fact that the moment of death might differ from the moment that interests the historians (for instance, a piece of wood from a Pharaoh's tomb may belong to a tree that had been cut down a lot earlier than the

sepulchre had been built), it is obvious that identifying the moment of death as that of an object's departure from the carbon exchange reservoir only seems correct initially. The matter is that carbon exchange *does not stop with death*. It just slows down and assumes a different form, and one has to bear this in mind. At least three processes may alter the radiocarbon content in a body ([110], page 31):

1. Organic decomposition;
2. Isotopic exchange with foreign carbon;
3. The absorption of environmental carbon.

According to M. J. Aitken, "The only possible kind of decomposition results from the production of carbon oxide or dioxide. However, this process *isn't relevant to us*, since it only concerns the *carbon lost by an object*" ([986], page 149). M. J. Aitken seems to imply that since the oxidation of carbon isotopes has the same speed, it does not affect the percentage of radiocarbon. However, in a different place he proceeds to tell us the following:

"Although ^{14}C is identical to ^{12}C chemically, its greater atomic mass manifests as a result of natural processes. The exchange mechanism between the atmospheric carbon dioxide and the oceanic carbonates provides for a higher (by 1.2%) concentration of ^{14}C in carbonates; on the other hand, the photosynthesis of atmospheric carbon dioxide by the plants of Earth leads to their possessing a somewhat lower (by 3.7% in average) concentration of ^{14}C ." ([986], page 159)

Craig Harmon offers the following table of carbon and radiocarbon propagation for the various parts of the exchange reservoir ([1080] and [986], page 143).

	Carbon content, trillions of tonnes	Division effect for C^{14}
Atmosphere	0.64	1.037
Living biosphere of the Earth	0.30	1.000
Humus	1.10	1.000
Biosphere of the sea	0.01	1.024
Sea-solved organic substances	2.72	1.024
Inorganic substances in the sea	35.40	1.049

Therefore, *biosphere and humus are the lowest in radiocarbon content, whereas inorganic substances and sea water are the highest*.

The book [110] tells us nothing of the difference between the carbon isotope oxidation speed differences in decomposition processes, but the information cited

above gives reason to believe them to be quite visible. In any case, *the carbon oxidation process is the reverse process to that of its photosynthesis from atmospheric gas, hence the isotope ^{14}C should oxidize faster (or with greater probability) than the isotope ^{12}C . Thus, decomposing (or decomposed) specimens should have a lower content of radiocarbon ^{14}C , which should make the specimens appear a lot older than they really are.* This is one of the mechanisms that leads to the gathering of *extra age* by the specimens that distorts the true picture. We have witnessed actual examples of such artificial ageing above, which distorts radiocarbon datings often throwing them considerably off the mark.

Counting other possibilities of carbon exchange between the specimens and the exchange reservoir is *next to impossible*. It is supposed that “wood and organic matter appear to be the most inert in what concerns carbonization, whereas a large quantity of bones and shell carbonates show frequent changes in isotope content” ([110], page 31). *Since measuring the actual carbon is de-facto an impossibility, it gets ignored, by and large.* Standard methods and procedures of radiocarbon measurements are at best concerned with the ways of possible cleansing of the specimen from foreign radiocarbon and reasons of specimen contamination. S. V. Boutomo finds it sufficient to merely state that “charred organic matter and wood in *a good condition* (?! – A. F.) are dependable enough in most cases” ([110], page 31).

M. J. Aitken adds that “in order to work with any specimen at all, one has to clean it thoroughly from foreign roots and other fibres, and treat it with acid in order to solve all sedimentary carbonates. The removal of humus is achieved by washing the specimen in a base solution” ([986], page 149).

Note that the important question of whether this chemical cleansing might affect the specimen’s radiocarbon content had not been raised back in the day – and we’re talking about the time when it was claimed that the radiocarbon method “gives solid proof to historical chronology”.

16.5. Radiocarbon content variations in the exchange reservoir

The second hypothesis of Libby’s is that the radiocarbon content in the exchange reservoir *remains constant all the time*. Quite naturally, this hypothesis is also an *erroneous* one, and one has to consider the effects that affect the radiocarbon content of the exchange reservoir. The estimations of the general volume of radiocarbon on Earth as cited above imply that in a modern specimen the ratio is one radiocarbon atom per every 0.8×10^{12} atoms of regular carbon. This means that every minute *about 15 decays*

occur in a gramme of natural carbon ([986], page 143). Thus, if the radiocarbon content in the exchange reservoir for the moment of a specimen's death differed from the current by a ratio of 1%, the calculations of this specimen's age shall contain an error of about 80 years, 2% shall give an error of 160 years etc (!). A deviation of 10% shall give a dating error of 800 years, and higher deviations shall also alter the linear rule, and so a 20% deviation shall lead to an error of 1760 years, and not 1600, and so on. The radiocarbon content in old specimens for the moment of their departure from the carbon reservoir cannot be estimated in any other manner but via the comparison with the radiocarbon content of the modern specimens considering several effects that alter the radiocarbon content in specimens with the passage of time. M. J. Aitken cites the following well-known effects that influence the radiocarbon content in the exchange reservoir:

1. The change of radiocarbon generation speed in accordance with the changes in the intensity of cosmic radiation;
2. The change of the size of the exchange reservoir;
3. The finite speed of mixing between the different parts of the exchange reservoir;
4. The separation of isotopes in the exchange reservoir.

M. J. Aitken makes the justified remark that “any concrete data concerning points 1 and 2 is hard to obtain in any other way except for measurements conducted on the specimens veraciously dated with other methods” ([986], page 153). This pours light on the existence of a very important circumstance. The physicists required veracious external reference for the correct graduation of the radiocarbon scale. Having absolute trust in the historians, they took the dates from history textbooks and chronological tables. It appears that the physicists have been misinformed from the very beginning, since the radiocarbon method had been based on the same old *Scaligerian chronology* of historical specimens. Its reconstruction shall invariably affect at least some of the fundamental concepts that define the actual method.

Furthermore, one has to notice two more modern effects that affect the current radiocarbon concentration, namely, the increase in radiocarbon content due to experimental thermonuclear explosions, and the decrease (the so-called Süss effect) thereof that is caused by the burning of fossil fuels – oil and coal, whose radiocarbon content should be minute due to their great age. The estimation of the change in radiocarbon production speed (see point 1) has been attempted by many authors. Crowe, for instance, has researched the “materials with veracious historical datings”

and shown that there was a correlation between the errors of radiocarbon dating and the changes in the magnetic field of the Earth ([1082], also [110], page 29). The measurements of the yearly layers formed by sequoia trees are cited nearby for comparison ([110], page 29; [1480]).

It is assumed that the specific activity has been varying within the range of 2% in comparison to the average from 600 A.D. to the present time, with the maximal alterations occurring every 100-200 years ([110]). We see yet again that the creation of the “radiocarbon scale” involved the materials that the Scaligerian chronology dated as belonging to 600 A.D. or maybe even earlier. We do already know, however, that this chronology isn’t to be trusted with anything that concerns the times preceding the XIII-XIV century. The physicists have been deceived by the Scaligerian chronology yet again.

Thus, the radiocarbon dating is implicitly based on the same old incorrect chronology of Scaliger and Petavius. In order to separate it from the very basics of radiocarbon dating, we shall have to trust the historical objects that can really be dated veraciously. However, we’re beginning to understand that the age of such “trustworthy objects” cannot exceed 500-600 years, since none of them predate the XIV century A.D. Thus, *all the work on the calibration of the radiocarbon method shall have to be done again.* The results that the physicists will achieve in this case may strike them as surprising.

“Apparently, the changes in cosmic radiation occurred before, but due to the brevity of their period, the effect of these fluctuations is *hard to consider*. We base our assumption that the intensity of cosmic radiation over the last 35000 years has been constant within the error range of 10-20% on the coincidence of the calculated value of specific activity and on the proximity of the age of oceanic sediment estimated with the aid of mutually independent carbon and ionium methods” ([110], page 29). Let us remind the reader that the “constancy” within the range of 20% means an error of 1760 years in the dating of the specimen. It isn’t that significant an age compared to 35000 years, but the fluctuation rate is unacceptably high for what concerns the issues of the so-called “ancient” history. We have already given examples of *millenarian* discrepancies between the radiocarbon datings and the Scaligerian “ancient” chronology. The fluctuations of 10-20% mentioned by the physicists are a reality, and not just theory.

In America – the regions withdrawn from the entire “Classical scene” – the dendrologists of the Arizona University have discovered plantations of bristlecone pine

(*Pinus aristata*) whose age exceeded 4000 years. Some dead standing trees have been found nearby which have remained in their current condition for several thousand years ([414], page 6). It is assumed that cross-dating, that is, the temporal superposition of living and dead tree specimens, allowed for the creation of a dendrochronological scale spanning 7117 years ([1431], [1432], [1433]). However, this American dendrochronological scale, even if it is indeed correct, cannot help “ancient” European and Asian dendrochronology in any way at all, q.v. above.

In [414] on page 7 we can see a schematic drawing of the correlation of dendrochronological and radiocarbon datings based on the measurements conducted with the aid of over 300 specimens. If we’re to consider the dendrochronological dating absolutely veracious (which is wrong, as we have already pointed out), the maximal radiocarbon dating error equals to the following values:

Dendrochronological dating	Radiocarbon dating	Error
300	30	-270
500	250	-250
800	900	+100
1500	1600	+100
1900	2100	+200
2700	2400	-300
4000	3500	-500
5000	4300	-700

The error rate keeps on growing with a negative value.

These American data can be interpreted in the following manner. The radiocarbon content in American bristlecone pine has been varying over the years in the following manner (in comparison to its current radiocarbon content):

Years	Radiocarbon content
1965	1
1700	1.035
1500	1.031
1200	0.988
100	0.975

-700	1.038
-2000	1.063
-3000	1.100

Furthermore, on page 7 the authors of [414] write that “it is estimated, that the C-14 variations are of a global character – that is, they happen simultaneously all across the planet”. No argumentation is given. It would thus be appropriate to inquire about the possible grounds for making hypotheses that arose from the analysis of nothing but American materials, and ones belonging to a rather small and very specific geographical location at that, valid for the entire planet.

The authors of [414] also make the conclusion that the difference between the dendrochronological and radiocarbon datings is a result of a *temporal* variation of radiocarbon content in the exchange reservoir. However, this very difference might lead one to an alternative hypothesis that a growing tree *continues to take part in carbon exchange* after the formation of the rings, which isn’t even mentioned in [414]!

On page 4 of [414] we see the schematic drawing also included in [1025] that displays the correlation between the historical dates of the “ancient” Egypt and the hypothetical radiocarbon datings, and comparisons of the same dates to European monuments and artefacts. The commentary is as follows: “this drawing shows us that the datings of the Roman period are virtually identical, whereas the datings of the early dynastic period differ by 500-700 years” ([414], page 7). Apart from this, we have already seen the data showing that the radiocarbon datings of at least some of the “ancient” Egyptian specimens really pertain to the *late Middle Ages*.

In 1964 Kigoshi conducted precise measurements of ^{14}C concentration in the tree rings of an old Japanese cryptomeria whose age reached 1890 years ([567], page 172). This information is also of little utility for the European dendrochronology and radiocarbon scale. The results of this research proved somewhat different from the ones related to a small area in America as cited above, but show the radiocarbon concentration for 1000 A.D. to have been 2% lower than it is currently ([567]). The conclusion is apparently valid for some small area in Japan.

The variations in the exchange reservoir (see point 2 above) are primarily determined by the alterations of the ocean level. Libby claims that a change of 100 metres in the sea level curbs the volume of the reservoir by 5% ([986], page 157). If this were accompanied by a temperature drop, during the Ice Age, for instance, the concentration of carbonates in the water would diminish, and the entire carbon exchange reservoir would shrink by 10%. We are to be aware that we are considering hypotheses

that are extremely hard to prove nowadays, and all such proof is, it turn, based on other hypotheses that are just as hard to prove.

The data that concern the mixing speed as mentioned in point 3 are somewhat contradictory. Ferguson, for instance, having studied the radioactivity of tree rings (also in a small geographical area) reckons that this speed is rather high, and that the average time that it takes the carbon molecule to reach a different part of the reservoir equals seven years maximum ([986], page 158). On the other hand, thermonuclear test explosions have produced about half a tonne of radiocarbon, which shouldn't affect the general radiocarbon mass of 60 tonnes that greatly in theory – however, the activity of the specimens *grew by 25% as measured in 1959, and this growth had reached 30% by 1963*. This speaks in favour of the *low mixing level* hypothesis.

According to Süß, it takes about 1500 years for all of the water to mix in the Pacific, and 750 is the figure given for the Atlantic ocean by E. A. Olson and W. S. Brecker ([480], page 198). But the mixing of ocean waters is greatly affected by the temperature. A 50% increase in the mixing of both shallow and deep waters shall imply a 2% shrinkage of the atmospheric radiocarbon concentration.

16.6. Variations in radiocarbon content of living bodies

The third hypothesis of Libby's is that the radiocarbon content is *equal for all of the organisms on the entire Earth*, and thus independent from the *latitude* and the species. In order to verify this hypothesis, Anderson (Chicago University) had conducted an in-depth research and discovered *that the radiocarbon content does indeed fluctuate, as one should have expected* ([480], page 191). See the table below.

Specimens	Geomagnetic latitude	Per minute decay frequency for one gramme
White fir (Yukon)	55 degrees in lat. North	14.84 ±0.30
Norwegian fir (Sweden)	55 degrees in lat. North	15.37 ±0.54
Fir (Chicago)	53 degrees in lat. North	14.72 ±0.54
Ash (Switzerland)	49 degrees in lat. North	15.16 ±0.30
Honeysuckle leaves (USA)	47 degrees in lat. North	14.60 ±0.30
Pine branches (USA, 3.6 km above sea level)	44 degrees in lat. North	15.82 ±0.47
Heather (North Africa)	40 degrees in lat. North	14.47 ±0.44
Oak (Palestine)	34 degrees in lat. North	15.19 ±0.40
Unidentified timber (Iran)	28 degrees in lat. North	15.57 ±0.31

Manchurian ash (Japan)	26 degrees in lat. North	14.84 \pm 0.30
Unidentified timber (Panama)	20 degrees in lat. North	15.94 \pm 0.51
Chlorophora excelsa timber (Liberia)	11 degrees in lat. North	15.08 \pm 0.34
Sterculia (Bolivia, 2.7 km above sea level)	1 degree in lat. North	15.47 \pm 0.50
Ebony tree (The Marshall Isles)	0 degree	14.53 \pm 0.60
Unidentified timber (Ceylon)	2 degrees in lat. South	15.37 \pm 0.49
Eucalyptus (Australia)	45 degrees in lat. South	16.31 \pm 0.43
Seal-oil (The Antarctic)	65 degrees in lat. South	15.69 \pm 0.30

Thus, modern radiocarbon activity varies from 14.03 (North African heather) to 16.7 (Australian eucalyptus) decays per minute depending on the geographical location and the species of the tree. This gives a deviation rate of 8.5% as compared to the average radiocarbon content value. Libby tell us the following:

“Over the ten years that have passed since that time, this information has not been refuted; the only exceptions concern the carbonate rock formations, where ground waters dissolve and wash away a significant part of ancient carbon, thus making carbon-14 content lower in comparison with the average planetary rate of the atmosphere-biosphere-ocean system. Such cases are extremely rare (? – A. F.), and can easily be accounted for” ([\[480\]](#)).

17.

Summary

Let us sum up the information that we have just considered. We have learnt that the real activity of ancient specimens may alter from the average value for the following reasons:

1. A temporal change in timber activity: 2% deviation range;
2. Cosmic ray intensity changes (theoretical estimation): 20% deviation range;
3. Short-term changes of solar activity: additional 2%;
4. An increase in the mixing rate of the oceanic water: minus 2%;
5. Variations in radiocarbon concentration depending on the geographical location and the tree species: 8.5% deviation range;
6. Variations in radiocarbon content resulting from decomposition processes: ? (unknown);
7. Variations in radiocarbon content resulting from a specimen's chemical processing: ? (unknown);
8. The variations in the exchange reservoir radiocarbon content resulting from the washing out of carbonate rock formations: ? (unknown);
9. Variations in radiocarbon content caused by large quantities of carbonates produced by volcanic eruptions: ? (unknown). This reason can provide for significant distortion of radiocarbon datings for the areas close to volcanoes, such as Italy with its Vesuvius and Etna.

One should also bear in mind the dating deviation resulting from the temporal gap between the cutting of a tree, for instance, and the use of the wood for the object or building researched. Finally, one has to consider the imprecision of the currently used ^{14}C half-life value, that has been corrected *by almost 10%* as of late, and the errors of experimental measurement of a specimen's radioactivity (background radioactivity consideration etc). We do not cover these errors (whose correction has cost the physicists lots of labour) presently, since having learned of all the factors mentioned, we deem it nonsensical to attempt the precise measurement of a value whose theoretical *uncontrolled error rate* may equal 10% if we're to make modest assumptions. *The most optimistic calculations give a radiocarbon dating uncontrolled error range of 1200 years of arbitrarily added or subtracted age.*

This makes the placidity of the following conclusion made by B. A. Kolchin and Y. A. Sher most peculiar indeed: “Summing up the brief overview of the centurial ^{14}C variation research, one has to point out that apart from its mere failing to undermine the trust that we have in radiocarbon chronology, this research had made its precision even higher (! – A. F.)” ([414], page 8). Another specialist in radiocarbon datings, S. V. Boutomo, is of a more realistic opinion: “due to the *considerable fluctuations* of ^{14}C ’s specific activity rate, the radiocarbon datings of *relatively young specimens (under 2000 years of age)* cannot be used as fundamental referential data for the absolute chronological scale” ([110], page 29). However, from the point of view of the “Classical age” studies, including those of the “ancient” history of Egypt, these “relatively young specimens” are of the greatest interest. Thus, certain specialists in the field of radiocarbon dating confess openly (albeit in special scientific literature) that the use of the radiocarbon method in its current state for the specimens whose age is 2000 years or less appears a most dubious endeavour.

We could have finished our overview of the radiocarbon dating method here if it hadn’t been for the criticisms of the method coming from archaeologists and certain oddities in the behaviour of the radiocarbon method specialists themselves. We have quoted some of the examples above. The first thing to attract one’s attention is the absolute trust of the authors in the infallibility of historical datings, as one sees from such passages as “the ages of specimens younger than 5000 years concur well (! – A. F.) with the historical estimations” ([986], page 155). Such statements appear very odd indeed considering what we have just learnt.

Libby wrote that “further research has been undertaken involving specimens of known ages... The results... span a historical period of 5000 years... Thus, the general reliability of the radiocarbon method is well-proven” ([986], page 135). As we have already demonstrated, the popular myth of the “concurrence” between the Scaligerian chronology and the radiocarbon datings is based on flimsy foundations, and proves immaterial at closer study; the myth’s popularity is clearly of an unnatural origin. Let us remind the reader of something that Libby himself has mentioned in this respect: “One of the exceptions was discovered when we have worked on the materials of a large collection collected by James H. Breasted in Egypt together with the specialists of the well-known Chicago Institute for Oriental Studies. The third object suddenly turned out to have proved modern after analyzing. The finding belonged to a collection ascribed to the time of the V dynasty. It had really been a heavy blow” ([478], page 24). As we have already mentioned, this object was claimed a forgery. The fact that Libby mentions

this “strange occurrence” makes one wonder how many of those he remained taciturn about.

As we have already demonstrated, the calibration of the radiocarbon method has been largely based on the Scaligerian chronology. It would be expedient to check *whether the radiocarbon method can actually be made independent from written sources*.

Libby cites the table of modern carbon activity for various rock formations claiming that “it has been shown that there are no significant differences between the studied specimens collected at various latitudes from pole to pole” ([480], page 191).

Wait a second, we have just learnt that the deviation range equals 8.5% in one direction or the other, that is, *over 700 years*. How is it possible to claim five pages further on that “the carbon content that we have estimated concurs well with the expected value, all deviations being nothing but acceptable reference point errors” ([480], page 196). Could it be that Libby had been certain that the readers would not be interested in the details of Anderson’s table? Libby also says that their “conclusions may have proved wrong if the measurement errors of all kinds – those of cosmic ray intensity, mixing rate and ocean depths, had been in correlation. However, since this is not the case, we reckon that large error rates are improbable” ([480], page 193).

We are not quite certain as to what kind of improbability is being talked about here, since the cosmic ray intensiveness, mixing speed, and other physical values affecting the initial radiocarbon content in a specimen for the moment of its departure from the exchange reservoir are *far from being random – all of these values had all equalled something at a given point in time*. If we do not know these values and have to make a choice from some interval of possible values, *the radiocarbon dating error shall equal the sum (!) of all the errors that have been made in the estimation of the source data for the specimen*.

Libby writes that “despite the *great differences* between the cosmic ray intensiveness values at different geographical latitudes (they are a lot higher in the northern and southern latitudes than they are around the equator), *one has to expect* (? – A. F.) the radioactive carbon propagation rate to be *homogeneous* for the entire planet” ([478], page 23). The effect mentioned may nevertheless result in “extra age” gathered by specimens in Egypt, for example.

Libby proceeds to tell us the following:

“The coincidence of the age of the core and the entire tree shows that the sap from the core of gigantic sequoias is not chemically balanced in comparison to the fibre and other molecules of the tree. In other words, the carbon in the central part of the tree had been stored there about 3000 years ago, although the actual tree had only been cut down several decades ago” ([480], page 195).

However, three years after this, the radioactivity of tree rings was researched by Süss, who has found the discrepancies between the radiocarbon datings and the dendrochronological ones. Did he make the conclusion that Libby's initial hypothesis was wrong? He did not. Süss made the claim that the radiocarbon content in the ancient times used to be higher than it is today instead. What we see is a vicious circle.

L. S. Klein gives a similar example in [\[391\]](#). First Libby proves the veracity of the radiocarbon method using the historical chronology of the “ancient” Egypt; however, when control measurements showed deviations, Libby immediately questioned the Egyptian chronology concerning these particular specimens ([\[391\]](#), page 104). Similarly, Libby had used dendrochronology in support of the radiocarbon method, explaining arising deviations by the fact that several tree-rings may be formed in a year. However, Libby is far from being the only one to demonstrate the lack of logic where its presence is undesired.

In the article by Kolchin and Sher ([\[414\]](#)) we read that “the dates calculated in assumption of the constancy of atmospheric ^{14}C content from the ancient times to our age need to be revised. Does this mean they aren't true? The following analogy appears congruent...” ([\[414\]](#), page 6). The authors proceed to tell us how the distance between the Earth and the Moon had been calculated in several stages, each time with a greater precision. The same allegedly applies to the radiocarbon method where gradual corrections make the calculations more precise as time goes by. This may well be so in theory. However, we read in the very same article that “the half-life period for ^{14}C is 5570 years, with the possible deviation range of 30 years in each direction...” (page 4), and that “the half-life period for ^{14}C is set (!? – A. F.) at 5730 years, give or take 40”. 160 years – that's some correction!

M. J. Aitken writes that “an important characteristic of all these methods is their output, that is, the carbon content in the original volume that is transformed into gas. It would be expedient to have an output of 100% in order to eliminate all possibility of ^{14}C turning into gas more readily than ^{12}C , or the other way round” ([\[986\]](#), page 168). We also learn that “the shortcoming of the synthesis of the latter is that only 10% of the carbon is transformed into benzol; this increases the possibility of error resulting from isotope separation” ([\[986\]](#), page 17. The author appears to have full awareness of the necessity of considering the isotope separation effect in all chemical reactions. However, in 6.3, while discussing the issues of a specimen's suitability for measurements, M. J. Aitken writes that “charcoal and wood in good condition are considered the best specimens: their taking part in exchange is improbable (? – A. F.),

and the only possible kind of decomposition results from the production of carbon oxide or dioxide. However, this process *isn't relevant to us*, since it only concerns the *carbon lost by an object*" ([\[986\]](#), page 149). What about isotope separation? The radiocarbon content in a specimen may change as a result of decomposition!

Such careless attitude of specialists to the effects that may greatly affect the research results remains enigmatic for us. We have listed some of these effects in the general list. Some of them may really be difficult to evaluate currently. *However, a number of effects reflected in literature may be quantitatively assessed after a series of experiments. No careful activity reports of either living or dead specimens have been made for any of the below:*

1. latitude;
2. longitude;
3. proximity to certain geological and geographical formation on dry land and in the ocean;
4. altitude above the sea level;
5. climate, etc.

Without such analysis, the self-righteous claims of the alleged independence of specimen activity from their locations and other characteristics are altogether impossible to understand.

Therefore, we have to concede the following:

1. The radiocarbon method in its current condition has deviation rate of 1000-2000 years for specimens whose age is estimated as under 1000 years. This means there's not much to be learnt about the events of the last two millennia from this method.
2. The radiocarbon method needs a fresh graduation that would not be based on Scaligerian chronology at the very least.
3. Other physical dating methods are even less precise, ergo, they can tell us nothing about the dating of objects younger than 2000 years.
4. The actual archaeological methods that aren't based on documented chronology can give no absolute dates; these methods can only aid the estimation of relative chronology of some findings in a limited number of cases.
5. Scaligerian chronology implicitly or explicitly affected the graduations of scales used for archaeological and even physical methods, including the radiocarbon method. This also questions the usability of the method in its current condition for

the dating of historical objects.

6. According to a number of archaeologists (see above), the unacceptable practice of familiarizing the physical laboratories that perform radiocarbon datings with the opinions of the archaeologists about the estimated ages of findings still exists.

18.

Numismatic dating

It is assumed that in some cases certain archaeological findings can be dated with the aid of the ancient coinage found on the site. However, one should be aware that the so-called numismatic dating as used today *is wholly dependent on Scaligerian chronology*. This chronology was created in the XVI-XVII century, and all the kings and rulers described in chronicles and other documents took certain chronological places. Then the ancient coins were distributed along the time axis – for instance, coins bearing the legend “Nero” were dated to the I Scaligerian century A.D., the ones saying “Justinian,” as the VI Scaligerian century A.D., etc., since those are the centuries where Scaligerian chronology locates the Roman emperors Nero and Justinian.

After that, all of the coins found in the XVIII-XX century have either been dated by the same “method,” or compared to the ones that have already received datings, and placed on the time axis accordingly.

It is perfectly obvious that any alteration of the Scaligerian chronology that this “method” is based upon shall automatically alter the “numismatic datings” as well. Furthermore, an independent comparison of different coins that isn’t based on external chronological considerations, *cannot even tell us anything about the relative chronology of the coins under comparison*, let alone their absolute chronology. Comparing actual coins as metallic objects bearing graphical designs of some sort cannot give us exact knowledge of which coin is older and which is newer. The analysis of the metal that the actual coin is made of can point at its *geographical point of origin* in some cases. However, the calculation of the *date* – absolute or relative – sadly remains an impossibility. It is possible that some method will be developed eventually that will estimate absolute ages of coins after a study of the alloys that they are made of. However, as far as we know, no such method has yet been developed. This opens a great many opportunities for physicists, chemists and metallurgists.

The historians write that “numismatics as a science is a *relatively recent phenomenon*. The transition period between the collection of coins to scientific methods of their study... can be estimated to fall into the very end of the XVIII century” ([345], pages 13-14). We shall thus repeat that the entire numismatic science is based on Scaligerian chronology that was based on written sources, and can in no way be considered an independent dating method.

As a result, we encounter many oddities nowadays when we compare “ancient” coins to their mediaeval counterparts. An abnormally large number of parallels and even direct coincidences appear between the “ancient” and the mediaeval – sometimes even late mediaeval – coinage. These parallels have been known for a long time, and their number keeps on growing. Historians try to explain them by elaborate and nebulous theories of “imitation”, “copying,” etc. The English Edwardian pennies allegedly dating from 1042-1066 A.D. *copy* the Constantinople solidi of Justin II dated 565-578 A.D. in Scaligerian chronology ([1163], page 449). The chronological difference between the “original” and the “copy” exceeds 450 years here! No such cases of “copying” coins from 450-year-old “originals” have been registered in either late mediaeval or newer history.

The coinage history has allegedly seen an “ancient dawn,” then the Dark Ages are supposed to have come, and later on the Renaissance epoch. It is assumed that between the VIII and XIII century A.D. all Roman golden coinage disappeared from Italy ([1070]). This strange effect is noticeable enough to have entered the names of chapters of certain monographs on history and numismatics, such as “The End of Roman Coinage (V century),” or “Imitation epoch (VI century)” ([1164]), or “The Lack of Gold Coinage” ([64], page 151).

Let us pay close attention to the following information provided by specialists in numismatic history. It turns out that in the Middle Ages “the West of Europe did not try to compete with Byzantium and the Muslims in this respect [coin minting – A. F.]. The idea of having regular gold coinage was given up, and most mints produced silver coins” ([1070], page 20; [1435]). It is also said that “regular golden coinage had *practically ceased* in VIII-century Western Europe, and towards the end of the same century on the Italian peninsula as well. Even in Muslim Spain *no golden coinage was minted* between the beginning of the VIII century and the beginning of the X” ([1070], page 20).

Numismatists attempt to give some sort of explanation to this mysterious “mediaeval gap” in coinage history. It is suggested that “gold coinage was ceased by an order issued by Pepin”. The council at Reims allegedly forbade the use of the golden solidi of imperial Rome, and the type of circulating coinage allegedly “became barbaric” in the VIII century ([64], page 151).

Doesn’t this imply that the “ancient” Western European coinage is really mediaeval, minted after the XIV century A.D., and cast way back in time by Scaligerian chronology?

Historians proceed to tell us that “there are *no Papal coins* from the time of Benedict VII (who died in the alleged year 984 A.D. – A. F.) to that of Leo IX [allegedly the middle of the XI century – A. F.] *in existence*; this is purely incidental, since the coinage must have existed, naturally... There is only one coin from the times of Leo IX... Even stranger is the fact that not a single coin remained from the times of Gregory VII” ([196], Volume 4, page 74, comment 41).

Where did all these mediaeval coins go? Let us formulate a hypothesis. All of these coins have been misdated, and thrown back into the past, transforming into “ancient coins” as a result. Some of them are exhibited in museums as “very old ones” nowadays.

Apparently, the naissance of golden and silver coinage in Western Europe really dates to the XIII century A.D. at the earliest. Confronted by the non-existence of mediaeval Western European coins predating the XIII century A.D., the numismatists were faced with the necessity to invent various theories aimed at explaining the economical stagnation of Europe that allegedly followed the “flourishing Classical age”. The strange “stagnation” in Roman minting between the VIII and XIII century A.D. is all the more amazing since it follows a very fruitful and glorious period of Roman coinage of the alleged I-VI century A.D. Golden coins of this “ancient” empire are on a par with the mediaeval ones dated to the XIII-XVII century in quality and detail. This oddity is most probably explained by the misdating of the XIII-XVII century coins that have been moved a long way into the past.

Let us point out another strange effect. According to the historians, the coin caches of the X-XIII century found on the territory of Russia *hardly contain any* Italian, French, or Spanish coins of X-XIII century A.D. ([685]). Only *single Italian coins* (!) of the X-XIII century have been found among the tens of thousands of coins dating from that period. Historians have created a theory that is supposed to explain this strange occurrence – namely, that there were no economical or trade connexions between Russia and Italy in the X-XIII century ([685], pages 200-211). This “numismatic theory” contradicts written sources explicitly mentioning extensive trade and economic relations ([685], page 201). The historian’s commentary is that “the contradictions between the numismatic and other data is purely illusionary” ([685], page 201). However, no explanations of any kind are given. We shall formulate the following hypothesis: Western Europe and Italy in particular really minted a very small number of gold coins before the XIII century, which is why they aren’t found in treasure caches on the territory of Russia.

However, in 1252 A.D. full-scale golden coinage is allegedly “resurrected” in Rome all of a sudden, and it becomes international currency over a very short period of time, chasing the Byzantine coinage off the market ([\[1070\]](#)). This sudden appearance of Italian gold coinage in the XIII century is considered to be “a dramatic change of the situation prevalent for the first half of the mediaeval period” ([\[1070\]](#), pages 20-21). However, most probably, no such dramatic occurrences really took place. What we appear to witness here is more likely the real naissance of European coinage in the XIII-XIV century as a result of serious changes that happened in the life of Western Europe. See more about the nature of these changes in [Maps and Coins vs History](#).

The concept of uniform mass coinage is extremely close to that of printing engravings and books. Thus, qualified coin minting shouldn't predate the birth of book-printing by too long, and that event is dated to the XV century nowadays ([\[797\]](#), page 352).

Are History and Astronomy incompatible?

By Béla Lukács

History: Fiction or Science? is a most unusual book series, one that undermines the very foundations of History. According to the author and his team of researchers, History as it has been taught in Europe ever since the Renaissance is fundamentally false, verified history beginning around 1250 A.D. the earliest. Jesus Christ was born in 1152 and crucified in 1185, the First Crusade being an immediate reaction to his Crucifixion. Homer identifies an anonymous poet of the second half of XIII century A.D., and the event led to the creation of the *Iliad* had been the fall of the Latin Empire of Constantinople in 1261 A.D. The list goes on and on.

Historians generally oppose the author's views without making much commentary. The author is not a historian, period. He is only a leading differential geometrician (mathematician), successful and respected. A. T. Fomenko is also a corresponding member of the Russian Academy of Sciences; his main argumentation is of a statistical and astronomical nature. I happen to be a physicist myself and not a historian. However, astronomy and differential geometry are known to me well from the area of general relativity, and I cannot recommend this book enough, since its author approaches History, usually a highly emotional discipline ascribed to the field of humanities, armed with impartial mathematics.

History is collective memory; yet even our own memory errs at times, and no real memory extends beyond three generations. There are written sources, but each one of those might easily prove a forgery. There are material remnants of archaeological nature, but they may be misinterpreted.

Astronomy is precise by definition, and a historical dating that can be calculated from information about eclipses should satisfy any researcher.

Yet the XIX century astronomers did not use the lunar tidal friction term in the equations of lunar motion, which would make ancient lunar eclipses appear several hours off the mark and relocate several total eclipses of the sun geographically (assuming tidal friction has remained the same all the time but there is no reason to believe it hasn't). How could XIX century calculations have conformed to consensual history?

I must say that a methodical recalculation of ancient eclipse datings shall invariably bring surprises; in the unlikely case these datings are correct, we shall prove the existence of erratic changes in telluric rotation over the last 4,000 years instead. Both possibilities are highly alarming.

Fomenko demonstrates the incompatibility between consensual history and modern astronomy. This incompatibility is a sad fact. (He exposes a number of other contentious issues as well, but those do not fall into my professional scope.) Which is more reliable – history or hard-boiled scientific facts? Science cannot afford subjectivity; most of us would feel the same way about history as well.

Chronological problems are very serious indeed; Fomenko offers a viable solution to most of them, and a radical one at that – a “Copernican revolution” of history, no less. I am not using the term to predict the final and total victory of his version; that is a matter for a multitude of scientific and scholarly discussions to come. But the contradiction between history and astronomy that becomes graver with the day cannot and must not be tolerated, in the best interests of both history and the theory of telluric rotation.

History of the New Chronology

By A. T. Fomenko and G. V. Nosovskiy

The first stage – the XVI-XX century, when various researchers periodically discovered major inconsistencies in the edifice of the Scaligerian chronology. We shall quote the names of some familiar scientists that dissented with the chronology of Scaliger-Petavius and reckoned that the real ancient and mediaeval chronology differed significantly.

De Arcilla – the XVI century, Professor of the Salamanca University, see [Chron1](#), Chapter 1. The information on his chronological research is of a rather volatile nature, and it was only by accident that N. A. Morozov managed to learn of it. It is known merely that De Arcilla claimed “ancient” history to have been forged in the Middle Ages. However, we regrettably failed to have found any of his works. The Salamanca University could not give us any information about them, either.

Sir Isaac Newton (1643-1727) – the great English scientist, physicist, and mathematician devoted a large part of his life to chronology and published a large volume entitled *The Chronology of Ancient Kingdoms Amended. To which is Prefix'd, A Short Chronicle from the First Memory of Things in Europe, to the Conquest of Persia by Alexander the Great*. See [\[1298\]](#); more details in [Chron1](#), Chapter 1.

Jean Hardouin (1646-1729) – eminent French scientist and author of a large number of works on philology, theology, history, archaeology, and numismatics. He was also Director of the French Royal Library, and wrote a few chronological works with sharp criticisms of the entire Scaligerian chronology. He was of the opinion that most of the so-called “ancient artefacts” were either counterfeit, or belonged to a much more recent age. See details in [Chron7](#), Appendix 3.

Peter Nikiforovich Krekshin (1684-1763) – the personal secretary of Peter the Great wrote a book criticizing the contemporary version of Roman history. It was “still fresh” in his day and age, and wasn’t taken for granted the way it is today. See details in [Chron4](#), Chapter 14:30.

Robert Baldauf – the German philologist of the late XIX – early XX century. Assistant professor at the Basel University and author of the four volumes entitled *History and Criticisms* ([\[1025:1\]](#)). He came to the conclusion that the “ancient” literary works had been a lot more recent than one was accustomed to think, guided by philological considerations. Baldauf proved that those works were all mediaeval in their origins. See details in [Chron7](#), Appendix 3.

Edwin Johnson (1842-1901) – English historian of the XIX century, criticized the Scaligerian chronology severely in his works ([\[1214\]](#) and [\[1215\]](#)), claiming that they needed to be truncated drastically. See details in [Chron1](#), Chapter 1.

Nikolai Alexandrovich Morozov (1854-1946) – a prominent Russian scientist and encyclopedist, made a breakthrough in chronological studies. He criticized the Scaligerian version of chronology and history extensively. He offered the concepts of several new natural scientific methods of analyzing chronology and introduced scientific approaches to chronology making the latter a science de facto. See details in [Chron1](#), Chapter 1.

Wilhelm Kammeyer (late XIX century – 1959) – a German scientist and lawyer, developed a method of verifying the authenticity of ancient documents. He discovered nearly all of the ancient and early mediaeval Western European documents to have been either copied or forged in a more recent age. He came to the conclusion that both ancient and mediaeval history were falsified, and wrote several books on the topic.

Immanuel Velikovsky (1895-1979) – a prominent psychoanalyst of Russian origin lived and worked in Russia, the UK, Palestine, Germany, and the USA. He wrote a number of books on ancient history that concerned several contradictions and peculiarities of ancient history. He also made an attempt of explaining them in relation to the Catastrophism

Theory. He is considered to be the founder of the “critical school” in chronology, but what he really did can be regarded as an attempt to protect the Scaligerian chronology from drastic changes, so his inclusion in the list of the founding fathers of the new chronology is rather arbitrary.

Velikovsky’s works are much better known than the earlier and more detailed ones by N. A. Morozov; this must have inhibited the development of the new chronology in the Western Europe of the XX century considerably. See details in [Chron7](#), Appendix 3.

All in all, one has to state that the precariousness of the Scaligerian chronology was mentioned rather explicitly in the scientific works of the XVII-XIX century. The Scaligerian version of history had been subjected to extended criticisms, and the thesis of the global fabrication of ancient texts and artifacts was formulated. Nevertheless no one with the exception of N. A. Morozov managed to find a way of constructing a proven version of the correct chronology; even his version was hardly based on any substantial evidence, being incomplete and having inherited a number of substantial flaws from the chronology of Scaliger and Petavius.

The second stage – first half of the XX century. This stage should doubtlessly be linked to the name of N. A. Morozov. He was the first to have understood and formulated the fundamental idea about Scaligerian chronology being in need of a complete revision, not just the “ante-mundane” part, but also its entire edifice up to the VI century A.D. N. A. Morozov had used a number of innovative natural scientific methods for chronological analysis and quoted a number of indisputable arguments for proving his brilliant idea. The publication of his main works on the revision of the ancient history occurred in 1907-1932 ([\[542\]](#)-[\[544\]](#)). However, he held the erroneous opinion that post-VI century chronology had been basically correct. See details in [Chron1](#), Chapter 1:3.

The third stage – the period of 1945-1973, can be characterized as one of “deliberate muting”. The historical science tries to cast the chronological research of N. A. Morozov and his predecessors into oblivion. The chronological discussions in Russia cease altogether, and an “alienation

zone” of sorts is created around N. A. Morozov’s works on chronology, whereas in the West, the debate becomes circular and doesn’t venture outside I. Velikovsky’s hypothesis of “Catastrophism.”

The fourth stage – which was the period of 1973-1980, commenced in 1973, when A. T. Fomenko, faculty member of the Department of Mathematics and Mechanics of the Moscow State University, was researching several problems related to celestial mechanics. He had noticed the 1972 article of the American astrophysicist Robert Newton ([\[1303\]](#)), where the latter described a strange leap in lunar acceleration, and the so-called parameter D'' . The leap occurred around the X century A.D. Using the Scaligerian datings of the writings that make reference to lunar and solar eclipses, R. Newton computed lunar acceleration as a time function on the interval of the I-XX century A.D. The leap in question comprises an entire mathematical order (!), and cannot be explained by the gravitational theory in any way. It was the issue of the discussion organized by the Royal Society of London and the British Academy of Sciences in 1972, and one that had spawned major controversy ([\[1453\]](#)). The discussion had failed to elucidate the situation in any way, and so R. Newton suggested to attribute the leap to certain mysterious extra-gravitational forces in the Earth-Moon system.

A. T. Fomenko noted that all the attempts of explaining the gap in the behaviour of D'' failed to raise the issue of the veracity of the eclipse datings that were the actual basis for R. Newton’s calculations. However, despite the fact that A. T. Fomenko was well outside the paradigm of historical research back in the day, he had heard that N. A. Morozov offered some new datings of the “ancient” eclipses in his work entitled *Christ*, published in 1924-1932. It has to be said that A. T. Fomenko’s initial attitude towards N. A. Morozov’s works was rather sceptical and based on whatever random information he had received on the subjects during informal discussions with fellow faculty members. Nevertheless, having overcome his scepticism, A. T. Fomenko unearthed an astronomical table by N. A. Morozov that contained the new datings and

performed a new calculation of the parameter D'' using the same algorithm offered by R. Newton. He was amazed to discover the disappearance of the mysterious leap and the transformation of the D'' diagram into an even, practically horizontal line. A. T. Fomenko's work on the topic was published in 1980 ([\[883\]](#)).

However, the elimination of the enigma from celestial mechanics led to another question of paramount importance: what was one supposed to do with the chronology of the ancient times in this case? The eclipse dates were supposed to be evidentially linked to a vast array of historical materials. Since N. A. Morozov's works helped to solve a complex celestial mechanics problem, A. T. Fomenko decided to study them in more detail. The only professor from the MSU Department of Mathematics and Mechanics to have had Morozov's *Christ*, already a bibliographical curiosity by that time, in his possession, was M. M. Postnikov. He was interested in N. A. Morozov's research and occasionally told his colleagues about it. In 1974, A. T. Fomenko approached M. M. Postnikov with the suggestion of reading a series of introductory lectures on N. A. Morozov's works. M. M. Postnikov had acquiesced after a brief hesitation, and read five lectures for a group of mathematicians that worked in the MSU Department of Mathematics and Mechanics later the same year.

As a result, a group of mathematicians developed an interest in chronological problems, regarding them from the point of view of applied mathematics. It became obvious that the complexity of this issue demanded the development of new independent methods of dating. Hence the main focus in 1973-1980 was on developing methods of analyzing historical texts that were based on mathematical statistics, a number of which was proposed and formulated by A. T. Fomenko in 1975-1979. They allowed for the elucidation of the global picture of chronological misdatings in Scaliger's version and elimination. More specifically, A. T. Fomenko had discovered three important chronological shifts, of roughly 333 years, 1053, and 1800 years respectively. These shifts are only inherent in the erroneous chronology of Scaliger-Petavius, and have nothing to do

with the correct one. It turned out that “the Scaligerian textbook” was compiled from four copies of one and the same brief chronicle.

The first scientific publications on this topic were composed and prepared for publishing in 1973-1980.

The fifth stage – 1980-1990 can be characterized by the publication of articles on the new methods of dating and achieved chronological results in specialized periodicals dedicated to pure and applied mathematics. The first publications on the topic were the two articles by A. T. Fomenko ([\[883\]](#) and [\[884\]](#)) published in 1980, as well as the preprint by A. T. Fomenko and M. M. Postnikov ([\[681\]](#)), published the same year. In 1981 a young mathematician by the name of G. V. Nosovskiy, specializing in probability theory and mathematical statistics, actively joined the new chronology research. This period saw the publication of several dozens of scientific articles on independent empirical-statistical and astronomical methods in chronology. They were written by A. T. Fomenko, either alone or in collaboration with the mathematicians G. V. Nosovskiy, V. V. Kalashnikov, S. T. Rachev, V. V. Fyodorov, and N. S. Kellin (see [Bibliography](#)).

It has to be mentioned that the research was supported by Academician E. P. Velikhov, the physicist that proposed two of A. T. Fomenko’s articles with the description of methods and a global picture of chronological misdatings to be submitted to the *Doklady AN SSSR* (a periodical of the USSR Academy of Sciences), and Academician Y. V. Prokhorov, the mathematician who had done the same for two articles by A. T. Fomenko, V. V. Kalashnikov, and G. V. Nosovskiy on the issue of dating Ptolemy’s *Almagest*.

A. T. Fomenko made reports concerning the new dating methods at scientific seminars on mathematics conducted by Academician V. S. Vladimirov, Academician A. A. Samarsky, Academician O. A. Oleynik, and Corresponding Member S. V. Yablonsky, as well as a scientific seminar on history conducted by Academician I. D. Kovalchenko, a specialist on applying mathematical methods to history, who was

genuinely interested in those methods and claimed that historians needed to delve deeper into chronology issues.

Over the period of 1980-1990, A. T. Fomenko, G. V. Nosovskiy, and V. V. Kalashnikov presented their reports on the new methods of independent dating at a number of scientific conferences on mathematics.

The position of Academician A. N. Kolmogorov in this respect is most interesting. When A. T. Fomenko was presenting a scientific report on the new methods of dating at the Third International Conference on Probability Theory and Mathematical Statistics in Vilnius, 1981, A. N. Kolmogorov came to the presentation and spent the entire forty-plus minutes that it took standing in the back of the hall, having strategically chosen a spot where he wouldn't be seen from the hall, retaining the ability to see and hear everything that was going on at the blackboard. A. N. Kolmogorov departed immediately after the presentation and did not approach the person at the blackboard. It has to be said that A. N. Kolmogorov's health was already quite frail by that time, and being forced to stand for forty minutes must have taken a considerable effort on his part.

Later on, in Moscow, A. N. Kolmogorov invited A. T. Fomenko over to his residence and inquired whether he could borrow any of his publications on chronology. He was given a brief 100-page essay written by A. T. Fomenko in 1979 that had circulated around as a manuscript prior to its publication as a preprint in 1981 ([\[888\]](#)). Apart from that, A. T. Fomenko had given A. N. Kolmogorov a more exhaustive 500-page typewritten text on the topic. In two weeks' time, A. N. Kolmogorov invited A. T. Fomenko to converse with him once again. During the two-hour discussion it became clear that A. N. Kolmogorov had made a thorough study of the materials. He had asked a large number of questions, and his primary concern was about the dynastical parallelisms between the ancient dynasties, including the biblical ones, and those of the Middle Ages. He said he was frightened by the possibility of a radical reconstruction of several modern conceptions based on ancient history. He

had no objections to the legitimacy of the methods. Finally, A. N. Kolmogorov gave the 500-page text back to A. T. Fomenko and asked whether he could keep the 100-page essay as a present. The request was complied with.

One has to add the following report that A. T. Fomenko received orally from one of the partakers of the conversation that is to be described below. A while ago, Professor M. M. Postnikov submitted an article with an overview of N. A. Morozov's chronological research in a journal titled *Uspekhi Matematicheskikh Nauk* (The Successes of Mathematical Sciences). The following dispute among members of the journal's editing board, among them Academicians P. S. Alexandrov and A. N. Kolmogorov, ensued. A. N. Kolmogorov refused so much as to touch the article, saying something along the lines of "This article is to be rejected. I spent enough time and effort fighting Morozov in the days of yore." However, he added the following: "And yet we shall all look perfectly idiotic if it turns out that Morozov was right." The article was rejected.

This conversation sheds some light on the events of the days when N. A. Morozov's research was practically vetoed. Today we are being convinced that everything had happened "automatically" and that N. A. Morozov's research was of little enough interest to have been forgotten by everyone in a short time. We are now beginning to understand that the forces opposing N. A. Morozov were all the more formidable to have needed the assistance of A. N. Kolmogorov. It is also noteworthy that A. N. Kolmogorov considered it possible for N. A. Morozov to have been correct.

Apparently, ever since the time N. A. Morozov's research was cast into oblivion, historians have been constantly bothered by the possibility of someone resuming it. It is hard to find another explanation for the peculiar fact that as early as 1977, when the research conducted by the Moscow State University mathematicians was in its earliest stages without any publications on the topic, the *Communist* magazine published an article by A. Manfred, Doctor of History, with a severe criticism of "the new

mathematical methods” in history. The names of the methods’ authors weren’t mentioned, but the implications were perfectly clear. A. Manfred wrote the following: “If these ‘young’ scientists are given any degree of liberty at all, they will drown the book market in summaries of numeric data. The ‘new’ tendencies need to be overcome by scrupulous critical analysis, since they are holding back the progress of global historical science...” (*Communist*, July 1977, issue 10, pages 106-114).

In 1981, immediately after our first publications on chronology had come out, the History Department of the USSR Academy of Sciences gathered for a special session on June 29, 1981, the criticism of our work being its main objective. The Learned Secretary of the History Department of the USSR Academy of Sciences, Cand. Hist. Sci. V. V. Volkov, and the Learned Secretary of the Principal Tendencies of Human Society Development Council of the History Department of the Academy N. D. Loutzkov sent A. T. Fomenko an official note saying, among other things, that: “The Department’s session took place on 29 June, 1981, conducted by the Vice Academician Secretary of the Department, Academician Y. V. Bromley... Your conclusions were sharply criticized by the specialists of six humanities institutes as well as the staff members of the Sternberg Institute of Astronomy” (8 May 1984).

The most vehement criticisms of the 1981 session belonged to the Corresponding Member of the USSR Academy of Sciences, Z. V. Udaltsova, and the chairwoman of the commission, Y. S. Goloubtsova, both of them historians. Y. S. Goloubtsova was in charge of a special commission of historians that had been assembled to analyze our works. The materials of this discussion have provided the basis for a series of articles with harsh criticisms of our research in various historical periodicals.

A similar “discussion” recurred in 1998-1999, as shall be mentioned below.

The sixth stage – the post-1990 period. It can be characterized as “the stage of publishing books on new chronology.” This is when the books

that covered our chronological research, as well as those containing derived hypotheses about what pre-XVII century history had really looked like, started to appear. The first book on this topic was A. T. Fomenko's *Methods of Statistical Analysis of Narrative Texts and their Application to Chronology* (MSU Publishing, 1990). The foreword was written by A. N. Shiryaev, President of the International Bernoulli Society for Mathematical Statistics and Probability Theory in 1989-1991, Corresponding Member of the Russian Academy of Sciences, Doctor of Physics and Mathematics, Head of the Probability Theory Studies Section of the Moscow State University Department of Mathematics and Mechanics, Head of the Probability Theory and Mathematical Statistics Department of the V. A. Steklov Mathematics Institute of the Russian Academy of Sciences.

It has to be mentioned that this book was supposed to have been published much earlier. It was already typeset by the Publishing House of the Saratov University in 1983-1984 and edited by Cand. Hist. Sci. S. A. Poustovoyt (Moscow). However, the publishing house received a sudden missive from the historians of Leningrad, Head of the Universal History Sector, the Leningrad division of the USSR History Institute, Corresponding Member of the USSR Academy of Sciences, V. I. Routenburg, Learned Secretary T. N. Tatsenko, Cand. Hist. Sci., Head of the History of Ancient States Formerly on USSR Territory and the Ancient World Group, I. A. Shishova, Cand. Hist. Sci., Learned Secretary I. V. Kouklina, Cand. Hist. Sci. Among other things, they wrote that our research was "obviously contradicting the founding principles of the Marxist historical science... the Universal History Sector as well as the history of Ancient States Formerly on USSR Territory and the Ancient World Group considering the publication of A. T. Fomenko's *Methods of Statistical Analysis of Narrative Texts and their Applications to Chronology* an absolute impossibility". The historians demanded the publication of the book to be stopped in the most categorical way, and so the typesetting of the book was recycled.

The Nauka Publishing House planned to publish our book titled *The Geometrical and Statistical Analysis of Star Configurations. The Dating of the Star Catalogue of Almagest* authored by A. T. Fomenko, V. V. Kalashnikov and G. V. Nosovskiyy in 1991. It was reviewed and submitted for publishing. However, when a significant part of work had already been done, the Nauka publishing house all but ceased its publishing activity due to the change of the political and economical climate in the country. The book was published later, in 1995, by the Faktorial Publishing House that had received the prepared materials from Nauka, which would subsequently resume work and publish two more of our books on chronology in 1996 and 1997.

As we can see, the release of A. T. Fomenko's *Methods* in 1990 was followed by a break of sorts. After that, starting in 1993, a number of books covering the current stages of our research eventually got published. This was when the term *New Chronology* had been coined in reference to the chronology that was beginning to emerge due to the application of our new dating methods. It was new in the sense of differing from the consensual chronology of Scaliger-Petavius, and should have really been called *the Correct Chronology* due to its freedom from the errors of the Scaligerian school.

The publication of books on the new chronology was undertaken by a number of Muscovite publishing houses: MSU Publishing, the MSU Educational Centre of Pre-University Education Publishing, as well the publishing houses Nauka, Faktorial, Kraft, Olimp, Anvik, and Delovoi Express. Outside Russia our books on chronology were published in both English and Russian by Kluwer Academic Press (the Netherlands), CRC Press (USA), and Edwin Mellen Press (USA). In 2000-2003 the entire material was collected, processed and arranged as the seven volumes of *Chronology*.

Starting in 1995-1996, a large number of articles discussing our books on the new chronology began to appear in various newspapers and magazines. Most of them expressed two polar points of view. One camp

enjoyed our books a great deal, whilst the other was positively infuriated by them. About a hundred of such articles appeared every year; their numbers surged dramatically in 1999-2000.

In 1998, the Free Russia radio station had been broadcasting a series of radio programmes for over six months, where Y. S. Chernyshov brilliantly rendered the contents of our books. Namely, he had read the nearly complete text of the two of our books on the radio – *The Empire* and *The New Chronology of Russia, England, and Rome*. In addition to that, the first couple of chapters of *The Biblical Russia* also received a reading. The programmes were resumed in 2001, but ceased shortly after that, despite Y. S. Chernyshov being ready to continue with them.

In 1998, seven series of the Night Flight programme on TVC (produced by ATV Studios, a.k.a. Author Television, hosted by A. M. Maksimov) featured A. V. Podoinitsyn, a Muscovite economist and a member of the informal “New Chronology” organization as their special guest. A. V. Podoinitsyn had related the main points of our research and answered a great many of the viewers’ questions live. The programmes had caused a great resonance.

In 2001 and 2002 G. K. Kasparov, the World Chess Champion, voiced his support of the critical part of the New Chronology publicly.

In 1999, the prominent writer, sociologist, logician, and philosopher A. A. Zinoviev, who had just returned to Russia after many years spent in emigration, got in touch with us. Having read some of our publications, he decided that our concept was generally a correct one, concurring well with his own research in the field of history and historical falsifications. He voices a number of related ideas in his preface to the new edition of our *Introduction to the New Chronology*, 2001, Kraft Publishing (read it in [Book 1 of the History: Fiction of Science series](#)).

In 1996, our materials on the new chronology started to appear online. The number of related web sites keeps on growing and at the moment there are about ten of them in Russia and at least one in Germany, which is the brainchild of Professor E. Y. Gabovitsch (Karlsruhe and Potsdam,

Germany), the founder of the new German Salon of History – the institution where the new chronology has been discussed very actively over the last couple of years. E. Y. Gabovitsch has also helped us immensely with archive research he had conducted in Germany. A number of valuable ideas and considerations of his have helped with the reconstruction of the true history.

The web site is currently becoming increasingly popular in Russia, offering constant discussion opportunities for both proponents and opponents of the new chronology; its URL is chronologia.org (see also: history.mithec.com).

The reaction of historians during the period of 1990-1998 was rather lukewarm and didn't go beyond the odd occasional article whose authors didn't even bother to give scientific counter-arguments but merely expressed their disapprobation. The radical change came about in 1998. One of the Presidium sessions of the Russian Academy of Sciences was gathered with the sole purpose of discussing our research.

Later on, the History Department Bureau of the Academy was called for a special session, and the issue was also discussed at the subsequent session of the Mathematics Department Bureau. The History Department Bureau had proposed an entire combat plan for opposing the new chronology, which was implemented most visibly in December 1999, when the History Department of the MSU organized a large conference suggestively enough named “The Myths of the New Chronology”. The main point of the conference agenda was that of a categorical deprecation of our research, and the conclusion was made that the new research should be pronounced perfectly unacceptable, all research concerning the New Chronology was to be banned, and its authors reprimanded severely. (See details in [Chron7](#), Appendix 4). A rather amusing process commenced shortly afterwards. The materials of this conference were published several times under different titles and covers, with minute variations. Our opponents went so far as to publish a whole series of book under the title of “Anti-Fomenko”. There are seven such books to date,

and all of them duplicate each other; it looks like their number might grow in near future. We familiarized ourselves with the criticisms thoroughly and learned that the historians haven't managed to find any original counter-arguments. The material was presented in a more "scientific" and "advanced" manner, with considerable progress made in the fine art of attaching labels. We have written a detailed reply, see [Chron7](#), Appendix 4.

Starting with 1996, a number of books proving the falsity of Western European mediaeval chronology were published by German scientists (see [Chron7](#), Appendix 3). However, the authors of works appear to misperceive the entire scale of the problem, thinking that several minor local corrections of the Scaligerian chronology should suffice. This is a mistake that they need to become aware of before they succeed in any of their endeavours. At the same time, the critical part of those works is written thoroughly enough. The first book that has to be mentioned in this respect is Uve Topper's *The Great Campaign* on the falsification of history, as well as *C-14 Crash* by Blöss and Nimitz that conveys to us the knowledge of radiocarbon analysis (see [Bibliography](#)).

The years 2000-2001 have been marked by the publication of such books as *The True History of Russia* and *Multi-Optional History* by Alexander Goutz, a mathematician from Omsk, and N. I. Khodakovsky's *The Temporal Spiral*. A. Boushkov's *The Russia That Never Was* is also visibly influenced by our works. This list can be continued. Despite the fact that the key chronological issues are not related in these books, they unravel several new and interesting facts that confirm our general concept.

However, we must firmly disagree with a number of ideas voiced in these works and ones similar to them. Being in favour of such activity in general, we beg to differ between these works and our scientific research of chronology. We regard ascribing what we clearly did not say to us, or speaking on behalf of the New Chronology without our consent, as perfectly unacceptable. All that we deem worth relating is already

published in our books, or will be formulated in the upcoming ones. They remain the original source for the entire concept of the New Chronology. It is also unacceptable to ascribe our ideas and results, leave alone the basic postulates of our concept, to others. We thoroughly deprecate the use of the term that we coined along with the entire concept of New Chronology for the propaganda of views that we do not share.

Let us mention another interesting effect. The recent publication of certain authors is clearly derivative, spawned by the “echoes” of the New Chronology. Such “informational reverberations” are doubtlessly of use; nevertheless, one has to bear in mind that they neither constitute the essence of the New Chronology, nor its foundations, namely, the natural scientific dating methods and the new concept of history that has evolved from those as our hypothesis. Any attempts to replace the foundations of the New Chronology with derivative observations of linguistical or historical nature may create the illusion of being essential or evidential to the New Chronology. This is untrue. The conception is based on statistical and astronomical dating methods first and foremost.

A. T. Fomenko, G. V. Nosovskiy
April 2001

The strange leap of parameter D'' in the theory of lunar motion

Nowadays we have special calculation tables – the so-called canons – whose compilation was based on the theory of lunar motion ([\[534\]](#)). They contain the date of each eclipse, the area to be covered by the lunar shadow, the phase, etc. See the famous astronomical canon of Ginzel, for instance ([\[1154\]](#)). If an ancient text describes some eclipse in enough detail, we can determine what characteristics of the eclipse had been observed – the phase, the geographical area that the shadow passes over, etc. The comparison of these characteristics to the referential ones contained in the tables may give a concurrence with an eclipse possessing similar characteristics. If this proves a success, we can date the eclipse. However, it may turn out that several eclipses from the astronomical canon fit the description; in this case the dating is uncertain. All the eclipses described in the “ancient” and mediaeval sources have been dated by the following method to some extent at least ([\[1154\]](#), [\[1155\]](#), [\[1156\]](#), [\[1315\]](#), [\[1316\]](#), [\[1317\]](#), etc.).

Nowadays the datings of the “ancient” eclipses are occasionally used in astronomical research. For instance, the theory of lunar motion has the notion of the so-called parameter D'' – the second derivative of lunar elongation that characterizes acceleration. Let us remind the reader of the definition of elongation. Fig. 2.1 shows the solar orbit of the Earth and the telluric orbit of the moon. The angle between the vectors ES and EM is called lunar elongation D – the angle between the lines of sight drawn from the Earth to the Sun and the moon. Apparently, it is time-dependent. An example of the elongation of Venus can be seen in the picture on the right. Maximal elongation is the angle where the line of sight as drawn

from Earth to Venus ($E'V'$) touches the orbit of Venus. One has to note that the orbits in fig. 2.1 are shown as circular, while being elliptic in reality – however, since the eccentricity is low here, the ellipses are schematically drawn as circles.

Fig. 2.1. Lunar elongation is the angle between the vectors ES and EM . The elongation of Venus is the angle between ES and EV . The maximal elongation of Venus is the angle between $E'S$ and $E'V'$.

Some computational problems related to astronomy require the knowledge of lunar acceleration as it had been in the past. The problem of calculating parameter D'' over a large time interval as a time function was discussed by the Royal Society of London and the British Academy of Sciences in 1972 ([1453]). The calculation of the parameter D'' was based on the following scheme: the equation parameters of lunar motion, including D'' , are taken with their modern values and then varied in such a way that the theoretically calculated characteristics of ancient eclipses coincide with the ones given for dated eclipses in ancient documents. Parameter D'' is ignored for the calculation of actual eclipse dates, since the latter are a rougher parameter whose calculation does not require the exact knowledge of lunar acceleration. Alterations in lunar acceleration affect secondary characteristics of the eclipse, such as the shadow track left by the moon on the surface of the Earth, which may be moved sideways a little.

The time dependence of D'' was first calculated by the eminent American astronomer Robert Newton ([1303]). According to him,

parameter D'' can be “defined well by the abundant information about the dates scattered over the interval from 700 B.C. until the present day” ([1304], page 113). Newton calculated 12 possible values of parameter D'' , having based them on 370 “ancient” eclipse descriptions. Since R. Newton trusted Scaligerian chronology completely, it is little wonder that he took the eclipse dates from Scaligerian chronological tables. The results of R. Newton combined with the results obtained by Martin, who was processed about 2000 telescopic observations of the moon from the period of 1627-1860 (26 values altogether) have made it possible to draw an experimental time dependency curve for D'' , qv fig. 2.2.

Fig. 2.2. The D'' graph calculated by Robert Newton. Parameter D'' is measured here as seconds divided by century². Parameter D'' performs a sudden leap on the interval of the alleged VI-XI centuries A.D. Taken from [1303] and [1304].

According to R. Newton, “the most *stunning* fact... is the drastic drop in D'' that begins with 700 [A.D. – A. F.] and continues until about 1300... This drop implies the existence of a “square wave” in the osculating value of D'' ... Such changes in the behaviour of D'' , and such rates of these changes, *cannot be explained* by modern geophysical theories” ([1304], page 114; [1453]). Robert Newton wrote an entire monograph titled *Astronomical Evidence Concerning Non-Gravitational Forces In The*

Earth-Moon System ([\[1303\]](#)) that was concerned with trying to prove this mysterious gap in the behaviour of D'' , which manifested as a leap by an entire numeric order. One has to note that these mysterious non-gravitational forces *failed to manifest in any other way at all*.

Having studied the graph that was drawn as a result of these calculations, R. Newton had to mark that “between the years (-700) and (+500), the value of D'' remains the lowest as compared to the ones that have been observed for any other moment during the last 1000 years” ([\[1304\]](#), page 114).

Newton proceeds to tell us that “these estimations combined with modern data tell one that D'' may possess *amazingly large values*, and that it has been subject to *drastic and sudden fluctuations* over the last 2000 years, *to such an extent that its value became inverted around 800 A.D.*” ([\[1453\]](#), page 115).

Summary:

1. The D'' value *drops suddenly*, and this leap by an entire order begins in the alleged V century A.D.;
2. Beginning with the XI century and on, the values of the parameter D'' become more or less constant and close to its modern value;
3. In the interval between the alleged V and XI centuries A.D. one finds D'' values to be in complete disarray.

This strange fact has a natural explanation within the paradigm of the New Chronology.

2.

Are the “ancient” and mediaeval eclipses dated correctly?

2.1. Some astronomical data

Let us give a brief digest of the information that shall ensure a better understanding of the current chapter. More detail can be found in such sources as [\[534\]](#), for instance.

When the moon gets into the cone of telluric shadow, one can observe a *lunar* eclipse on Earth – more specifically, on its nocturnal hemisphere, the one that faces the moon. A lunar eclipse can be observed from any point of the Earth’s nocturnal hemisphere. An eclipse doesn’t last longer than three hours and is only possible during a full moon; however, due to the irregularity of lunar motion, it doesn’t happen every time the moon is full. The repetition of lunar eclipses is roughly and approximately periodic, and conforms to the so-called *Saros cycle*. A Saros period equals about 18 years. 28 lunar eclipses occur over this time, so one can find an eclipse that falls over virtually every given year. A Saros is easily determined over 50-60 years of systematic observation, and might have already been known at the dawn of astronomy. The prediction of lunar eclipses based on the Saros cycle is nevertheless somewhat uncertain, not only due to the imprecision of the Saros cycle, but also because of the fact that the eclipse might occur when the hemisphere where the observer is located is illuminated by sunlight, which renders the moon invisible.

A *solar* eclipse occurs when the observer gets into the cone of the lunar shadow. If the solar disc is completely covered by the moon, the place where the eclipse can be observed becomes darkened to the extent of making the stars visible. This is a full eclipse whose duration does not exceed 8 minutes in the equatorial zone, and 6 in moderate latitudes. The

lunar shadow moves across the surface of the Earth at the speed of about 110 meters per second, forming a narrow line. The width of this line does not exceed 4 degrees. The track of the umbral shadow is bordered by stripes of penumbral shadow, whose width as counted from the centre of the umbral shadow comprises about 30 degrees in moderate latitudes and about 15 degrees near the equator. The observer in the penumbral shadow only sees a partial covering of the solar disc by the moon: a partial eclipse. The maximal degree of the covering of the solar disc by the lunar shadow is called the depth, or the phase of the eclipse. The estimations of the phase are usually expressed by the b value that is calculated by the formula $b=12h$, h being the ratio between the shadow-covered part of the solar diameter and the entirety of the latter. Hence, a total eclipse of the Sun will have a phase value of 12. A solar eclipse becomes visible as a darkening of the solar disc starting with the phase values of 3"–4".

The lunar eclipse phases are calculated differently – namely, another item that is proportional to the duration of the eclipse if the latter is more than full is added to the phase value of 12". Thus, the phase value of a lunar eclipse might reach up to 22.7".

In cases of *solar* eclipses there may be situations when the cone of the moon's umbral shadow does not reach the Earth. In this case, an annular solar eclipse is possible, when no stars are visible, as is the case with all partial solar eclipses. A solar eclipse is only possible when the moon is new; however, not every new moon is marked by a solar eclipse, since the Earth may slip past the cone of the lunar shadow due to the incline of the lunar orbit towards the ecliptic (or the plane of the telluric orbit). This is why there are only 2-7 solar eclipses happening every year. Every geographical area of the Earth gets an eclipse with a minimal phase value of 6" in the span of 10-20 years from any date.

Predicting solar eclipses is a truly formidable task due to the complexity of the lunar motion that is defined by a large number of external factors. One may attempt to predict solar eclipses by the Saros cycle that includes about 43 solar eclipses – 15 of them being partial, 14 annular, 2 belonging

to the category of the so-called “total-annular,” and 12 total. However, the eclipses from the Saros cycle can occur in different areas of the Earth, and so a prediction for a given location is true in one case out of 400 in general. That is to say, the probability of a correct prediction based on the Saros cycle equals $1/400$ ([544], Volume 4, page 415). In theory, the so-called triple Saros, whose duration is 24 years, should be more precise; however, the probability that it may give a correct prediction equals about $1/99$, so it is of little practical utility. From the astronomical point of view, the empirical triple Saros can only be discovered as a result of long-time solar eclipse observations. Due to the low recurrence rate of the eclipses separated by the triple Saros, let alone the problems of mathematical processing of the empirical data necessary for the calculation of an undefined recurrence rate, any such discovery would imply a well-developed system of natural sciences.

A more or less certain prediction of solar eclipses is apparently only made possible by the existence of a sufficiently advanced theory of lunar motion that would at least account for the principal irregularities of the latter. Thus, the prediction of solar eclipses remained a de facto impossibility a hundred years after Copernicus. We should thus treat the eclipse prediction reports preceding the XVI-XVII centuries with the utmost caution, or even suspicion.

2.2. The discovery of an interesting effect: an unprejudiced astronomical dating shifts the dates of the “ancient” eclipses to the Middle Ages

Dealing with certain celestial mechanics issues in the 1970s, the author of the current book discovered the possibility of a link between the alleged gap in the value of D'' (see [1303]) and the results of N. A. Morozov’s research concerning the datings of ancient eclipses ([544]). A study of the issue and a new calculation of parameter D'' attains an *altogether different quality*; namely, one sees the *complete elimination* of the mysterious leap.

Parameter D'' appears to be subject to minute fluctuations around one permanent value coinciding with the current value of this parameter (qv in A.T. Fomenko's articles [\[1128\]](#) and [\[883\]](#)). All of this can be summed up as follows.

The previous calculation of the parameter D'' was based on the dates of ancient eclipses used in the consensual chronology of Scaliger-Petavius. All the astronomers' attempts to explain the strange gap in D'' didn't get anywhere near the issue of the correctness of datings considered "ancient" and early mediaeval nowadays – in other words, in how far the parameters of the eclipse described in the chronicle correspond with the calculated parameters of the real eclipse that Scaligerian chronology suggests to be described in the chronicle in question.

The following method of independent astronomical dating was proposed in [\[544\]](#): obtaining all of the characteristics described in the chronicle, such as the phase, the time, geographical observation location, etc., and copying all of the eclipse dates fitting these characteristics from the reference tables mechanically. N. A. Morozov discovered that the astronomers have been under the pressure of Scaligerian chronology, and so only considered the dates that Scaligerian chronology had already ascribed to the eclipse in question and the events related thereto ([\[544\]](#)).

As a result, in many cases astronomers failed to find eclipses corresponding to the chronicle description in the required century, and had to resort to approximations, without the merest thought of questioning Scaligerian chronology and indicating eclipses that would fit the chronicle description partially. Having revised the datings of the eclipses considered "ancient," Morozov found that the reports of these events fall into two categories:

1. Brief and nebulous accounts with no details given. In many cases it is altogether unclear whether the event described is an eclipse at all. The astronomical dating in this category either has no meaning whatsoever, or gives so many possible solutions that they can

basically fit any historical epoch at all.

2. Exhaustive, detailed reports. The astronomical solution for those is often singular, or there are two or three solutions at most.

Apparently, all of the eclipses with detailed descriptions falling into the period between 1000 B.C. and 500 A.D. get independent astronomical datings that differ significantly from the ones offered by Scaligerian chronology and belong to a much latter epoch, namely, the interval between 500 and 1700 A.D. Being of the opinion that Scaligerian chronology was correct about the interval 500-1800 A.D. for the most part, Morozov did not analyze the mediaeval eclipses of 500-1700 A.D., assuming that no contradictions would be found there. Let us dwell on this for a short while.

Morozov didn't possess the sheer deliberation needed for the realization that Scaligerian chronology had been erroneous up until the epoch of the XI-XIII century A.D. He stopped with the VI century A.D., assuming more recent chronology to be correct in the form offered by Scaliger and Petavius. His erroneous presupposition naturally affected the analysis of the "ancient" eclipses. We see today that Morozov's analysis was not completely objective, since he had obviously been reluctant to alter the post-VI century chronology. This isn't hard to understand, as the transition from the artificially extended Scaligerian chronology spanning millennia to a much shorter one beginning with the XI century A.D. looked absurd even to N. A. Morozov.

In Volume 4 of [\[544\]](#), for instance (in Section 4, Part II, Chapter 2), Morozov discusses one of the eclipses that is today ascribed to the V century A.D., being of the opinion that its Scaligerian dating is confirmed. However, it becomes obvious that no confirmation of the Scaligerian chronology could have possibly taken place. The description of the eclipse is quite nebulous, and the use of comets for dating purposes is impossible due to reasons that shall be related in the chapter of [Chron5](#) where we consider comet lists specifically. Being certain that Scaligerian history was

following the correct chronology ever since the V century A.D., Morozov was inconsistent in his analysis of post-V century eclipses. Had he encountered an equally nebulous description referring to a *pre-IV century* eclipse, he would have justly considered it a description that cannot be proved astronomically.

Morozov made a similar mistake in his descriptions of other eclipses dated to the alleged V-VI century A.D. He treated them a lot more benevolently than their pre-IV century precursors. The eclipses of the VI-XI century weren't checked by Morozov at all, since he had believed the Scaligerian datings to have been satisfactory. Unlike Morozov, we have continued with the critical research, having covered the post-V century period up until the XVII century A.D., and discovered that Morozov should not have stopped with the IV-V century. The datings of the eclipse descriptions that are ascribed nowadays to the X-XIII centuries A.D. contradict astronomy to just as great an extent as those preceding the IV century A.D. In cases when there's a concurrence of sorts, one almost always discovers that these eclipses have been *calculated a posteriori*, that is, affixed to a certain point in the past by the mediaeval chronologers of the XVI-XVII century in order to confirm Scaligerian chronology, whose naissance occurred around that time. Having calculated the dates for certain lunar eclipses of the past, Scaligerite chronologers included them in the "ancient" chronicles that they were creating in order to give "solid proof" to the false chronology. It is of course possible that the odd occasional veracious description of the VI-XIII century eclipses would reach the chronologists of the XVI-XVII century. However, it would surely have to pass the filter of the Scaligerian version and be "brought into accordance" with the "correct" dates.

Thus, continuing the research that began in [\[544\]](#), the author of this book conducted an analysis of other mediaeval eclipses in the interval between 400 and 1600 A.D. It turned out that the "transfer effect" affecting the "ancient" eclipses as described in [\[544\]](#) also applies to those usually dated to 400-900 A.D. This either means that there are many possible

astronomical solutions, which make the dating uncertain, or there are just one or two, in which case they all fall in the interval between 900 and 1700 A.D. Only starting with approximately 1000 A.D. – and not 400 A.D., according to Morozov in [544] – does the Scaligerian dating begin to concur with the results of Morozov’s method satisfactorily enough, becoming more or less certain by as late a date as 1300 A.D.

Let us give a few extremely representative examples demonstrating how the “ancient” eclipses and the chronicles that describe them become a great deal younger.

2.3. Three eclipses described by the “ancient” Thucydides

Scaligerian history tries to convince us that Thucydides was born in approximately 460 B.C., or 456-451 B.C., and died around 396 B.C. ([924], page 405). He was a wealthy aristocrat and politician from Athens. During the Peloponnesian war Thucydides was in command of the Athenian fleet, albeit unsuccessfully. He was subsequently banished from Athens for 20 years. He wrote his famous tractate during his sojourn in Thracia. Thucydides had received amnesty near the end of the war; he returned to Athens and died shortly afterwards.

Historical tradition trusts Thucydides in his descriptions of military events, considering him an eyewitness and a participant. Thucydides himself writes the following: “I was writing down the events witnessed by myself as well as what I had heard from others, after as meticulous a study of each fact as circumstances allowed... I have survived the entire war... understood it, and studied it attentively” ([923], V:26).

Thucydides is the only source that we have in what concerns the history of the Peloponnesian War. Historians write that “after Thucydides... nobody turned to the history of the Peloponnesian war ever again. Many have however thought it would prove flattering for them to be seen as his followers, and started their own works where the tractate of Thucydides ended” ([961], page 171). It is supposed that the work of Thucydides either hadn’t had any title at all originally ([924], page 412), or had been

called *Communal Account* in Greek, having received the name *History of the Peloponnesian War* in later translations. The entire historical account of the 27-year war between the Ionians and the Dorians (could Doria mean “Horde” when read in reverse?) is given by Thucydides clearly and consequentially, though it remains incomplete.

The entire work of Thucydides, whose volume comprises about 800 pages when printed ([\[923\]](#)), is written in a brilliant style. Numerous commentators have pointed out the following hallmarks of his book a long time ago:

1. Thucydides demonstrates great erudition and writing experience;
2. The phrase constructions are complex and contain non-trivial grammatical structures;
3. One sees a clear development of an elegant realistic concept in the account of historical facts;
4. The author is sceptical about everything supernatural in people’s lives.

We are being convinced that this work was written in the V century B.C. when writing materials had still been scarce and expensive – the Mesopotamians use styluses to scribble on clay, the Greeks aren’t familiar with paper yet, and write on pieces of tree bark or use sticks for writing on wax-covered plaques.

The oldest written copy of the *History* of Thucydides is supposed to be the *Codex Laurentianus* parchment dated to the alleged X century ([\[924\]](#), page 403). All other old manuscripts belong to the alleged XI-XII centuries ([\[924\]](#), page 403). Some papyrus fragments of the second book of Thucydides were found in Egypt in the XIX century. A papyrus commentary is also in existence, published as late as 1908. However, the condition of these fragments is very poor indeed ([\[544\]](#), Volume 4, page 495). Let us note straight away that the datings of all the “oldest” manuscripts listed are based on palaeographical hypotheses exclusively, and therefore don’t seem very trustworthy. Any alteration of the chronology changes all of these “palaeographical datings” automatically.

There are no calendar dates mentioned in the *History* by Thucydides, and no planetary horoscopes. However, it contains the descriptions of three eclipses – two of them solar and one lunar. We shall be calling this combination as a triad. Apart from that, the first book (I:23) contains mentions of solar eclipses – however, those are rather general and vague, and cannot serve for any astronomical dating. The descriptions of the triad, however, are quite sufficient for an unambiguous solution. We shall consider it below.

The second volume of *History* contains a rather detailed description of the eclipse. (The Russian original refers to the well-known professional Russian translation of Thucydides done by F. G. Mishchenko in the XIX century – [923].) Thucydides writes that “the summer when the Athenians have chased the Aeginians with their wives and children from Aegina [Thucydides is referring to the first year of the war – A. F.]... The very same summer, when the moon was new – apparently, that is the only time when such things can happen – *the sun became darkened after midday and became full again, attaining the shape of a crescent, and several stars appeared*” ([923], II:27-28). The Greek text can be seen in fig. 2.3.

Thucydides II 28:
 Τοῦ δ' αὐτοῦ θέρους νουμηνία κατὰ σελήνην . . .
 ὃ ἥλιος ἐξέλιπε μετὰ μεσημβρίαν καὶ πάλιν ἀνεπληρώθη
 γεγόμενος μηνοειδὴς καὶ ἀστέρων τινῶν ἐκφανέντων.

Fig. 2.3. The Greek text of Thucydides describing the first eclipse from the “Thucydides triad” – a solar eclipse. Taken from [1154], page 176.

Let us pay attention to the fact that the author appears to understand the mechanism of the eclipse well, mentioning the new moon to be a necessary condition, which is a reference to a long-time practice of eclipse observation in the epoch of Thucydides.

The second eclipse of the triad, also solar, happens in the *eighth* year of the Peloponnesian war, in the beginning of summer. Thucydides writes in

the fourth volume that “the winter has ended, and with it – the seventh year of this war, whose history has been described by Thucydides. *In the beginning of the next summer, with the advent of the new moon, a partial solar eclipse took place*” ([923], IV:51-52). The Greek text can be seen in fig. 2.4. Apparently, the summer month mentioned as the month when the aestival campaign began was March, the month of Mars when military campaigns were usually started. It shall be interesting to verify this statement *after* the finite solution of the problem is obtained.

Thukydides IV, 52:
 τοῦ δ' ἐπιγιγνομένου θέρους εὐθὺς τοῦ τε ἡλίου
 ἐκλιπές τι ἐγένετο περὶ νοσημνίαν

Fig. 2.4. The Greek text of Thucydides describing the second eclipse from the “Thucydides triad” – a solar eclipse. Taken from [1154], page 178.

The third (lunar) eclipse is described in the seventh volume: “The winter was coming to an end together with the eighteenth year of the war whose history has been described by Thucydides. As soon as the next spring began, the Lacedaemonians and their allies invaded Attica, in the earliest season” ([923], VII:18-19). The events of the summer are related in detail further on. The analysis of the manoeuvres described shows that the next sections (50 and 51) most probably refer to the *end of summer*. This is where Thucydides writes that “when everything was ready, and the Athenians were preparing to sail away, *a lunar eclipse occurred; it had been full moon then*” ([923], VII:50). See Greek text in fig. 2.5.

Thukydides VII 50:
 μελλόντων αὐτῶν . . . ἀποπλεῖν ἢ σελήνη ἐκλείπει
 ἐτόγγανε γὰρ πανσέληνος οὕσα.

Fig. 2.5. The Greek text of Thucydides describing the third eclipse from the “Thucydides triad” – a lunar eclipse. Taken from [1154], page 178.

Let us sum up. The following information can be obtained from the text by Thucydides with absolute certainty:

1. All three eclipses were observed from the square fitting into the following geographical coordinates: longitude between 15 and 30 degrees, latitude between 30 and 42 degrees;
2. The first eclipse is solar;
3. The second eclipse is solar;
4. The third eclipse is lunar;
5. The time interval between the first two eclipses equals 7 years;
6. The interval between the second eclipse and the third equals 11 years;
7. The first eclipse occurs in the summer;
8. The first solar eclipse is a total eclipse, since one can see the stars – that is, its phase value equals 12. Remember, one cannot see any stars during a partial eclipse;
9. The first solar eclipse occurs after midday, local time;
10. The second solar eclipse occurs in the beginning of summer;
11. The lunar eclipse takes place around the end of summer;
12. The second solar eclipse occurred within the temporal vicinity of March. As a matter of fact, this consideration doesn't have to be included in this list.

The problem can be formulated as follows: finding the astronomical solution that would satisfy the requirements 1-11.

Historians and chronologists have naturally paid attention to such a precise description of three eclipses in an “ancient” work, and tried to date them accordingly. Apparently, the chronologists immediately ran into serious difficulties that haven't been overcome since. We shall proceed to give a more detailed account of the problem of dating the triad of Thucydides, following the well-known astronomical work of Ginzel ([\[1154\]](#), pages 176-177).

In the XVI century the chronologer Dionysius Petavius found the date that fitted the first eclipse: 3 August, 431 B.C. Johannes Kepler later

confirmed the fact that there was indeed an eclipse that day. The beginning of the Peloponnesian war was dated to the very same year, 431 B.C.

Petavius found the dating of the second eclipse as well, which was 21 March, 424 B.C. J. Kepler also confirmed the fact that a solar eclipse took place that day.

The date that D. Petavius found for the third eclipse was 27 August, 413 B.C.

This is how astronomy appears to have dated the events described by Thucydides to the V century B.C. However, a secondary analysis of the “astronomical solution” offered by Petavius unearthed serious complications that were repeatedly discussed in astronomical and chronological literature in the XVIII-XX century. These rather heated debates have recurred and abated several times; however, modern historians prefer to remain taciturn in everything that concerns this long and difficult discussion, pretending that the problem doesn’t exist and has never existed.

The main dating problems that the chronologers ran into concerned the first eclipse. The fact of the matter is that the eclipse of 3 August in 431 B.C. *proved an annular one, and so it couldn’t have been total anywhere on Earth*. This was realized after the inclusion of the Scaligerian “astronomical dating” of the beginning of the Peloponnesian war into Scaliger’s chronological tables. This eclipse is claimed to have been annular by Ginzel’s canon as well ([\[1154\]](#), page 176). The fact that the eclipse in question was an annular one can also be proved by the existing computer software for eclipse calculations. We have verified it using a simple program called Turbo-Sky that was developed by the Muscovite astronomer A. Volynkin in 1995, which is easy to use and convenient for approximate calculations. The eclipse of 3 August that occurred in 431 B.C. was in fact an annular eclipse.

However, Thucydides tells us explicitly that stars were visible during the eclipse. As we have already stated, one cannot observe the stars during a partial eclipse. Furthermore, it turned out that the phase value of the

“Petavius eclipse” of 431 B.C. was rather small in Athens, which means Kepler has also made a mistake in his *Optics* telling that the phase value of this eclipse had equalled twelve, or, in other words, that the eclipse had been total. Such a statement on the part of Kepler is most probably explained by the imperfection of the eclipse calculation methods of his age. The calculation of the phase of an eclipse is a delicate matter. However, we should not exclude the possibility that Kepler, who was involved in many chronological matters, had been perfectly aware of the fact that one can only see the stars during a total eclipse, and slyly transformed the annular eclipse of 431 B.C. into a full eclipse in order to make it satisfy the description given by Thucydides and protect the nascent Scaligerian chronology from such an unpleasant dissonance. Kepler had been in constant contact with Scaliger, who had been his correspondent.

Due to the abovementioned circumstances, astronomers and chronologists started new calculations of the phase of the eclipse that took place in 431 B.C. All sorts of empirical corrections were made in the equations of lunar movement in order to make the phase value of the eclipse as observed from Athens and neighbouring areas approach 12. Among the most prominent astronomers of the time that have dealt with the “Thucydides triad problem” we find such names as Petavius, Zech, Heis, Struyck, Kepler, Riccioli, Hofman, Ginzell, Johnson, Lynn, Stockwell and Seyffarth.

According to Petavius, the phase value of the eclipse equalled 10"25 ([\[1337\]](#), page 792). The phase value equalled 11" according to Struyck, 10"38 according to Zech, 10"72 according to Hofman, and only 7"9 according to Heis (!) ([\[1154\]](#), pages 176-177). Ginzell devoted the most attention to the problem of the “stars of Thucydides.” He came up with a phase value of 10" ([\[1154\]](#), pages 176-177). It became perfectly clear that apart from having been annular, the eclipse could only have been observed from Athens as partial, and with a rather small phase value at that. The lunar shadow track on the surface of the Earth during the eclipse of 3 August 431 B.C. is shown in fig. 2.6 as a dotted line, which signifies

the fact that the eclipse was an annular one. No umbral shadow could be observed anywhere.

Fig. 2.6. The erroneous astronomical “solution” for the “Thucydides triad” of eclipses as offered by D. Petavius. The track of the lunar shadow for the first annular solar eclipse of 431 B.C. is represented by a dotted line. The track for the second solar eclipse of 424 B.C. is represented by a solid line, with the large dot standing for the zenith point of the lunar eclipse of 413 B.C. Taken from [\[544\]](#), Volume 4, page 505.

The fact that the phase value of the Athenian eclipse of 431 B.C. only equalled 10" means that 1/6th of the solar disc was open. This is all but bright daytime, and one naturally cannot see any stars or planets. Furthermore, as it is made obvious in fig. 2.6, this eclipse had only passed Crimea around 17:22 local time (17:54 according to Heis). Thus, it can hardly be called an afternoon eclipse as Thucydides explicitly states. It

should rather be called an evening eclipse.

We have computed the respective positions of the moon and the sun at the moment when the phase value had been maximal for the observation point – the city of Athens and the area around it. One can see the screenshot in fig. 2.7. It is obvious that a large part of the solar disc is open, and neither stars nor planets can possibly be seen.

Fig. 2.7. The solar disc during the maximal phase of the 431 B.C. eclipse as seen from Athens. A large part of the sun remained uncovered. Neither stars nor planets were visible. Calculated with Turbo-Sky software.

Thus, the eclipse of 3 August 431 B.C. couldn't have been the one described by Thucydides, since conditions 8 and 9 aren't satisfied, as shown above.

This discovery was naturally a most unpleasant one for the Scaligerite chronologers and historians. The astronomer Ginzel went so far as to claim that “the low phase value which equalled 10" for Athens according to the latest calculations *caused a shock and significant doubt about the fact that ‘the stars could be seen,’ as Thucydides claims*” ([\[1154\]](#), page 176).

Since the stars clearly couldn't have been visible during the eclipse of 431 B.C., Heis and Lynn decided to calculate the disposition of bright planets in hope that they might save the situation. However, it turned out

that Mars was only 3 degrees above the horizon. Venus was high enough, about 30 degrees above the horizon. Ginzel makes the cautious remark in regards to Venus and Mars that these two planets “may have been visible” ([1154], page 176). However, this probability is low in what was practically broad daylight. All other hopes have been for Jupiter and Saturn, but it turned out that Jupiter was *below the horizon* during the eclipse, and therefore invisible; and as for Saturn, although it was above the horizon, its location was in Libra, a long way off to the south, and, according to Ginzel, its “visibility was *very dubious* [*sehr zweifelhaft*]” ([1154], page 176).

We have used the Turbo-Sky software in order to compute the planet locations for the time of the eclipse that occurred on 3 August 431 B.C. (see fig. 2.8). What one sees here is a view of the sky from Athens for the maximal phase of the eclipse at 14:57 GMT. It is clear that Venus, Mars, and the much dimmer Mercury are *close to the sun*, and thus rendered invisible by the rays of the partially obscured radiant orb. Their visibility in broad daylight is extremely improbable.

Fig. 2.8. Planet disposition at the moment of the eclipse in 431 B.C. Venus and Mars are close to the sun, and most probably aren't visible with a large part of the solar disc

exposed. Mercury is altogether dim, whereas Jupiter is below the horizon. Saturn is far away to the south, and its hypothetical visibility is “quite dubious”, as Ginzel justly points out.

The gravity of the situation that the proponents of Scaligerian chronology had been well aware of made Johnson suggest a different eclipse, one that occurred on the 30th of March in 433 B.C.; however, it isn't included in any triad. The nearest triads are 447, 441 and 430 B.C., and 412, 405 and 394 B.C. They don't fit for different reasons. The phase value of the eclipse suggested by Johnson also turned out to have equalled a mere $7''8$, which is even less than the eclipse mistakenly suggested by Petavius ([1154], page 177).

Stockwell then tried to revise the calculations in order to make the phase maximal. However, the very peak of his ingenuity only allowed him the result of $11''06$. However, Ginzel's reaction to Stockwell's calculations was quite sceptical.

Seyffarth put forward a hypothesis that Thucydides may have been referring to the eclipse of 27 January 430 B.C. ([1154], page 177). However, despite the fact that this eclipse is far from fitting the description given by Thucydides (for instance, it cannot be included into any triad at all), a thorough check showed that the eclipse could not have been visible near Athens ([1154], page 177).

The shock that Ginzel mentioned eventually became replaced by a confusion of sorts, which has brought about altogether different considerations that led farther and farther away from astronomy; among those – pure demagogy. Zech, for instance, tried to eliminate the problem by his references to “the clear skies of Athens and the sharp eyes of the ancients” ([1154], page 177). Apparently, our contemporaries would fail to see any stars at all, but the ancients were an altogether different race. Their vision was a lot keener. They ran faster, too.

Hofman went even further in his suggestion to consider the stars of Thucydides a mere rhetorical embellishment ([1154], page 177). This

translates as “we trust him in every other respect, but refuse to do so in this particular instance.” Hofman tries to find linguistic proof for his theory, implying that Thucydides reports the appearance of stars when the sun had already assumed the shape of a crescent. We have asked the philologist E. V. Alekseyeva (Department of Philology, MSU, 1976 – see [Annex](#)) to perform a philological analysis of the text that can be seen in fig. 2.3. The linguistic verdict was that the following four events are described by Thucydides:

1. The occultation of the sun;
2. The crescent shape assumed by the sun;
3. The appearance of stars;
4. The restoration of the entirety of the solar disc.

Thus, the entire eclipse process is described. The darkening of the disc at the beginning, its transformation into a crescent, and the subsequent visibility of the stars (this only happens at the maximal phase of a total eclipse), and the return of the disc to its original form. The consequence of events 1-4 is quite natural, and is unequivocally defined by the grammatical structure of the phrase. Actually, that was exactly the way that the professional translator quoted above, F.G. Mishchenko, translated this fragment from the ancient Greek in the XIX century. The analysis performed by E. V. Alekseyeva confirmed the correctness of the classical translation yet again – it wouldn’t have been questioned in the first place, if it hadn’t been for the problem with astronomical dating that arose in this respect.

Therefore, Hofman’s opinion, that was also shared by the modern astronomer Robert Newton, is really based on the wish to save Scaligerian chronology at any cost, and not the actual translation.

We see that the attempt to substitute astronomy for linguistics does not solve the problem.

Despite all this, the erroneous date offered by Petavius wasn’t altered, and any modern history textbook indicates the date that the Peloponnesian

war began as 431 B.C., albeit for no other reasons than Petavius' opinion. *His chronology has been legitimized despite its blatant deviation from the clear and unambiguous description of Thucydides.*

The description contained in the original text is a detailed and fundamental, which makes all attempts of rectifying the case by playing with the text look ridiculous. Apart from Hofman's "solution," it was proposed to alter the durations of the intervals between the neighbouring eclipses (the ones that equal 7 and 11 years according to Thucydides). However, even the authors of this proposal refused to elaborate on it.

It is hard to doubt that Thucydides was referring to a full eclipse when describing the first one of the triad. In case of the second eclipse (which was partial) he explicitly states that "a *partial* eclipse of the sun occurred when the moon was new" ([\[923\]](#), IV:52). The word "partial" is used here; apparently, the author understood the difference between a total eclipse and a partial eclipse quite well. That is why he emphasized the visibility of the stars in the first case, which is a hallmark of a total eclipse.

Let us give a summary. The astronomers failed to find any other fitting astronomical solutions in the interval between 600 and 200 B.C. However, no one had thought of broadening the search interval so that the Middle Ages would be included. It is well understood – they have all been raised on Scaligerian chronology, and trusted it, by and large. As a result, the erroneous triad of Petavius was kept, despite the fact that this "solution" contradicts the text of Thucydides. The use of the independent dating method in the entire interval between 900 B.C. and 1700 A.D. shows that a *precise astronomical solution does exist; furthermore, there are only two solutions that fit exactly.* The first one was discovered by N. A. Morozov in [\[544\]](#), Volume 4, page 509; the second, by A. T. Fomenko during a new analysis of the "ancient" and mediaeval eclipses.

The first solution (N.A. Morozov):

1133 A.D., 2 August (total solar);

1140 A.D., 20 March (total solar);

1151 A.D., 28 August (lunar).

The second solution (A.T. Fomenko):

1039 A.D., 22 August (total solar);

1046 A.D., 9 April (partial solar);

1057 A.D., 15 September (lunar).

Even condition 12, stipulating the time around March for the second eclipse, is met here. More importantly, the first eclipse is *total*, the way Thucydides describes it. Thus, once we managed to venture outside Procrustean paradigm of Scaligerian chronology, we found the answer to a question that has been of great interest to astronomers – that of the astronomical descriptions contained in the book of Thucydides.

Taking all the facts that we already know into consideration, we should conclude that the solution closest to historical reality is apparently the one suggested by Morozov – the more recent triad of eclipses falling on the middle of the XII century – namely, 2 August 1133 A.D., 20 March 1140 A.D., and 28 August 1151 A.D. The XI-century solution is most probably too early. Morozov's 1133, 1140, and 1151 A.D. solution is illustrated in fig. 2.9. One can see the lunar shadow tracks on the surface of the Earth for total solar eclipses of 1133 and 1140 as well as the zenith visibility point for the lunar eclipse of 1151 A.D.

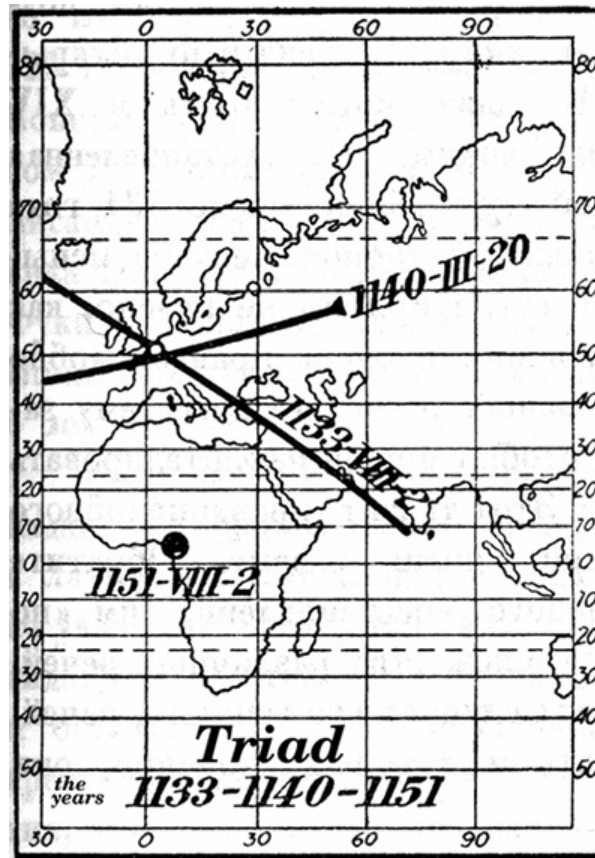

Fig. 2.9 The triad of eclipses described by the “ancient” Thucydides: 1133, 1140, and 1151 A.D. The solution was found by N. A. Morozov. One sees the lunar shadow tracks for the first two eclipses and the zenith visibility point for the lunar eclipse of 1151.

Taken from [\[544\]](#), Volume 4, page 509.

We have verified the two solutions listed above with the Turbo-Sky software. Let us quote the exact data characterizing the total eclipses of 22 August 1039 and the 2 August 1133. They are listed as full in the Oppolzer eclipse canon ([\[544\]](#), Volume 5, pages 77-141). The Turbo-Sky application identifies them as total eclipses as well. We shall give the geographical coordinates of the beginning, middle, and end of the lunar shadow trajectory on the surface of the Earth for the total eclipse of the 2 August 1133. The first line gives the longitude, and the second, the latitude.

$$\begin{array}{l} -89 +8 +72 \\ +52 +53 +9 \end{array}$$

The umbral lunar shadow had been at the central point of the trajectory (with the sun in the zenith) from about 11:15 to 11:17 GMT (according to the Turbo-Sky application).

For the eclipse dating from 22 August 1039 of the second triad (the XI-century one), the umbral shadow of the moon was at the central point of the trajectory at about 11:15 GMT. The coordinates are 7 degrees of Eastern longitude and 45 degrees of Northern latitude (Turbo-Sky).

N. A. Morozov made the following justified remark regarding the full eclipse of 2 August 1133 in the XII-century triad: “The sun appeared to rise in total occultation on the southern coast of the Hudson Bay, it had been matutinal in England as well, came to Holland at noon, to Germany, Austria, *the vicinity of the Bosphorus*, Mesopotamia, and the Gulf of Arabia, and set in complete darkness in the Indian ocean” ([\[544\]](#), volume 4, page 508). The eclipse was full and its phase maximal, everything went dark, and one could naturally see the stars in the sky.

Thus, the XII-century triad discovered by N. A. Morozov can be seen as follows:

1) The first total eclipse of the sun occurred on 2 August 1133 A.D. and happened in the following manner:

$$\begin{array}{r} -89 +8 +72 \\ +52 +53 +9 \end{array}$$

The central point of the lunar shadow trajectory on the surface of the Earth was passed between about 11:15 and 11:17 GMT (see fig. 2.9; also see [\[544\]](#), Volume 5, page 122).

2) The second full eclipse happened on 20 March 1140, as follows:

$$\begin{array}{r} -96 -30 +48 \\ +20 +42 +55 \end{array}$$

The central point of the lunar shadow trajectory on the surface of the

Earth passed at approximately 13:40 GMT (Oppolzer's canon; see [\[544\]](#), Volume 5, page 123, and fig. 2.9).

3) The partial lunar eclipse of 28 August 1151 A.D. had the maximal phase value of 4" at 23:25 GMT. The zenith visibility of the moon concurred with the point whose geographical coordinates were 8 degrees of Eastern longitude, and 7 degrees of Southern latitude ([\[544\]](#), Volume 5, page 51).

This XII-century triad is ideal in all respects. The second eclipse really occurred in March, as one should have expected from the text of Thucydides.

The XI-century triad discovered by A.T. Fomenko:

1) The first solar eclipse, of 22 August 1039 A.D., happened in the following way:

$$\begin{array}{r} -82 +7 +64 \\ +55 +45 +2 \end{array}$$

The central point of the lunar shadow trajectory on the surface of Earth was passed at about 11:15 GMT (see fig. 2.9; also see [\[544\]](#), volume 5, page 118).

2) The second solar eclipse (partial) of 9 April 1046 A.D. occurred as follows:

$$\begin{array}{r} +22 +87 +170 \\ +19 +47 +50 \end{array}$$

The central point of the lunar shadow trajectory on the Earth surface was passed about 5:46 GMT (Oppolzer canon; see [\[544\]](#), Volume 5, page 123 and fig. 2.9).

3) The partial lunar eclipse of 15 September 1057 A.D. had the maximal phase value of 5" at 18:09 GMT. The zenith visibility of the moon concurred with the point whose geographical coordinates were 86 degrees of Eastern longitude, and 1 degree of Southern latitude ([\[544\]](#), Volume 5, page 49).

The Thucydides eclipse triad is a very substantial argument proving that the *History of the Peloponnesian War* by Thucydides couldn't have been written earlier than the XI century A.D. It is most improbable that the triad is a fantasy of the author, since in that case a fitting astronomical solution would most probably have been nonexistent. It is also hard to consider the eclipses an apocryphal part of the “ancient” text, since they fit the consecutive and detailed narration incredibly well.

N. A. Morozov appears to have been correct in noting that “the book of Thucydides isn't ancient or mediaeval, it dates [from] the thirteenth century of our era at least, the Renaissance epoch” ([\[544\]](#), Volume 4, page 531).

2.4. The eclipses described by the “ancient” Titus Livy

Let us give a few more examples. Omitting the details this time, we shall just report that the eclipse from the *History* by Titus Livy (XXXVII, 4, 4) that the modern chronologers ascribe to 190 B.C. or 188 B.C., also fails to satisfy the description of Titus Livy. The situation with the eclipses of Thucydides is repeated yet again. It turns out that an independent astronomical dating yields just one precise solution in the interval between 900 B.C. and 1600 A.D.: 967 A.D. ([\[544\]](#)).

The situation with the lunar eclipse that Titus Livy describes in his *History* (LIV, 36, 1) is exactly the same. Scaligerite chronologers suggest that Livy is referring to the eclipse of 168 B.C. However, analysis shows that the characteristics of this eclipse do not fit the description given by Livy. The eclipse that he describes could really have happened on one of the following dates:

- Either in 415 A.D., at night between the 4th and the 5th of September;
- In 955 A.D., at night between the 4th and the 5th of September;
- Or in 1020 A.D., at night between the 4th and the 5th of September.

This pattern of false dating goes on and on. A list of such examples includes all the ancient eclipses that have detailed descriptions. We shall

present the whole picture of this effect of moving ancient eclipse dates forward in time, below.

3.

Transferring the dates of the “ancient” eclipses forward in time into the Middle Ages eliminates the enigmatic behaviour of the parameter D''

The author of the current book proceeded to re-calculate the parameter D'' values using the new dates for ancient eclipses that were produced as a result of the method described above. The discovered effect of moving ancient eclipses forward in time led to the identification of many “ancient” eclipses with the mediaeval ones. This, in turn, allowed us to expand and alter the list of such mediaeval eclipses. New data were obtained from the descriptions considered “ancient” earlier on, and added to the mediaeval eclipse descriptions. Nevertheless, research has shown that previous values of D'' basically didn’t change over the interval of 500-1990 A.D. A new curve for D'' can be seen in fig. 2.10.

Fig. 2.10. Comparison of D'' graphs as calculated by R. Newton and A. T. Fomenko. Parameter D'' is measured here as seconds divided by century². The new D'' graph has neither gaps nor leaps, and fluctuates around a constant value.

*The new curve is qualitatively different from the previous one. In the interval between 1000 and 1900 A.D. parameter D'' reflects in an even curve on the graph, one that is practically horizontal and fluctuates around a single constant value. It turns out *there have never been any drastic leaps in the parameter, whose value has always equalled the current*. Therefore, one doesn't have to invent any mysterious non-gravitational theories.*

The fluctuation rate of D'' values, which is rather low in the interval of 1000-1900 A.D. grows significantly when we move from 1000 A.D. to the left, towards 500 A.D. This means that either the scarce astronomical descriptions that chronologists ascribe to this period are very nebulous, or, more likely, these chronicles are also misdated, and the events they describe are in need of re-dating. However, due to the utter vagueness of the remaining astronomical descriptions, they cannot be used for dating purposes since they offer too many solutions. The re-dating of the events that precede the XI century shall have to be done by other means and methods, some of which shall be related below.

Further on, to the left from 500 A.D., we see the zone of no observation data. We know nothing at all about this epoch.

The resulting picture reflects the natural temporal distribution of the observation data. The initial precision of the mediaeval observations of the IX-XI centuries was naturally rather low, and then grew together with the precision and perfection of the observation techniques, which resulted in a gradual decrease in the fluctuation of D'' values.

4.

Astronomy moves the “ancient” horoscopes into the Middle Ages

4.1. The mediaeval astronomy

The naked eye can see five planets: Mercury, Venus, Mars, Jupiter, and Saturn. Their visible movement trajectories are adjacent to the solar ecliptic, or the line of its annual movement. The very word “planet” means “wandering star” in Greek. Unlike stellar motion, the movement of the planets is relatively fast. Their movement on the “sphere of immobile stars” is characterized by significant irregularities that can be explained by the fact that the planet trajectory as observed from the Earth is a result of the projection of the telluric orbit onto the immobile celestial sphere through the moving planet. Most of the time, the planets as observed from Earth follow the sun in their movement. However, after certain periods of time that differ for various planets, they begin to move *in the opposite direction*. This is the so-called *retrograde movement* of the planets. We should note that Mercury and Venus don’t go far from the sun in their movement as observed from the Earth. Other planets can get far away from the sun, since their orbits are located *beyond* the telluric orbit, unlike those of Venus and Mercury.

Complex and seemingly chaotic movement of the planets gave birth to the belief, back in the days of yore, that there is a feedback between planets and human lives. Objectively, this belief was based on the undeniable correlation between the change of seasons and the position of celestial objects. This is how astrology was born – a science of planets, stars, and the effect they have on people’s lives.

A significant part of mediaeval literature contains astrological texts, especially astronomical tractates up until Kepler’s age and even after that.

The existence of several competing astrological schools led to the use of lavish symbolism by mediaeval astrologers, which makes it hard to speak of unified astrological definitions. Furthermore, each school developed its own linguistic and symbolic system. However, we shall soon see that many countries have surprisingly enough used a more or less *uniform astrological symbolic system* – for zodiacal constellations, for example. This can mean that astrology was born relatively recently, in the epoch when the means of communication between the astronomers of different countries had already been developed well enough to provide for regular information exchange and a similar “astrological language” – in Europe and in Egypt, for instance.

It would be expedient to remind the reader that the modern names for planets have been introduced by astrologers. The names for days of the week in such languages as English, French and German are also in direct relation to astrological concepts ([470]).

Planets have roughly the same trajectory on the sky. The circle of their movement along the ecliptic plane is called the zodiac. It is separated into 12 parts or constellations ([571]). Astrology was of the opinion that there is a special relation between the planets and each zodiacal constellation ([470]). A detailed theory was developed in this respect, wherein each constellation and each planet have been assigned a “character”: Mars is alleged to be aggressive, Jupiter divine, Saturn deathly, etc. In the so-called *Four Books* of the mediaeval astrologers, one may read that “Mars scorches and burns; his colour is red, the colour of fire” ([470]). Colour used to be ascribed to the planets as well – thus, Mars was considered red, Saturn pale, etc. ([470]). The combination of planets and constellations was given special attention. For instance, bloodthirsty Mars entering the sign (constellation) of Leo was considered an extremely dangerous omen of war and bloodshed. Ill-boding Saturn, the “god of death,” when entering the sign of Scorpio, was regarded as an omen of epidemics and plague. Saturn and Scorpio were actually considered symbols of death ([470]).

As we have already mentioned, the projections of planets onto the immobile stellar sphere move in leaps as the Earth revolves around the sun. In its movement between the stars from the west to the east, each planet located *outside* the orbit of the Earth slows down at some point, then stops and begins to move in the opposite direction. It stops after that, begins to move back, stops again, and resumes its movement from the west to the east. An elongated loop appears as a result – the projection of the telluric orbit onto the immobile stellar sphere through a planet. These *leaps* were naturally observed a long time ago, and led to the comparison with *horses* running across the sky.

A *horoscope* is a name used for referring to the disposition of planets in zodiacal constellations: Mars in Virgo, Saturn in Pisces, etc. Horoscopes can be calculated. The question of a planet's location in one constellation or another is a question of its fitting into the sector about 30 degrees wide. For many problems, the longitudinal precision of 5 degrees is quite sufficient. The *latitude* of the planet doesn't have to be calculated. Their deviations from the ecliptic are minute from the point of view of fitting into a constellation. This is why the old documents that contain horoscopes usually only give the zodiacal, or longitudinal, planetary disposition.

Horoscopes are calculated in the following way. Having fixed the constellational distribution of planets for a given moment (today, for instance), and knowing the numeric values of the periods of the planets' revolutions around the sun, we can move to the front or to the back using periods divisible by the revolution length, and get zodiacal planetary dispositions for the past or the future. Tables of various precision exist nowadays, ones defining the zodiacal positions of planets. Such tables have been compiled by P. Neugebauer, Newcomb, Leverrier, Morozov and others. Also see [\[1293\]](#). Such tables exist to answer the question of what the zodiacal position of a given planet was on a given day in a given year. N. A. Morozov and M.A. Viliev have also compiled reverse tables showing when a given planetary disposition may have really taken place

([\[544\]](#), volume 4). Relatively recently a number of good computer applications have appeared that can be used for horoscope calculation. We have employed some of them.

Nowadays we have a rather vague concept of the way of thinking characteristic for mediaeval astrologer astronomers. The astrological hue was dominant in the perception of many mediaeval scientists, not just astronomers. Mediaeval books on astronomy are filled with astrological symbolism despite the fact that they describe real celestial events. These books weren't written in a cipher – this was the usual way of writing down celestial observations understandable for both writers and readers. For instance, dates of death on gravestones and monuments, or memorable dates, were often written down as horoscopes – in other words, drawn as the zodiacal positions of planets for a given moment in time.

Astrology occupied one of the leading positions as a fundamental cosmological discipline. This ideology is largely lost for us nowadays. That is why the understanding of such books requires the knowledge of the symbolism used therein. An ideological overview of mediaeval astrology is given in [\[849\]](#), for instance. Troels-Lund, a specialist in history of religion, gives an illuminating description of the mediaeval Western European scientific Weltanschauung. This is what he writes about planets in particular:

“Such strange movement could only have been interpreted as a manifestation of will, as proof of independent life... the opaque celestial dome rotates above all of this, and it has ‘stars affixed to it, in figures bearing semblance to animals’... This was nothing but *astronomy transformed into a religion*... Thus happened the birth of art and science that would never fail to attract human attention for centuries to come, and considered the crown of human knowledge.” ([\[849\]](#), pages 24-26)

The book [\[849\]](#) quotes Biblical fragments that are astronomical in their nature according to Troels-Lund. We shall get back to this issue soon.

The flourishing scientific astrology invariably spawned an offshoot, the

so-called applied astrology, or the science of predicting the destinies of people, states and monarchs by planetary movements, or “by the stars.” Astrology enjoyed state support in mediaeval Western Europe ([849]). Astronomy (mixed with astrology) was also extensively used by the Roman church, which employed it for calendarian purposes in particular ([849]).

“Astrology became the leading science of the time, the basis for all other sciences” ([849], page 166).

“If we regard the XVI century astrology objectively nowadays... Our first reaction will be that of surprise at how great a role the belief in stars and the way they affect one played in that epoch... It had not just been the ignorant masses that believed in astrology, even the greatest minds followed suit... It suffices to take a look at the great variety of works on astrology that appeared in the XV and XVI centuries. Just the ones that can be found in the two main Copenhagen libraries, would make a rather voluminous pile... Their authors aren’t obscure anonymous scribblers – on the contrary, these books were written by the greatest minds of the time. There is no name in the XVI century Scandinavia that could compare to Tycho Brahe, one of the greatest representatives of natural sciences... a popularizer of Heinrich Rantzau, the viceroy of Schleswig-Holstein.” ([849], page 169)

About Tycho Brahe: “all of his scientific activity was dedicated to [astrology’s] development to a certain extent” ([849], page 169).

The same can be said about Melancthon and Kepler in Germany. Astrology flourished at the courts of European monarchs in France, England, and Italy. It is known that Rudolf II, Louise of Savoy, Catherine de Medici, Charles IX, Henry IV, and other Western European rulers were active proponents of astrology ([849], pages 170-171).

Melancthon claimed that the Bible gave direct indications of the divine origins of astrology ([849], page 175). *The fact that many fragments of the Bible’s prophetic books, for example, are astronomical and contain horoscopes in cipher was considered indisputable in the Middle Ages*

([\[849\]](#), page 180).

It is believed that the authority of astrology had received several mortal blows from Copernicus, Newton and Laplace. Therefore, the astrological symbolism of many ancient texts lost its importance and mystery, became lacklustre and soon forgotten. Nowadays the majority of readers will fail to understand it for the most part. The discovery of the chronometer and other instruments rendered quotidian sky observations void of value, which has completely crushed the foundations of astrological ideology.

“There has been no other epoch when people’s direct perception of the sky had been quite as meagre [in reference to the XIX-XX century – A. F.]. There is hardly one person in a hundred in London, Paris and Copenhagen that knows whether the moon is full or new today, or what the current location of Ursa Major is. The light of the nocturnal sky has assumed a purely decorative role.” ([\[849\]](#), pages 212-213)

Unlike the spiritual leaders of the Western European countries, the Russian Orthodox Church is considered to have had a very negative attitude towards astrology.

“A very demonstrative episode occurred in the Kremlin in 1559, when Ivan the Terrible returned the present of a sophisticated clock embellished with moving representations of celestial bodies to the Danish ambassadors, who were told that ‘the present is of no use for a Christian ruler who believes in God without concerning himself with either planets or (celestial) symbols.’” ([\[775\]](#), pages 125-126)

At the same time, astronomy was used in Russia for Paschalian calculations. We shall be relating this in more detail in [Chron6](#). Apart from that, we quote some facts in [Chron6](#) that shall greatly aid in the explanation of the negative attitude of the Orthodox church towards astrology that has been prevalent ever since the second half of the XVI century and continues until the present day.

4.2. The method of unprejudiced astronomical dating

As we have already mentioned, the idea of using the horoscopes contained

in old documents for the astronomical dating of the events described in the texts originated as early as the XVI century. It has been occasionally used by astronomers and chronologists of more recent epochs. If some document contains a horoscope, then the use of theoretical calculation tables for reference can allow for the attempt to select a fitting horoscope whose astronomical characteristics would satisfy the description of the old document. A certain date would be the result of these calculations, or a number of dates in case of several astronomical solutions, which will happen if the description is vague or incomplete. However, the practical use of this apparently simple idea ran into great practical complications whose reasons were far from astronomical – the culprit was the existing Scaligerian chronology.

N. A. Morozov had discovered that under the pressure of Scaligerian chronology, the astronomers of the XVII-XIX century had to resort to *arbitrary fittings* to a greater or a lesser extent in order to make the “historical tradition” that they believed in correspond to the results of their astronomical calculations ([\[544\]](#)). The thing is that the astronomers of the XVII-XVIII century in an epoch when Scaligerian chronology *had already been shaped*. Therefore, the principal historical reigns, wars, characters, etc. were distributed across the time axis by historians for the most part. This is why astronomers had already “known” the approximate datings of old texts that they needed to date astronomically from historical chronology. The role of astronomers would thus become limited to making marginal corrections of historical datings using the “astronomical method.” If the astronomers failed to find a precise astronomical solution in the “necessary” epoch, they preferred to *question the old document’s exactness, and not historical chronology*. In such cases astronomers usually utter something along the lines of “the scribe must have made a mistake putting Saturn into Pisces, since it has to be in Virgo so that the events described would fall over the V century B.C.” Correcting Pisces for Virgo, the astronomers ipso facto “confirmed” the opinion of Scaligerite historians who dated the document to the V century B.C.

N. A. Morozov's great achievement is that he was the first to question the consensual historical chronology, and not the astronomical reports contained in the old documents. He suggested extending the search interval of astronomical solutions so that it would include *the entire* historical epoch up to the Middle Ages. However, even N. A. Morozov wasn't entirely consistent and usually preferred not to venture further in time than the VI century A.D.

It turned out that the accurate use of the astronomical method reveals dates that are *a lot more recent* than the ones offered by Scaliger. Furthermore, in some cases the new dates turn out to pertain to *the late Middle Ages*! All of this is notwithstanding the fact that the astronomical results obtained by Morozov cannot be regarded as *finite*. Being certain that only the "ancient" chronology had been incorrect, he was gullible enough to have trusted the mediaeval chronology beginning with approximately 300-500 A.D. This is why he usually failed to research the entire possible time interval, most often contenting himself with attempts at finding the solution in the period between 2000 B.C. and 600 A.D., and only occasionally further into the Middle Ages.

Morozov most often did not consider the later epoch between the XIV and XVIII century at all. He was of the opinion that the "ancient" eclipses and horoscopes couldn't possibly have moved forward in time to such an extent that they would end up in the XIII or even XVII century A.D. Thus, moving forwards along the time axis in his search of astronomical solutions, he would most probably stop at the first one that fit.

This is why we treat his astronomical results as preliminary when we report them. It is possible that if we carry on with his unfinished research, we shall find astronomical solutions that will be a lot more recent, and occasionally more precise.

However, we can already state the following with certainty: if new and more precise astronomical solutions are really found – this is the case with the Dendera zodiacs and the Apocalypse (see below) – they shall be even closer to us than the ones found by N. A. Morozov, since he had already

analyzed the period between the antiquity and the VI century A.D.

4.3. Many “ancient astronomical observations” may have been theoretically calculated by late mediaeval astronomers and then included into the “ancient” chronicles as “real observations”

One shouldn't forget that in the creation of the “correct history according to Scaliger,” the chronologers of the XVI-XVII century often turned to astronomers asking them to perform calculations of some sort.

We have already mentioned the heavy astrological influence that the mediaeval science was subject to. The astrological schools of the XV-XVII century may have occupied themselves with solving such “scientific” problems as the planet disposition during the coronation of Justinian I (who lived in the VI century A.D. according to the erroneous opinion of the mediaeval chronologers) with astronomical/astrological methods.

Another problem they may have been busy with was giving exact datings to the lunar eclipses of the Roman Empire epoch that the mediaeval chronologers had already erroneously ascribed to the III-VI century A.D.

Yet another one may have been the estimation of the Easter Sunday in the year of the Nicaean council, whose erroneous dating of allegedly the IV century A.D. was already “calculated theoretically” a few years earlier, in the XVI-XVII century.

All these “astronomical calculations” were slyly included in the final editions of ancient chronicles. All of this probably happened in the XVI-XVII and even XVIII century. It was a great body of work, which would have been useful if the chronology created by the mediaeval historians had been *correct*. However, this chronology proved *erroneous*, and so the mediaeval astronomers aggravated the mistakes of the historians, calculating planetary dispositions for the VI century A.D. (when Justinian

I is supposed to have lived), and entering something like “on the day Justinian I was crowned, the planets were in such-and-such constellations” into the chronicles. As a result, the chronicles may have been given an erroneous chronological and astronomical skeleton, which was apparently just a result of later mediaeval calculations represented as true “ancient astronomical observations” in the chronicles.

Afterwards this partially erroneous and partially falsified material rigidified, gathered some authority dust, and reached us in this exact form. Our contemporaries, both historians and astronomers, read ancient chronicles and rejoice to find “astronomical data” in them. The alleged observations – fruits of *theoretical calculations* of the XVI-XVIII century – are dated with modern astronomical methods, and everybody is clearly brimming with satisfaction when the results obtained concur with Scaligerian chronology. Thus, the chronology of Scaliger-Petavius receives additional “proof,” which *leads to a vicious circle*.

Of course, one occasionally finds discrepancies with modern astronomy due to the fact that the astronomical calculation methods of the XVI-XVIII century (those dealing with past dates) were imprecise, and a lot worse than the ones currently used. Upon locating such discrepancies, modern astronomers patronizingly correct the “ancient observer,” which creates an even greater illusion of the veracity of Scaligerian chronology.

What should one do when the results of modern astronomical calculations *radically* contradict the Scaligerian chronology? In such cases modern historians start talking about “the ignorance of the ancient observers.”

Our new results show that *mediaeval chronology can only be trusted from the XVI century on* (see [Chron5](#)). One needs to perform an even greater body of work in the field of finite independent dating of eclipses and horoscopes present in written sources. According to the latest research, N. A. Morozov’s astronomical solutions are often complemented with new, *considerably more precise and recent* solutions scattered across the interval between the XIII and XVI century.

4.4. Which astronomical “observations of the ancients” might be a result of late mediaeval theoretical calculations?

Our idea is as follows: the chronologers of the Scaliger-Petavius school first created the erroneous chronology of the ancient and mediaeval history, having arbitrarily extended the real history of the XI-XVII century A.D. into the past.

After that, in the XVI-XVII century a great body of work was started in order to make this scheme “look scientific” and backed by the authority of astronomical calculations. If we’re to call a spade a spade, it was really a deliberate falsification of history.

1) The “*Ancient calendar theories*” were put forward. The chronologers of the XVI-XVII century began to “reconstruct” the ancient calendar systems that people had allegedly been using in antediluvian times for hundreds and thousands of years. The “initial points” of calendars would appear as a result of theoretical calculations, as well as dates of the Genesis, the Great Deluge, etc. The results of these calculations would be *written into* the “ancient” chronicles without any hesitation whatsoever in order to “help maintain chronological order.” What this meant in fact was the confirmation of mistakes or blatant falsifications of the Scaliger-Petavius school. Real mediaeval events assumed wrong datings that moved them a long way into the past. Nowadays these “ancient” datings are considered to prove the Scaligerian history by historians who remain unaware of the fact that many of these “calendar observations” are a result of *theoretical calculations* of the chronologers of as late an epoch as the XVI-XVII century A.D. – yet another vicious circle.

2) Certain *horoscopes* may have been calculated in reverse. Rough calculations of planetary dispositions may already have been known in the late Middle Ages. The chronicles would then undergo special editing, after which they began to contain such passages as “in the VIII century since the foundation of Rome, on the day Julius Caesar was murdered, the planets

occupied the following positions.” The planet dispositions would be calculated exactly for the I century B.C., since the astronomers of the XVI-XVII century “already knew” in their blind trust of Scaliger-Petavius that Caesar lived in the I century B.C. Nowadays historians believe these “astronomical observations” to be the real thing, and try to present them as proving the correctness of the Scaligerian chronology, which leads to a vicious circle. For instance, one of the astronomer/astrologers of the Middle Ages would first calculate that some astronomical event occurred in the I century B.C. Afterwards the fact that this dating was calculated would fall into oblivion, and the result of the same mediaeval calculation would be called *proof* – of the fact that Julius Caesar really lived in the I century B.C., for instance.

3) First and foremost, a number of *lunar eclipses* were calculated into the past. Let us mention that *the lunar eclipse calculations are rather simple*. They were successfully performed already in the epoch of the XVI-XVII century. *Solar eclipses are a different matter, and involve a lot more complex calculation*. However, in the XVII, let alone the XVIII century, the astronomers were already capable of counting solar eclipses into the past as well. The “calculated” lunar and solar eclipses may have been included into the erroneous history of Scaliger and Petavius in the following manner: “On the day such-and-such emperor died, an eclipse occurred.” The process was apparently as follows: having calculated that some eclipse occurred in the beginning of the II century A.D., the astronomer would take the “Petavius textbook” and see what emperor’s reign coincided with the date of the eclipse that he had calculated. For instance, Scaligerian chronology would claim that some ruler died that year. The edited chronicle would then become altered to include some phrase like “the moon (or the sun) darkened upon his demise.” The examples of mediaeval calculations that were claimed “ancient observations” a posteriori are given in abundance by the modern astronomer Robert Newton in his well-known work entitled *The Crime of Claudius Ptolemy* ([\[614\]](#)).

4) The appearances of certain *comets* may have been calculated into the past. Late mediaeval scientists starting with Tycho Brahe and Kepler were already able to calculate their recurrence periods based on trustworthy observations. The Galley comet may serve as an example. Then the alleged dates of comet appearances were calculated by the extension of several recurrence periods into the past. After that the erroneous “Petavius textbook” was used for reference, and the edited chronicles were altered to contain such phrases as “in the nth year of reign of emperor such-and-such a comet with a fuzzy tail adorned the sky.”

Nowadays we are being convinced that the ancient astronomers really observed all of these “appearances of the Galley comet” in times immemorial. Moreover, these “observations” are nowadays presented as proof of the Scaliger-Petavius history textbook. This is not the case in reality. We shall cover comet “datings” in general and the Galley comet in particular in the chapters of [Chron5](#) that deal with the history of China.

In the XIX-XX century even some of the professional astronomers were taken in, thinking that they dealt with true ancient observational material, which has led to the construction of theories that should have made the calculated trajectory of the Galley comet’s movement “more precise.” However, such “reconstructions” invariably lead to the distortion of the very mathematical theory of the comet’s movement, since certain constants in motion equations have to be obtained from empirical observations. If such observations are incorrect or simply fictitious, the constant values also turn out wrong.

One sees just how serious the consequences for the history of science may prove, ones that arise from the late mediaeval chronological calculations that were slyly presented as “true astronomical observations” later on.

These considerations are primarily valid for written sources. It must have been easy enough to take a quill and *write* the “ancient observation” down on the page of the chronicle.

Such suspicions are less applicable to *trustworthy archaeological*

findings or the ancient monumental architecture, although great caution is required there as well. However, if a horoscope is presented as a large bas-relief on the ceiling of an old cathedral, or on a coffin in an old sepulchre, one has reason to believe that we see the result of a *veracious* astronomic observation, and not a later calculation based on Scaliger-Petavius chronology.

5.

A brief account of several examples of Egyptian zodiacs

In this section we shall give a rather brief account of the results of our research related in detail in [Chron3](#), Part 2.

5.1. Some general observations

The ancient horoscopes that have reached our days are a valuable body of chronological material. A horoscope's dating can be based on modern astronomical theory. Generally speaking, horoscopes may possess several astronomical solutions, but usually only one of them falls into the historical time interval. In this case we may calculate the precise dating of this horoscope.

However, the dating of horoscopes is a tricky business. The concept of using astronomy for the purposes of dating old documents was already familiar to Scaliger and the rest of the XVI-XVII century chronologers. Thus, the ones responsible for the forgery of history may have employed this concept and must have certainly done so. Since the written sources have largely been edited in the XVII-XVIII century, as we understand, the astronomical information contained therein may also be a forgery – especially in cases when this did not require much time and effort, as in the case with horoscopes. The astronomers of the XVI-XVII century already knew planetary revolution periods well, and could calculate horoscopes for any given date, including those pertaining to days long gone.

Thus, in order to obtain certain chronological datings based on horoscopes and independent from the Scaligerian chronological scale, it only makes sense to use the horoscopes whose calculation in the XVI-

XVIII century is improbable. From this point of view, a horoscope *carved in stone on the wall of an ancient temple* is a lot more dependable than a horoscope included in an “ancient” manuscript. Carving a large and detailed bas-relief in stone would require lots of effort; apart from that, the construction of a temple is an event of high social significance that directly involves a large number of people. Writing something about the constellation that housed the planets on a given “ancient date” on a sheet of paper isn’t nearly as difficult. This is office work. The history swindlers have been involved in precisely this sort of activity. It was only after Scaligerian history became consensual that it began to affect monumental construction as well, in the XVII-XVIII century. Furthermore, it is a lot easier to correct the horoscope in a manuscript while editing it than altering one carved in stone on a cathedral wall, which is hardly a possibility at all.

Thus, the horoscopes contained in written sources are of little interest in what concerns independent dating. This particularly refers to the “ancient” Greek horoscopes collected in the well-known work entitled *Greek Horoscopes* by O. Neugebauer and H.B. Van Hoesen ([\[1290\]](#)).

5.2. The Dendera Zodiacs

The images known as the Round and the Long Zodiac nowadays have been found in the Dendera temple in Egypt. Multiple attempts of the XIX-XX century astronomers to find “ancient” solutions that would fit the horoscopes depicted on the Zodiacs, have failed to yield any results. Such eminent scientists as Laplace, Fourier, Letron, Biot and Helm have tried to solve this problem. The search for a correct solution was eventually abandoned after many unsuccessful attempts. Nowadays the temple and the horoscopes are dated to 30 B.C. and 14-37 A.D. However, it turns out that there are *exact astronomical solutions*. We shall give a very concise account of the matter presently, since part 2 of [Chron3](#) contains a detailed study of this problem.

Dendera is a town in Egypt, north of Thebe, on the bank of Nile. The

ruins of the ancient town of Tenteris, with its remains of a magnificent temple, are located nearby. We shall reproduce several unique old drawings made by the French artists who accompanied Napoleon's military units on his Egyptian expedition of violent conquest, towards the end of the XVIII century. These drawings present priceless proof; they are extremely important documents since they reflect the state of the Egyptian monuments at the end of the XVIII century – right after the troops and the artillery of Napoleon had fought their way through the terrain. They can be considered “photographs” of sorts, reflecting Egypt the way it was in the late XVIII – early XIX century, taken by eyewitness members of the Egyptian campaign. Of course, they are far from being real photographs, but we have no reason to doubt that Napoleon's artists faithfully represented what they saw.

In fig. 2.11 we can see a dilapidated arch and a view of the main, northern, entrance to the Dendera temple. We can see that the buildings are largely in a decrepit state. We give a “reconstruction” of the temple in fig. 2.12 for comparison. Its authorship can most probably be credited to the very same artists who made the other drawings. What we see is thus their concept of what the temple “really looked like” prior to its destruction. The reconstruction is most satisfactory in general (see fig. 2.12), although the “reconstructed faces” on the columns are visibly different from the semi-obliterated stone originals, qv in [Chron3](#), Part 2.

Fig. 2.11. A rare old picture showing a dilapidated arch, and the Great Dendera Temple behind it. We see its main northern entrance. The drawing was made by the French painters who accompanied the Napoleonic troops during the Egyptian invasion. Taken from [\[1100\]](#), A., Volume IV, pl. 5.

Fig. 2.12 A reconstruction of the Dendera Temple done by French painters of late XVIII – early XIX century. We only show the right portion of the “reconstructed” façade here. The reconstruction in general was apparently done rather conscientiously; however, one immediately notes the curious fact that the faces of the statue columns on the “reconstruction” significantly differ from those on the original drawing ([\[1100\]](#), A., Volume IV). Also see [Chron3](#), Part 2. The original stone faces with chipped noses have high cheekbones differing from the ones depicted by the “restorers” of Egyptian history.

It isn't quite clear just what considerations the French artists were guided by, and why they would have to substitute "becoming Graeco-Roman faces" for the original ones with high cheekbones. Taken from [\[1100\]](#), A., Volume IV, pl. 29.

In figs. 2.13 and 2.14 we can see the rear view of the Great Temple of Dendera. This was how Napoleon's artists would have seen it when the front line could finally advance, and Napoleon's troops entered Dendera. It is clearly visible that it wasn't "almighty time" that has caused most of the destruction. We see a scene of utter devastation here; the buildings have either been shelled, or simply exploded with gunpowder.

Fig. 2.13. Rear view of the Great Dendera Temple. We see utter devastation most probably caused by artillery or powder kegs placed under the foundations of the buildings. Taken from [\[1100\]](#), A., Volume IV, pl. 3.

Fig. 2.14. Rear view of the Great Dendera Temple. The devastation wasn't necessarily caused by the French troops; it may have been the result of the Ottoman=Ataman conquest of the XV-XVI century, when the troops of Moses that came from Horde-Russia, or the children of Israel (the army of Joshua), were conquering "their very own" Egypt, cleansing it from the "plague" that reigned there. From the epidemics, in other words, q.v. in [Chron6](#). Over the centuries elapsed since that time, a large part of the

ruins have become buried in sand. However, the sand may have gathered over a matter of decades, or already accumulated by Napoleon's era, which means it would only have taken several years. This is quite possible, since the strong dry winds of Egypt carry sand continuously. Taken from [\[1100\]](#), A., Volume IV, pl. 3.

In figs. 2.15, 2.16 and 2.17 one sees modern photographs of the Dendera temple. Pay attention to the immaculate stonework of the wall that surrounds the temple (fig. 2.15). The piers supporting the foundation of one of the buildings that used to stand in front of the temple are visible very clearly. The building is a ruin, qv in fig. 2.16. The stonework quality and the clever construction solutions give us an idea of the highly professional work of the “ancient” builders of the temple. In fig. 2.17 we see a bird's eye view of the Dendera temple and its environs. One thing in particular that draws our attention is the tall wall that surrounds a large area around the temple, and contains the remnants of other buildings. One gets the idea that the entire set was planned as a Christian monastery – possibly relatively recently.

Fig. 2.15. Modern condition of the Dendera Temple. The low wall around the temple is built from large blocks; the stonework is done accurately. Taken from [\[1062\]](#), page 10.

Fig. 2.16. Modern condition of the Dendera Temple. Taken from [\[1062\]](#), page 63.

Fig. 2.17. A bird's eye view of the Dendera Temple and its environs. The temple and the constructions around it were erected as a Christian monastery. One sees a tall wall containing a considerable amount of space around the temple. Taken from [\[1062\]](#), page 64.

Two sculptural compositions from the dome of the Great Temple of Dendera have survived – the so-called Round and Long Zodiacs. They are ancient bas-reliefs carved in stone. The Round Zodiac is about 2.5 by 2.5 metres ([\[1177\]](#), Volume 1, page 121). The Round Zodiac was taken to Paris, and is now kept in the Louvre. The Long Zodiac was also taken to Europe. In fig. 2.18 we can see the drawing of the Round Zodiac done by Napoleon's artists ([\[1100\]](#), A., Volume IV, pl. 21). It was published in the

fundamental oeuvre titled *Description de l’Egypte* ([\[1100\]](#)), compiled by the artists and archaeologists who accompanied Napoleon’s troops in Egypt. The work was published under a direct order from Napoleon, which is explicitly stated in the subtitle: “Publiée sous les ordres de Napoléon de Bonaparte.”

Fig. 2.18. A copy of the Round Zodiac done by the painters of Napoleon’s Egyptian expedition. Taken from [\[1100\]](#), A., Volume IV, pl. 21. Left sheet.

Both Zodiacs – the Round one and the Long one – contain images of planets presented as various human figures located in zodiacal

constellations. Thus, what we have in front of us is a pair of horoscopes which can be dated astronomically.

These images have been discussed in astronomical literature as well as historical. The consensual dating of the Zodiacs attributes them to 30 B.C. and 14-17 A.D., respectively ([\[1453\]](#), No. 4, page 64). However, this dating falls apart after the first criticism, qv in [Chron3](#), Part 2.

The fact that the Zodiacs of the Dendera temple contain horoscopes is reflected in their very names, and the zodiacal positions of the planets that they depict was noted by astronomers some time ago. The constellations and the planets are represented as human and animal figures in a standard Egyptian symbolism; some of the figures are combined in the procession.

An event as unique as the discovery of a horoscope in an ancient temple invoked great interest among astronomers. However, as we have already pointed out, astronomical research shows that ever since the distant past and up until the III century A.D., the planets did not form those celestial configurations observable on the Dendera Zodiacs. On the other hand, the detailed accuracy of the bas-reliefs was so great that the chronologists reluctantly formulated a hypothesis that the bas-reliefs depicted pure fantasy, bearing no relation to actual celestial events. After that no further attempts at dating the Zodiacs were made. None of the astronomers thought of extending the researched time span forward, beyond the III century A.D.

Attempts at deciphering the Round Zodiac started a long time ago. One should name Brugsch, Morozov, and Turayev in this respect. Zodiacal constellations are depicted very skilfully, and form a zodiacal belt, as one should rightly expect. Its visual representation is hardly any different from the ones in Bayer's star charts, for instance, or even the astronomical tractates of the XVIII-XIX centuries. Identifying the planets, however, proved a lot more complex.

N. A. Morozov offers a partial decipherment of the Round Zodiac in [\[544\]](#), Volume 6, and the dating that was obtained as a result. Morozov's idea was simple, but truly revolutionary. If there was no satisfactory planet

combination before the III century A.D., one should carry on with the calculations and go forward in time in order to cover those epochs closer to us. Morozov conducted all of his calculations on the interval between the III and the XIII centuries A.D. ([544], Volume 6, pages 662 and 667). As a result, he found one astronomical solution that could provide the key to the cipher (assuming Morozov's partial decipherment), namely, 15 March 568 A.D. ([544], Volume 6). This solution (assuming the same Morozov's decipherment) was then verified by the astronomer N. I. Idelson. See the details of his verification in the tables in [544], Volume 6.

The Muscovite physicists N. S. Kellin and D. V. Denisenko made another attempt to date the Round Zodiac in 1992. Their work was published in [METH2:1] and [METH1:6], pages 315-329. The date they came up with (given in the so called 'Old Style' calendar) is 22 March 1422 A.D.

Later on, in 1999, a partial decipherment and dating of the Round Zodiac were performed by T. N. Fomenko, who based her method on an altogether different concept and calculated everything from scratch (see [METH3:3]). The result was as follows: either 15 March 568, or 22 March 1422 ([METH3:3]). The results of an extensive research of several important Egyptian Zodiacs, such as the Round and the Long Zodiacs of Dendera, and the Greater and the Lesser Zodiacs of Esna, were published by T. N. Fomenko in Chapter 12 of the book [METH3:3].

The final solution formulated by A. T. Fomenko and G. V. Nosovskiy in 2001 is given below.

The identification of the figures from the Round and the Long Zodiacs with contemporary astronomical symbols as reflected in [METH1:6] was based on the following method. The figures on the Dendera Zodiacs were compared to the pictures of planets and constellations known to us from mediaeval atlases. It turns out that the symbols contained in both Zodiacs are virtually identical to the ones used on mediaeval and even late mediaeval star charts.

The planets on the Dendera Zodiacs are represented as human figures –

namely, wanderers carrying staves. Planets were depicted in a similar manner in a number of European mediaeval books on astronomy. In fig. 2.19 we can see a zodiac with planets from a mediaeval French manuscript on astrology ([\[1046\]](#), ill. 80). The planets here have the appearance of *wanderers* proceeding on their journey across the sky. Mars, for instance, is pictured as a warrior who walks with his shield, and a sword in a raised hand, qv in fig. 2.20. The inscription near the picture unambiguously identifies this figure as Mars.

Fig. 2.19. A picture of the zodiac and the planets from a mediaeval French astronomical manuscript. Planets are depicted as human figures. The figure of a warrior with a sword and shield is explicitly subtitled “Mars ...” As we see, similar symbolism – wanderers with staves – is also used for planets in the “ancient” Egyptian Round Zodiac. Taken from [\[1046\]](#), ill. 80.

Fig. 2.20. Close-up of the fragment depicting Mars as a warrior. Taken from [\[1046\]](#), ill. 80.

In a number of such cases the pictures can be identified as planets without any complications whatsoever. The mediaeval representations of the planet Jupiter sometimes emphasized the fact that Jupiter was a Thunderer, and the chief deity in Roman mythology. Jupiter's symbol is a royal crown. One of such mediaeval pictures can be seen in fig. 2.21. We see a thunderbolt in his hand, a crown upon his head, and the symbol of Jupiter next to the thunderbolt. Another detailed old picture of Jupiter can be seen in fig. 2.22

Fig. 2.21. Mediaeval picture of the planet Jupiter. The Thunder God is holding a thunderbolt in his hand and has a royal crown on his head. Jupiter's chariot is rolling over the zodiacal constellations. Taken from a book by Ioanne Tesnierio titled *Opus Mathematicum Octolibrum, Coloniae Agrippinae*, 1562. The book archive of the

Pulkovo Observatory (St. Petersburg). Also see [\[543\]](#), page 71.

Fig. 2.22. A mediaeval picture of the planet Jupiter from a book by Albumasar titled *Dé Astrú Sciência*, 1515. The book archive of the Pulkovo Observatory. Also see [\[543\]](#), page 181, ill. 92.

Mediaeval pictures of the planet Saturn often referred to the imagery of Saturn, the Roman god of death. The standard astronomical representation of Saturn is that of a person with the scythe of Death in his hands ([\[543\]](#), pages 181, 241, and 157). The mediaeval astronomical symbols of Saturn include the sickle and the scythe. A well-known book by Leopoldus of Austria allegedly dating from 1489 ([\[1247\]](#)) has a picture of a scythe and the inscription “Saturn” next to it, qv in fig. 2.23. Tesnierio’s book of 1562 depicts the planet Saturn with a scythe and devouring a child ([\[1440\]](#)). The scythe or the sickle are often located over the head of Saturn and bear visible resemblance to the Ottoman crescent, or “horns” (see fig. 2.24). It may be that the fear and respect that the inhabitants of the mediaeval Western Europe had for the Ottomans=Atamans caused the Ottoman crescent to become a symbol of punishment.

Fig. 2.23. A mediaeval picture of the planet Saturn with a scythe over its head. The scythe looks like an Ottoman crescent. Taken from *Compilatio de Astrorum Scientia* by Leopoldus of Austria, 1489 ([\[1247\]](#)). The book archive of the Pulkovo Observatory. Also see [\[543\]](#), page 181, ill. 92.

Fig. 2.24. A mediaeval picture of the planet Saturn with a scythe over its head. The scythe looks like an Ottoman crescent. Taken from *Dé Astrú Sciência* by Albumasar, 1515. The book archive of the Pulkovo Observatory. Also see [\[543\]](#), page 241, ill. 123.

The identification of the Egyptian god Anubis with the Roman Saturn is described in the oeuvres of the Egyptologist H. Brugsch ([\[99\]](#)), and the expert in the history of religions J. Frazer ([\[918\]](#) and [\[919\]](#)). The Egyptian Anubis is most frequently portrayed with long pointed jackal ears, somewhat curved, qv in figs. 2.25 and 2.26. It is possible that the Ottoman crescent would occasionally be compared with long pointed jackal ears.

Fig. 2.25. “Ancient” Egyptian picture of the god Anubis with a jackal’s head and pointed ears resembling the Ottoman crescent, or a pair of horns. The specialists in the history of religion call this picture “The Mummy of Osiris Prepared for Burial by Anubis.” Taken from [\[1415\]](#), page 100. Also see [\[966\]](#), Volume 1, page 128.

Fig. 2.26. A picture of Anubis from the famous Egyptian *Book of the Dead*. The pointed ears on the god's jackal head are painted in such a way that they resemble the Ottoman crescent or a pair of horns. Taken from [\[1448\]](#), pl. 3.

In Tesnierio's book [\[1440\]](#), Saturn's chariot is drawn by a griffin and an asp – monsters of death.

The representation of the planet Saturn on the Round Zodiac is as follows: behind the Virgo constellation and beneath it we see two male figures crowned by crescents, one of them bearing a staff, and the other – a large scythe. No other figure on the Round Zodiac, including constellations, has a scythe.

Virgo is portrayed here in exactly the same manner as it is on the mediaeval astronomical charts – as a *woman holding an ear of wheat*, qv in fig. 2.27. Let us remind the reader that this constellation contains a well-known star – Spica, or the Ear of Wheat.

Fig. 2.27. An ancient picture of the constellation of Virgo from an astronomical book by Bacharach. Virgo is holding a bunch of wheat ears. Near her hand is the star called Spica, or the “Ear of Wheat”. Taken from [\[1021\]](#). Also see [\[543\]](#), page 81, ill. 44.

The figure of Saturn is drawn with a jackal’s head. Numerous Egyptian pictures of Saturn accompanying people to the Underworld, are well known. See figs. 2.28, 2.29, 2.30 and 2.31, for instance. Incidentally, one clearly recognizes the well-known Christian Doomsday theme in the “ancient” Egyptian pictures in figs. 2.30 and 2.31 – one of the most popular themes in mediaeval Christian art. We see Jesus Christ sitting on a throne and pronouncing judgement. The scribe in front of him is reading a scroll, or the Book of Fate, where all the deeds of the dead are listed. The god Anubis is weighing the good and the bad deeds on his scale in order to determine whether the person should go to heaven or to hell. This is clearly an illustration of the Christian Apocalypse, or the Revelation of St. John the Divine. This means all such “ancient” Egyptian drawings belong to a Christian epoch – which couldn’t have preceded the XI century A.D. according to the New Chronology.

Fig. 2.28. Famous Egyptian *Book of the Dead*. The “ancient” Egyptian god Anubis is weighing the good and the bad deeds of humans on a scale. The subject is clearly a Christian one, popular in the Middle Ages. Taken from [\[1448\]](#), plate 3. Also see the photograph on the back of the book cover [\[1448\]](#).

Fig. 2.29 Another “ancient” Egyptian picture from the *Book of the Dead*. The subject is the same one – the comparison of good and evil deeds of humankind at doomsday; its origins are clearly Christian. Anubis is weighing human deeds on a scale. Taken from [\[1448\]](#), plate 31.

Fig. 2.30. “Ancient” Egyptian picture of the Christian Judgement Day as described in

the Biblical Apocalypse. Jesus Christ is judging people; in front of him we see a scribe with a scroll, and somewhat further on is Anubis, weighing the deeds of the people on a scale. This bas-relief, distinctively Christian, is kept in the Egyptian Thèbes, Memnonium. Taken from [\[1100\]](#), A., Volume II, pl. 36.

Fig. 2.31. A similar Christian Judgement Day scene from an “ancient” Egyptian papyrus. Jesus Christ is judging people, with Anubis weighing their deeds. It is evident that such drawings could only have appeared after the description of the Apocalypse, not in the dateless antiquity that they are nowadays supposed to date from. Taken from [\[1100\]](#), A., Volume II, pl. 67.

Furthermore, the mediaeval pictures of Venus emphasized the fact that Venus was the only female among planets, not counting the moon and the sun, naturally. Astronomical maps practically always represent Venus as a woman. The mediaeval symbols of the planet Venus can be seen in figs. 2.32 and 2.33. The first picture is a close-up of a fragment of an ancient picture taken from the French astronomical manuscript cited above (see fig. 2.19). In fig 2.33 we see an ancient miniature called “The Planet Venus” ([\[1046\]](#), ill. 71). Venus is also represented as a woman and has her name written over her head, qv in fig. 2.34. Let us remind the reader that Venus resembles Mercury in being positioned relatively close to the sun.

Fig. 2.32. A close-up of the picture of the planet Venus on an old French miniature. The complete title of this astronomical miniature was “Zodiac and the Planets,” and it can be seen in its entirety on one of the preceding illustrations. We see Venus depicted as a woman in motion, with the inscription above her head saying “Venus.” Taken from [\[1046\]](#), ill. 80.

Fig. 2.33. Ancient miniature titled “The Planet Venus” from the *Livre des echés amoureux*. The planet Venus is depicted as a woman with the name Venus written above her head. Taken from [\[1046\]](#), ill. 71.

Fig. 2.34. A close-up of a fragment of the previous picture of Venus. Taken from [\[1046\]](#), ill. 71.

We see the astronomical symbol for the sun in mediaeval books – a large disc with a point in its centre, qv in the drawings in the mediaeval book by Tesnierio ([\[1440\]](#), fig. 2.35), as well as the mediaeval book by Albumasar ([\[1004\]](#), see fig. 2.23). The usual astronomical symbol for the moon is a narrow crescent, qv in fig. 2.36.

Fig. 2.35. Picture of the Sun from a mediaeval book by Tesnierio dating from 1562. The symbol of the Sun – a disc with a dot in the centre – can be seen to the left of the baculus in Sun's hand. Taken from [\[1440\]](#), also see [\[543\]](#), page 71, ill. 31.

Fig. 2.36. Mediaeval picture of the Moon. Its astronomical symbol is a crescent. Illustration in the book by Tesnierio dating from 1562 ([\[1440\]](#)). Here the crescent is also drawn on the head of the woman (the moon), but already in the shape of a pair of “horns.” This is how Moses used to be portrayed in ancient Bibles – with “horns” on his head. As it is pointed out in [Chron6](#), the implication is that the mediaeval painters would have had to be carrying on an ancient tradition of depicting the Biblical Moses with a crescent on his head. Taken from [\[1440\]](#). Also see [\[543\]](#), page 71, ill. 32.

How did the ancient Egyptians draw the sun and the moon? On the Round Zodiac, directly over Pisces we can see a disc that contains an alectryon’s eye. Let us remind the reader that the cock that cries at dawn is a natural symbol of the moon or the rising sun. On the other hand, the brightest star in the constellation of Aries is called The Eye, and the disc with an eye could really indicate that the sun or the moon were in Aries.

The fact that in certain cases the “alectryon disc” could be associated with the moon is also reflected on another stone bas-relief on the dome of the Great Dendera Temple, close to the entrance. There is no planetary horoscope here; however, one sees a large number of separate representations of celestial objects. We can see a *disc with an alectryon’s eye* yet again, with a crescent circumscribing it. The reference to either the moon or the sun is apparent, qv on figs. 2.37 and 2.38. Furthermore, we see an identical alectryon-eye disc on this bas-relief, this time accompanied by *fourteen* identical human figures. The reader will recall that a lunar month contains 28 days, so what we see here can probably be identified as representations of halves of lunar months, or fortnights. Each day is

represented by a small figure. All of the figures are identical, as “similar days” coming one after another. This may be the way the artist represents the 14-day interval between the *new moon* and the *full moon* that is separated into two weeks each with seven figures for days. Furthermore, this second “lunar disc” is sailing the skies in a boat that clearly resembles a *crescent*, qv in fig. 2.39. Let us also point out that both “lunar discs” on the dome near the entrance clearly depict some celestial deity, since they are worshipped by other figures.

Fig. 2.37. A fragment of a bas-relief located on the ceiling of the Great Dendera Temple, close to the entrance. Both discs are depicting the same celestial deity worshipped by surrounding figures. The first disc with an alectryon's eye is inscribed within a crescent. What we are seeing most probably represents the solar and the lunar symbols. The second disc with an alectryon's eye contains 14 identical glyphs that we presume to represent a half of the lunar month, namely, the interval between the new moon and the full moon. A 3D copy made by Napoleon's painters. Taken from [\[1100\]](#), A., Volume IV, pl.19.

Fig. 2.38. A close-up of a fragment of the bas-relief near the entrance to the Dendera Temple showing either the lunar or the solar disc inscribed within a crescent. Taken from [\[1100\]](#), A., Volume IV, pl. 19.

Fig. 2.39. A close-up of a fragment of the bas-relief near the entrance to the Dendera Temple showing either the lunar or the solar disc with 14 glyphs inside. Most probably, the glyphs served to represent half of the lunar month – 14 days out of 28, or the period between the new moon and the full moon. The 14 figures are divided into 2 groups of 7, perhaps a pictorial representation of two seven-day weeks. Taken from [\[1100\]](#), A., Volume IV, pl. 19.

However, in this case our identification of the “alectryon disc” as the Moon or the Sun coincides with that offered by the Scaligerite Egyptologists. They are of the opinion that Osiris had the double name Osiris-Moon, and a disc such as this one used to be one of his symbols

([\[1062\]](#), pages 22, 68 and 69. See figs. 2.40 and 2.41). However, one should also bear in mind that Osiris used to symbolize the sun.

Fig. 2.40. The “ancient” Egyptian Osiris as either the Moon or the Sun, with his symbol – the disc with the head of an alectryon. Taken from [\[1062\]](#), page 22.

Fig. 2.41. The “ancient” Egyptian Osiris as either the Moon or the Sun, with his symbol – the alectryon disc. Taken from [\[1062\]](#), page 69.

We can see that a final identification of any particular disc on the Egyptian Zodiac as the Moon or the Sun is only feasible after all possible options are tried and all the necessary astronomical calculations performed – which is exactly what we shall do in [Chron3](#), Part 2.

Mediaeval drawings of Mercury were based on the idea that both Mercury and Janus were considered gods of trade, and patrons of contracts of all sorts. Janus is an “ancient” Roman god with *two faces* ([\[533\]](#), Volume 2, p. 684). His two faces face different sides, qv in figs. 2.42 and 2.43. Mercury is always close to the Sun and never drifts too far away from it. In Tesnierio’s book [\[1440\]](#) we see Mercury’s famous caduceus resembling a *trident* in the hands of the planet Mercury (see fig.

2.44). Another depiction of Mercury, allegedly dating from the XVI century, can be seen in fig. 2.45.

Fig. 2.42. An old picture showing the two-faced “ancient” Roman god Janus. Taken from [\[966\]](#), Volume 2, page 339.

Fig. 2.43. “Janus, the Roman god watching doors and gates from both the inside and the outside” ([\[1425\]](#), page 3). Taken from [\[1425\]](#), page 3.

Fig. 2.44. An ancient picture of the planet Mercury with a caduceus, from Tesnierio's book of astronomy dating from 1562 ([\[1440\]](#)). Taken from [\[543\]](#), page 71, ill. 33.

Fig. 2.45. A sculpture of Mercury with his caduceus resembling the Greek letter ψ (*psi*). A sculpture by Giambologna allegedly dated 1564. Museum of Bologna, bronze. The sculpture was most probably made in the XVII-XVIII centuries at the latest. The finish is beautiful; the running or flying figure looks practically modern. Taken from [\[533\]](#), Volume 2, page 140.

We shall limit ourselves to these examples, since in [Chron3](#), Part 2, we shall study all possible planet identification options for the Egyptian zodiacs with the greatest care, and select a finite version.

However, one shouldn't think that what we encounter in the Egyptian zodiacs is the fixed result of a *real* astronomical observation. The fact is that in the Middle Ages certain important dates were apparently written

down as picture horoscopes, or “celestial dates” of sorts. This is why when a temple commemorating some ancient event would be erected in the XVI-XVIII century, for instance, the zodiacal dislocation of the planets could well be calculated for the “ancient date” in question, and then depicted on the dome of a temple.

Let us now report the datings of the horoscope depicted on the Long Dendera Zodiac. This bas-relief used to be on the dome of the temple, in the hall one enters via the main entrance.

N. A. Morozov offered the following astronomical solution, basing it on his partial decipherment: 6 April 540 A.D. ([\[544\]](#), Volume 6).

N. S. Kellin and D. V. Denisenko extended the analysis methods, and offered 14 April 1394 as an astronomical solution.

An even more detailed, albeit also partial, decipherment of the Long Zodiac as well as its dating were performed by T. N. Fomenko. The result was the 7 or 8 of April, 1727 ([\[METH3:3\]](#)).

The finite answer obtained by A. T. Fomenko and G. V. Nosovski in 2001 shall be formulated below.

5.3. The horoscopes of Brugsch and Flinders Petrie

In 1857 the eminent Egyptologist Henry Brugsch found an “ancient” Egyptian wooden coffin in Egypt that was in a remarkable condition, as if it were created in a very recent period, qv in fig. 2.46. It contained a typical “ancient” Egyptian mummy ([\[1054\]](#)). On the inside of the lid there was a symbolic representation of the starlit sky with planets affixed to constellations – a horoscope, in other words, qv in [Chron3](#), Part 2.

Fig. 2.46. “Ancient” Egyptian wooden sarcophagus found by G. Brugsch in Thebe in 1857. Allegedly dating from 90 A.D. Taken from a book by Henri Brugsch titled *Recueil de Monuments égyptiens, dessinés sur lieux*. 1862. Also see [\[543\]](#), page 297, ill. 148.

The entire burial rite, the artwork, and especially the demotic scripture doubtlessly indicated (according to Scaligerite historians) that the finding was exceptionally ancient. Brugsch himself dated it to the I century A.D. at the earliest ([\[1054\]](#)).

The demotic inscriptions are close to the figures of certain zodiacal constellations and make direct references to the planets they contain.

The situation is extremely advantageous. Indeed, all the necessary astronomical information is given clearly and accurately by the creators of this remarkable “ancient” Egyptian sepulchre.

All the researchers of the horoscope were hypnotized by the alleged antiquity of the demotic scripture (first discovered by Ackerblade 20 years prior to Champollion deciphering hieroglyphic writing), and dated the artefact to the historical epoch corresponding to Scaligerian chronology of Egypt. What ensued was a series of attempts made by astronomers to ascribe the horoscope to the very historical epoch that concurs with the Scaligerian version of the Egyptian chronology. This, however, has failed to yield any results, since, as was the case with the Dendera Zodiacs, the ancient sky, from deep antiquity and until the first centuries of the new era, has never been positioned the way the lid of the sarcophagus depicts it.

The astronomer M. A. Viliev went a little further along the time axis than the other astronomers. However, he didn’t go beyond the first couple of centuries of the new era. It is interesting that despite N. A. Morozov’s numerous suggestions, M. A. Viliev *refused* to carry on with the research so that it would include the Middle Ages as well, since this would blatantly contradict Scaligerian chronology, which Viliev did not doubt in the least ([\[544\]](#), Volume 6). N. A. Morozov proceeded with the calculations and

went forward in time ([\[544\]](#), Volume 6, pages 694-728). N. A. Morozov discovered the following astronomical solution, basing his calculations on his own partial decipherment of the Zodiac found by Brugsch: 17 November 1682. The final 2001 solution of A. T. Fomenko and G. V. Nosovskiy will be formulated below.

In 1901 the eminent Egyptologist W. M. Flinders Petrie found an artificial cave in Upper Egypt, near Sohag, that was used as an “ancient” Egyptian sepulchre. Its walls were covered by ancient artwork and graffiti, and there were two colour horoscopes on the ceiling (see *Athribi* by W. M. Flinders Petrie in Volume 14 of the *British School of Archaeology in Egypt Research Account*, 1902. Details in [Chron3](#), Part 2.)

In 1919, academician B. A. Turayev suggested to perform an astronomical dating of the horoscopes to N. A. Morozov. Their preliminary analysis and deciphering were performed by E. B. Knobel in Britain ([\[1224\]](#)), who also gave preliminary datings to the horoscopes. The dates he obtained were as follows: 20 May 52 A.D. and 20 January 59 A.D.

However, E. B. Knobel remarked that he found the position of Mercury in the second horoscope quite dubious. In other words, the solution he offered only satisfied the conditions if one was to close one’s eyes at some inconsistencies. As for the first horoscope – he put forth the hypothesis that the planetary positions were calculated by the astronomer who had painted it, and not actually observed. The planets were far away from the positions indicated on the horoscope on 20 January 59 A.D. ([\[1224\]](#)). Apart from Mercury, E. B. Knobel had his doubts about the position of Venus in the first horoscope.

This led E. B. Knobel to try out a few other “ancient” versions pertinent to the epoch where Scaligerite Egyptologists had a priori placed them, guided by the style of burial. However, all Knobel’s attempts to find a better astronomical solution turned out utterly fruitless. All the other options that he had researched satisfied to the given conditions even less.

Furthermore, when M. A. Viliev verified Knobel’s calculations, it turned out that Knobel had been somewhat imprecise with Mars and Saturn as

well. This made both of Knobel's dates (52 A.D. and 59 A.D.) highly questionable.

Then M. A. Viliev performed another series of calculations, and offered his own solution of 186 B.C. and 179 B.C. However, it turned out that the subconscious (or conscious) desire of M. A. Viliev to make the solution fit into the historical interval a priori defined by Scaligerian chronology of "ancient" Egypt, led him to several unjustified allowances. In [\[544\]](#), Volume 6, pages 733-736, all of Viliev's calculations are cited, with all of their errors and deviations pointed out as a good example of what a desire to save Scaligerian chronology by all means might lead to.

Then M. A. Viliev put forth a hypothesis that the couple of 349 and 355 A.D. would provide a better fit. However, numerous verifications proved this pair to be even worse than the first solution. Another similar attempt also led to a complete fiasco.

N. A. Morozov carried on with the research. However, he also failed to find a precise astronomical solution. This was beginning to look most peculiar indeed. The character of the painted horoscopes clearly indicated that the ancient painter was fully aware of what he was painting, and not just making the artwork up as he went along. Then N. A. Morozov started to suspect that the horoscope had been deciphered incorrectly. He analyzed the horoscope and suggested another interpretation, a more logical one in his opinion. It was partial as well; however, the astronomical solution for the problem presented itself as 6 May 1049 for the upper horoscope and 9 February 1065 for the lower.

Now we are ready to consider the finite answer obtained by A. T. Fomenko and G. V. Nosovskiy in 2001.

5.4. Finite datings of Egyptian Zodiacs based on their complete decipherment, as calculated by A. T. Fomenko and G. V. Nosovskiy in 2001

Let us quote a part of our introduction to [Chron3](#), Part 2.

Previous attempts to decipher the “ancient” Egyptian Zodiacs – primarily, those of N. A. Morozov, N. S. Kellin, D. V. Denisenko and T. N. Fomenko – have all been partial, since some part of the zodiacal depictions had remained unidentified. The complications they had to face are perfectly understandable, since to try out all possible permutations one would have to perform a gigantic amount of calculations impossible to do manually. The decipherment we obtained in 2001 was the first one to be completed, with an exhaustive computer search of *every* symbol in the zodiacs that was interpreted ambiguously. The singular complete decipherment possible was the only one that accounted for everything depicted on the zodiacs, and allowed for an astronomical solution to boot. This fact is extremely important. The very existence of a complete and datable decipherment is anything but obvious. Furthermore, our astronomical solution is the only one possible. This makes our decipherment finite.

Apparently, the complete decipherment that we performed includes the partial decipherments formerly offered by N. A. Morozov and T. N. Fomenko, but differs from them somewhat in details. These differences have the shape of circumstantiations in the complex situations where one would formerly have to choose between a great number of possible options. This concerns the differing symbols for the sun and the moon as used by astronomers in the Middle Ages. All of the previously mentioned researchers did not perform any computer search, basing their choice on the analysis of the “ancient” Egyptian symbols in general. Their interpretations weren’t finite in a number of cases; therefore, the dates they came up with could not fit ideally. This explains the fact that the precise datings calculated by the authors differ from the ones calculated previously by N. A. Morozov, N. S. Kellin, D. V. Denisenko and T. N. Fomenko; however, it is significant that all the exact dates remain mediaeval. It turns out that no finite astronomical solution for the Egyptian zodiac goes further back in time than the XII century A.D.

Let us re-emphasize that computer calculations allowed us to discover

that the previous partial decipherments provided for the foundation of the finite complete interpretation of the zodiac, confirming that the research of our predecessors had been conducted in the correct general direction.

The computer datings we have come up with for the “ancient” Egyptian zodiacs are as follows:

- The Round Zodiac of Dendera:
morning of 20 March 1185 A.D.
- The Long Zodiac of Dendera:
22-26 April 1168 A.D.
- The zodiac from the Greater Temple of Esna:
31 March – 3 April 1394 A.D.
- The zodiac from the Lesser Temple of Esna:
6-8 May 1404 A.D.

The Athribean horoscopes of Flinders Petrie:

- The upper zodiac:
15-16 May 1230 A.D.
- The lower zodiac:
9-10 February 1268 A.D.
- The Horoscope of Thebe by H. Brugsch:
 - The horoscope of demotic subscripts:
18 November 1861 A.D.;
 - The “Horoscope without Staves”:
6-7 October 1841 A.D.;
 - The “Horoscope with Boats”:
15 February 1853 A.D.
- The “Colour Horoscope of Thebe” (Luxor):
5-8 September 1182.

This research of ours proved to include a great body of material, and was quite complex. It turned into an entire book that we include in [Chron3](#).

5.5. On the errors of E. S. Goloubtsova and Y. A. Zavenyagin

This could mark the end of our account of Egyptian zodiacs and their datings, if it hadn't been for the publication of a certain article by E. S. Goloubtsova and Y. A. Zavenyagin often quoted by the proponents of Scaligerian chronology. The article in question is entitled "One More Study of the 'New Methods' and the Ancient Chronology" and was published in *Voprosy Istorii (Historical Issues)*, No. 12, 1983, pages 68-83 ([\[179\]](#)). The authors of the article tried to question the dating of the Round Zodiac as obtained by N. A. Morozov. It will be edifying to study the article of Goloubtsova and Zavenyagin, since it appears to be concerned primarily with using a computer for solving the problem, which makes the conclusions arrived at by the authors seem scientific and objective.

E. S. Goloubtsova and Y. A. Zavenyagin write that "the complication lies in the fact that it is perfectly unclear which figure (of the five on the Round Zodiac) should stand for which planet." This is why they suggest considering the Zodiac to depict the following planets: Saturn, Venus, Mercury, Mars and Jupiter. However, the authors *don't offer any proof* for such an interpretation of the Zodiac ([\[179\]](#)). Furthermore, they cite the following table and suggest that the abovementioned planets are localized on the Zodiac with a possible deviation rate of 20 degrees to one side or another.

<i>Figure 1 between Pisces and Aquarius</i>	0 ± 20 degrees, or (340 - 360 - 20)
<i>Figure 2 between Cancer and Gemini</i>	120 ± 20 degrees, or (100 - 140)
<i>Figure 3 between Virgo and Leo</i>	180 ± 20 degrees, or (160 - 200)
<i>Figure 4 between Libra and Virgo</i>	220 ± 20 degrees, or (200 - 240)
<i>Figure 5 between Capricorn and Aquarius</i>	320 ± 20 degrees, or (300 - 340)

The authors report that none of these possible combinations were realized in 568 A.D. (supporting this by computer calculations) and add that “this conclusion is of course valid for any decipherment of the figures of the Round Zodiac.” ([179]) They proceed to offer 53 A.D. as a solution.

So, one may get the impression that the astronomers have finally refuted “the fantastic inventions of Morozov” and confirmed the Scaligerian chronology once again.

However, nothing here is quite as simple as it is presented to be. This is a reflection of the typical illusion of the average lay observer that it suffices to “load” some mathematical data into a computer so that “mathematical science” can provide us with an immediate answer. Let us return to the very beginning and observe just what Goloubtsova and Zavenyagin, the authors of [179], load into their computers. They write that the five planets of the Round Zodiac are allegedly localized near the following constellations: Pisces, Aquarius, Cancer, Gemini, Virgo and Capricorn, giving presumed intervals (in degrees) that contain the planets: 340-360-20 degrees, 100-140 degrees, 160-200 degrees, 200-240 degrees and 300-340 degrees.

The problem here is that the data used by the authors of [179] as basis for their calculations fails to concur with the actual depiction of the planets on the dome of the temple. Where did their bizarre table come from, the one they processed mathematically afterwards? It would have sufficed to carefully study the photographs of the Round Zodiac contained in scientific literature in order to reconstruct the correct horoscope. It differs considerably from the one described by Goloubtsova and Zavenyagin, since the Round Zodiac explicitly depicts Venus in either Aries or Pisces.

In our opinion, the fact that the authors of [179] “omitted” the constellation of Aries in their table speaks for itself. It is little wonder that the computer “failed to find a solution” in the Middle Ages. As we can see, Goloubtsova and Zavenyagin have *falsified the initial data* and have *de facto prohibited the computer from studying the interval between 25 and 50 degrees* – the actual location of the constellation of Aries.

E. S. Goloubtsova and Y. A. Zavenyagin appear to have wanted to find confirmation of Scaligerian chronology without being overly accountable for the means they used for this end. This means that avid Scaligerites should think twice before referring to this “research.”

6.

Astronomy in the New Testament

Example 1

The terms and images used in mediaeval astronomical literature for the designation of planets and constellations can be compiled into a glossary of sorts, which can later be used for the decipherment and dating of similar terms and images found in other chronicles.

E. Renan was apparently the first scientist to point out that the biblical book of the Apocalypse contains a verbal description of a horoscope ([725]). Not being an astronomer, Renan did not date the horoscope, although the dating of the Apocalypse is of the greatest interest. ([765], page 135). But a precise astronomical solution of the Apocalypse horoscope does exist, and it is both unique and unambiguous. This horoscope dates from the 1 October 1486 A.D. (See details below.)

Example 2

The dating of the eclipse, which, according to the early Christian authors, accompanied the crucifixion of Jesus Christ. Such authors as Sinkellos, Flegon, Africanus, and Eusebius wrote about this eclipse. However, the Evangelical descriptions aren't very explicit on whether the description refers to a solar eclipse, or a lunar. Scaligerian chronology presumes the eclipse to be lunar, although this is highly debatable. The ecclesiastical tradition has preserved evidence of the eclipse being solar. The Gospel according to Luke, for instance, states specifically: "For the sun stopped shining." (Luke 23:45)

The gospel of Nicodemus, declared apocryphal by historians, says: "And it was about the sixth hour, and there was darkness over the land until the ninth hour, for the sun was darkened... And Pilate sent for the

Jews and said unto them: Did ye see that which came to pass? But they said: There was an eclipse of the sun after the accustomed sort.” (Nicodemius XI – [\[29\]](#), p. 83).

The last phrase in this passage shows that in the epoch when the gospel of Nicodemius was written, the fact that the eclipses of the sun occur according to a specific astronomical law was well understood. There is a direct reference made to the eclipse happening “after the accustomed sort”, which most probably reflects that such astronomical notions already existed in the mediaeval period.

Scaligerian “astronomical solution” suggests the lunar eclipse of 3 April 33 A.D. to have accompanied the crucifixion of Christ ([\[1154\]](#)). This theory does not hold up to any criticisms at all, which is well known, although de-emphasized, and this problem is deliberately presented as nonexistent. (See the discussion in [\[544\]](#), Volume 1.)

In spite of the totally questionable characteristics of the “evangelical eclipse” extracted from early Christian texts, and repeatedly discussed in chronological literature, an attempt can be made to date this eclipse precisely. For this end, both the solar and lunar versions of the eclipse should be examined. A suitable astronomical solution exists on the interval between 200 A.D. and 800 A.D. The lunar eclipse solution of 368 A.D. was found by Morozov ([\[544\]](#), Vol. 1]). However, Morozov did not extend his calculations to later centuries for the reasons cited above – the primary being his unswerving confidence in Scaligerian chronology from the VI century A.D. and on. The calculations of the authors of the present book covered the entire historical period up to 1600 A.D. and revealed an additional precise astronomical solution, quite unexpectedly. This was the lunar eclipse of the 3 April 1075 A.D. The dating of our solution differs from the Scaligerian by over 1.000 years, and by 700 from Morozov’s. (See more details below.)

We recall that Scaligerian astronomical dates and modern calculations only come to concurrence from the XI century A.D. and on, and are only fully reliable from as recently as the XIII century A.D.

But if we consider the eclipse described in the Gospels to be solar, we cannot fail to notice that a total solar eclipse whose shadow track traversed Italy and Byzantium occurred in the XI century, on 16 February 1086. See more on the correspondence of this eclipse with the old ecclesiastical tradition that dated the crucifixion of Christ to the XI century A.D., qv in the book entitled *The Biblical Russia* (Annex 4) and [Chron6](#). However, this ecclesiastical tradition was 100 years off the mark, as we demonstrate in our book “King of the Slavs”. It turns out that the solar eclipse of 1185 A.D. corresponds a lot more to the real dating of the Crucifixion. See more on this subject in our book entitled *King of the Slavs*. We shall come back to this “Evangelical eclipse” in [Chron2](#).

Grammatical analysis of an eclipse description in *History* by Thucydides

This section contains quotations from works by Y. V. Alexeyeva

In the present Annex, references are made to the list of books and notes in the end of the Annex.

Curcius [d1], Schwyzer [d2] and Cherny [d3] noted the similarity between systems [d4] of perfective and imperfective aspects of the verb in the ancient Greek and Slavonic languages. Thus, the imperfective aspect of a verb (praesens) indicates that the action in question is rather a process that goes through various stages over the course of time. Cf.: *I am dying* (imperfective aspect), *I have died* (perfective aspect), *I am dead* (conveys effective aspect). While perfective aspect of a verb (aoristus) (cf.: similarly) indicates either a momentary action (cf.: *gave a cry, drew breath*), or the moment when a given action begins (cf.: *she started singing*), or ends (cf.: *she stopped singing*). One should note, however, that the ancient Greek language has, besides perfective and imperfective aspects, effective aspect (perfectum) (cf.: *gave a cry, drew breath*), which does not exist in contemporary Slavonic languages but still can be seen as traces (in the Russian language, for instance ([d5])). This aspect is used to either refer to an achieved result of action usually continuing at the moment of speech, or a state caused by such completed action which is still a reality.

Let us look at a phrase by Thucydides:

ὁ ἥλιος ἐξέλιπε ... καὶ πάλιν ἀνεπληρώθη, γεγόμενος μηνοειδής καὶ
ἀστέρων τινῶν ἐκφανέντων.

Let us research it grammatically in order to establish the correct order of events. In doing so, we shall present other possible interpretations of this phrase which, albeit constructed correctly from the grammatical point of view, can prove void of meaning, such as the phrase “he had died, but continues to breathe”.

The beginning of the phrase goes as follows:

ὁ ἥλιος ἐξέλιπε ... καὶ πάλιν ἀνεπληρώθη ...

That is, “The sun darkened (disappeared) ... and again (anew) replenished”. The form [d4] ἐξέλιπε (darkened) is used to refer to the 3rd person, singular, active voice of the verb ἐκλείπω, indicative mood, perfective aspect (3 Sin. aoristi indicative activi). The form [d4] ἀνεπληρώθη (replenished) is used to refer to the 3rd person, singular, passive voice of the verb ἀνὰπληράω, indicative mood, perfective aspect (3 Sin. aoristi indicativi passivi). Further: ἐξέλιπε and ἀνεπληρώθη are similar predicates related to the subject ὁ ἥλιος (the sun). Actions expressed by these verbs in perfective aspect are not simultaneous. This difference, a certain gap between ἐξέλιπε (darkened) and ἀνεπληρώθη (replenished), is indicated by πάλιν (again, rursus, wieder, вновь).

Note 1. In the Greek language, in order to indicate the simultaneity of actions performed by the same person (in present, past, and future tense), personal form of one verb and the imperfective aspect of another one's participle [d6]. E.g.: “The sun, darkening, replenished”, “The sun, having darkened, replenished”.

Note 2. A number of verbs in imperfective aspect, being predicates with one subject, can denote actions which at a certain moment of development occur simultaneously (i.e., imperfective aspect neither indicate the beginning nor the end of an action).

The next part of the phrase:

γενόμενος μηνοειδής καὶ ἀστέρων τινῶν ἐκφανέντων

– explains circumstances that provide us with additional information. In adverse case, these actions would likewise be expressed by personal forms of verbs:

ὁ ἥλιος ἐξέλιπε ... καὶ πάλιν ἀνεπληρώθη καὶ ἐγένετο μηνοειδής καὶ
ἀστέρες τινεὺς ἐξέφάνησαν ἐξέφάνθησαν,

“The sun darkened... and again replenished, and became similar to the crescent, and some stars appeared in sight”. Further: γενόμενος – the perfective aspect participle from the verb γίγνομαι, the coordinated in masculine gender, singular, nominative with the subject ὁ ἥλιος. The participle is used instead of adverbial modifier subordinate clause, when the subject of a subordinate clause is a part of the principal clause (in this case, the subject of the principal clause) [d7]. Perfective aspect participle (adverbial modifier and the predicative participles) always expresses precedence [d8] to the action of the principal verb, as opposed to the imperfective aspect participle that refers to the simultaneity of its action and that of the principal verb. See Par. III, Note 1. In our phrase γενόμενος (having become, having turned) means precedence only to the action ἀνεπληρώθη (replenished). First, if the author should need to indicate that this action (γενόμενος – having become) equally precedes action ἐξέλιπε (darkened) and action ἀνεπληρώθη, then the phrase would be constructed differently, along the lines of:

... γενόμενος μὲν μηνοειδής ὁ ἥλιος ἐξέλιπε καὶ πάλιν ἀνεπληρώθη
ἐκφανέντωνδὲ ...,

or “having become similar to the crescent, the sun darkened and again

replenished.”

Second, καὶ πάλιν means a strict sequence of actions ἐξέλιπε and ἀνεπληρώθη, clearly dividing one from the other [d9]. Therefore, one should not believe the circumstances accompanying one action (ἀνεπληρώθη) to equally relate to the other (ἐξέλιπε). Thus, the sun had acquired the shape of the crescent before it replenished, and after (or simultaneously with) having darkened. Translators to German, English, and French can only convey this sequence by description: these languages have no participle which would possess the meaning of precedence. Adverbial modifier subordinate clause, the subject of which does not occur in the principal clause, neither in nominative nor in any other indirect case, can be replaced by a special adverbial modifier construction Genitivus Absolutus, where the subject of a subordinate clause is in the genitive case, and the predicate is replaced [d10] by the genitive case of the participle of the same verb.

If the construction Genitivus Absolutus contains an imperfective aspect participle, then the action of the construction occurs simultaneously with that of the principal clause [d10]. E.g.,

ὁ ἥλιος ἀνεπληρώθη ἀστέρωντινων ἐκφαινομένων,

“The sun replenished, at the same time some stars were coming in sight”.

If the construction Genitivus Absolutus contains a perfective aspect participle, then the action of the construction precedes that of the principal verb [d10]. E.g.,

ὁ ἥλιος ... ἀνεπληρώθη ... ἀστέρων τινων ἐκφανευντων,

“The sun replenished, before that some stars came in sight”.

In our phrase, the action of the construction Genitivus Absolutus only precedes the action ἀνεπληρώθη (replenished). Indeed, in the phrase:

... ὁ ἥλιος ἐξέλιπε ... καὶ πάλιν ἀνεπληρώθη γενόμενος μηνοειδής
καὶ ἀστέρων τινῶν ἐκφανέντων,

– the conjunction καὶ πάλιν joins the predicate ἐξέλιπε (darkened) and the predicate ἀνεπληρώθη (replenished), while the conjunction [d11] καὶ joins the circumstance actions which, for the purposes explained above, are constructed differently from the grammatical viewpoint. However, Thucydides might have expressed both circumstance actions through similar adverbial modifier phrases, such as:

... ὁ ἥλιος ἐξέλιπε ... καὶ πάλιν ἀνεπληρώθη, ἐπεὶ ἐγενετο μηνοειδής
καὶ ἐπεὶ ἀστέρες τινεὶ ἐξεφάνησαν,

“The sun darkened and again replenished after it had become similar to the crescent, and after some stars have come in sight”.

Thus, the actions γενόμενος and ἀστέρων τινῶν ἐκφανέντων are joined by the conjunction καὶ and compose a united adverbial modifier group related to ἀνεπληρώθη; however, it is impossible to establish, judging merely by the grammatical analysis, the correlation between the actions γενόμενος μηνοειδής and ἀστέρων τινῶν ἐκφανέντων (the appearance of the crescent sun and the stars) – namely, the precedence of one over the other, or the determination of a dependence existing between the two events.

Note 3. If we consider καὶ to unite the construction Genitivus Absolutus with the whole of the phrase

... ὁ ἥλιος ἐξέλιπε ... καὶ πάλιν ἀνεπληρώθη ... καὶ ἀστέρων τινῶν
ἐκφανέντων,

– then the appearance of stars in the sky turns out to have preceded both

the darkening and the replenishing of the sun. In this case, the contraposition (of the appearance of stars against the darkening and the replenishing of the sun) is obvious and not expressed by particles μέν and δέ grammatically:

... ὁ ἥλιος ἐξέλιπε ... καὶ πάλιν ἀνεπληρώθη ... καὶ ἀστέρων δέ
τινῶν ἐκφανέντων.

Therefore, such a stance is erroneous. On the other hand, acknowledging that καὶ simply unites the construction Genitivus Absolutus with the whole of the phrase, without any contrapositions of any kind attests to the fact that the action of the “appearance of stars” is of equal value with, and similar to, the action of “darkening-replenishing”, which is impossible. Firstly, Genitivus Absolutus is by nature an adverbial modifier and of equal value with a subordinate clause, therefore cannot have equal rights with the principal clause, but should be subordinate thereto. Secondly, ἐξέλιπε, ἀνεπληρώθη and ἀστέρων τινῶν ἐκφανέντων, [d13], possess no similarity, and so it would be an error to ascribe the actions “darkened”, “replenished”, “stars appeared”, etc., to the same class of events.

Conclusion. *Sequence of events is as follows: the sun darkened – assumed the shape of a crescent – the stars came into sight – the sun replenished again.*

As a rule, contemporary languages convey the constructions of the ancient Greek by proxy of description, where the forms available are clarified by means of adverbs or other form words [d13]. Thus, the construction of Genitivus Absolutus is replaced by a subordinate clause, and the adverb γενόμενος – by a personal form of verb. To show the precedence of the action “assumed the shape of a crescent” to the action “replenished”, a relevant word order is used.

[d3] Cherny, *On Relation of Aspects of Russian Verb to Greek Tenses*. SPb., 1887, pp. 4-8.

[d4] The issue of terms needs to be discussed: verbal forms are a complex fusion of meanings – aspect, mood, tense, etc. Disagreement may arise on whether a verb is in an indicative mood of the perfective aspect, or whether the verb of perfective aspect is in the indicative mood; whether an aspect has the participles of verb “x”, or whether the verb “x” of a certain aspect has participles. Issues like that are beyond the scope of the current work and believed to be terminological issues. In this case, we are concerned with the fact that two forms can be contraposed by the same feature – aspect of verb, e.g.: ἐξέλειπε, ἐξέλιπε – 3rd person, singular, active voice, indicative mood, but ἐξέλειπε is a verb of the imperfective aspect, while ἐξέλιπε is a verb of the perfective aspect.

[d5] Such as gender contraposition in the past tense. The existing form originates from a perfect adverb.

PART ONE

The New Dating of the Astronomical Horoscope as Described in the Apocalypse

By Anatoly Fomenko and Gleb Nosovskiy

1.

The proposed research method

Let us attempt to date ancient artefacts containing astronomical or astrological symbolism in the following self-implied manner: we shall study astronomical references contained in a number of ancient documents with the aid of the *mediaeval* system of astrological symbols. Many mediaeval books on astrology, for instance, identify planets with *chariots or with horses drawing these chariots* across the celestial sphere. Planetary trajectories were probably perceived as equine leaps.

Our method revolves around the comparison of the studied text with similar mediaeval texts containing both astrological symbols and their *interpretations* in terms comprehensible to us. In other words, we propose to read old astrological records with the aid of a mediaeval astrological “dictionary” of sorts, one that identified chariots or horses with planets. Of course, the applicability of the method will be substantiated in this way only if the use of such a dictionary should help us with obtaining intelligible results that can be confirmed by other independent procedures of dating applicable to old documents.

N. A. Morozov had been the first one to apply this procedure to several Biblical books that contained apparent astronomical or astrological symbolism. The dates cited in this introduction were obtained by Morozov. After the publication of his works on this topic ([\[542\]](#) and [\[543\]](#)) many specialists persistently but unsuccessfully attempted to find errors in his calculations – however, the correctness of his interpretation of Biblical texts with the aid of a mediaeval “astrological dictionary” defied doubts as a rule. Morozov’s reading of astrological texts was at first perceived by historians as completely correct and aberration-free.

N. A. Morozov had also been a pioneer in his assumption that the author of the Biblical Apocalypse coded nothing intentionally, but only described

what he actually saw on the celestial sphere using the astronomical language of his time ([\[542\]](#) and [\[544\]](#), Volume 1, pages 3-70).

We can leap ahead for a short instance in order to tell the reader that Morozov's dating of the Apocalypse to the fourth century A.D. does not in fact concur with the explicit data contained in the text of the Apocalypse one hundred per cent. Being erroneously convinced of the correctness of Scaligerian chronology after the sixth century A.D., Morozov stopped at the first early mediaeval solution, which didn't fit completely, having deliberately rejected the much better astronomical solution of the late XV century A.D. – one fitting *perfectly*, as unprejudiced analysis shows.

2.

General information about the Apocalypse and the time of its creation

The authors cite the Apocalypse from the 1898, 1912, and 1968 Russian editions of the Bible ([\[67\]](#)). The translation uses the Authorised Version.

The Apocalypse, also called the Book of Revelation, is the twenty-seventh and last book of the New Testament. It is also the last book of the contemporary canon of the Bible. The Apocalypse is considered an integral part of the New Testament. However, in mediaeval Russia the Apocalypse was not included in the New Testament manuscripts as a rule. As we shall demonstrate in the chapters related to the Slavic Bible manuscripts in [Chron6](#), Slavic manuscripts of the Apocalypse are exceptionally rare – for instance, there is only one known manuscript of the Apocalypse dating from the IX-XIII centuries, whereas there are 158 known manuscripts of the remaining books of the New Testament dating from the same period. Furthermore, even as recently as the XVII century, references to the Apocalypse and the Revelation of St. John the Divine apparently could imply entirely different books. (See Appendix 2 to [Chron6](#).)

This means that many uncertainties are closely related to the history of the Apocalypse, and primarily its dating. Proposed dates are very diverse, reflecting the disagreement amongst the historians. For example, Vandenberg van Eysing dated the Apocalypse to 140 A.D., A. Y. Lentsman to 68–69 A.D., A. Robertson to 93–95 A.D., Garnak and E. Fisher to not earlier than 136 A.D., and so forth. (See the survey in [\[765\]](#).)

I. T. Sunderland wrote that “dating the Book of Revelation to this epoch [the end of first century A.D. – A. F.] *or indeed any other epoch at all* [sic! – A. F.] is a task of *tremendous complexity*” ([\[765\]](#), page 135).

Furthermore, in the opinion of V. P. Rozhitsyn and M. P. Zhakov ([732]), the creation of the Apocalypse was completed in the II-IV century A.D., most likely in the IV century! This opinion is in no way congruous with the Scaliger-Petavius chronology.

The Apocalypse itself doesn't contain a single explicit chronological indication of the epoch when it was written. No actual historical figures have been identified as definite contemporaries of the Apocalypse. No absolute dates whatsoever have been given in the work itself. The Apocalypse is commonly considered to be *the last* written book of New Testament; however, F. H. Baur, for one, has categorically asserted that the Apocalypse is not the last, but the "*earliest* writing of the New Testament" ([489], page 127). A. P. Kazhdan and P. I. Kovalev were also of the opinion that the Apocalypse was the *first* book of the New Testament, and not the *last* one ([765], page 119).

Furthermore, some researchers categorically reject to credit the Apocalypse to John, who has allegedly written a Gospel and three Epistles. Generally, it is assumed that no exact information about the author of the Apocalypse remains in existence ([448], page 117).

G. M. Lifshitz noted that the author of the Apocalypse is quite familiar with astronomy: the images of the dragon, beasts, horses, and so forth that he describes resemble the figures of the constellations on the celestial sphere, which are similarly designated on mediaeval star charts ([489], pages 235-236).

However, all these considerations were already expressed by N. A. Morozov in the beginning of the XX century. Apparently, his line of reasoning produced a strong impression on at least some of the abovementioned authors, and they actually reiterated his assertions without referring to him, which is very typical for such researchers.

M. M. Kublanov sums up: "The reasons for this abundance of contradictory hypotheses concerning chronological issues are explained primarily by the scarcity of reliable evidence. The ancients did not leave us any reliable data in this respect. Under the prevailing circumstances, *the*

only means for the dating of these writings are the writings themselves... The establishment of a reliable chronology of the New Testament still remains an open issue” ([448], page 120).

So, let us finally turn to the Apocalypse itself. *Its astronomical nature becomes immediately evident, especially when we compare it to the ancient celestial charts.* (See the mediaeval maps allegedly dating from the XVI century, for instance – figs 3.1, 3.2, 3.3, and 3.4.)

Fig. 3.1. Star chart of the Northern Hemisphere done by A. Dürer (1471-1528), allegedly in 1527. Taken from [90], page 8.

Fig. 3.3. Hemisphere constellations on a star chart from Ptolemy's *Almagest*, allegedly published in 1551. Pay attention to the fact that some figures are wearing mediaeval clothes. Taken from *Claudii Ptolemaei Pelusiensis Alexandrini omnia quae extant opera*, 1551 ([\[1073\]](#)). The book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[543\]](#), the inset between pages 216-217.

Today's specialists in Biblical history cannot conceive of any astronomical connotations in Biblical texts. There may be a unique possibility, as we shall now demonstrate, of *dating* some fragments of the Bible *astronomically*. If this be the case, though, we shall come up with dates that *do not correspond* with the ones the "tradition" insists upon *at all*.

The Apocalypse contains the famous prophecy concerning the Doomsday, or the Judgement Day. This prophecy is in immediate relation to the symbolic description of what the author observed on the celestial sphere. This was still remembered by the authors of the illustrations to the Apocalypse who had lived around the XVI century. We give one such example in fig. 3.5. As we have already noted, the inability of the latter day commentators to comprehend the astronomical symbolism of the Apocalypse is directly resulting from the loss of knowledge about the correct chronology and the distortions introduced by historians of the XVI-XVIII century. Another possibility is that there was an unspoken general taboo on what concerned a subject quite as dangerous, which resulted in the misdating of the Apocalypse. One way or another, the understanding of the astronomical descriptions that the Apocalypse contains got lost at some point. The Apocalypse had lost its distinctive astronomical hue in the eyes of the readers. However, its "astronomical component" is not simply exceptionally important – it alone suffices for the dating of the book itself.

Fig. 3.5. A drawing from a manuscript of the Apocalypse dating from the XVI century. The author of the miniature emphasizes that the events described occur on a starlit sky. The manuscript is kept in the State Library of Russia, Moscow, folio 98, number 1844, sheet 27, reverse. Taken from [\[745\]](#), Volume 8, page 446.

Let us turn to the astronomical fragments of the Apocalypse. *The main idea of our study consists in the comparison of the Apocalypse with the mediaeval astronomical maps. This comparison reveals many parallels and even direct coincidences between the two, which allows a confident*

determination of the astronomical horoscope as penned out by the author of the Apocalypse.

We propose that the readers divert their attention to a star chart that has the stars pointed out in some manner. Even a contemporary map of the sky should do, but a mediaeval star chart would be better – the one by Albrecht Dürer, for instance, which we have provided on figs. 3.1 and 3.2, or the map from the *Almagest* that one sees on figs. 3.4 and 3.3.

3.

Ursa Major and the Throne

The Apocalypse says: “John, To the seven churches in the province of Asia: Grace and peace to you from him who is, and who was, and who is to come, and *from the seven spirits opposite his throne*” (Rev 1:4–5).

In France, the constellation of Ursa Major is still called The Chariot of Souls. This is how this constellation used to be drawn, q.v. in the mediaeval book by Apianus ([\[1013\]](#)). This ancient figure can be seen below – see [Chron1](#), chapter 4:3.7.)

The Throne: Ursa Major is right in front of this constellation. (See the star chart fragment given on fig. 3.6. Also, the Greek text of the Apocalypse makes references to the “*Throne*” (*tronos*).)

Fig. 3.6. The Throne constellation, known as Cassiopeia nowadays, and the constellation of the Seven Souls, presently Ursa Major, near the pole. Taken from [\[542\]](#), page 37.

4.

The events took place on the Isle of Patmos

The Apocalypse says: “From the *throne* came flashes of lightning, rumblings and peals of thunder. Before the throne, *seven lamps* were blazing... Also *before the throne there was what looked like a sea of glass, clear as crystal*” (Rev 4:5–6).

Thus, seven fiery icon-lamps are situated before the throne on which God sits in glory. The “sea of glass, similar to crystal” apparently is the sky as observed by the author of the Apocalypse.

The Apocalypse says: “I, John, ... was on the island of Patmos” (Rev 1:9).

The observation point is defined explicitly – the island of Patmos in the Mediterranean. It is also emphasized throughout the entire Apocalypse that the main arena of the events described is the *celestial sphere*.

5.

The constellations of Cassiopeia and the Throne were drawn as Christ sitting on his throne in the Middle Ages

The Apocalypse says: “After this I looked, and there before me was a door standing open in heaven... and there before me *was a throne in heaven with someone sitting on it*. And the one who sat there had the appearance of *jasper and carnelian*” (Rev 4:1–3).

The person sitting on the throne can be seen on almost every mediaeval star chart – in the *Zodiaque expliqué* ([544], Volume 1, page 81, ill. 36), for instance, or on the star charts of A. Dürer ([544], Volume 4, page 204), on the map of Al-Sufi ([544], Volume 4, page 250, ill. 49), and so forth. Figures 3.7 and 3.8 provide one such image.

Fig. 3.7. The constellation of Cassiopeia from an ancient star chart. Taken from [543], page 70, ill. 30.

Fig. 3.8. The Throne constellation with a human figure sitting on it. Taken from a XVI century tractate titled *Astrognoſia*. Book archive of the Pulkovo Observatory. Also see [\[544\]](#), Volume 1, page 221, ill. 60.

All of these maps depict Cassiopeia enthroned.

The enthroned figure can be seen on many star charts of the XVI century, usually in the centre of the Milky Way. The Apocalypse indicates that there is a rainbow that encircles the throne: “A rainbow, resembling an emerald, encircled the throne” (Rev 4:3). The rainbow is a sufficiently precise image for the luminous Milky Way that spans the night sky like an arch.

A straightforward comparison of the description of the “enthroned person” with a *gemstone* (we are told that it “had the appearance of jasper and carnelian”) strengthens the impression that the images of the Apocalypse are taken from the celestial sphere. Indeed, the comparison of stars with luminous gems is perfectly understandable and natural.

The association of the constellation of Cassiopeia with Christ, which the Apocalypse actually refers to, was sometimes explicitly depicted on mediaeval maps. For example, the book of Radinus ([\[1361\]](#)) contains a picture of a throne with the *crucified* Cassiopeia upon it. The back of the throne serves as a cross, and the hands of the figure are *pinioned to it*. This is obviously a version of the *Christian crucifix*. (See fig. 3.9.)

Fig. 3.9. The constellation of Cassiopeia from a book by Th. Radinus titled *Sideralis Abyssus*, dated 1551. Book archive of the Pulkovo Observatory. Also see [\[543\]](#), page 267, ill. 139.

The figure of a king on a throne can also be seen on the Egyptian star charts ([\[1162\]](#) and [\[1077\]](#)). In figs. 3.10 and 3.11 one sees a number of Egyptian maps, which make it evident that the Egyptian astronomical symbolism is amazingly close to the European, which implies the two astronomical schools are related.

Fig. 3.10. Egyptian Star chart of the Northern Hemisphere. Taken from *Firmamentum Firmianum* by Corbinianus, dated 1731 ([\[1077\]](#)). Book archive of the Pulkovo Observatory. Also see [\[543\]](#), page 276, ill. 143.

Fig. 3.11. Egyptian Star chart of the Southern Hemisphere. Taken from *Firmamentum Firmianum* by Corbinianus, dated 1731 ([\[1077\]](#)). Book archive of the Pulkovo Observatory. Also see [\[543\]](#), page 277, ill. 144.

Therefore, the *Apocalypses* contains references to the constellation of Cassiopeia, which was actually perceived as the “stellar image” of Christ (the King) enthroned in the Middle Ages.

6.

The Milky Way

According to the Book of Revelations, “a rainbow, resembling an emerald, encircled the throne.”(Rev 4:3) Emerald is a bluish-green gemstone. One sees a “rainbow” encircling the constellation of the Throne on every mediaeval and contemporary star chart. The constellation of the Throne, with “a person enthroned” is always surrounded by the luminous strip of the *Milky Way* ([\[1162\]](#), [\[1077\]](#) and [\[1361\]](#)).

7.

Twenty-four sidereal hours and the constellation of the Northern Crown

The Apocalypse says: “Surrounding the throne were *twenty-four* other thrones, and seated on them were *twenty-four* elders. They were dressed in white and had crowns of gold on their heads” (Rev 4:4).

Any complete astronomy textbook points out that in the days of yore the sky was divided into twenty-four wing-shaped segments, that is, into twenty-four meridional sectors which converge at the poles of the celestial sphere. (See [\[542\]](#), page 44, or 544, Volume 1, page 7, ill. 6, for instance). These sectors are also called *sidereal hours*, or *direct stellar ascension hours*. The twenty-four hours define the celestial coordinate system, which can clearly be seen in the mediaeval image of the celestial globe in Zacharias Bornman’s book (fig. 3.12).

Fig. 3.12. Ancient astronomy. Taken from *Astra* by Z. Bornman, dating from 1596 ([\[1045\]](#)). Book archive of the Pulkovo Observatory. Also see [\[543\]](#), page 12, ill. 3.

Thus, each “elder” of the Apocalypse is apparently a star hour in the equatorial system of coordinates, which is the division standard for the celestial sphere in astronomy.

The white clothing of the “elders” simply reflects the white colour of the stars in the sky. The golden crowns apparently refer to the constellation of the *Northern Crown*, situated close to the *zenith*, that is, *exactly above the heads* of all twenty-four “elders”, or hours, or sectors (fig. 3.13).

Fig. 3.13. The Crown (or Diadem) constellation near the pole. Fragment of a chart dating from 1700. Taken from [\[1160\]](#), table 10.1, page 304.

8.

Leo, Taurus, Sagittarius, Pegasus

The Apocalypse says: “Also before the throne there was what looked like a sea of glass, clear as crystal. In the centre, around the throne, were four living creatures, and they were covered with eyes, in front and in the back”(Rev 4:6–7).

This is a description of the celestial sphere which surrounds the constellation of the Throne and is strewn with stars (or “eyes”). The initially obscure reference to a place “around the throne” becomes intelligible: the actual constellation of the Throne is being referred to, as well as the smaller stars scattered all across the background.

But what does “... were four living creatures, and they were covered with eyes...” mean? This becomes clear from a casual glance at the star chart. Moreover, in the following passage of the Apocalypse it is clearly said that: “the first living creature was like a *lion*, the second was like an *ox*, the third *had a face like a man*, the fourth was *like a flying eagle*” (Rev 4:7).

Lion (Leo) is a zodiacal constellation visited by the sun before the beginning of autumn. (See, for example, the mediaeval maps by Dürer and Grienberger ([\[1162\]](#)). See also figs. 3.4, 3.3 and 3.14)

Fig. 3.14. The Leo constellation on a star chart from a book by Grienberger ([\[1162\]](#)). Book archive of the Pulkovo Observatory. Also see [\[542\]](#), page 45, ill. 18.

Ox (Taurus) is a zodiacal constellation visited by the sun before the beginning of summer. (See the same maps of Dürer and Grienberger, as well as fig. 3.15)

Fig. 3.15. The Taurus constellation on the star chart from a book by Grienberger ([\[1162\]](#)). Book archive of the Pulkovo Observatory. Also see [\[542\]](#), page 45, ill. 19.

The animal with a human face (Centaur) is obviously a reference to the well-known zodiacal constellation of Sagittarius visited by the sun in the beginning of winter. (See fig. 3.16.)

Fig. 3.16. The Sagittarius constellation on the star chart from a book by Grienberger ([\[1162\]](#)). Book archive of the Pulkovo Observatory. Also see [\[542\]](#), page 46, ill. 20.

The animal “like a flying eagle isn’t in fact the Eagle, although such a constellation exists (see fig. 3.17.) Most likely, this is *the famous Pegasus*, the winged animal that completes the number of constellations in the Apocalypse indicated above. The sun visits the constellation of Pegasus before the beginning of spring. (See fig. 3.18.) Formally, Pegasus is not a zodiacal constellation, but an equatorial one; however, Pegasus almost touches the ecliptic between the zodiacal constellations of Pisces and Aquarius. The word even exists in the Greek text of the Apocalypse, where it refers to a mammal rather than a bird ([\[542\]](#)).

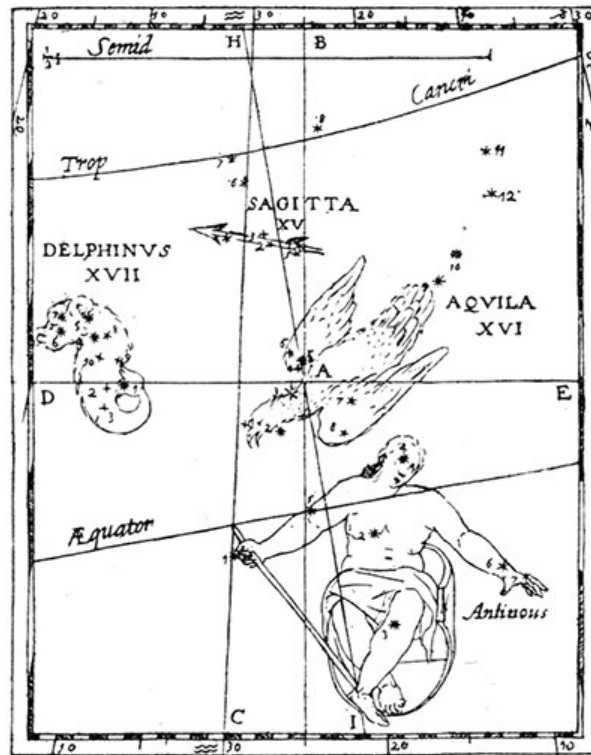

Fig. 3.17 Three constellations: The Eagle, The Dolphin and Antinoas, as seen on the star chart from a book by Grienberger ([1162]). Book archive of the Pulkovo Observatory. Also see [542], page 47, ill. 22.

Fig. 3.18. The Pegasus constellation on the star chart from a book by Grienberger ([1162]). Book archive of the Pulkovo Observatory. Also see [542], page 46, ill. 21.

Thus, the Apocalypse clearly enumerates the four main constellations along the ecliptic: the zodiac constellations of Leo, Taurus, Sagittarius, and the “almost zodiacal” Pegasus.

The selection of four well-known constellations in the apexes of the square on the ecliptic is a standard mediaeval astronomical method. Apparently, the four constellations (perhaps some others as well) were similarly set in the angles of the quadrangular zodiac from the Theban horoscope of Brugsch (see [Chron3](#), part 2.) Similar *quadrangular zodiacs* were also drawn in mediaeval India ([\[543\]](#), page 115).

Thus, the four constellations that denote the seasons form a square or a cross. But since there are exactly twenty-four star sectors (or wings) proceeding from the pole, each one of these animal constellations has exactly six sectors of direct ascension, that is, they have six “wings” around them. In other words, each animal constellation is located in the region that is covered by these six sector-wings on the celestial sphere.

It is notable that *all of this is absolutely accurately described in the Apocalypse*, in which we read that “*each of the four living creatures had six wings and was covered with eyes all around, even under its wings.*” (Rev 4:8). The “eyes” here are the stars. By the way, the Greek text formulates this as “inside and around” ([\[542\]](#)).

These “animals covered with eyes inside and around” are most probably constellations, and so the “eyes” in question should be stars. Indeed, they are drawn in precisely this form on any mediaeval star chart (see Dürer’s maps in figs. 3.1 and 3.2, for instance, as well as the map from the *Almagest* on figs. 3.4 and 3.3.)

9.

The daily rotation of the Northern Crown

In the northern moderate zone of the terrestrial globe, the upper parts of the sectors, or the “wings”, never set; however, the lower parts, or the “knees” of the “elders” (sectors) first descend below the horizon, then rise above it again. Therefore, it looks like each sidereal hour rises from its knees on the eastern part of the horizon and then goes down on its knees in the west. They were thus perceived as worshiping the centre of rotation, the north pole of the sky and the constellation of the Throne next to it.

Once again, *all of this is accurately described in the Apocalypse*. Actually, the Apocalypse says: “The twenty-four elders fall down before him who sits on the throne, and worship him who lives for ever and ever”(Rev 4:10).

In the process of everyday rotation in the Mediterranean latitudes, the constellation of the Northern Crown first rises into the zenith, then descends in the northern part of the horizon. What we have in mind is a local zenith for the latitude of the island of Patmos.

We shan’t continue with the enumeration of other constellations and stars mentioned in the Apocalypse, because *the presence of astronomical symbolism in the Apocalypse has already been made perfectly clear*. (See also [\[542\]](#) and [\[544\]](#)).

10.

Equine planetary images in mediaeval astronomy

We shall now relate several facts of paramount importance in what concerns the datings. The first thing that attracted the attention of astronomers to the planets was their rapid movement. Their displacement is very uneven as seen by the observer. The so-called *outer* planets – the ones *outside the telluric orbit* – are described as moving in regular loops. Examples of such loops for Saturn and Jupiter can be seen in figs. 3.19 and 3.20; for Mars – in figure 3.21. Planets stop, begin retrograde movement, and then *appear to rush forwards yet again*. This apparently gave birth to comparisons with *horses* galloping through the crystal firmament. It is not surprising that astronomy and astrology appealed to this vivid image.

Fig. 3.19. Looping trajectory of Saturn between Cancer and Leo in 1888 and 1889.
Taken from [\[542\]](#), page 12, ill. 4.

Fig. 3.20. Looping trajectory of Jupiter in Sagittarius in 1889. Taken from [542], page 12, ill. 5.

Fig. 3.21. Looping trajectory of Mars in Virgo in 1888. Taken from [542], page 13, ill. 6.

Ancient Gaulish coins bearing images of the equine planets are depicted on fig. 3.22 (see *Astronomical Myths* by John Blake, 1887.) One of them depicts *a horse with a rider* (the letter S) leaping over the urn of the constellation of Aquarius. This constellation is frequently depicted in the form of an urn or a person bearing an urn and pouring water from it, qv in the mediaeval book of Albumasar, for instance ([1004]).

Fig. 3.22. Ancient Gaulish coins as seen on the illustrations to John Blake's *Astronomical Myths* dating from 1887. Also see [\[542\]](#), page 14, ill. 8, 9.

On the second coin we see an *equine planet* carrying the constellation of Cancer on its back. The horse leaps over the constellation of Capricorn. (See fig. 3.22.)

These old coins clearly indicate the custom of at least some of the mediaeval astronomers to associate planets with *horses*.

Further development of this symbolism naturally led to the use of the images of planets in the form of horses harnessed into chariots. The solar image in particular was widely used in the Middle Ages and used to be included in the planetary seven.

Horses carting the sun are represented in the astrological book of Ioanne Tesnierio dating from 1562 ([\[1440\]](#) and fig. 3.23), the astrological work by Leopoldi, allegedly published in 1489 ([\[1247\]](#) and fig. 3.24), and the 1515 book of Albumasar ([\[1004\]](#) and figs. 3.25 and 3.26).

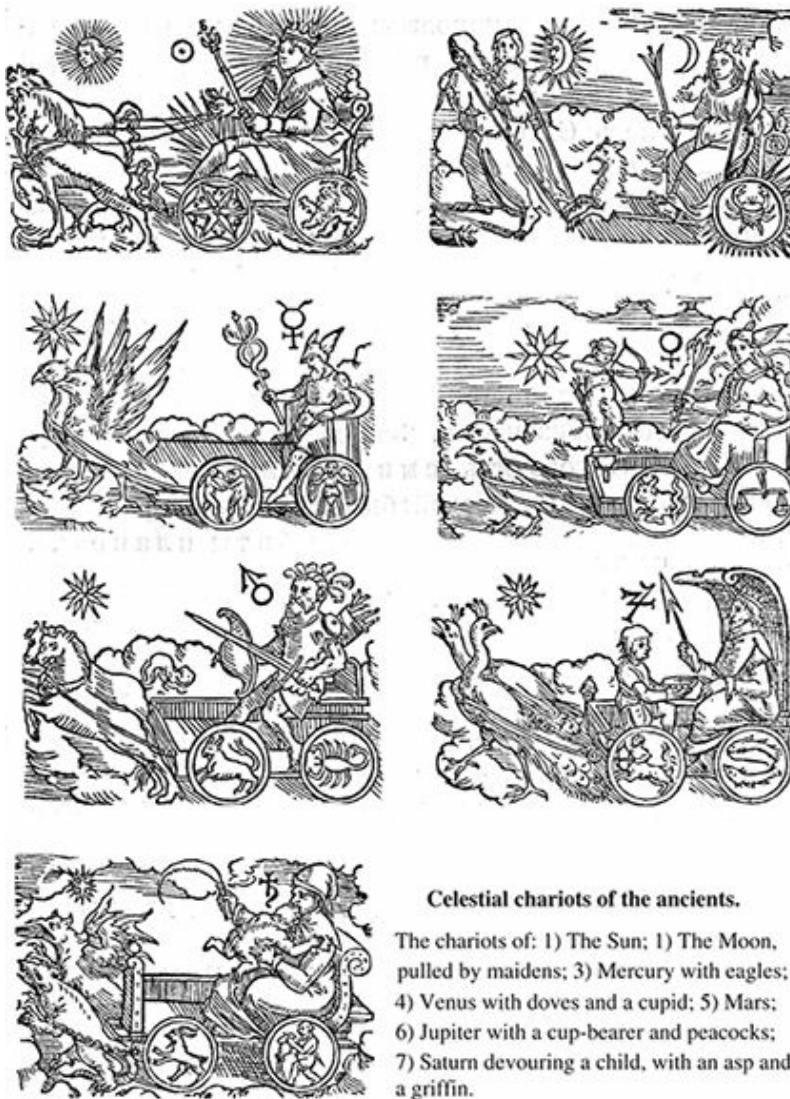

Fig. 3.23. Mediaeval pictures of the chariots of the Sun, the Moon, Mercury, Venus, Mars, Jupiter and Saturn. Taken from the *Opus Mathematicum octolibrum* by Ioanne Tesnierio ([\[1440\]](#)). Coloniae Agrippinae, 1562. Book archive of the Pulkovo Observatory. Also see [\[543\]](#), page 71, ill. 31-37.

Fig. 3.24. A mediaeval picture of the solar chariot. Taken from *Leopoldi compilation de astorum scientia*, 1489 ([\[1247\]](#)). Book archive of the Pulkovo Observatory. Also see [\[543\]](#), page 169, ill. 89.

Fig. 3.25. Mediaeval pictures of the chariots of the Sun, Mercury, Venus and the Moon. Taken from Albumasar's *De Astru Sciencia*, 1515. Book archive of the Pulkovo Observatory. Also see [\[543\]](#), page 240, ill. 117-120.

Fig. 3.26. Mediaeval pictures of the chariots of the Sun, the Moon, Mercury and Venus. Taken from Albumasar's *De Astru Sciencia*, 1515. Book archive of the Pulkovo Observatory. Also see [\[543\]](#), page 156, ill. 78-81.

Horses driving the planet Mars in a chariot are shown in the 1562 book of Ioanne Tesnierio ([\[1440\]](#) and fig. 3.23), with Mars referred to by its astrological sign, and in the 1515 book of Albumasar ([\[1004\]](#) and fig. 3.27).

Fig. 3.27. Mediaeval pictures of the chariots of Mars, Jupiter and Saturn. Taken from Albumasar's *De Astru Sciencia*, 1515. Book archive of the Pulkovo Observatory. Also see [\[543\]](#), page 157, ill. 82-85.

Sometimes such books depicted actual horses as chariots, thus accosiating chariots with horses. The chariot of Jupiter, for instance, with a galloping centaur drawn on its gigantic wheels, can be seen in the book by Albumasar [\[1004\]](#) (fig. 3.27).

The concept would evolve. Sometimes horses would draw entire constellations. In the book of Bacharach dating from 1562 ([\[1021\]](#)), horses draw the constellation of Auriga. A similar figure can also be seen in *Astrology* by Radinus (fig. 3.28).

Fig. 3.28. Horses dragging the Auriga constellation. From a book by Radinus dated 1511. Taken from [\[1361\]](#). Also see [\[543\]](#), page 243, ill. 125.

Astronomers ascribed such value to the leaps of the planets that they devised a special symbol of a halted chariot in order to refer to the moments the planets stop before beginning their movement, either straightforward or retrograde. The mediaeval book of Albumasar, for instance ([\[1004\]](#)) depicts the halted chariots of all the planets: Mercury, Venus, Mars, Jupiter, and Saturn (figs. 3.25 and 3.29).

Fig. 3.29. Mediaeval pictures of the chariots of Mars, Jupiter and Saturn. Taken from Albumasar's *De Astru Sciencia*, 1515. Book archive of the Pulkovo Observatory. Also see [\[543\]](#), page 241, ills. 121-123.

Sometimes, instead of horses, chariots were harnessed to fantasy animals – griffins, eagles, and the like. Similar “horses” draw the planets in the mediaeval books of Albumasar ([\[1004\]](#)) and Ioanne Tesnierio ([\[1440\]](#) and figs. 3.23 and 3.30).

Fig. 3.30. A mediaeval picture of Saturn's chariot. Taken from the book titled *Leopoldi compilatio de astrorum scientia*, 1489 ([\[1247\]](#)). Book archive of the Pulkovo Observatory. Also see [\[543\]](#), page 181, ill. 92.

It is well known that in some languages days of the week were associated with planets in a so-called “planetary week.” On the other hand, days of the week were frequently depicted as horses. Whenever an equine planet would pass between the constellations or through them, the constellations were referred to as “saddling” said planet, thus transforming into the riders of this horse.

But let us return to the Book of Revelations.

11.

Jupiter is in Sagittarius

The Apocalypse says: “I looked, and there before me was a white horse. Its rider held a bow, and he was given a crown, and he rode out as a conqueror bent on conquest” (Rev 6:2).

This apparently describes a bright equine planet carrying the glorious rider, or the constellation with the bow. There is only one such constellation in the zodiac – Sagittarius (fig. 3.16).

The horse is said to be white. The Greek text renders this as “dazzling white” or “resplendent” ([\[542\]](#)). The combination of the characteristic “conqueror bent on conquest” and the fact that the horse in question is the first to ride out most likely refers to Jupiter.

Another dazzling white planet is Venus; however, it cannot be located here, since the text of the Apocalypse (12:1) indicates the sun to be in Virgo, in which case Venus, which never goes too far away from the sun, can by no means be in Sagittarius. We are thus given a direct reference to the fact that Jupiter was in Sagittarius.

12.

Mars is beneath Perseus in either Gemini or Taurus

The Apocalypse says: “And there went out another horse that was red [the Greek text renders this as follows: “Then another horse came out, a fiery red one (see [\[542\]](#) – A. F.)]. Its rider was given power to take peace from the earth and to make men slay each other. To him was given a large sword” (Rev 6:4).

What we see here is the description of a red equine planet. There is only one such planet – Mars. There is also only one constellation with a sword – Perseus. Thus, Perseus is described in the Book of Revelations as the rider of Mars. Consequently, Mars is located in either Gemini or Taurus, with Perseus above (see the fragment of a mediaeval star chart on fig. 3.31.) This is the map from Ptolemy’s *Almagest*. N. A. Morozov proposes to consider this an indication that the zodiacal constellation of Aries was located beneath Perseus ([\[542\]](#)). However, it is only in such a case that the word “beneath” could be understood in relation to the ecliptic, that is, the constellation of Perseus were projected onto the ecliptic from its pole. But in such a case Perseus shall be suspended over Mars in an unnatural position – on his back. This can be observed on the same mediaeval map, fig. 3.31.

Fig. 3.31. Constellations of Perseus, Gemini and Taurus on a star chart from Ptolemy's *Almagest*. A close-up of a fragment of a map. We have removed all other constellations so as not to make the illustration look too cumbersome. Taken from the *Pelusiensis Alexandrini omnia quae extant opera* by Claudius Ptolemy. Published in 1551 ([\[1073\]](#)). Book archive of the Pulkovo Observatory. Also see [\[543\]](#), the inset between pages 216-217.

This description most probably refers to the zodiacal constellations located under the feet of Perseus. These can either be Taurus or Gemini. Perseus seems to be standing on them. But in case with Aries he lies on his back, with his feet directed upwards. Furthermore, it is important to consider the position of the local horizon of the observer. Indeed, when the observer writes that Mars is located beneath Perseus – that is, Perseus was visible above Mars – this most likely means that their position is given in relation to the local horizon. It is natural that one should search for such an astronomical solution, in which the observer would be able to see Perseus above Mars considering the relation to the local horizon – for instance, some location in the Mediterranean region.

This was well understood by N. A. Morozov. While pondering one of the solutions, namely, the solution of 1486 A.D., he did not note any aberrations concerning Mars. But on the date he indicated, 1 October 1486, Mars was located in Gemini and not Aries. We should thus understand that Mars must be searched in either Gemini or Taurus.

13.

Mercury is in Libra

The Apocalypse says: “I looked, and there before me was a black horse. Its rider was holding a pair of scales in his hand. Then I heard what sounded like a voice among the four living creatures, saying, ‘A quart of wheat for a day’s wages, and three quarts of barley for a day’s wages, and do not damage the oil and the wine!’” (Rev 6:5-6).

Apparently this is Mercury, the faintest of all of the primary planets. Only Mercury, Venus, Mars, Jupiter, and Saturn were considered primary in antiquity. Mercury is truly the “invisible” planet. Furthermore, due to its proximity to the sun, Mercury is only rarely visible due to the intensity of sunshine. Therefore, errors were frequently made in estimations of the position of Mercury in the Middle Ages.

The synodal translation says “a quart on the scale in thy hand”. According to the Greek translation, the rider holds a scale in his hand ([\[542\]](#)). The entire verse 6 distinctly speaks about trade. Even the prices of wheat and the barley are given. Mercury was considered the patron of trade.

Thus, the position of Mercury is indicated in Libra.

14.

Saturn is in Scorpio

The Apocalypse says: “I looked, and there before me was a pale horse. Its rider was named Death, and Hades was following close behind him. They were given power over a fourth of the earth to kill by sword, famine and plague, and by the wild beasts of the earth” (Rev 6:8).

The Greek text provides the rendering “deathly pale, greenish” ([\[542\]](#)). Most probably, this refers to the ominous planet Saturn. The rider on it, named Death is, apparently, Scorpio. In the Middle Ages Saturn entering Scorpio was considered an omen of great afflictions.

The Greek text renders another part of the passage as “They were given power,” which corresponds with this pair of death symbols even better ([\[544\]](#), Volume 1, pages 46–47, ill. 27).

N. A. Morozov was not the first one to associate four of the famous horses of the Apocalypse with planets. E. Renan put this hypothesis forth a long before Morozov ([\[725\]](#), page 353). Renan considered that:

- red horse = Mars (this is correct),
- black = Mercury (this is also correct),
- white = Moon (this is incorrect)
- pale = Jupiter (also incorrect).

Renan did not provide any proof for the last two identifications, and, as we can see, they actually do not correspond to the description given in the Apocalypse. However, Renan did not even attempt to date the Apocalypse on the basis of this astronomical information.

15.

The Sun is in Virgo with the Moon underneath the feet of the latter

The Apocalypse says: “A great and wondrous sign appeared in heaven: a woman clothed with the sun, with the moon under her feet and a crown of twelve stars on her head” (Rev 12:1).

This apparently is the picture of the celestial sphere in its usual mediaeval imagery. The sun is named as being in Virgo. Let us point out that Virgo is the only female constellation on the ecliptic. The moon is located at the feet of Virgo. Directly above the head of Virgo, in the direction of the zenith, we see the constellation of Coma Berenices or the Twelve Stars. On any celestial chart one can see the well-known globular cluster, the Diadem, or the Crown. It is referred to as 5024/M5e in contemporary numeration.

The Apocalypse refers to a crown of twelve stars. It is interesting that the standard designation for globular clusters on star charts is specifically a crown of precisely twelve stars in a circle. (See the maps in [\[293\]](#), for instance).

Thus, the sun is in Virgo and the moon at the feet of Virgo.

16.

Venus is in Leo

The Apocalypse proceeds to tell us that “To him who overcomes... I will also give him the morning star” (Ap. 2:26, 2:28).

The morning star, as is well known, a mediaeval name for Venus. But in zodiacal constellations “he who overcomes” is, of course, the constellation of Leo. This follows directly from the passage “See, the Lion of the tribe of Judah, the Root of David, has triumphed. He is able to open the scroll and its seven seals” (Ap. 5:5). The text of the Apocalypse clearly indicates that “he who overcomes” is Leo.

17.

The astronomical dating of the Apocalypse by the horoscope it contains

The Apocalypse apparently contains the descriptions of the stars in the sky. They give us the following horoscope:

1. Jupiter in Sagittarius,
2. Mars in Gemini or Taurus (N. A. Morozov included Aries here as well),
3. Saturn in Scorpio,
4. Mercury in Libra,
5. The sun in Virgo,
6. The moon under the feet of Virgo,
7. Venus in Leo.

For a rough astronomical calculation, even three of these basic planets would suffice: Jupiter, Mars, and Saturn. The sun moves rapidly and makes a complete zodiacal revolution in a year. Therefore it is only useful in determining the month. Mercury is usually poorly visible. (See above.) Therefore, its position was frequently misestimated in the Middle Ages.

• **The Assertion of N. A. Morozov** ([\[542\]](#) and [\[544\]](#), Volume 1, pages 48–50)

N. A. Morozov asserted that the three basic planets of Jupiter, Mars, and Saturn were sufficient in order to date the Apocalypse to the fourth century A.D. the earliest, because the indicated horoscope, that is, the arrangement of planets, was only true for 395, 632, 1249, and 1486 A.D.

N. A. Morozov thought that 395 A.D. was the best solution, but in this solution Mars is located above Aries, which, as we have noted, is not very

fitting. Morozov was satisfied with this answer, because he thought the Apocalypse could not have been written after the fourth century A.D. But his result was cautiously formulated in this manner: “If the Apocalypse was written during the first four centuries of the Christian era, this happened in 395 A.D.” ([\[542\]](#)).

However, nowadays, after the new research into the chronology of antiquity, we understand that Morozov had no real point in limiting himself to the first four centuries of the new era.

Once we break free from these limitations, we shall see two additional solutions: a 1249 solution and 1 October, 1486. The solution of 1249 is worse because Mercury, which in this case is in Virgo, was closer to Leo that year.

- **Main Assertion** (A. T. Fomenko and G. V. Nosovskiy)

The solution of 1 October 1486 ideally satisfies to all conditions, as indicated in the Apocalypse:

Jupiter is in Sagittarius,
Saturn is in Scorpio,
Mars is in Gemini, close to the boundary with Aries, and directly at the feet of Perseus,
Mercury is in Libra,
The sun is in Virgo,
The moon is under the feet of Virgo, and
Venus is in Leo.

The arrangement of the planets on 1 October 1486 (shown in figure 3.32) provides clear evidence that all planets are found exactly in the constellations indicated in the Apocalypse. We verified this astronomical result with the aid of the Turbo-Sky software, which is modern, simple, and convenient for such approximated calculations. The result is shown in figures 3.33 to 3.39. The program came up with the year 1486 as the astronomical solution. See also fig. 3.40.

Fig. 3.32. Planet disposition for 1 October 1486. It is distinctly visible that all the planets are located in the very constellations indicated by the Apocalypse.

Fig. 3.33. On 1 October 1486 Jupiter was actually in Sagittarius.

Fig. 3.34. On 1 October 1486 Saturn was actually in Scorpio.

Fig. 3.35. On 1 October 1486 Mars was actually in Gemini, close to the Taurus border, right under Perseus.

Fig. 3.36. The location of Mars in Gemini, close to Taurus, right under the feet of Perseus, on 1 October 1486.

Fig. 3.37. On 1 October 1486 Mercury was actually in Libra.

Fig. 3.38. On 1 October 1486 the Sun was actually in Virgo.

Fig. 3.39. On 1 October 1486 Venus was actually in Leo.

Fig. 3.40. Planet disposition for 1 October 1486. Calculations performed with Turbo-Sky software.

The visibility conditions of the planets on the night of 1–2 October 1486 was verified for the Mediterranean by using an observation point in the vicinity of the Bosphorus as an example.

It turns out that on 1 October 1486 the sun set at 17:30 local time, that is, at 15:30 GMT.

The crescent of the new moon was visible after sunset until 19:00 local time, after which the Moon set at the local horizon.

Saturn was visible until 20:00 local time.

Jupiter was visible until 21:45 local time.

Mars did not become visible immediately, because it was located below the horizon. It ascended at 21:05 local time and was visible the whole night.

At this time Mercury was located at almost the maximum distance from the sun for the terrestrial observer, almost in the maximum elongation, and had a brightness of $M = +0.7$. Consequently, it was located in almost the best visibility conditions. Mercury was actually visible until 20:15 local time, after which it went under the local horizon.

Venus ascended at 3:00 local time that night, and was perfectly visible up until sunrise.

All of this data was received from the calculations performed with the aid of the Turbo-Sky software, which is convenient for approximate

computing.

We re-emphasize that the solution of 1 October 1486 is ideal from all points of view. The arrangement of the planets for 1 October 1486 A.D. is reflected in the Apocalypse with surprising accuracy.

It is evident, as one can see in fig. 3.35, that the mediaeval observer was quite correct about Perseus riding Mars: “Its rider was given power to take peace from the earth and to make men slay each other. To him was given a large sword” (Rev 6:4). At this time Mars was actually located directly underneath the feet of Perseus. This can clearly be seen on fig. 3.36, which shows a fragment of a mediaeval map from Ptolemy’s *Almagest* with the position of Mars for the 1 October 1486 pointed out. Mars was in Gemini, right under the feet of Perseus. And compared to the line of the local horizon in the environs of the Bosphorus, at 23:00 local time, Mars was exactly under Perseus. Finally, the brightly luminous Milky Way passes precisely through the constellations of Perseus and Gemini in the nocturnal sky. That is where Mars was located on that date, and the Milky Way seemingly bound together the constellations of Gemini and Perseus, as well as the planet Mars (fig. 3.36). The mediaeval observer pointed out this remarkable event.

But why did the observer mention Mars in combination with the constellation of Perseus rather than Gemini? Indeed, Perseus is not a zodiacal constellation, unlike Gemini. The reason the observer did this apparently owes to the fact that the author of the Apocalypse described the forthcoming Doomsday, obviously, a very dramatic event. Therefore, he selected the symbols maximally pertinent to the spirit of a great catastrophe.

The first primary planet (Jupiter) ended up in Sagittarius, or the “martial constellation,” depicted with bow and arrows.

The second primary planet (Saturn) ended up in Scorpio, which is believed to be a terrifying, mortally dangerous constellation.

The third primary planet (Mars) ended up in Gemini, which is a “peaceful constellation.” But directly above it at this moment was Perseus,

the martial constellation with the sword, held in his hands and used for beheading the Gorgon Medusa with her serpent hair and stare that turned all living things to stone (fig. 3.36). Furthermore, Mars himself, as it is commonly known, was considered the God of War. It is therefore quite clear that the author of the Apocalypse selected Perseus with the Sword due to its perfect correspondence with the eschatological scenario.

One begins to understand why Mars is referred to in the Greek text of the Apocalypse (translated by N. A. Morozov) as having “*gone beyond, to the other side*”, qv above and in [\[542\]](#). Fig. 3.32 demonstrates clearly that on 1 October 1486 Mars was really in visible opposition to the other planets, which were all grouped in Scorpio. A terrestrial observer would see Jupiter, Saturn, the moon, Mercury and the sun near one side of the celestial dome, and Mars *drawn to its other side*, qv on fig. 3.32.

Why did Morozov reject the solutions of 1249 and 1486 A.D.? Morozov’s answer is simple and sincere. He frankly explained: “Hardly anyone would dare to say in this respect that the Apocalypse could have been written on 14 September 1249” ([\[544\]](#), Volume 1, page 53]. He did not even consider 1486 a possible solution.

However, nowadays, more than seventy years after N. A. Morozov, and relying on new results obtained from our books on New Chronology, among other things, one can confidently claim the Apocalypse to have been written precisely in 1486, that is, during the epoch of the Ottoman=Ataman conquest. See [Chron6](#) for more details.

Why is 1486 the most congruous dating for the writing of the Book of Revelations in our reconstruction? As it is commonly known, the Book of Revelations is primarily concerned with all matters related to Doomsday. “The Apocalypse and its visions (apart from the first three chapters)... is an image of the final hour of the World... or the Eschaton, and it must serve as a manual for the Revelations” ([\[845\]](#), Book 3, Volume 11, page 511). But that year, when the entire mediaeval Christian world anticipated Doomsday in terror, is well known to history. This is 1492 A.D., which was year 7000 from Adam of the Byzantine era. According to the tradition

of the epoch, Doomsday was supposed to have happened that very year.

The Apocalypse is thus concerned with the advent of the Judgement Day, expected in 1492 A.D. The first lines of the Apocalypse state explicitly: “Because the time is near” (Rev 1:3). That should mean the proximity of the year 1492 A.D., or the year 7000 since Adam. Note that it was in 1492 that Columbus set out to sea, in the age of Doomsday expectations.

Therefore, our independent astronomical dating of the Apocalypse, or the year 1486 A.D. – that is, 6994 years from Adam – corresponds ideally with the content of the book. The Apocalypse was written only six years before the expected End of the World in the XV century.

Dating the Apocalypse to the end of the fifteenth century also corresponds ideally with our formal mathematical result as discussed in [Chron1](#), Chapter 5:9.3. Namely, it implies that the Apocalypse must not be considered the last book of the Bible canon chronologically, but, rather, one of the first books of the Old Testament. In other words, the Apocalypse chronologically occurs simultaneously with the Pentateuch of Moses, or the very beginning of the Bible, and not the Gospels.

In other words, the position of the Apocalypse in the Biblical canon is chronologically incorrect. It was written much later than the Gospels. The Gospels describe the events of the XI century, according to our reconstruction. See more details below.

18.

Our reconstruction of the initial content of the Apocalypse

The Apocalypse predicts Judgement Day masking the prediction with astronomical symbolism. However, it is possible that this symbolism was obscured in the subsequent editions of the XVI-XVII century. An astronomical horoscope is encrypted in the Apocalypse, and provides for the possibility of dating it. The date of the horoscope is 1 October 1486, which ideally corresponds to the expected mediaeval date of the Judgement Day in 1492.

The Apocalypse was most likely written at the end of the XV century A.D., several years before what the entire mediaeval Christian world perceived as the impending Judgement Day in the year 7.000 since Adam, or 1492 A.D. Mortal fear of this event is vividly reflected in the Apocalypse.

The consensual opinion that the Apocalypse was written by Apostle John, the author of the fourth Gospel, is apparently incorrect, because the Gospels were most likely written in the XII-XIII century, that is, much earlier than the XV century. On the contrary, the assertion of many old ecclesiastical authors that Apostle John, and John, the author of the Apocalypse, are different persons, is confirmed by our independent astronomical dating of the Book of Revelations. Thus, the Gospels and the Apocalypse were written in different and distant epochs.

We have already pointed out that the epoch of the Apocalypse apparently coincides with the epoch of the Pentateuch. As we demonstrate in [Chron6](#), this is the epoch of the Ottoman = Ataman conquest of the XV century A.D., that is, the “Biblical Exodus” under the leadership of Moses and Aaron – Leo/Lion. The Apocalypse is correct in dubbing him “he who

overcomes”. The constellation of Leo, “is adorned with the morning star,” or Venus. The identification of “he who overcomes” mentioned in the Apocalypse Leo – Aaron or Moses – is also supported by the following verse: “To him who overcomes, I will give some of the hidden manna. I will also give him a white stone with a new name written on it, known only to him who receives it” (Ap.2:17). Let us recall that manna is described in the Biblical book of Exodus, which, as we will show in [Chron6](#), tells of the Ottoman = Ataman conquest of the XV century. And we can easily recognize the white stone with the “new name” written upon it as the stone tablets of Moses, whereupon the new law, or Deuteronomy, was written.

After having astronomically dated the Apocalypse to the end of the XV century, it is interesting to evaluate the mediaeval illustrations to this Biblical text from an entirely new point of view. A mediaeval XVI century picture of the Apocalypse can be seen in fig. 3.41 ([\[745\]](#), Volume 8, page 442). We see a rider who is shooting a musket (figure 3.42). The lock of the musket is quite visible. The rider pulls the trigger, and the barrel disgorges fire. The powder horn can be seen attached to the barrel. The word “Death” is written above the rider. We see that mediaeval artists reflected the realities of the epoch when the Apocalypse was written in their illustrations. It is well known that firearms, muskets, and guns were already widely used on the XV century battlefields. For example, in the Constantinople siege of 1453, the Ottomans used heavy artillery ([\[240\]](#)).

Fig. 3.41. A mediaeval illustration from the Biblical Apocalypse. XVI century. The Lenin State Library, folio 98, no. 1844, sheet 24. One sees a rider firing a musket and the fire of a shot coming from the barrel. Taken from [\[745\]](#), Volume 8, page 442.

Fig. 3.42. Fragment of an illustration from the Biblical Apocalypse. Death is riding a horse and firing a musket. Taken from [\[745\]](#), Volume 8, page 442.

Another XVI century illustration from the Apocalypse ([\[745\]](#), Volume 8, page 451 and fig. 3.43) shows the destruction made by an angel “blowing into the pipe” from which a fountain of flame escapes. This very probably depicts a mediaeval gun, shooting with either cannonballs or case-shot. The mediaeval artist depicted the flame of a large explosion where the ball landed. Apparently, in the Middle Ages guns were sometimes referred to and depicted as pipes belching fire and smoke. This tradition of depicting guns on the illustrations to the Apocalypse survived until as recently as the XVIII century. Figure 3.44 provides an illustration from the **Commented Apocalypse** of 1799 ([\[745\]](#), Volume 9, page 485). On the whole, the subject is the same as that of the XVI century illustration – an angel “blowing into a pipe” disgorging fire. We also see flames rising from the explosion of the missile at a distance. A gunshot is even better visible in the mediaeval illustration to the Apocalypse which one sees on fig. 3.45 (see [\[745\]](#), Volume 9, page 486). Above we can see the “pipe,” into which

the angel blows. The flame escapes the pipe, and we see a faraway explosion of a projectile hitting the ground.

Fig. 3.43. A mediaeval illustration from the Biblical Apocalypse. XVI century. The Lenin State Library, folio 98, no. 1844, sheet 33. The angel is “blowing a horn” which disgorges a bright fiery flare. Probably a representation of a mediaeval cannon in action. Taken from [\[745\]](#), Volume 8, page 451.

Fig. 3.44. A mediaeval illustration from the *Biblical Commented Apocalypse*, 1799. The State Library of Russia, folio 247, no. 802, sheet 61, reverse. We see the subject that we're already familiar with: a horn-shaped cannon firing a shot. One also sees the explosion of the cannonball. Taken from [\[745\]](#), Volume 9, page 485.

Fig. 3.45. A mediaeval illustration from the *Biblical Commented Apocalypse*, 1799. The State Library of Russia, folio 247, no. 802, sheet 61, reverse. The same subject. Gunfire, the “grenade” falling and exploding. Taken from [\[745\]](#), Volume 9, page 486.

From the XV century and on, guns invoked terror in Europe. The appearance of such terrifying images on the illustrations to the recently

written Apocalypse was therefore completely natural. All of this, albeit indirectly, confirms our astronomical dating of the Apocalypse to the end of the XV century.

PART TWO

Astronomy in the Old Testament

By Anatoly Fomenko

1.

Mediaeval astronomy in the Old Testament Book of Ezekiel

1.1. The title of the book

Charles Briggs, Professor of Theology, wrote that “most of the books in the Old Testament were compiled by authors whose names and exact relation to the writings were lost in deep antiquity” ([543], pages 119-120).

Let us regard the actual name of the book of Ezekiel. As N. A. Morozov pointed out, the Hebrew IEZK-AL translates as “The Lord Shall Overcome” ([543], page 226). Scaligerian history believes Ezekiel to have lived between 595 and 574 B.C. However, the word “Ezekiel” is only used for referring to a person just once (Ezekiel 24:24), in a rather vague context that becomes clear only after we translate “Ezekiel” as “The Lord Shall Overcome.” God addresses the author of the prophecy dozens of times, always saying “thou” and never calling him by name. One can come to the logical conclusion that “Ezekiel” is merely the name of the actual book, which concurs with its content perfectly well – predicting the victory of some currently disavowed deity. This rational explanation of the name of the book is in no way related to the analysis of its astronomical content, as we can understand perfectly well; however, it is useful for pointing out just how useful it is to think about the possibility that ancient words and names may be translated, since it clarifies a great many things.

N. A. Morozov’s analysis performed in [543] shows that the entire prophecy is based on two main topics:

1) Visible borrowings from the New Testament Apocalypse

Modern commentators interpret this in reverse, since the books of the Old Covenant are considered to have been written a lot earlier than those of the

New Covenant. However, this is most probably erroneous, and the Gospels either *predate* the Heptateuch, or were created around the same time (see [Chron6](#)).

2) *The astronomical “visions” of the author of the prophecy*

N. A. Morozov was of the opinion that the book of Ezekiel contained a planetary horoscope. He even tried to date it astronomically, coming up with the date 453 A.D. as the first solution that he found moving forward in time from deep antiquity towards contemporaneity. There may have been other solutions dating from a much later epoch that Morozov failed to discover due to his certainty that the Bible couldn't have been written later than the V-VI century A.D. This was a grave error of his. The Bible was most probably compiled in the XI-XVII century A.D. See [Chron6](#) for more details.

Our opinion is as follows: unlike the Apocalypse, the horoscope of Ezekiel is described *extremely vaguely*, and this ambiguous and Delphic description is *hardly applicable to astronomical dating*. We shall refrain from wasting time on it; should the readers get really interested, Morozov's oeuvre [\[543\]](#) gives an exhaustive account of the issue.

What N. A. Morozov is definitely correct about is the fact that the testamentary book of Ezekiel is really filled with all kinds of *astronomical* information that allows us to consider this book a mediaeval – possibly late mediaeval, astrological text, and be quite confident about it. This particular fact is important enough for us to illustrate it by the following examples ([\[543\]](#)).

1.2. The description of the Milky Way and the Ophiuchus constellation

The Bible says: “The heavens were opened, and I saw visions of God” (Ezekiel, 1:1). We are given the same direct indication as we got from the book of Revelation – namely, that we should observe the sky.

N. A. Morozov periodically queried the synodal translation of the Bible using the Hebraic text without vocalizations. Apparently, the authors of the synodal “translation” often failed to understand the old text. These circumstantiations of Morozov often facilitate the translation greatly and elucidate the actual meaning, so we shall be making references to his comments as we proceed ([\[543\]](#)).

The Bible says:

“And I looked, and, behold, a whirlwind came out of the north, a great cloud, and a fire infolding itself, and a brightness was about it [a more exact translation would be “an irradiance like a river of light,” qv [\[543\]](#) – A. F.]” (Ezekiel 1:4).

The irradiance goes to the south from the north. Since the events take place in a starlit sky, as we have mentioned above, this metaphor most probably stands for the Milky Way, which may really be perceived as a luminous river of light flowing from the north to the south.

The Biblical observer looks towards the luminosity and sees that “out of the midst thereof came the likeness of four living creatures [the Hebraic text uses the term “living entities,” whereas the synodal translation refers to them as “beasts,” qv [\[543\]](#) – A. F.]... they had the likeness of a man” (Ezekiel 1:5). N. A. Morozov makes the correction referring to the Hebraic text, and suggests that the Bible really says that “the image of man could be seen right there.” What could this possibly mean?

Nearly every astronomical map of the Middle Ages – see fig. 4.1, for instance, has a constellation in the south, right in the middle of the Milky Way, that has the shape of a man – the Ophiuchus (see fig. 4.2).

Fig. 4.1. A mediaeval star chart from a book by S. De Lubienietzki titled *Historia universalis omnium Cometarum*, Lugduni Batavorum, 1681 ([\[1257\]](#)). Book archive of the Pulkovo Observatory (Saint-Petersburg). Also see [\[543\]](#), pages 26-27.

Fig. 4.2. The constellation of the Ophiuchus against the background of the Milky Way. A mediaeval book titled *Astrognoia*, XV century. Book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[544\]](#), Volume 1, page 218, ill. 57.

1.3. The Biblical description of the astronomical sectors, or “wings,” on the celestial sphere

As we have already mentioned, the mediaeval celestial sphere was divided into 12 pairs of star hours that were pictured as meridians that converged

at the poles of the sphere and divided it into 24 sectors, or “wings,” qv fig. 3.12. Ophiuchus is holding the Serpent, and both of them occupy two pairs of wings – two on the left, and two on the right. In our case, four “living entities” are mentioned in the constellation of Ophiuchus – possibly planets. The Bible, for instance, tells us that “every one had four wings” (Ezekiel 1:6). See the mediaeval book of Borman dating from 1596, for example ([\[1045\]](#)), which gives the position of Ophiuchus as well as that of his wings.

The synodal translation tells us that the “living creatures” also had four faces each. N. A. Morozov points out the missing words “one obscured” and gives his own translation: “he was the one with four faces, and it was he in his mystery who had possessed four wings” (Ezekiel 1:6).

The synodal translation tells us that “they four had their faces and their wings. *Their wings were joined one to another*, and they turned not when they went; they went every one straight forward” (Ezekiel 1:9). It is obvious that the reference is to the sectors, or the wings on the celestial sphere. It is natural that they should be *joined together*.

N. A. Morozov’s translation proceeds to tell us that “the procession of these creatures was immutable, and the concavity of their pass was like the concavity of a circumference, and all four faces shone like polished brass.”

1.4. The constellations of Leo, Taurus and Aquila

Let us now regard a mediaeval map – [\[1256\]](#) or [\[1257\]](#) by S. Lubienietzki, for instance (see fig. 4.1), and study the constellations in the south of the sky, next to Sagittarius. On the right we see Ophiuchus and the Serpent, with Leo on his right and Taurus on his left. On top, near the peak of the trajectory of the sphere’s rotation, we can see Aquila in the centre, above all of the constellations. The human hands of Sagittarius and Hercules can be seen rising from beyond the equinoctial, as described in the prophecy: “and they had the hands of a man under their wings” (Ezekiel 1:8).

This astronomical picture is explicitly described in Ezekiel’s prophecy.

The Bible says the following (in N. A. Morozov's translation):

“The outline of Leo was to the right of all four, with the outline of Taurus to the right of all four, and Aquila above the four” (Ezekiel 1:10).

Since Morozov's translation differs from the synodal at times, we shall demonstrate the difference by the following example. The synodal text of this quotation is as follows:

“they four had... the face of the lion, on the right side: and they four had the face of the ox on the left side; they four also had the face of an eagle” (Ezekiel 1:10).

The similarity is apparent; however, N. A. Morozov's translation makes a lot more sense.

According to the Bible, “as for the likeness of the living creatures, their appearance was like burning coals of fire, and like the appearance of lamps” (Ezekiel 1:13). What we see here is an astronomical comparison of the planets with lamps and coals. “And the living creatures ran and returned as the appearance of a flash of lightning [in zigzags – A. F.]” This must refer to the forthright and retrograde movement of planets on the celestial sphere (see figs. 3.19, 3.20 and 3.21).

1.5. The Biblical description of the mediaeval “wheels,” or planetary orbits

We shall now return to the mediaeval charts. They often depict planet orbits as concentric wheels, with the Earth in the centre. They reflect the initial concepts of the mediaeval astronomers who used to regard the Earth as the centre of the universe. Such imagery is clearly pre-Copernican. One should, however, bear in mind that the planetary orbits would occasionally be drawn in that manner as recently as the XVII-XVIII century.

The concentric planetary orbits can be observed in the mediaeval book by J. Steeb ([\[1412\]](#), see fig. 4.3). The wheels bear the planetary names and

insignia.

Fig. 4.3. A mediaeval picture of the ten celestial spheres as concentric wheels. Taken from the Latin book by J. Ch. Steeb titled *Coelum Sephiroticum Hebraeorum* (*The Sephirotic Skies of the Jews*), Maguntiae, 1679 ([\[1412\]](#)). Book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[543\]](#), page 15, ill. 5.

The first wheel, which is also the greatest, is the empyrean.

The second wheel is the sphere of immobile stars.

The third wheel is the celestial ocean.

The wheels to follow are those of Saturn, Jupiter, Mars, the sun, Venus, Mercury, and the moon.

Planetary orbits are also drawn as concentric wheels in the book by Orontius Finaeus Delphinatis allegedly dating from 1553 ([\[1320\]](#), fig. 4.4). The orbital wheels can rotate independently. Concentric wheels, or several concentric planetary orbits, can be seen in Sacro Bosco's (or Sacrobusto's)

book allegedly dating from 1516 ([\[1384\]](#), fig. 4.5). One should emphasize that the felloes of the wheels are *covered in stars*, or eyes, which is quite natural, since the orbits are celestial objects and exist amidst myriads of stars.

Fig. 4.4. According to the mediaeval cosmological concept, the planetary orbits had the shape of concentric wheels. Taken from the book titled *Canonum Astronomicum*, 1553 ([\[1319\]](#)). Book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[543\]](#), page 54, ill. 22.

Fig. 4.5. Planetary orbits as concentric wheels. Taken from a mediaeval book by J. de Sacro Bosco (or Sacrobusto) titled *Sphaera Materialis*, 1516 ([\[1384\]](#)). Book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[543\]](#), page 118, ill. 65.

Wheel-like orbits are drawn in another book by Sacro Bosco (or Sacrobusto) allegedly dating from the XVI century ([\[1385\]](#)). The felloes of the concentric orbital wheels bear the images of the Zodiacal constellations filled with *stars*, q.v. fig. 4.6.

Fig. 4.6. Mediaeval wheel-like orbits. The terrestrial globe is in the centre, and the planetary orbits surround it. Taken from a book by Sacro Bosco (or Sacrobusto) titled *Opusculu de Sphaera... clarissimi philosophi Ioannis de Sacro busto*, Viennae Pannoniae, 1518 ([\[1385\]](#)). Book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[543\]](#), page 131, ill. 72.

Wheel-like orbits with felloes covered in stars can also be seen in the book by Corbinianus allegedly dating from 1731 ([\[1077\]](#) and fig. 4.7). The orbital wheels roll over the zodiacal belt. In general, one has to remark that

mediaeval science had developed an extremely complex articulation system for the *orbital wheels* in order to explain planetary movements. This science was cast into oblivion by Copernicus, who placed the sun in the centre of the system instead of the Earth. However, this sophisticated geocentric system used to flourish before Copernicus.

Fig. 4.7. Mediaeval Egyptian cosmology. The wheel-like orbits roll across the zodiac. Taken from *Firmamentum Firmianum* by Corbinianus dating from 1731 ([\[1077\]](#)). Book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[543\]](#), page 254, ill. 136.

Let us return to the Biblical prophecy of Ezekiel. The Bible says:

“Behold *one wheel* upon the earth *by the living creatures* [planets? – A. F.], with his four faces. The appearance of the wheels and their work was like unto the colour of a beryl: and they four had *one likeness* [or identical construction – A. F.]: and their appearance and their work was as it were a wheel in the middle of a wheel... As for their rings, they were so *high* [above the ground – A. F.] that they

were dreadful; and their rings were full of eyes [full of stars! – A. F.] round about them four. And when the living creatures *went*, the wheels *went by them*; and when the living creatures were *lifted up* from the earth, the wheels were *lifted up in line with them* [the rotation of the planetary orbital wheel – A. F.]. Whithersoever the spirit was to go, they went... and the wheels were *lifted up over against them*: for *the spirit of the living creature was in the wheels*. When those went, these went; and when those stood, these stood; and when those were *lifted up* from the earth, the *wheels were lifted up in line with them*.” (Ezekiel, 1:15-16, 1:18-21)

The Biblical observer quite explicitly describes planets and their quotidian movement over the orbital wheels. The description is so clear that identifying the “living creatures” with planets appears quite natural.

By the way, many late mediaeval painters who illustrated the Bible without understanding the correct astronomical meaning of the “eyes round about them four” would interpret this literally and draw a multitude of eyes covering the entire body of the animal. The result was of dubious aesthetic value, and could serve as yet another illustration of the distortions one gets when later commentators fail to understand the original meaning of the ancient text.

1.6. Parallels with the astronomical symbolism of the Apocalypse

What we encounter later in the prophecy of Ezekiel resembles direct quotations from the Apocalypse, a New Covenant book: starlit sky, semblance of a crystal, etc.

According to the Bible,

“the likeness of the firmament upon the heads of the living creature was as the colour of the terrible crystal, stretched forth over their heads above. And under the firmament were their wings straight, the one toward the other... and every one had two, which covered on that side, their bodies. And when they went, I heard the noise of their wings... when they stood, they let down their wings” (Ezekiel 1:22-

24).

Also:

“And above the firmament that was over their heads was *the likeness of a throne* [the constellation of the Throne, q.v. above – A. F.], as the appearance of a sapphire stone: and upon *the likeness of the throne* was the likeness as the appearance of a sapphire stone: and upon the likeness of the throne was the likeness as the *appearance of a man above upon it*” (Ezekiel 1:26).

This is virtually identical to the Revelation of St. John, where we encounter the following passage: “and behold, a *throne* was set in heaven, and one sat on the throne... and there was a rainbow [the Milky Way – A. F.] round about the throne, in sight like unto an emerald” (Revelation 4:2-3). See the previous paragraph.

1.7. Biblical cherubim, chariots, and mediaeval planetary orbital wheels

Let us remind the reader that *planets* were often represented as *chariots* in the Middle Ages. More on this can be seen in the paragraph above that deals with the Apocalypse. Chariots would be drawn by horses, and occasionally fantasy animals. A planet would ride a chariot, and the gigantic *orbital wheels* would bear the planetary insignia, or zodiacal constellations where the wheels were rolling. Let us point out that planets move over the zodiac, and the symbolism used here was typical for the Middle Ages.

It is amazing that the book of Ezekiel describes *virtually identical symbols*. This fact alone would give sufficient cause to inquire whether this Old Covenant book could have been written in the Middle Ages, around the XIII-XVI century A.D.

The Bible tells us the following:

“behold, in the *firmament* [in the sky yet again – A. F.] that was above the head of

the cherubim there appeared over them as it were a sapphire stone, as the appearance of the likeness of a *throne* [the Throne constellation – A. F.]” (Ezekiel 10:1).

The word “cherubim” (KHRBIM or RKHBIM) can also be used to refer to a chariot ([\[543\]](#), page 72). The 10th chapter of Ezekiel’s prophecy that we quote tells us about several new celestial observations of the Biblical author that are unlike the ones mentioned in the first chapter (see above). He refers to planetary chariots, or the Cherubim moving across the firmament, or the celestial dome, somewhere near the Throne constellation.

The Bible says:

“And when I looked, behold the four wheels by the cherubim, one wheel by one cherub [chariot – A. F.], and another wheel by another cherub: and the appearance of the wheels was as the colour of a beryl stone [the reference is probably made to each planet possessing an orbit of its own – A. F.]. And as for their appearances, they four had *one likeness*, as if *a wheel had been in the midst of a wheel*... they turned not as they went... and their whole body, and their backs, and their hands, and their wings, and the wheels, *were full of eyes round about*, even the wheels that they four had.” (Ezekiel 10:9-12)

We shall quote the next fragment in the translation of N. A. Morozov: “The names of these wheels... the one in the rear bore semblance to a Chariot.” It is possible that what we see here is a reference to Ursa Major, which used to be represented as a chariot. This rare mediaeval depiction can be seen on the chart from the 1524 Apianus book, for instance ([\[1013\]](#), fig. 4.8).

Fig. 4.8. This picture shows us that the Chariot constellation (on the left) was *replaced* by Ursa Major (on the right). Taken from *Cosmographicus Liber Petri Apiani mathematici studiose collectus*, Landshutae, impensis P. Apiani, 1524 ([\[1013\]](#)). Book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[543\]](#), page 91, ill. 53.

Let us carry on with quoting Morozov’s translation: “the second had the likeness of a man and the third, that of a lion; the fourth had the likeness of an eagle. The chariots went upwards. They were *the same living creatures as I have seen*” (Ezekiel 10:14-15). The Biblical observer points out that the chariots and the living creatures that he describes in the first chapter are one and the same. Could they be planets?

We witness mediaeval astronomy on the pages of the Biblical prophecy yet again: planets on their orbital wheels moving across the celestial sphere.

The Bible says that “when the cherubim [the chariots – A. F.] went, the *wheels went by them*: and when the cherubim lifted up their wings to mount up from the earth, the same wheels also turned not from beside them. When they stood, these stood; and when they were lifted up, these lifted up themselves also: for the spirit of the living creature was in them” (Ezekiel, 10:16-17).

1.8. The Biblical description of mediaeval cosmology as a celestial temple

One should definitely point out another remarkable astronomical fragment in the book of Ezekiel. Morozov’s translation is as follows: “there was a

likeness of a Man together with the likeness of a Serpent. He had a *land-chain and measuring cane* in his hands and stood at the gates” (Ezekiel 40:3).

An entire page is to follow, dedicated entirely to the descriptions of various measurements and numeric coefficients of the *celestial temple*. Some surveyor is conveying the measurements. Who could he be, and what exactly is the temple that the Bible describes in such great detail, giving the locations of rooms, partitions, entrances and exits, pillars, their size, and so on? The answer is amazingly simple. It suffices to turn to mediaeval star charts yet again.

The 1731 book by Corbinianus, for instance ([\[1077\]](#)) contains a picture of Ophiuchus as a man who holds the equinoctial in his hands in the shape of a chain, or rope, or lasher, q.v. fig. 4.9. The semblance between the equinoctial and a measuring rope or land-chain is obvious, since the equinoctial has degree marks upon it. This is how most ancient star charts depict it. We can also see a vertical cane on this picture – the lower solstice meridian, which the Ophiuchus holds in his hand vertically. Therefore, the ancient maps portray him as a measurer. We see that this mediaeval map of constellations is represented in the Old Covenant book quite faithfully.

Fig. 4.9. A mediaeval picture of the Ophiuchus holding the equinoctial in his hands. There are grading points on the equinoctial, making it look like a measuring-rope. Taken from the *Firmamentum Firmianum* by Corbinianus, 1731 ([\[1077\]](#)). Book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[543\]](#), page 105, ill. 57.

The celestial temple is depicted as a large hall on dozens of late mediaeval charts as a well-known astronomical object, exactly the way the Biblical prophecy refers to it. A temple, or a hall in the sky can be seen in the book by P. Apianus, for instance ([\[1013\]](#), fig. 4.10). Similar celestial palaces can be seen in the book by Bacharach dating from 1545 ([\[1021\]](#)) – on the so-called Egyptian Zodiac. See also [\[543\]](#), pages 81-82, ill. 39-50 and 51. The celestial hall merely reflects the cosmological concepts of the mediaeval astronomers. We can see planets, their orbits, the zodiac, constellations, their movement, etc. This is the pre-Copernican mediaeval cosmology.

Fig. 4.10. A mediaeval model of the celestial temple. We can see celestial mechanisms of all kinds, pillars, corbeils, etc. Taken from *Petri Apiani Cosmographia*, 1540, or *Cosmographicus Liber Petri Apiani mathematici studiose collectus*, Landshutae, impensis P. Apiani, 1524 ([\[1013\]](#)). Book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[543\]](#), page 129, ill. 71.

The plan of the celestial temple as a building that has planetary orbital wheels and a zodiacal wheel revolving inside it can be seen in the XVI century book by Sacro Bosco (or Sacrobusto) – see [\[1385\]](#) and fig. 4.11. Another similar representation from a different book by Sacro Bosco ([\[1383\]](#)) is shown in fig. 4.12. This picture reflects the entire mediaeval cosmology. Angels move within a hall, revolving the eaves, the pales, and the heavy zodiacal belt that has planetary orbital wheels sliding across it.

Fig. 4.11. A picture of the celestial temple from the *Opusculu de Sphaera ... clarissimi philosophi Ioannis de Sacro busto*. Book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[543\]](#), page 111, ill. 61.

Fig. 4.12. Mediaeval concept of cosmology, or the construction of the celestial temple. The angels rotate the axes, the wheels, and the zodiacal belt. Taken from the *Opusculum Johannis de Sacro busto spericum, cu figures optimus ei novis textu in se, sine ambiguitate declarantibus* by J. de Sacro Bosco (Leipzig, 1494). See [\[1383\]](#). Book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[543\]](#), page 118, ill. 64.

We may be told that the mediaeval astronomers merely drew the “extremely ancient” Biblical images on their charts, which came to them from the pages of the Bible “out of deep antiquity.” This interpretation is highly dubious, in our opinion. Most probably, the astronomical objects were of a primary nature, and not their literary descriptions – in the Old Testament, for instance. All the astronomical images listed above are far from being “illustrations to the Bible.” They are filled with concrete scientific meaning: orbital wheels, equinoctials, meridians, star hours, etc. These concepts were introduced by mediaeval astronomers who pursued pragmatic and scientific ends, which were far away from the literary paradigm. It was only *afterwards* that poets and writers began to create their literary images after having studied the star charts. Mediaeval cosmology – the celestial temple with its orbital wheels etc, wasn’t created by poets, but rather by astronomy scholars. The poets merely followed them in order to chant praises to science.

The conclusion is rather clear. All the astronomical fragments from the Biblical book of Ezekiel are manifestations of mediaeval, or possibly late mediaeval, scientific culture. Late mediaeval star charts, as well as Biblical texts, were apparently created in the XI-XVI century A.D. within the same paradigm of scientific ideology. Scaligerian chronology that came into existence somewhat later is nevertheless persistent in separating them by a temporal gap of 1500-2000 years.

2.

The Biblical prophecy of Zechariah and the date of its creation

Scaligerian chronology tries to convince us that the prophecy of Zechariah was written between 520 and 518 B.C. – about seventy years after the book of Ezekiel, that is. N. A. Morozov suggests to translate the word Zechariah as “The Thunderer Remembers” ([\[544\]](#), Volume 1, page 252). The entire book, as well as the prophecy of Ezekiel, or “The Lord Shall Overcome,” is concerned with the same topic, namely, that some God-to-come didn’t forget his promise of advent. He merely postpones it in order to punish people for their lack of faith.

The combination YHVH was pronounced as Jehovah by the translators of the Bible; it is often translated as The Lord God. “YHVH” can also be the future tense of the verb “to be” – “God-to-be,” or “God-to-come.” Latins transformed this word into Jovis, or Jupiter – an abbreviation of Jovis-Pater, or Jovis-Father. The Greeks transformed this name into Zeus. The historian Eunapius who had allegedly lived in 347-414 A.D. writes that “the Italians call Zeus *Iovius*” ([\[132\]](#), page 86).

N. A. Morozov suggests translating the name YHVH, or Jehovah, as “Thunderer,” since it is a widely used synonym for J-Pater (Jupiter). One has to remember that believers haven’t always had the right to pronounce God’s full name aloud, and called him Adonai, or Lord, instead. This is probably the reason for the existence of the abovementioned abbreviation – the full form YHVH transformed into YAH or IAH, or even single letters I or J, which gave birth to the name Jupiter, or J-Pater – God the Father.

This is how this word is written in the Biblical title of the book of Zechariah. ZECHAR-IAH is written here instead as the more complete ZECHAR-YHVH, or “The Thunderer Remembers.”

All of this, together with the distinct astrological hue of certain Biblical texts referring to Jehovah ([\[544\]](#)) leads one to the thought that the Thunderer, whom the prophets of the Old Testament await with such eagerness, isn't some unknown pre-Christian deity, but, rather, the very same God that says "I am the Alpha and Omega, the beginning and the end" to John in the first chapter of the Apocalypse (Revelation 1:8). None other than Jesus Christ, in other words. The Apocalypse proclaims the Second Coming and Doomsday. The prophets of the Old Testament of the XIV-XVI centuries A.D. are expecting his advent.

The book of Zechariah (ZECHAR-YHVH) is filled with descriptions of the same events that we find in the Gospels. The actual prophecy mentions "Joshua the great priest" often enough (Zechariah 3:1). It is significant that Scaligerian chronology is forced to acquiesce that the prophecies contained in the books of the Old Covenant "predict" the advent of Jesus Christ, as well as certain evangelical events. Let us but give one example.

The book of Zechariah tells us the following:

"And I said unto them, if ye think good, give me my price; and if not, forbear. So they weighed for my price *thirty pieces of silver*. And the Lord said unto me, Cast it unto the potter: a goodly price that I was prised at of them. And I took the thirty pieces of silver and *cast them to the potter* in the house of the Lord... Woe to the idol shepherd that leaveth the flock!. His arm shall be clean dried up, and his right eye shall be utterly darkened." (Zechariah 11:12-13, 11:17)

It is assumed nowadays that all of this was written centuries before Jesus and the legend of the apostle Judas who betrayed him for *thirty pieces of silver*. Compare the passage from Zechariah to the following from the Gospels:

"and said unto them, What will ye give me, and I will deliver him unto you? And they covenanted with him for *thirty pieces of silver*... And he cast down the pieces of silver in the temple, and departed, and went and hanged himself. The chief priests took the silver pieces and said, It is not lawful for to put them into the

treasury... and they... bought with them the *potter's field*, to bury strangers in.”(St. Matthew 26:15; 27:5-7)

This alone should tell us that the testamentary book “The Thunderer Remembers,” or “Zechariah” was written after the Crucifixion – which occurred in the XI century A.D. by our reconstruction.

The fact that the versions of the Gospels that have survived until our day make frequent and extensive references to the books of prophets most probably means that they all were written around the same time, or, alternatively, that the editing of the Gospels lasted for a long enough time, after their creation in the XII-XIII century A.D., to incorporate such references.

The analysis of the astronomical fragments of the book “The Thunderer Remembers” is based on the same principle as the analysis of Revelation and the book “The Lord Shall Overcome,” or Ezekiel. We shall thus cut the details short, and give a brief summary. Details can be found in [\[543\]](#).

In the book of Zechariah we encounter the same four planetary chariots as described in Ezekiel. This time the reference to the “four chariots” remained in the synodal translation as well (Zechariah 6:1). One marks the uniformity of the symbolism found in Zechariah and Ezekiel. Actually, according to the Scaligerian point of view, Biblical prophecies were written in the same epoch and belong to the same literary tradition. We see no reason to argue with this, and share the opinion of historians.

N. A. Morozov believed that Chapter 6 describes a horoscope that he dated to 453 A.D. the earliest. However, despite the fact that this description is clearly astronomical, it is rather hard to use it for obtaining a reliable horoscope.

3.

The Biblical prophecy of Jeremiah and the date of its creation

According to N. A. Morozov, the word “Jerem-Iah,” or IERMNE-IAH translates as “The Thunderer Shall Cast a Bolt” ([544], Volume 1, page 267). This is apparently a title as opposed to the author’s name yet again. Scaligerian chronology dates the book to the alleged years 629-588 B.C. – the same epoch as Ezekiel, that is. Their ideological proximity is duly noted, even the use of the same literary style and form. Since these considerations only refer to relative chronology, we find no reason to argue with historians.

The book contains another reference to the god who declares his intent to keep the promise that he once gave, that he will soon come to earth at the time of great afflictions in order to judge the people. This looks like yet another variation of the Apocalypse.

The impending advent of God is symbolized by a poised mace hanging in the sky. The synodal translation offers “a rod of almond tree” as an alternative (Jeremiah 1:11). However, the Hebraic text says MKL-SHKD, which stands for “a poised stick, a mace ready to strike, or a club ([543], page 184). This is why the translation should run as follows: “I said, I see a poised mace [almond rod]. Then said the Lord unto me, Thou hast well seen” (Jeremiah, 1:11-12).

As with the other prophetic books treated presently, Jeremiah contains a large number of astronomical fragments. We shall refrain from analysing them here, since an in-depth analysis is given in [543]. According to N. A. Morozov, this refers to a *comet* that appeared in the sky.

Pictures of comets can be found in many mediaeval books on astronomy. Comets were oftentimes represented as fantasy images whose

purpose was to intimidate. A club or a poised mace is a mediaeval image that was frequently used to denote a comet.

Bacharach's book allegedly dating from 1545, for instance, depicts a comet as a *mace* (see fig. 4.13). The same book contains another picture of a comet as a mace *surrounded by stars* (see fig. 4.14). The book of Stanislaw Lubienietski dating from 1666-1668 depicts a comet similarly ([\[1256\]](#), fig. 4.15).

Fig. 4.13. A mace-shaped comet. Taken from the mediaeval *Astronomia* by Bacharach, dated 1545. Book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[543\]](#), page 185, ill. 94.

Fig. 4.14. A mace-shaped comet. Taken from the mediaeval *Astronomia* by Bacharach, dated 1545. Book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[543\]](#), page 188, ill. 96.

Fig. 4.15. A mace-shaped comet. Taken from the *Theatrum Cometicum, etc.* by Lubienietzki, Amstelodami, 1666-1668 ([\[1256\]](#)). Book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[544\]](#), page 195, ill. 101.

A particularly vivid description of a comet is given in the following fragment of “The Thunderer’s Bolt,” or “Jerem-Iah”: “What seest thou? And I said, I see a seething pot; and the face thereof is toward the north. Then the Lord said unto me, Out of the north an evil shall break forth upon all the inhabitants of the land” (Jeremiah, 1:13-14).

Bacharach’s astronomy allegedly dating from 1545 has a most remarkable illustration where one sees a comet that looks like a gigantic round *face seething with flames and heat*, surrounded by stars incinerated by the flames (see fig. 4.16). The illustration is done in such a manner that the spectator has the illusion of seeing the top of a *boiling cauldron*.

Fig. 4.16. A comet shaped as a boiling cauldron concealing a face. Taken from the mediaeval *Astronomia* by Bacharach, dated 1545. Book archive of the Pulkovo

Observatory. Also see [\[543\]](#), page 185, ill. 93.

Thus, the book of Jeremiah doubtlessly contains a mediaeval description of some comet. The actual fact that the description refers to a comet was noted a long time ago. D. O. Svyatsky wrote about it in his *Halley Comet in the Bible and the Talmud*. He tried to date this comet, but without any success. It is also possible that the very title of the book, “The Thunderer’s Bolt,” is related to the appearance of a comet in the sky.

There is no reliable horoscope in the prophecy of Jeremiah, despite the fact that we have seen some fragments that were clearly astronomical in nature. Dating the book astronomically is far from simple. Using the description of the comet for a dating is also impossible. Comets in general are poor assistants in matters of astronomical dating since their descriptions are usually rather vague and fanciful. Furthermore, there is no reliable historical proof for numerous reappearances of periodical comets which could provide some basis for “comet datings.” We shall consider comets in more detail in [Chron5](#).

4.

The Biblical prophecy of Isaiah and the date of its creation

The prophecy of Isaiah is one of the longest in the Bible. It is allegedly dated to 740 B.C. According to N. A. Morozov, the word “Isaiah” means “Forthcoming Freedom.” This prophecy is also among the most famous. N. A. Morozov had been of the opinion that it contained the description of a comet, which he attempted to date – unsuccessfully, in our opinion, since, as we shall demonstrate below, comets are hardly suitable for independent dating.

The book is full of memories of Christ. It isn't without reason that this particular prophecy is often referred to as the Fifth Gospel ([\[765\]](#)). Let us cite several “Jesus fragments” from the book of Isaiah as examples:

“Behold my servant, whom I uphold; mine elect, in whom my soul delighteth; I have put my spirit upon him: *he shall bring forth judgement to the Gentiles*” (Isaiah 42:1).

The reference is most probably to John – a follower of Jesus and the author of the Revelation that predicted Doomsday.

“As many were astonished at thee; his visage was so marred more than any man” (Isaiah 52:14).

“He is despised and rejected of men; a man of sorrows, and acquainted with grief: and we hid as it were our faces from him; *he was despised, and we esteemed him not*. Surely he hath borne our griefs, and carried our sorrows: yet we did esteem him stricken, smitten of God, and afflicted. But *he was wounded for our transgressions...* the chastisement of our peace was upon him; and with his stripes we are healed. All we like sheep have gone astray... and the Lord hath laid on him the iniquity of us all. He was oppressed, and he was afflicted, yet he

opened not his mouth: he is brought as a *lamb* [sic! – A. F.] to a slaughter, and as a sheep before her shearers is dumb, so he openeth not his mouth. He was taken from prison and from judgement... *for the transgression of my people was he stricken*. And he made his grave with the wicked [compare with the Gospels – “there they crucified him, and the malefactors, one on the right hand, and the other on the left” (Luke 23:33) – A. F.], and *with the rich in his death* [another reference to the Gospel – buried by Joseph – A. F.]... by his knowledge shall my righteous servant justify many; for *he shall bear their iniquities*.” (Isaiah 53:3-9, 53:11)

And so on, and so forth.

Scaligerian history attempts to prove to us yet again that all of this was written many centuries before Jesus Christ was crucified. We deem this to be highly dubious. This text was most probably created after the XII century A.D., long after the “Passion of Christ.” We should also point out that if one translates the words “salvation” and “saviour” which are scattered all across the text of Isaiah in great abundance, we shall get the word “Jesus.” See details in [\[543\]](#).

5.

The Biblical prophecy of Daniel and the date of its creation

Historians used to date this book to 534-607 B.C. ([765]). However, this point of view was subsequently revised. Nowadays the book is considered to have been written around 195 B.C., so the date was moved about four centuries forward. This fact alone should tell us that there is no reliable way of estimating the independent dating of the book in Scaligerian chronology. The book of Daniel is considered to be the last prophecy ([765]). If Scaligerite historians can keep ignoring the relation of other prophecies from the Old Testament to the Revelation, the prophecy of Daniel is in a privileged position. The parallel with the Apocalypse here is so *obvious* that historians were forced to admit its existence.

Apparently, this is exactly why the dating of the book of Daniel started travelling forwards in time – it was necessary in order to get closer to the Scaligerian dating of the Apocalypse pertaining to the first centuries of the new era. The historians say the following in this regard: “its nature [that of the book of Daniel – A. F.] demands calling it apocalyptic rather than prophetic” ([765], pages 93-94).

According to N. A. Morozov, the name Daniel translates as “The Truth of God” ([544], Volume 1, page 274). Once again we are confronted with the possibility that it is the title of the book and not the name of the author. The Biblical critics have established that it is the *most recent* prophecy from the Bible – it makes references to previous prophets, for one thing. Considering our new results concerning the dating of Biblical books, this prophecy is most probably late mediaeval in its origin.

Apparently, this book contains no precise astronomical horoscope. However, it contains a wonderful description of a comet. Although “comet

datings” are not to be trusted the slightest bit, and can only serve as secondary proof for independent astronomical research, we shall give a brief account of the comet description contained in the book of Daniel.

This book is widely known for its legend about the prophet Daniel who had explained the inscription, “MENE, MENE, TEKEL, PERES,” written by a fiery hand on the wall of a palace, to king Belshazzar.

The Bible says:

“In the same hour came forth fingers of a man’s hand, and wrote over against the candlestick [lamp – A. F.] upon the plaster of the wall of the king’s palace: and the king saw the part of the hand that wrote” (Daniel 5:5).

“And this is the writing that was written, MENE, MENE, TEKEL, UPHARSIN.” (Daniel, 5:25).

Let us also quote Morozov’s translation of the Hebraic text, which differs from the synodal translation somewhat.

“This very hour a finger appeared [ATSBEN in Hebraic, whereas the plural would be “ATSBEUT” – A. F.] in the hand of a stately man [the Hebraic text says DI-ID-ANSH, or ‘the hand of a mighty person,’ while ID indicates possession, and not an actual part of the hand, so there is a human hand that holds some finger – A. F.], and he began to write towards the lamp of night on the plasterwork of the princely hall” (see [\[543\]](#), page 213).

What could a “finger in the hand of a stately man” possibly refer to, and one that wrote on the walls of a “princely hall” – most probably the sky – at that? We have already witnessed that astronomical topics are abundant and obvious in the Bible. It suffices to take a look at the mediaeval illustration to S. Lubienietski’s *Cometography* dating from 1681 ([\[1257\]](#), see fig. 4.17).

Fig. 4.17. Picture of a comet next to a human hand writing something across the sky. Taken from a mediaeval book by S. Lubienetski titled *Historia universalis omnium Cometarum*, 1681 ([\[1257\]](#)). Book archive of the Pulkovo Observatory (St. Petersburg). Also see [\[543\]](#), page 208, ill. 106.

We can observe a cloud of dust on the starlit sky, and a hand that grasps a branch protruding from the cloud. The branch ends with a twig that resembles a finger, which the hand uses for tracing out some illegible inscription. We see a *comet* directly above the hand, depicted as a gigantic fiery star with a tail.

It is very likely that the prophecy of Daniel really contains the description of a comet, since it says that the hand wrote towards the Lamp of Night, or, most probably, the moon. N. A. Morozov was of the opinion that “stately man” referred to the constellation of Ophiuchus. We have discussed this identification above.

The terrified king proceeds to turn to KSHDIA, or “astrologers” ([\[543\]](#)). This is normal, since the profession of the mediaeval astrologers implied interpreting events observed on the celestial sphere (Daniel 5:7). Finally, Daniel explains the inscription to the king:

“And this is the writing that was written, MENE, MENE, TEKEL, UPHARSIN. This is the interpretation of the thing: MENE; God hath numbered thy kingdom... TEKEL; Thou art weighed in the balances... PERES; Thy kingdom is divided, and given to the Medes and the Persians” (Daniel 5:25-28).

The Hebraic text has MNA-MNA, TKL, U PRSIN, which can be translated as “the measurer has measured, Libra and towards Perseus.” We have already pointed out that Ophiuchus was identified with the measurer of the celestial sphere on many mediaeval maps – see fig. 4.9 from the book by Corbinianus dating from 1731 ([\[1077\]](#)). Therefore, “Daniel” as applied to the Measurer is most possibly a second reference to Ophiuchus – in other words, a stately man as depicted on mediaeval star charts. This gives one the idea that some comet may have moved towards Perseus from Libra, passing through Ophiuchus.

Having analyzed the information about comets that has reached our age, Morozov made the assumption that this could have been the comet of the alleged year 568 A.D. or 837 A.D. However, comet dating can by no means be seen as dependable. We shall elaborate on this point in [Chron5](#).

We shall conclude with the observation that the “ancient” Hebraic has no future tense, and so inferences of future time have to be determined according to the context. Therefore some text written in the present tense and referring to the events of the present and the past could be transformed into text written in the future tense, according to the perception of later readers ([\[543\]](#)). Could this be the reason why Hebraic literature contains so many prophecies?

Our reconstruction

Biblical prophecies contain astronomical fragments whose analysis allows for the formulation of a hypothesis about these books being mediaeval or even late mediaeval in origin. This conclusion concurs well with the results of using new empirico-statistical methods in relation to the Bible, transferring the time of its creation into the epoch of the XI-XVI century

A.D. See more about this below. Let us remind the reader that the astronomical dating of the Revelation yields the date of 1486 A.D. This is why the proximity of the Old Testament prophecies to the New Testament Book of Revelations might indicate that all of them were created in the XV-XVI century A.D. We shall point out certain fragments from the book of Daniel that refer to XVI century events in [*Chron6*](#).

HISTORY: FICTION OR SCIENCE?

THE ISSUE WITH DARK AGES

ANATOLY FOMENKO

Contents

[About the author](#)

[Overview of the e-Series](#)

[From the Publisher](#)

[Ages in Chaos](#). Foreword by Dr. Eugen Gabowitsch

1. The mysterious Renaissance of the “Classical Age” in mediaeval Rome

- 1.1. The lugubrious “Dark Ages” in Europe that presumably succeeded the splendour of the “Classical Age”
- 1.2. Parallels between the “antiquity” and the Middle Ages that are known to historians, but misinterpreted by them
- 1.3. Mediaeval Roman legislators convene in the presumably destroyed “ancient” Capitol
- 1.4. The real date when the famous “ancient” statue of Marcus Aurelius was manufactured
- 1.5. Could the “ancient” Emperor Vitellius have posed for the mediaeval artist Tintoretto?
- 1.6. The amount of time required for the manufacture of one sheet of parchment
- 1.7. The “ancient” Roman Emperor Augustus was Christian, since he had worn a mediaeval crown with a Christian cross

2. The “ancient” historian Tacitus and the well-known Renaissance writer Poggio Bracciolini

3. The mediaeval Western European Christian cult and the “ancient” pagan Bacchic celebrations

4. Petrarch (= Plutarch?) and the “Renaissance of Antiquity”

- 4.1. How Petrarch created the legend of the glorious Italian Rome out of nothing
- 4.2. Petrarch’s private correspondence with people considered “ancient characters” nowadays

5. “Ancient” Greece and mediaeval Greece of the XIII-XVI century

- 5.1. The history of the mediaeval Athens is supposed to be obscured by darkness up until the XVI century
- 5.2. Greece and the Crusades

- 5.3. The history of Greek and Athenian archaeology is relatively short
- 5.4. The tendentious distortion of the image of mediaeval Athens in the “restoration works” of the XIX-XX century

6. Strange parallels in the Scaligerian history of religions

- 6.1. Mediaeval Christianity and its reflection in the Scaligerian “pagan antiquity”
- 6.2. Mediaeval Christianity and the “ancient” Mithraism
- 6.3. References to Jesus Christ contained in “ancient” Egyptian artefacts
- 6.4. Researchers of the ancient religions commenting on the strange similarities between the cults of the “antiquity” and of the Middle Ages
- 6.5. Moses, Aaron and their sister Virgin Mary on the pages of the Koran
- 6.6. The XII century as the apparent epoch of St. Mark’s lifetime. The history of Cathedral of San Marco in Venice

7. The “ancient” Egypt and the Middle Ages

- 7.1. The odd graph of demotic text datings
- 7.2. The enigmatic “revival periods” in the history of “ancient” Egypt
- 7.3. The ancient Hittites and the mediaeval Goths

8. Problems inherent in the Scaligerian chronology of India

9. Was the artificial elongation of ancient history deliberate?

What mainstream historians say about the New Chronology?

Bibliography

Ages in Chaos

Foreword by Dr. Eugen Gabowitsch (1938–2009)

It is impossible to make an exhaustive survey of the Russian historical and critical research performed in the XX century, so I shall just give you a brief outline of just what this new Russian critical school is all about. The first question that needs to be asked in order to understand the issue at hand is one about the exact definition of history. Let us adhere to the formula “history begins today” – after all, history is still in formation, and formulate some general postulations.

Firstly, the traditional model of the past as presented in multitudes of historical books is erroneous. Just how erroneous is what we are trying to estimate, as well as the approximate epoch when consensual history finally became crystallised in its present form, if such a thing is at all possible.

And so, our very first question was about the definition of history. One must understand that the object of our critical analysis isn't the past itself, but rather the surviving records thereof. However, “the past” and “history” strike most people as synonyms, which is incorrect – when people refer to “history”, they can only speak about whatever they read in books and not any real past of humankind. One can very easily become confused if one doesn't distinguish between one and the other – a virtual reality populated by a vast number of kings and pharaohs and the real past that we have no substantial information about for the most part. Let us therefore remember that *history is nothing but our model of the past.*

History begins today

The above postulation formulates the very essence of what the Russian critical school is all about. Any historical book we open shall tell us about historical situation for 7000 B.C. being such-and-such, with similar assessments of “historical situations” for 5000 B.C. and so on, 2800 B.C. marking the birth of the Sumerian civilization. This dating isn't substantiated in any way at all; the precision of datings is perfectly scholastic in nature, and the great antiquity of documented history is purely arbitrary.

We shall therefore refrain from beginning our narration with a distant B.C. dating. Let us take the present as a reference point and move backwards gradually, explaining every

step of our chronological voyage. One must remember that it isn't a real past that we are about to explore, but a mere model thereof.

The phrase "history begins today" also applies to our first steps in the direction of an interdisciplinary mindset; this is precisely what the Russian scientists are trying to do nowadays. The community of people who research critical approaches to history is of a very interdisciplinary character itself and consists of mathematicians, computer science experts, professors of history and sociology, chemists, geologists and many representatives of natural sciences in general.

Johan Huizinga wrote that one could hardly fit history into the mediaeval education system. The representation of historical science in universities had indeed been very limited; there is hardly a single important work on history dating from that period that would be written by a university scholar (up until the beginning of the XIX century). One must also add that history gradually transformed into a humanity and therefore not a "science", strictly speaking.

If one should find it hard to grasp the concept of history beginning today, one might as well consider a situation when an alien spaceship lands on planet Earth, and we are confronted with the necessity to explain a great many things to the aliens – our linguistics, our manner of reproduction and the like. They are likely to ask us about our history, and the datings of historical events. How can one give an exhaustive answer to this question? We would have to explain everything to the aliens step by step and very logically – after all, we can't expect them to be familiar with our general university curriculum or our model of the past.

History Creation

Next we must explicate the fact that history is still being created. Most people say a critical watershed in the entire historical formation is the Gregorian Calendar reform of 1582. However, in many cases the veracious historical period begins a great deal later. Three years ago we suggested 1650 as the beginning of the veracious period in history, all prior epochs being in need of thorough research and chronological verification. Having been in close touch with the Russian community of unorthodox historians for quite a few years, I can say that even this dating is far too optimistic; history is still being created, and this process may even be happening a great deal more rapidly nowadays. India, for instance, is attempting to introduce a new model of the Indian past – much more grandiose, yet free from conflicts, wars, violence and all "anti-Ghandian" phenomena in general. This politically correct version of history is being taught in

Indian schools today.

China can be taken as another example. The Great Wall, for instance, has only been built after 1950 – its prior existence is but an old European myth. The reaction of utter surprise and astonishment is very natural. I have published a paper with the results of my research that lead one to the abovementioned conclusion; there is another book in existence, written by a professional historian, that says the very same thing. However, this literature never gets read by the masses; everyone reads newspapers and watches films, which adhere to the model where the Great Wall of China has existed for the last 2000 years. There isn't a single old Chinese drawing of the wall – the oldest ones come from European books. It has been different for the last 50 years or so; the Chinese Communists built an actual wall, and now declare it to be more ancient than even the most daring estimates of historians.

Another example is the invention of the printing press by the Germans in the XV century, 1440 being the earliest estimation. There is nothing odd about this invention being made in Europe around that time – after all, all European languages use phonetic alphabets. However, consensual history is trying to convince us that somebody invented printing moulds in China 300 years before, in the XI century – for tens of thousands of hieroglyphs, no less. The invention had promptly been forgotten, serving no other purpose than going down in history. The more plausible version is that a European (possibly Dutch) book about the invention of the printing press in Germany became translated into Chinese around the XVII century and became part of Chinese history.

One must also recollect the alleged invention of the logarithms in China that took place 500 years before they were invented in the Netherlands. The comparison of two publications, European and Chinese, demonstrates that *a misprint* from Napier's table of natural logarithms (first published in 1620) *was repeated* in a Chinese book that is presumed to be 500 years older. Is that the natural way of making history, one wonders? The Spanish Armada of 300 great vessels also became an important part of Chinese history. Every Chinese history book reports about the construction of a gigantic 300-vessel armada in 1405; some of the ships are said to have been 150 metres long, which is quite impossible for wooden ships. This fleet was presumably sent to India, the Arabic countries and so on; the expedition recurred six or seven times, its purpose remaining unclear. This is obviously the Great Spanish Armada transformed into a Chinese myth.

As a matter of fact, if one does a bit of research, one shall see the very same process taking place *now* in Kazakhstan, Kirghizia, Uzbekistan, Turkmenistan and the Ukraine. I

come from Estonia, and I know the Estonians to have the longest history in the world – tribes of proto-Estonians have presumably inhabited the territory of modern Estonia in 5000 B.C. It is quite naturally a myth that cannot be verified; yet the creation of such myths is still taking place in virtually every country in the world. *Everyone tries to trace their history as far back into the illusionary past as possible.* This is the historical mindset of the XX century.

The most important period in the making of history falls on the XVIII century. This is when the Russian, the German and the Chinese history was created; the creation of Chinese history in particular has been transparent to the extreme, since it amounted to the translation of historical books in different European languages into Chinese. All of them have become native a long time ago, incorporated into Chinese history. Chinese writing is not phonetic; the language of the original becomes thoroughly lost in translation, that is. Nearly every major European chronicle, likewise every invention made in Europe, became reflected in Chinese history.

The origins of the real Chinese history date to the XIV century A.D. the earliest, which is ridiculously late from the consensual point of view. Prior to that, history in the traditional European understanding had been nonexistent in China, and may be referred to as “moral history”. This also applies to Indian history – according to a certain Japanese scientist, modern Indian history is like a telephone directory, with a hodgepodge of names culled from a plethora of chronicles without a single correct dating or indeed any historical events at all.

One can plainly see that a critical approach to history is very much called for; one must however say that critical schools of historians are anything but a recent phenomenon – it suffices to mention Sir Isaac Newton, who had been one of the most vehement critics of consensual history in his epoch. The Russian critical tradition begins with Nikolai Morozov, whose fundamental critique entitled “Christ” was published in the 1930’s. Nowadays Fomenko and his team of scientists possess unsurpassable mathematical and statistical tools that they successfully use for the critical analysis of historical data, discovering more and more irrefutable facts that prove consensual history to have just about as much in common in reality as a book of nursery rhymes. Their latest fundamental work is being translated into English, and the first two volumes are now widely available; one cannot recommend those enough, since their release is doubtlessly a very important step towards the understanding of human history as it is, which is miles and miles apart from what we have grown accustomed to believe.

Fomenko is not alone

Most historians and archaeologists are only vaguely familiar with the theory of the Academician A. T. Fomenko, the eminent mathematician, and his numerous works on chronology (written together with mathematician G. V. Nosovskiyy for the most part) from very negative hearsay, yet they repudiate and criticise the works of these authors with great ardour and much malice, adhering to the principle: “I have never read the works of the renegade Fomenko, and never will, but I condemn the horrendous aspersions that they cast on our beloved Antiquity nonetheless!” All of the above notwithstanding the fact that the books that contain criticisms of the consensual chronology and historiography sell in thousands of copies.

Wide masses of historians that comprise the “consensual chronology army” get very limited exposure to the numerous critiques of chronology and history that have been coming out in Germany and several other countries for many a year. The primary goal of this article is an attempt to familiarise the above with the primary critical works that suggest a radical revision of history and chronology, as well as their authors.

One hopes that a few historians and archaeologists out there will eventually realise the enormous potential of this direction in historical research, once they become aware of the multitude of authors, methods, approaches and historical topics involved in the reformation of history and chronology in one way or another. The most promising stratum of audience is comprised of young scientists and the unorthodox minority of broadly-educated people as opposed to the bureaucratic majority of the “historian backoffice personnel”.

Eminent critics of chronology and historiography in the past

Independent thinkers who weren't afraid of the fact that historical science and the people whose interests it represents have always been extremely hostile towards all criticisms of chronology, existed in every epoch, alongside the masses of obedient historiographers that were too scared or too reluctant to go against the grain. Owing to the fact that these independent researchers had possessed the courage to expose blatant contradictions inherent in the very chronological foundations of historiography, official science didn't manage to keep them out of the general public's reach. We shall mention some of them below.

The four names one finds below are merely the ones who received the most publicity. Many a honest historian has tried to criticise the condition of historical sources, but never dared to cross the border of loyalty to historical science in general, as well as the

corporate mass of fellow historians. They remained in the shade – however, their efforts helped several radical critics of chronology to emerge and voice the existence of the abovementioned contradictions and very blind spots in history publicly.

Sir Isaac Newton

Readers familiar with the works of Fomenko and Nosovskiyy know that the great English physicist had also been an eminent chronologist; they keep emphasizing that in his every book Sir Isaac insists on the necessity of narrowing the historical temporal space drastically. I consider that the great physicist and theologian, rather put emphasis on criticisms of consensual chronology than the shortening of the historical period.

Let us assume that Joseph Scaliger, the founding father of the consensual chronology, had been perfectly scrupulous in his work with the historical sources that he had selected for his research. It is true that he may have invented some of them; however, seeing as how modern historiography regards them as valid historical sources, this circumstance (hardly an extraordinary phenomenon in the past) is of little importance to us. On the other hand, we have no reasons to assume that Newton wasn't capable of conducting his chronological calculations without any errors, based on the sources that he had chosen for this purpose. Assuming this, we can claim that Newton *de facto* proves the following two theorems – empirically, if not logically:

- ***Theorem 1:*** The system of historical sources is woven of contradictions: some of its parts lead one to conclusions that contradict other parts:
- ***Theorem 2:*** Consensual chronology as used by the modern historical science is untrue. Furthermore, the general mass of historical sources that we have at our disposal doesn't allow for its unambiguous reconstruction.
- ***Corollary:*** Historical chronology is nonexistent.

Moreover, Newton had been the first to use statistical considerations for testing the veracity of chronological materials. He can therefore be considered the ideological progenitor of the Russian critical school in Chronology (Morozov, Fomenko *et al.*), which is concerned with natural scientific and mathematical argumentation for the most part, albeit not exclusively.

Jean Hardouin

Jean Hardouin (1646-1729) was a contemporary of Newton and one of the best-educated people of his epoch. A member of the Jesuit order, he had been the director of

the French Royal Library since 1683. Hardouin had also been a Professor of Theology who would constantly surprise his listeners by the depth of his knowledge and his tremendous erudition. Hardouin is the author of several books on philology, theology, history, archaeology, numismatics, chronology and philosophy of history for a complete bibliography). Unfortunately, these oeuvres remain unknown to the wider audience of specialists, one of the reasons being the fact that they're written in Latin for the most part.

Hardouin's most famous work is a collection of ecclesiastical edicts in re the assembly of Ecumenical Councils, starting with the I century A.D. and on. When this grandiose oeuvre finally came out in 1715 after 28 years of labour and after the editions of 1684, 1685 and 1693 (11 volumes with comments altogether), it had remained banned by the church for the 10 years that followed, since the ecclesiastical authorities had, understandably enough, been alarmed by the criticisms of sources contained in the conclusions made by Hardouin in the course of his research. The church had only allowed public access to the materials published by Hardouin after the public renunciation of the latter's former beliefs, which was perceived as a mere formality by Hardouin's contemporaries.

From 1690 and on, J. Hardouin had claimed that the works of many ancient authors were written hundreds of years later than whatever was implied by the consensual datings of their lifetimes. In other words, he had exposed the works in question as forgeries. This critique of sources had been getting ever more scalding; one of Hardouin's final conclusions had been that nearly all the ancient works of literary art date from the XIII century the earliest. He had made exceptions in several cases: the works of Cicero, the satires of Horace, Virgil's "Georgics" and Pliny the Elder's "Natural History". However, his famous comments were written about his authors, and so Hardouin may have found it hard psychologically to recognise them as mediaeval authors.

Hardouin had claimed that Christ and his apostles, if they existed at all, must have read their sermons in Latin. He was convinced that the Greek translations of the New and the Old Testament date from a much later epoch than the church presumes. He had named St. Augustine among the fraudulent Christian classics and didn't trust the veracity of his works. He had also mentioned the falsification of nearly all of the "ancient" coins, works of art, stone carvings and, particularly, the documents of all the Ecumenical Councils that had preceded the Council of Trident (1545-1563).

The reaction of Hardouin's contemporaries to his iconoclasm is of as great an interest

to us as his criticisms of historical sources. Hardouin naturally got criticised, but usually sotto voce, which leaves one with the impression that the critics themselves were well aware that the publication of apocryphal works had been the norm relatively recently. Even his most vehement opponents acknowledged that Hardouin's academic eminence and his highest authority in the scientific world made it unnecessary for him to seek cheap publicity of a nihilist or to amuse himself with disclosures that irritated the ecclesiastical and scientific circles alike. Only deep conviction about the veracity of the critical approach to chronology and historiography could have made Hardouin dare to oppose the entire canonical science and theology.

It is noteworthy that Hardouin criticised Newton's book on amended chronology in the same vein of the complete negation of deep antiquity, urging Newton to stop writing about the fictitious "days of yore". He had been of the opinion that the destruction of Jerusalem and the burning of Troy were the same event in reality, which corresponds to the point of view expressed by Fomenko and Nosovskiy.

Most of Hardouin's work (including the ones published postmortem) **were banned by the church in 1739-1742 and included in the list of banned books**. After the death of J. Hardouin, most of the "ancient" sources that he had exposed have been "rehabilitated" and are once again taken seriously by historical science.

Robert Baldauf

If Newton and Hardouin were world famous scientists whose biographies are known in great detail, the only thing we know about Robert Baldauf, the Swiss philologist, is that he was a Privatdozent of Basel University and published two volumes out of the four that he had intended to publish under the general title of "History and Criticism", namely, the first and the fourth volume. These two volumes are of the utmost interest to the critics of chronology and history, since Baldauf managed to come to virtually the same conclusions as Hardouin using an altogether different method, that of philological analysis.

Baldauf had studied the archives of the famous Swiss monastery of St. Gallen, formerly one of the key centres of Catholicism, and discovered the traces of the barbaric library raid made by Poggio Bracciolini and a friend of his, both of them highly educated servants of the Roman curia. They purloined numerous manuscripts and books that were considered ancient from the library of this monastery (however, the manuscripts may date to a more recent epoch, which wouldn't preclude them from serving as prototypes for the manufacture of numerous "ancient" works by Poggio and

his assistants.

One must also mention Baldauf's study of numerous presumably ancient manuscripts and the exposure of the latter as recent forgeries for the most part. Baldauf discovered parallels between the "historical" books of the Old Testament and the works of the mediaeval Romance genre as well as Homer's "Iliad" that were blatant enough to lead the scientist to the assumption that both the Iliad and the Bible date from the late Middle Ages.

Some of the mediaeval chronicles ascribed to different authors resembled each other to such an extent that Baldauf was forced to identify them as works of the same author, despite the fact that the two documents were presumed separated chronologically by an interval of two centuries at least. At any rate, some of the expressions characteristic for Romanic languages that one finds in both documents fail to correspond with either of the alleged datings (one of them being the IX and the other the XI century). Apart from that, some of the manuscripts contain distinctly more recent passages, such as frivolous stories of endeavours in public steambaths (which the Europeans only became acquainted with during the late Reconquista epoch) and even allusions to the Holy Inquisition.

Baldauf's study of the "ancient" poetry in Volume 4 demonstrates that many "ancient" poets wrote rhymed verse resembling the mediaeval troubadours. Unlike Hardouin, Baldauf is convinced that the verse of Horace is of a mediaeval origin, pointing out German and Italian influences inherent in his Latin. Furthermore, Baldauf points out such pronounced parallels between the poetry of Horace and Ovid (who were presumably unaware of each other's existence) that one becomes convinced that the works of both belong to a third party – apparently, a much later author.

Robert Baldauf wasn't alone in his criticism of the style characteristic for the "ancient" authors. As early as in 1847 Borber expressed surprise about the striking similarity of the Druids and the Egyptian priests as described in Julius Caesar's "De bellum Gallico", which he considers a later forgery, likewise "De bellum civile" by the same author. Baldauf sums up his research in the following words: "Our Romans and Greeks have been Italian humanists". All of them – Homer, Sophocles, Aristotle and many other "ancient" authors, so different in our perception, hail from the same century, according to Baldauf. Furthermore, their home wasn't in the Ancient Rome or Hellas, but rather Italy of the XIV-XV century. The entire history of the Ancient Greeks and Romans, likewise the Biblical "history", which correlates with the above to some extent, was conceived and introduced by the Italian humanists, as well as their

colleagues and followers from other countries.

Humanism has given us a whole fantasy world of the antiquity and the Bible, as well as the early Middle Ages, which Baldauf had also considered an invention of the humanist writers. This fictional history, initially drafted on parchment, was carved in stone and cast in metal; it has rooted itself in our perception to such an extent that no positivist criticisms can make humanity doubt its veracity.

Wilhelm Kammeier

In case of Wilhelm Kammeier, a German critic of historical sources, we don't know so much as the date of his birth; he was born between 1890 and 1900. He died in 1959 in Arnstadt (Thuringia, former East Germany). He was a lawyer by trade, and had worked in Hanover as a notary. He had taken part in World War II and was taken prisoner. After that, he had lived in Arnstadt, which became the new home of his family after the destruction of their Hanover residence during the war. All his post-war life he had been afflicted by poverty and state repressions. Very probably his death resulted from chronic malnutrition.

The job of a notary provided Kammeier with an excellent basis for the critical research of old documents, which he became fascinated with in 1923. By 1926 he had completed his 292-page manuscript entitled "The Universal Falsification of History", where he subjects historical documents serving as the basis for the mediaeval history of Germany to rigorous criticisms. However, it had taken him many years to find a publisher for this critique.

He sent a brief summary of the key points related in the manuscript to the Prussian Academy of Sciences with a request to be given the opportunity of making a public speech in front of the historians. This request was rejected under a formal pretext that private persons weren't allowed to address the Academy, with no substantial argumentation given. The mere fact that Kammeier had not held an office in an academic institution sufficed for the rejection of a well-reasoned critique.

Kammeier's manuscript got published only as late as 1935. This was followed by a brochure, where the criticisms of historical sources were taken further, encompassing the entire mediaeval period in Europe, and seven more brochures on the same subject. This work ([\[g9\]](#)) has long ago become a bibliographic rarity. It was published again in a small number of copies as part of the book ([\[g10\]](#)) that also includes the following works of Wilhelm Kammeier dating from 1936-1939: "Enigmas of Global History – an Answer to my Critics", "The Mystery of Mediaeval Rome", "Dogmatic Christianity and

the Falsification of History”, and “The Foundation of the Roman Ecumenical Church”.

Finally, Kammeier’s manuscript on the “sources” of the early Christianity and their falsification, previously unpublished and presumed lost, came out as a book ([\[g11\]](#)).

Official science had only been reacting to Kammeier’s works during the first few years that followed the release of his first book – critically, of course. One of his critics, a certain Professor Heimpel, accused Kammeier of having no positive conception of history. A critic must naturally be concerned with the positive historical picture first and foremost, regardless of whether or not it is a work of fiction through and through: “If we see the entire historical conception of the Middle Ages disintegrate and transform into a spot of impenetrable darkness, or indeed a gigantic question mark, we shall naturally end up with feeling inner resentment against Kammeier’s criticisms, well-reasoned or not”.

Kammeier’s counter-argumentation was that it hadn’t been his fault that the history of Germany and the entire Ancient World proved a work of fiction to a tremendous extent, the literary and documental sources of the epoch being forgeries. He only pleaded guilty of discovering this historical falsification, mentioning the necessity to live with a new historical truth that new generations of historians would inevitably face (as we know, they still shudder at the mere thought), alluding to Schopenhauer’s concept about truth needing no permission for its existence. Once perceived, the truth becomes an elemental force: intelligent persons shall try to turn this force to their benefit instead of opposing it.

However, after the reasoned refutation of the historians’ criticisms by Kammeier, the learned scholars have switched to the tried and viable tactics of obstruction and concealment (after all, things that remain unknown to the general public may as well be nonexistent). The world war that broke out around that time had aided this obstruction greatly. Kammeier’s participation in military action, his captivity and the unsettled state of his post-war life had interrupted his active research for a long time.

The only job Kammeier managed to find in the East Germany was that of a schoolteacher. As soon as circumstances allowed, he resumed his research of the “ancient” documents, concentrating all of his attention on the documental foundations of the history of early Christianity. It is quite possible that he had counted on a benevolent attitude towards this topic from the part of Socialist historiography in an atheistic country that the East Germany was striving to become. Instead of that, as soon as he had offered his critique of early Christian documents to the historians of the German Democratic Republic, he became a victim of repressions: he lost his job, the manuscript

of his book ([\[gl1\]](#)) was confiscated and had been presumed lost for a long time; his estate was nationalised, and his family forced to dwell in hunger and poverty.

Kammeier's research of the "ancient" documents begins with the trivial remark that every donation document (the most common kind of mediaeval documents; donations could assume the form of estate, privileges, ranks etc), must contain information about the nature of the gift, the date of the donation, the names of the benefactor and the receiver and the place where the document was written. Documents with blank fields (date, name of the donation's receiver etc) are *null and void* from the legal point of view, and can only serve as historical sources indirectly (in the research of historical falsifications, for instance).

Documents kept in libraries often fail to correspond to these criteria:

- One finds documents with no date, or a date that was obviously introduced later – alternatively, the date can be incomplete or transcribed in a manner that fails to correspond with the presumed epoch of the document's creation.
- Documents dating to the same day would often be "signed" in different geographical location.

The analysis of places and dates leaves us with the following picture: all German emperors, regardless of age, health and basic human logic, don't reside in any capital, but keep on the move all the time, occasionally covering gigantic distances in a single day, in order to make more and more donations to their loyal subjects.

It would be interesting to feed all such data to a computer in order to compile analytical overviews of the movement speed of the German feudal rulers and their supernormal Wanderlust. However, the tables that the historians have already compiled, demonstrate that German emperors often managed to be present in two mutually distant geographical locations on the same day. For instance, Emperor Conrad is presumed to have been present in 2 or 3 different cities at the same annual Christian feast for 50 years in a row.

The family name of the donation's recipient is absent from a great number of documents (this is the case with up to half of all surviving documents for some epochs) – one can therefore speak of headers at best, valid official documents being a far cry.

Naturally, Kammeier wasn't the first to discover forgeries during the research of ancient (or presumably ancient) documents. His primary merit is that he had managed to recognize the more or less systematic large-scale activities of whole generations of hoaxers serving the Catholic Church or individual feudal rulers and grasp the real scale

of the historical falsification campaign, which had been great enough to surprise historians even before his time.

These hoaxers have destroyed a great many of old originals and replaced them by forgeries. Old text would often be erased with new one taking its place on an ancient parchment, which would make the forgery look like an “authentic ancient relic” in the eyes of the hoaxers. It would often take a very minor alteration to change the original meaning of an old document completely.

According to Kammeier, the key goal of this prolonged and massive campaign for the falsification of historical documents had been the concealment, distortion and arbitrary extension of the pre-Christian history, with all the achievements of the pagan epoch ascribed thereto. Apart from that, “legal” acknowledgement of the possession rights must have been in *high demand* among the new feudal rulers, whose property was acquired from lawful pagan owners rather recently, and in a violent manner. Falsified donation documents were necessary to declare ancient rights of possession; their authorship could be traced to one of the great Christian rulers of antiquity – fictitious entities invented for this specific purpose in many cases.

The general condition of historical sources at the moment can be described as follows: the number of forgeries is mind-boggling, and every “ancient” work of history lacks an original (this is hardly a chance occurrence). However, historians keep on using forgeries in lieu of official documentation – possibly due to the fact that their inaccuracy has not been proven irrefutably yet, or that such irrefutable proof does in fact exist, but remains concealed from the scientific community.

One can find the following corollaries made by Kammeier in the course of his research of mediaeval documents in [\[g12\]](#):

- The humanists took part in the massive falsification of history alongside the Catholic clergy striving to create some proof of the historical significance attributed to their church; this process falls on the XV century for the most part.
- The documents related to the pagan “German” history have been destroyed and replaced by Gallic and Romanic forgeries.
- The existence of Catholic Pontiffs before the so-called Avignon captivity is of a figmental nature through and through.
- Historical events that preceded the XIII century are beyond reconstruction, since all of the earlier documents have been destroyed and replaced by counterfeits.
- The pre-Papal wars between national churches were subsequently presented as struggle against the heretics and the apostates.

- “Ancient” literature is as much of a forgery as the mediaeval documents. One of such fake literary works is “Germany” by Tacitus.
- The Catholic clergy can be credited with the invention of the New Testament, or at least a radical rearrangement thereof.
- The church keeps on manufacturing counterfeited “ancient” manuscripts in order to “prove” the authenticity of Evangelical texts and their great age with the aid of the new “findings.”

1.

The mysterious Renaissance of the “Classical Age” in mediaeval Rome

1.1. The lugubrious “Dark Ages” in Europe that presumably succeeded the splendour of the “Classical Age”

As we can see from the global chronological map arranged in the sum of the three shifts, nearly all documents considered “ancient” and referring to events that allegedly predate 900 A.D. in Scaligerian chronology are most likely to be phantom duplicates of the originals referring to the events of the X-XVII century A.D. One may question the availability of “space” for the “Classical age” in mediaeval history – in other words, there may be doubts about whether our attempt to relocate the “ancient” events to the Middle Ages might fail due to the latter being “filled up” with known historical events. This doesn’t seem to be the case, according to the results of our in-depth analysis.

Firstly, the epochs that were considered different *are identified as one and the same*. Consider, for example, the superimpositions of royal dynasties whose similarity wasn’t noticed previously. Secondly, many mediaeval periods in Scaligerian history are believed to be “concealed by tenebrosity.” Now we are beginning to understand why. The respective mediaeval documents describing these epochs were deliberately “set backwards in time” by Scaligerite chronologists. The withdrawal of these documents immersed a great number of mediaeval periods into artificial darkness.

The historians of the XVIII-XIX century gave rise to the peculiar conception that identified mediaeval period as the “Dark Ages.” The “great achievements of the Classical Age” are said to have faced utter decline and vanished. Scientific thought presumably “rolls all the way back into the Stone Age.” The great literary works of the “antiquity” are all supposed to have been kept stashed away as dead weight until the very Renaissance, when they miraculously re-surfaced ([\[333\]](#), page 161). Moreover, these “ancient” texts were allegedly kept by ignorant monks whose prime responsibility was, as we are now told, the destruction of “heathen literature.”

The absolute majority of the top ranking clergy is presumably illiterate ([\[333\]](#), page 166). The great achievements of the “ancient” astronomy – the eclipse theory, the calculation of planetary ephemerides, etc. – are reported to be completely forgotten.

The famous Cosmas Indicopleustes, who is supposed to have lived in the VI century A.D. and researched the movement of the Sun and the stars, honestly believes that the Universe is a box whose centre contains a flat Earth, washed by the Ocean and supporting the bulk of mount Ararat. Apart from this, the lid of the box is studded with stellar nails. There are four angels in the corners of the box that produce wind. This is the level of scientific cosmography of the Middle Ages (see [Chron3](#), Chapter 11:6.3).

Money coinage is allegedly forgotten, the art of architecture rendered unnecessary, and an “overall cultural degradation” spreads far and wide ([\[333\]](#), page 167). And so on, and so forth.

Of course, Scaligerian history of the Middle Ages mentions certain achievements of the period, but always with disclaimers along the lines of: “Even these *sudden flashes* of intellectual work were *random* and *singular* in their occurrence” ([\[333\]](#), page 169). We are being convinced that the “ancient” Latin in its brilliance “degrades” in an odd manner and transforms into a clumsy and squalid lingo, which only manages to regain splendour during the Renaissance – and that over a short period of time, to gain worldwide fame once again as the language of science ([\[333\]](#)).

Without a doubt, there are reasons for painting a picture this lurid if we are to rely upon Scaligerian chronology. But we want to give another explanation to this hypothetical “deluge of barbarity” that is presumed to have overwhelmed Europe, Asia, and Africa in the early Middle Ages. We are of the opinion that what we see isn’t a degradation of “the great legacy of the past” but, rather, the *naissance* of civilization and a gradual creation of the cultural and historical values, which were cast far back into the past due to the chronological errors that lit a spectral light in the “Classical Age” and left many mediaeval periods bare.

The contemporary version of mediaeval Roman history contains a multitude controversies and blatantly obvious *parallels* with the “Classical age” which, under close surveillance, may well be explained by the distorted concept of the historical role played by the Middle Ages. Let us throw a cursory glance at the history of Rome. Why Rome in particular? The reason is that Scaligerian history considers Roman chronology to be of paramount importance (see [Chron1](#), Chapter 1).

We shall begin with an intriguing detail. The famous *Chronicles* of Orosius inform us of the fact that “Aeneas departed from Troy and went to Rome” (!). Moreover, the “ancient” Orosius adds that he was told this *in school*. Let us explain. Such an itinerary of Aeneas, who took part in the Trojan war, makes Scaligerian history *400-500 years shorter* (also see [Chron1](#), Chapter 1).

The fragmentary history of the “ancient” Greece made a certain impact on the formation of the Roman chronology in the days of yore. The historian N. Radzig points out that “the heroic deeds of Aeneas in Italy and the fate of his offspring comprised the Roman pre-history of Rome... Initially this pre-history wasn’t very long: *it had called Romulus the grandson of Aeneas* [this is the root of the 500-year discrepancy with Scaligerian history, as mentioned in [Chron1](#), Chapter 1 – A. F.]; however, later on, when the Roman annalists acquainted themselves with the Greek chronology, they *invented* a whole sequence of Albanian rulers... Proud patrician clans got into the habit of tracing their ancestry all the way back to the companions of Aeneas, and the clan of Julius, directly to the son of Aeneas, whose name was arbitrarily altered for some reason”. ([\[719\]](#), page 8)

N. Radzig is honestly perplexed by such “ignorant endeavours of Roman chronographers.” However, below we shall demonstrate the amazing parallels between events as well as statistics that identify the ancient Trojan War of the alleged XIII century B.C. as the Gothic war of the alleged VI century A.D. that raged in Italy and the New Rome, as well as the Italian war of the alleged XIII century A.D. The Roman annalists were therefore correct in their claims that the Trojan War marks the *actual beginning* of mediaeval Roman history in the XIII century A.D.

We shall give a brief overview of the mediaeval history of Rome that is based, in particular, on the fundamental six-volume work of the German historian F. Gregorovius ([\[196\]](#)). The significance of this work is explained by the fact that it actually consists of a large number of *mediaeval documents* that were meticulously compiled by Gregorovius, along with his scrupulous and accurate comments on the matter.

Gregorovius writes that “ever since the decline of the Gothic state [which supposedly occurred in the VI century A.D. – A. F.], the ancient Gothic rule came to absolute ruination. Laws, monuments, and even historical recollections all fell into oblivion” ([\[196\]](#), Volume 2, pages 3-4).

The mandatory chronological sublation of secular chronicles from *mediaeval* Roman history – the *History* of Titus Livy, for example, which was declared “ancient history” – made Rome a thoroughly ecclesiastical city from the point of view of Scaligerian and modern history. F. Gregorovius writes that “*Rome had miraculously transformed into a monastery.*” This mysterious transformation of “secular ancient Rome” (let us remind the reader of the iron legions and the inflexible heroes of the days of yore) into the “mediaeval ecclesiastical Rome” was proclaimed “one of the greatest and most amazing metamorphoses in the history of humanity.” ([\[196\]](#), Volume 2, pages 3-6).

It is significant that almost all of the political and civil institutions that comprise “the quintessence of ancient Rome” according to Scaligerian history were intact at “dawn of mediaeval Rome.” Mediaeval references to the city of Rome are extremely scarce in Scaligerian chronology. Gregorovius tells us that “the events of the years to follow remain unknown to us, since *the chronicles of that age are as monosyllabic and blear as the epoch itself*, and they only report disasters and afflictions” ([196], Volume 2, page 21) – all of this coming from the author of a fundamental historical tractate ([196]).

The following is told of the middle of the alleged IX century A.D.: “historians specialising in Roman history have to contend themselves with the annals of the Frankish chronographers in what concerns this period, uninformative as the are, as well as Papal biographies that only contain indications of what buildings were erected and what donations made. There is no hope for a historian to present a picture of the city’s civil life during that period”. ([196], Volume 3, page 58)

Further, we learn that: “a great many ecclesiastical acts and regestae were kept in the Papal archive... The loss of these treasures [or their arbitrary transfer into the “antiquity” – A. F.], which perished without a trace in the XII or the XIII century, leaving *a tremendous gap in our knowledge of the epoch*.” ([196], Volume 3, page 121)

All of this appears to mean that the overwhelming portion of surviving documents pertinent to the history of mediaeval Rome in Italy dates from the XI century or even later epochs.

F. Gregorovius writes that “if all of these regestae were in our possession... there is no doubt that the history of Rome between the VIII and the X century [three hundred years, no less – A. F.] would instantly become illuminated by a different, and a much brighter light” ([196], Volume 3, page 131, comment 30).

He writes further:

“Not a single scribe can be found who would care to immortalize the dramatic history of the city in writing. Germany, France, and even Southern Italy... have provided us with a great many chronicles; however, the Roman monks must have been so indifferent to the fate of their city that the events of that epoch remain utterly nebulous”. ([196], Volume 3, pages 125-126)

It is assumed that “at the same time, the papacy carried on compiling its ancient chronicles with vehemence” ([196], Volume 3, pages 125-126). However, this is only a *hypothesis* of Scaligerian history.

This Papal chronicle – or, rather, its late version we’re being offered today – is *by no means continuous. It demonstrates gigantic gaps.* “The biography of Nicholas I

(who is supposed to have lived in the IX century A.D. – A. F) marks the point where the Papal books cease to be kept, and *we shall have many a chance to regret the lack of this source* in our presentation of the history of the city” ([196], Volume 3, page 127).

1.2. Parallels between the “antiquity” and the Middle Ages that are known to historians, but misinterpreted by them

The surviving fragments of mediaeval Roman chronicles tell us things that clearly testify to the “Classical” nature of certain events in their modern interpretation. In such cases historians join their voices in unison and start descanting about the revival of ancient recollections, Classical reminiscences, imitations of antiquity, etc. F. Gregorovius, for one, writes that “certain X century Romans that we encounter have very strangely-sounding names. They draw our attention and *revive ancient realities in our imagination*” ([196], Volume 3, page 316). If we’re to say the same thing differently, in a simpler manner, it turns out that many mediaeval Romans bore names that are considered “ancient” nowadays. This makes the “Classical Age” just another reflection of the Middle Ages.

Scaligerian history often discussed *the existence of the Senate and the Consulate in mediaeval Rome*. On the one hand, these famous political institutions are considered to have existed in the “ancient” Rome exclusively, which was presumably destroyed in the alleged V-VI century A.D. with the decline of the Third Western Roman Empire; on the other hand, some of the mediaeval chronicles that have reached our time occasionally make references to the existence of a senate, senators, consuls, tribunes, and praetors in *mediaeval Rome*. Those titles, grades, and offices are clearly “ancient.” There’s even a “schism” of sorts in the ranks of the Scaligerites, since one party considers these “ancient” institutions to have existed in the Middle Ages as well. Others – the majority that F. Gregorovius himself adhered to, were certain that the mediaeval Romans were using these “ancient” terms by sheer force of habit, without ascribing any “original meaning” to them, and only keeping them as a “pleasant memento” of the greatness of the “ancient Rome.”

F. Gregorovius ruminates upon the same, telling us that “*they* [the mediaeval Romans – A. F.] call upon the ancient graves for help, the ones that already became legends, and invoke the shadows of the consuls, tribunes, and senators that keep on haunting this eternal city throughout the Middle Ages *as if they were real* [sic! – A. F.]” ([196], Volume 3, page 349).

Also: “Consul’s rank is frequently mentioned in the X century documents” ([196],

Volume 3, page 409, comment 20). In the alleged X century “the Emperor [Otto – A. F.] *tried to revive the long-forgotten Roman customs*” ([196], Volume 3, page 388). In particular, Otto III “bore titles devised *in imitation of the titles borne by the ancient Roman triumphators*” ([196], Volume 3, pages 395-396). Gregorovius has got the following to say about the description of mediaeval Rome contained in a well-known mediaeval tractate titled *Graphia*: “the future and the past in the *Graphia* are all mixed up” ([196], Volume 3, page 458, comment 7).

Below we find that “this is precisely what we actually see in Otto III, who was passionately introducing the surviving *remnants* of the Roman Empire, such as the ranks, the garments, and the ideas of the imperial age into his *mediaeval* state where all of it must have looked [from the point of view of modern historians – A. F.] as *patches*... The will to *sanitize the barbaric epoch* with such reminiscing was a *widespread phenomenon* [sic! – A. F.]... The keeping of the priceless Papal book, interrupted at the biography of Stephan V, was resumed in Rome in the X century [our take is that it was most probably inchoated and not resumed, and that this event occurred a lot later than the X century – A. F.] – as short tables referred to as “catalogues”... The catalogues only contain the names of the popes, information about their origins, times of reign, and the odd occasional brief summary of individual events. Nothing provides better evidence of the barbarity of the X century Rome than the famous *Liber Pontificalis* continued in its primary and extremely imperfect form”. ([196], Volume 3, pages 458, 427, 431)

Mediaeval chronicles contain a large number of facts that contradict Scaligerian chronology and prove the existence of the three shifts in the Scaligerian chronological map that we have discovered. Furthermore, Ferdinand Gregorovius, possessing extensive and detailed knowledge of both the “ancient” and mediaeval history of Europe (he is considered one of the greatest specialists in Scaligerian history of Europe, after all), kept on running into *parallels* between the “ancient” and mediaeval events, some of which were blatantly obvious, that seemed extremely bizarre to him. Gregorovius points them out every now and then, and, possibly feeling vague qualms about them, attempts to provide an explanation. However, such “explanations” most often assume the shape of nebulous expatiations about the profundity of the “law of historical recurrences.” The readers should not be surprised, and, above all, are implored not to pay any attention.

It is, however, most significant that *nearly all such parallels* discovered by F. Gregorovius *fit perfectly into our scheme of the three chronological shifts of 330, 1050, and 1800 years, respectively*. In other words, the historian Gregorovius, raised

on the Scaligerian tradition, “discovers” the parallels between the “Classical Age” and the Middle Ages exactly where they are supposed to be according to the general picture of chronological duplicates as described in [Chron1](#), Chapter 6. We shall be citing some of these “Gregorovian parallels” later on.

So, we learn that “Noah [the Biblical patriarch! – A. F.] founded a city near Rome, and named it after himself; Noah’s sons Janus, Japhet, and Camesus built a city called Janiculus on the Palatina... Janus had lived near Palatina, and later built the town of Saturnia near Capitolia together with Nimrod [sic! – A. F.]” ([\[196\]](#), Volume 3, page 437). “In the Middle Ages there was even a monument at Nerva’s forum [in Rome – A. F.] called *Noah’s Ark*” ([\[196\]](#), Volume 3, page 461, comment 26).

All of these presumed “absurdities” (such presumptions are only made within the Scaligerian historical reality tunnel) completely fit the superimposition that we have discovered, wherein the kingdoms of Israel and Judaea become identified as the Holy Roman Empire of the X-XIII century as well as the Habsburg (could that name have been derived from “New Town,” or “Nov-Gorod” in Russian?) Empire of the XIV-XVI century. See more on the lifetime of the Biblical Noah and his most probable identity in [Chron6](#).

Another example of such a “sottise” (according to Scaliger and company) is that “it is well-known that the Franks have considered themselves descendants of the Trojans” ([\[196\]](#), Volume 3, page 361, comment 28).

In general, Gregorovius points out that “only this *Classical spirit* that prevailed in the city throughout the Middle Ages can explain a large number of historical events” ([\[196\]](#), Volume 3, page 443). It appears that the first lists of Roman monuments – compiled in the XII century A.D. the earliest, as we’re being told nowadays – are “an amazing mixture of correct and incorrect monument names” ([\[196\]](#), Volume 3, page 447). A typical example of how the “antiquity” could be de facto identified as the Middle Ages is as follows:

“It [the St. Serge Church – A. F.] was consecrated to St. Bacchus as well as St. Serge; the name of that saint *sounds strange* for this ancient pagan area; however, in Rome in was hardly exceptional, for among the Roman saints [the mediaeval Christian saints, that is – A. F.] we once again find the names of other *ancient gods and heroes*, such as St. Achilles, St. Quirinus, St. Dionysius, St. Hyppolitus and St. Hermes”. ([\[196\]](#), Volume 3, page 447)

All of these mediaeval Christian saints – Achilles, Quirinus, Hermes and others – were later arbitrarily exiled into times immemorial, where they transformed into the allegedly pagan “ancient” gods and demigods: Achilles, Quirinus, Hermes, etc.

1.3. Mediaeval Roman legislators convene in the presumably destroyed “ancient” Capitol

F. Gregorovius tells us that the history of the famous architectural monuments of Italian Rome cannot be traced any further back in time than the XI-XIII century A.D. with any degree of certainty at all.

Let us quote an example:

“For a long period of time (after the “Classical” age is supposed to have finished), we don’t seem to encounter the name of the Capitol; it simply disappears from the annals of history [apparently, due to the fact that Capitol wouldn’t be built until much later – A. F.]; despite the fact that the *Graphia* tells us that the walls of the Capitol were adorned with glass and gold [which is post-X century information – A. F.], *there is no description of the temple... the imperial forums, once full of grace, have drowned in taciturnity...* [which means they haven’t been built yet, either – A. F.], apart from the forum of Trajan; the forum of Augustus was encumbered with ruins to such an extent, and had so many trees growing there, that people used to call it *an enchanted garden*”. ([196], Volume 3, pages 447-448).

Apparently, the forum of Augustus was also built much later, and the place had been grown over with virgin vegetation.

Complete chaos reigns in the mediaeval names of the monuments of Italian Rome – a perfect hodgepodge of “ancient” and mediaeval names. For instance, “the Vestal temple had once been considered to have been a temple of *Hercules Victor*, and is considered to have been a *temple of Cybele* by modern archaeologists; however, this goddess shall, naturally [? – A. F.] have to make place for *some other deity*, which, in its turn, shall be *dethroned* after some other archaeological revolution”. ([196], Volume 3, pages 469-470)

All of these confused re-identifications and the general welter resemble a helpless game rather than scientific statements with a basis. This shows us how flimsy the foundations of the “archaeological identifications” that we’re offered nowadays really are.

F. Gregorovius proceeds to tell us that “for over 500 years this area *remained perfectly obtenebrated* [Capitol and its environs – A. F.]... Only the oral tradition allowed it to attain historical significance *once again* [sic! – A. F.] and become the centre of the city’s political activity, when the spirit of civil independence *awoke*. In the XI century the Capitol had already been the centre of all purely civil matters”. ([196], Volume 4, page 391)

We cannot help asking about whether any of this really could have happened among the ruins. After all, Scaligerian history assures us that Capitol was destroyed way back

in the past, and had been standing unaltered all these years “in a semi-obliterated state” ([196], Volume 4).

And further on we also read that “the halidom of the Roman Empire resurrected in the memories of the Romans, animated conventions of the nobility and the populace alike occurred *among the ruins of the Capitol* [sic! – A. F.]... Later on, in the epoch of Benzo, Gregory VII and Gelasius II, the Romans were summoned to the very same Capitol during high-wrought prefect elections, when the consent of the populace was required for the election of Calixtus II, or when the Romans had to be called to arms. It is possible, that *the city prefect also had lodgements in the Capitol* [slept under the stars? – A. F.], since the prefect appointed by Henry IV had lived here. Furthermore, the litigations also occurred in a palace located in the Capitol [among the ruins as well, or what? – A. F.]”. ([196], Volume 4, page 391).

It goes on like this. The bundle of oddities and absurdities gets ever larger. However, the sole reason for their existence is the certainty of the modern historian that all things “Classical” turned to dust aeons ago.

Is it possible to assume – even hypothetically – that all of these meetings, conventions, counsels, elections, debates, the discussions of documents and their storage, official state pronouncements, the signings of official papers and so on, occurred among old ruins grown over with weeds and reeds, and not in a special building that had been constructed for this very purpose, and precisely in this epoch – the Middle Ages? The destruction occurred a long time later – there were enough “waves of destruction” in the Italian Rome of the XIV-XVI century.

Scaligerian tradition obfuscates the history presented to F. Gregorovius to such an extent that Gregorovius – one of the most serious “documented” experts in the history of Rome and the Middle Ages in general – carries on with his narration apparently unaware of how ludicrous the picture that he offers really is, and to what extent it contradicts common sense.

He writes that “sitting on the prostrated columns of Jupiter or under the vaults of the state archive, amidst shattered statues and memorial plaques, the Capitoline monk, the predacious consul, and the ignorant senator could sense amazement and meditate on the vicissitudes of life” ([196], Volume 4, pages 391-392).

Altogether failing to notice the comical impossibility of such legislative assemblies, Gregorovius carries on telling us that “the mitred senators in their brocade mantles came to the *Capitol ruins* with only the vaguest idea of the fact that in the days of yore the statesmen ratified laws here, and the orators gave speeches... No flout is more

appalling and horrendous than the one suffered by Rome!... *among the marble blocks* [and the senators gathering for sessions in their midst, as we may well add – A. F.] *there grazed herds of goats*, and so a part of the Capitol received the name of Goat Hill... like the Roman forum that became dubbed The Cattle-Run [a senatorial one, perhaps? – A. F.].” ([196], Volume 4, pages 393-39).

Gregorovius cites a *mediaeval* description of the Capitol in order to prove the sad Scaligerian picture of the decline of Rome, which had remained the only original source up until the XII century A.D. or even later ([196], Volume 4, page 394). The most amazing fact is that this old text that occupies an entire page of a large-format modern book *doesn't utter a word about destructions of any kind*, describing the mediaeval Capitol as a functioning political centre of mediaeval Rome instead. *The narration mentions luxurious buildings, temples etc.* There isn't a single reference to the caprine herds dejectedly roaming this gilded splendour.

Gregorovius, having scrupulously quoted the entirety of this mediaeval text – one cannot deny him being conscionable as a scientist – couldn't help making another attempt at proselytizing, in his telling the reader that “in the description of the Capitol given by the *Mirabilia* we see it as if it were *lit with the last light of a dying dawn*; we have *no other information* about this epoch” ([196], Volume 4, page 394). And also: “even for these legendary books, everything remains *an enigma* and a matter of *days long gone*” ([196], Volume 4, page 428, comment 16).

It is most expedient to turn to original sources more often and to read them open-mindedly, without prejudice and a priori judgements. We find out lots of interesting things, the ones that Scaligerite historians prefer to hush up.

In reference to mediaeval Rome of the alleged X-XI century, Gregorovius points out (for the umpteenth time) that “Rome appears to have *returned to times long gone*: it had a *Senate* again, and was *at war with the Latin and the Tuscan cities*, which had united against Rome once again” ([196], Volume 4, page 412).

In the alleged XII century a “Classical revival” is observed yet again. Gregorovius tells us that “Arnold [of Brescia – A. F.] *was excessively vehement about adhering to the ancient traditions*” ([196], Volume 4, page 415). Apparently, he had “*revived*” the estate of *cavaliers* considered “ancient” nowadays ([196], Volume 4, page 415). Later on, in the alleged XII century, Pope Alexander III “*revives the pagan triumph of the ancient emperors*” ([196], Volume 4, page 503).

F. Gregorovius informs us of the fact that “the legendary name of Hannibal *reappeared as a mediaeval family name* borne by senators, warlords and cardinals for

several centuries” ([196], Volume 5, page 122). Hannibal is nevertheless considered an “extremely ancient” character nowadays.

Another “revival of antiquity” is presumed to have occurred in the alleged XIII century:

“The Roman populace has developed a new spirit over this time; it marched forth to conquer Tuscany and Latium *as it had done in ancient times*, in the age of Camillus and Coriolanus [believed to be “distant antiquity” nowadays – A. F.] *Roman banners bearing the ancient S.P.Q.R. initials appeared on battlefields yet again*”. ([196], Volume 5, pages 126-127).

A detailed list of the allegedly “revived” and “resurrected” traditions, names, and rites deemed “ancient” can be continued on dozens of pages, since practically all of the primary institutions of the “ancient” Rome appear to have been “revived” in the Middle Ages. We limit ourselves to a number of individual examples here. The interpretation of this amazing phenomenon as a “revival,” and not *naissance*, roots itself exclusively in the errors of Scaligerian chronology.

Nowadays the only original sources on the archaeology and the monuments of mediaeval Italian Rome add up to just two books compiled in the XII-XIII century at the earliest ([196], Volume 4, pages 544-545). We suddenly learn that according to Scaligerian chronology, the names of Roman monuments given in these mediaeval books are often considered *erroneous* and *chaotic*. We are now beginning to understand that what this really means is that they contradict Scaligerian history. Could it be that the old books are in fact correct, unlike the Scaligerian version?

For instance, these texts refer to *Constantine’s Basilica* as “the Temple of Romulus” (sic!). This sounds preposterous for a modern historian; however, this mediaeval indication concurs *perfectly* with the identification of Emperor Constantine as King Romulus that we have discovered as a result of a dynastic parallel (see fig. 6.52 in [Chron1](#), Chapter 6). Apart from such “bizarre” identifications, mediaeval chronicles contradict the consensual chronology of Scaliger and Petavius every now and then.

1.4. The real date when the famous “ancient” statue of Marcus Aurelius was manufactured

Ricobaldus, for one, claims that *the famous “ancient” equestrian statue of Marcus Aurelius was cast and erected by the order of Pope Clemens III. However, in this case the event occurred in the XI century, and not in the “Classical Age”* ([196], Volume 4, page 568, comment 74). Let us remind the reader that historians date this

statue to the alleged years 166-180 A.D. ([930], page 91). By the way, according to the parallelism that we have discovered (see fig. 6.45 in [Chron1](#), Chapter 6), the “ancient” Marcus Aurelius of the alleged years 161-180 is but a “phantom duplicate” of the mediaeval Otto IV of the alleged years 1198-1218 A.D.

The claim that Ricobaldus makes about the statue of Marcus Aurelius (that it was only erected as late as the papacy of Clemens III) makes Gregorovius utter the following rather embarrassed remark: “this is an *erroneous* statement that Ricobaldus makes...” ([196], Volume 4, page 568, comment 74). What is the argumentation that Gregorovius offers? It is rather droll indeed: “how could such a bronze work be crafted considering the barbaric level of fine arts characteristic for Rome of that epoch?” ([196], Volume 4, page 573). In other words, mediaeval Romans “could not manufacture anything of value.” The “ancient” Romans that preceded them by several centuries have, on the other hand, been fine craftsmen, and could confidently cast such masterpieces in bronze (see fig. 7.1).

Fig. 7.1. An “ancient” statue of the emperor Marcus Aurelius. According to F. Gregorovius ([196]), Ricobald used to claim that the famous “ancient” equestrian statue of Marcus Aurelius was cast and mounted *by an order of Pope Clemens III*. However, this period falls on the *end of the XI century*, and not the “antiquity”. Picture taken from [\[958\]](#), page 9.

The chronological oddities engulfing this famous statue are so blatantly obvious that they even make their way into the mainstream press on occasion. This is what our contemporaries write:

“The history of the equestrian statue is truly unusual. It contains many riddles, and has grown over with legends. *For instance, its author and previous location in ancient Rome remain unknown...* It was discovered by accident in the Middle Ages in one of the Roman squares... The statue was *mistaken for a representation of*

Constantine [?! – A. F.]” (See the issue of the *Izvestiya* newspaper dated 16 February 1980).

According to Gregorovius, this explanation was proposed by the historian Theo, who “points out that *the equestrian statue of Marcus Aurelius became confused with the statue of Constantine, and thus managed to survive the Middle Ages*. Such errancy is possible in Barbarian times” – as Gregorovius proceeds to expostulate – “but how can it be possible that the figure of Constantine could not be told apart from that of Marcus Aurelius in the times when the *Noticia* were written?” ([196], Volume 1, page 49, comment 32)

Scaligerian history has even got an “explanation” of sorts for the fact that “ancient masterpieces” have survived the twilight of the Middle Ages despite the militant church presumably busy destroying the pagan legacy. We are told that in the daytime the ignorant mediaeval monks destroyed pagan statues and “ancient” books, in order to secretly reconstruct them at night, copying the “legacy of the ancients” meticulously in order to carry it through the mediaeval tenebrosity to the luminous peaks of the Renaissance.

In the alleged XIII century we see a period of efflorescence in the arts which presumably represents ruthless pillaging of the “ancient” constructions and their transformation into mediaeval ones. For instance, we are now told that mediaeval Romans used “ancient sarcophagi” for their own entombments. Apparently, they had none of their own, since they did not know how to build them; the knowledge had been lost, and there were money shortages. According to the Gregorovian interpretation, new and original mausoleums – ones, that is, that didn’t resemble the “ancient” buildings (the way Gregorovius imagined them) – only started to emerge towards the end of the XIII century, and these were dubbed “mediaeval” with great relief. However, Gregorovius proceeds to voice his surprise at the fact that “*not a single monument of any Roman celebrity from the first part of the XIII century remained in Rome*” ([196], Volume 5, page 510). This should not surprise us. According to our reconstruction, the foundation of the Italian Rome as a capital city took place in the XIV century A.D. the earliest (see [Chron5](#)).

Incidentally, the mediaeval cardinal Guglielmo Fieschi, who allegedly died in 1256, “lays in an *ancient* [sic! – A. F.] marble sarcophagus, whose carvings in relief picture a *Roman wedding* – a peculiar symbol for a cardinal!” ([196], Volume 5, page 510). The amazement of Gregorovius is perfectly justified. Could the mediaeval cardinals really have been so poor as to be forced to use “ancient” sarcophagi, offhandedly shaking out the remains of their ancestors? It is considered sacrilege, after all. Common sense tells

us that the matter here lies in the contradiction between the planted Scaligerian chronological concepts and true specimens of mediaeval art that were later declared “ancient” (as in “very old indeed”).

The senatorial mausoleum in Arceli is a most curious artefact. This “monument *appears to associate the antiquity with mediaeval forms*; a marble urn with Bacchic relief carvings... serves as a foundation for a sarcophagus embellished with inlays and a Gothic superstructure” ([196], Volume 5, page 511). The amazement of Gregorovius is truly ceaseless.

Let us formulate a question: *where did the powerful clans of the Guelph and Gibelline aristocracy reside in mediaeval Rome?* It is hard to fathom. Apparently, we are told that they lived *among the ruins of the ancient steam baths*. This is precisely what the historians of today are forced to assume in their attempts to unravel the oddities of Scaligerian chronology.

This is what F. Gregorovius tells us:

“Powerful clans owned the slopes of Quirinal, and they built their fortifications near the forum of Imperial times... among them... the Capocci, who found lodgings in the thermae [in the steam baths – A. F.] of Trajan, as well as the Conti, whereas the nearby thermae of Constantine [steam baths again! – A. F.] housed the fourth castle of Colonnus... The enormous ruins of the forums built by Augustus, Nerva and Caesar have easily transformed [? – A. F.] into a fortress, which was erected by the Conti as a citadel reigning over the entire city”. ([196], Volume 5, pages 526-527)

Gregorovius, albeit obliged to follow Scaligerian chronology, cannot squirm out of having to admit that there is no genuine evidence of the existence of this gigantic and allegedly “ancient” fortress *before* the mediaeval Conti – it simply had not existed! He writes that “there is *no proof* that it had stood for centuries and only been enlarged by the Conti” ([196], Volume 5, page 527). Doesn’t this directly imply that Conti had most probably built this castle as his fortress in the Middle Ages, and its “extreme antiquity” was declared a lot later? This was done by the historians and archaeologists of the XVII-XVIII century when Scaligerian chronology began to shift authentic mediaeval constructions into the distant past.

1.5. Could the “ancient” Emperor Vitellius have posed for the mediaeval artist Tintoretto?

Let us formulate the following concept that may strike one as somewhat unexpected at first. It is possible that the XVI century painter Tintoretto (1518-1594) drew the “ancient” Roman emperor Vitellius from nature.

The catalogue titled *The Five Centuries of European Drawing* contains a drawing by the well-known mediaeval painter Jacopo Tintoretto ([714], page 52). He lived in 1518-1594 ([1472], pages 23-24). The drawing is dated to approximately 1540 A.D. The name that it is catalogued under draws one's attention instantly: "Etude of the head of the so-called Vitellius" ([714], page 52). See fig. 7.2.

Fig. 7.2. The etude of the head of the Roman emperor Vitellius done by the famous mediaeval painter of the XVI century Iacopo Tintoretto. According to Scaligerian chronology, emperor Vitellius and painter Tintoretto are separated by a period of roughly 1470-1500 years. Taken from [714], page 52.

Let us remind the reader that Vitellius is considered to have been an "ancient" emperor of Rome regnant in the alleged year 69 of the new era ([72], page 236). Thus, according to Scaligerian chronology, Tintoretto and Vitellius are separated by an interval roughly equalling 1470-1500 years. The modern commentary to this rather famous drawing is very noteworthy:

"Tintoretto had either a mask or a marble replica of an *ancient* bust in his studio, that was *considered a portrait of the Roman emperor Vitellius in the XVI century*. The *original* was given to the *Venetian Republic* by the cardinal Domenico Grimani *as a present* in 1523, and is currently part of the exposition of the Archaeological Museum of Venice (inventory number 20). *Modern archaeology* that dates this artefact to the epoch of Hadrian (roughly 178 A.D.), *excludes the possibility of identifying the portrait as that of Vitellius*, who had reigned in the years 67-68. However, Tintoretto has kept this sculpture under this very name, and the testament of the artist's son Domenicus proves this explicitly mentioning the "head of Vitellius."... More than twenty etudes of this head are known that were done by Tintoretto himself and his apprentices". ([714], page 187).

The XVI century opinion was that the bust really portrayed the Roman emperor Vitellius. As we have seen, the real history of the bust only began in 1523, when it entered the possession of the Venetian republic. It may have been drawn in the XVI century either from the death-mask of the emperor, or from nature – namely, the body of

the recently deceased Vitellius. Tintoretto's drawing clearly depicts someone who has just died, or is asleep. It is only natural that Scaligerian history deems it perfectly impossible to place the "ancient" Vitellius in the XVI century. It would therefore be interesting to try dating this bust to the XVI century within the paradigm of the New Chronology for comparison, especially considering the dynastic parallels that we have discovered. The historians consider Vitellius to have been an emperor of the Second Roman Empire ([72], page 236). As we already know, it is a phantom duplicate of the Holy Roman Empire of the X-XIII century (fig. 6.23 and 6.24 in [Chron1](#), Chapter 6), which, in turn, is a carbon copy of the Habsburg (New Town, or Nov-Gorod?) empire of the XIII-XVII century A.D. for the most part (see figs. 6.21 and 6.22 in [Chron1](#), Chapter 6).

The "ancient" Vitellius is considered to have been a short-term governor, and the immediate predecessor of the "ancient" Vespasian. He is supposed to have reigned in 69 A.D. ([72], page 236). Therefore, he travels forward in time as a result of said dynastic superimpositions, and turns out to have been a mediaeval ruler of the first half of the XVI century; as can be seen from fig. 6.22 in [Chron1](#), Chapter 6, the end of his reign and his death fall roughly on the year 1519. It is significant that, as mediaeval historians tell us, the bust that must have portrayed the recently deceased Vitellius only appeared on the historical scene around 1523, when it was given to the Venetian republic as a present ([714], page 187). Thus, the two dates correlate perfectly well: the "ancient" Vitellius dies around 1519, and a bust is made which the cardinal gives to the Venetians in 1523, four years later.

Everything falls into place. Apparently, the bust of Vitellius portrays a real mediaeval ruler of the first half of the XVI century. Tintoretto the painter and his apprentices paint Vitellius as a recently deceased famous contemporary of theirs. The latter saponaceous addition – "so-called" – added by the historians of the Scaligerian tradition, needs to be crossed out of the name of Tintoretto's drawing, leaving it with the shorter and more correct "Etude of the head of Vitellius."

If we're to consider the possibility of *minor* veers and fluctuations in mediaeval chronology, it might turn out that Vitellius died a few years later than 1519, so Tintoretto could have drawn him *from nature*, while one of his colleagues was making an intravital "ancient" bust of Vitellius. The apprentices of Tintoretto naturally trained for their task by first drawing a bust being inspired by the drawing done by their mentor – who, as we feel obliged to reiterate, may have been present to witness the famous emperor's death.

Another peculiar detail has to be mentioned. The lower part of Tintoretto's drawing bears the legend "1263" (see fig. 7.2) – dating from 1263. But Tintoretto lived in the XVI century. Modern historians mention this circumstance as well, albeit without commenting on it: "At the bottom in the centre one sees the number 1263 drawn with a pencil" ([714], page 187). We are confronted with an important fact here. The artist Tintoretto, having done the drawing around 1540, dated it to 1263. However, usually all painters date their works to the time of their creation. Tintoretto thus transcribes the year 1540 as 1263. This shows us, which is exactly what we claim, that there were various mediaeval chronological traditions that differ from the one that we're accustomed to. For instance, the number 1263 could have been used to refer to the year 1540. If we interpret it according to the modern tradition, we shall get a much earlier date, which would make the drawing about 277 years older. This is probably what Scaligerian historians usually did in such situations; however, this time they had to "let the drawing stay" in 1540, since Tintoretto is linked to the XVI century by various independent evidence.

1.6. The amount of time required for the manufacture of one sheet of parchment

We shall conclude with another useful observation. Many of the classical "ancient" texts are written on parchment or papyrus – however, they're written in a *perfect acrolect*. On the other hand, many really old mediaeval texts are written in a clumsy and brief manner, which is quite natural. Primitive language requires time in order to become literary language. Furthermore, really ancient texts contain words written in nothing but consonants comprising semantic skeletons of words, with vowels either altogether missing, or replaced by small diacritic signs. This is the reason for the existence of the vocalization problem in many ancient texts, namely, the Biblical ones – it translates as the necessity to find just the right vowels in order to restore the original. Apparently, due to the scarcity and high cost of writing materials in antiquity, the scribes were frugal with them, and condensed the text, leaving nothing but consonants. One naturally comes to think that a polished literary style implies a long evolution of culture, and also the availability of writing materials, since style takes practice to evolve. Paper, for instance, is rather cheap (although this has not always been the case). However, there was no paper in "antiquity." As we are being told nowadays, the "ancient" classics used parchment exclusively. Just how available had parchment been?

The manufacture of one sheet of parchment requires the following (see [544], for

instance):

1. skinning a young calf no older than 6 weeks, or a young lamb;
2. macerating the skin in running water up to 6 days;
3. scrubbing the membrane off with a special scrubber;
4. loosening the wool via souring the skin in a damp pit and subjecting it to ash and lime for 12-20 days;
5. scraping off the loosened wool;
6. fermenting the clear skin in oat or wheat bran in order to remove excessive lime;
7. tanning the skin with special extracts to make it soft after drying;
8. eliminating the roughness by pumicing the chalked skin.

This is the procedure required for the manufacture of *every* leaf of parchment. This made both parchment and papyrus luxuries, which had been the case until the very discovery of rag-paper before the Renaissance.

Let us open the work of the “ancient” Titus Livy. He begins his narration ornately and grandiloquently:

“Shall my writing of the history of the Roman people from the foundation of the capital be worth the effort? I do not know it well, and even if I did, I would have been too timid to utter it aloud. This endeavour, as I can see perfectly well, is far from original, and was attempted by many; also, the new writers that keep on appearing think they may either add something new factually, or excel the austere antiquity by the art of enunciation...” ([482])

We are being assured that such a free-flowing and elaborate style was used in the alleged I century B.C. for the writing of 142 (or 144, according to different sources) books of Titus Livy. Developing a style as confident as his must have required writing *lots of drafts*. How much parchment (and how many calves and lambs) would it require? We believe the explanation to be simple – the creation of all these “ancient” books took place in the Middle Ages, when paper was already widely known.

1.7. The “ancient” Roman Emperor Augustus was Christian, since he had worn a mediaeval crown with a Christian cross

In fig. 7.3 we can see the well-known mediaeval Hereford map, dating from the end of the alleged XIII century ([1177], pages 309-312). Its physical size is rather large – 1.65 metres by 1.35 metres. It is assumed that this map is based on the *History* by Paul Orosius, who is supposed to have lived in the IV century A.D. ([1177], page 311). As we understand, this map must have really been created in the XVI century at the latest.

Fig. 7.3. The famous mediaeval Hereford map allegedly created near the end of the XIII century. Its diameter is about 1.3 metres. In the bottom left-hand corner one sees the “ancient” Roman emperor Augustus sitting on a throne. On his head there is a crown with a Christian cross. See a close-in on the next illustration. Taken from [\[1177\]](#), page 311.

In the bottom left corner of this map we can see the famous “ancient” Roman emperor Augustus. He is handing out his edict demanding the creation of a description of the World to three geographers (see [\[1177\]](#), page 206, and fig. 7.4). Modern historians make the following comment: “on the left of the map we read that the measurements of the world have been commenced by Julius Caesar. In the bottom left corner we see a picture of the emperor Augustus holding his edict in his hands” ([\[1177\]](#), page 309).

Fig. 7.4. The bottom left-hand corner of the Hereford map showing the “ancient” Roman emperor Augustus sitting on his throne. We can see a crown with a *Christian cross* on the emperor’s head.

The fact that what we see on the head of the “ancient” Roman emperor Augustus is a mediaeval crown with a *Christian cross* (it looks very much like a Papal tiara as well, see figs 7.5 and 7.6) is perfectly astonishing within the reality tunnel of the Scaligerian history. Generally, the entire appearance of the famous Roman emperor doesn’t resemble his likeness in the “ancient history teaching aids” for the Scaligerian history whose mass production era in Western Europe peaked in the XVI-XVIII century, the least bit. In fig. 7.7 we can see an example of such a “propaganda” statue of Augustus which is kept in the Museum of the Vatican nowadays ([\[304\]](#), Volume 1, page 489). Octavian Augustus is represented in an austere and heroic manner here, doubtlessly an example to inspire the youths. This “ancient” statue must have been manufactured in the XVII century at the latest. On the Hereford map the very same Roman emperor Augustus is represented in a completely different manner, *in a crown with a Christian cross, a beard, and wearing typically mediaeval clothing*. As we now understand, there is nothing strange about it. The map is correct, and this ruler couldn’t have lived earlier than the XIII century A.D.

Fig. 7.5. A fragment of the Hereford map. We can see a mediaeval crown with a Christian cross on the head of the “ancient” Octavian Augustus. Taken from [\[1177\]](#), page 206.

Fig. 7.6. A Christian crown with a cross on the head of the “ancient” Roman emperor Octavian Augustus. Taken from [\[1177\]](#), page 206.

Fig. 7.7. An “ancient” statue of the emperor Octavian Augustus from the Vatican museum, most probably dating from the XVII century the earliest. Serves as a “visual learning aid” to the Scaligerian history textbook. Taken from [\[304\]](#), Volume 1, page 489.

2. The “ancient” historian Tacitus and the well-known Renaissance writer Poggio Bracciolini

Today it is considered that the famous “ancient” Roman historian Tacitus lived in the I century A.D. ([833], Volume 2, pages 203, 211). His most famous work is the *History*. In Scaligerian chronology, the books of Tacitus disappeared from sight for a long time, fell into oblivion, and only resurfaced in the XIV-XV century A.D. This is what Scaligerian history tells us:

“Mediaeval authors of the XI-XIII century usually demonstrate *no immediate knowledge* of Tacitus, he is only known by proxy of Orosius... In the XIV century Tacitus becomes known better. The Montecassino manuscript had been used by Paulinus of Venetia (in 1331-1334)... and later on Bocaccio... Then it... came to the well-known Florentine humanist Niccolo Niccoli, and is also kept in Florence currently, in the Medicean Library... Our tradition of the last books of the *Annals* and *History* ascends to this manuscript for the most part. Only the Italian manuscript of 1475 currently kept in Leiden must have had some other source. In the 1420's, the Italian humanists started to look for Tacitus' manuscripts in Germany. The history of this search remains unclear in many ways due to the fact that the owners of the freshly-found texts often withheld their acquisitions, especially if they were made illegally. In 1425 the eminent humanist and Papal secretary Poggio Bracciolini received an inventory of a number of manuscripts that contained several minor works of Tacitus from a monk from the Hersfeld Abbey... Whether the manuscript had really been from Hersfeld or from Fulda, or whether Poggio had really received it, likewise the possible date of this event – all of this remains a mystery. In 1455 the manuscript or its copy was already in Rome, and provided the basis for the manuscripts that have reached our day”. ([833], Volume 2, page 241).

We have thus been told the following:

1. According to Scaligerian chronology, Tacitus lived in the alleged I century A.D., presumably around the years 58-117 A.D. ([797], page 1304).
2. However, his *History* had not been known in the Middle Ages.
3. The biography of the *History* by Tacitus that we have at our disposal can only be traced as far back from our time as the XIV-XV century A.D.
4. *Nothing is known* about the fate of the *History* before the XIV century. Hence the hypothesis that the books of Tacitus may have been *mediaeval* in their origin and referred to *real mediaeval events* of the X-XIV century A.D. However, they may have been edited in the XVI-XVII century.

This summary would have been sufficient. However, let us point out an interesting fact. The academic account of the fate of Tacitus' books that we have quoted from [833] is written neutrally and demurely, and contains nothing that could surprise us. Except for

the odd *gap of a millennium and a half* between the moment the book was written and its surfacing in the XV century A.D.

This arid text really conceals some rather peculiar circumstances blearing the entire history of the discovery of the books written by the “ancient” Tacitus. Modern historians aren’t too keen on recollecting these facts, since they lead to a number of confused questions and serious doubts about the correctness of the datings of the events described in the books of Tacitus.

Let us give an account of what really happened in the XV century. We shall study the history of how the famous *History* by Cornelius Tacitus was discovered, according to the following works: [\[1195\]](#), [\[1379\]](#), and [\[21\]](#). Towards the end of the XIX century the French expert Hochart and the English expert Ross independently proclaimed the *History* of Cornelius Tacitus to have actually been written in the XV century by the eminent Renaissance humanist Poggio Bracciolini. In other words, *they accused Bracciolini of premeditated forgery*.

The publication of the works by Hochart and Ross initially caused a great scandal in the historian community. However, their opponents were forced to give over with the discussion, since they had nothing of substance to counter the evidence of Hochart and Ross with; they resorted to the stance of complete obmutescence instead. This is a method common for such adversaries. The modern commentary to [\[833\]](#) is a perfect example, since it doesn’t mention the research of Hochart and Ross with a single word.

The analysis performed by Hochart and Ross was very important. Let us state right away that nowadays when we possess information that had been unknown to Hochart and Ross, we should say that we cannot agree with their conclusion about the *History* of Tacitus being a forgery. The facts that we have discovered and the new concept of the abbreviated chronology suggest that it was based on a lost *original* – which was, however, describing real *mediaeval* events and not some distant antediluvian epoch. However, this text reached us in a more recent edition, possibly done in the XVI-XVII century.

Hochart and Ross discovered distinct *relics proving the History of Tacitus to be mediaeval in its origins*. Hochart and Ross had only been wrong concerning one thing – namely, the interpretation of their own results. Remaining perfectly unaware of the inveracity of the Scaliger-Petavius chronology, they considered the facts they discovered to prove *History* a sham; however, from our point of view the very same facts may indicate that the *History* of Tacitus was a genuine historical text describing real events of the XIV-XV century A.D. However, it could have undergone a

transformation in the hands of the partisan “caring editors” of the XVI-XVII century.

Let us consider the Renaissance atmosphere that the “ancient” manuscripts were “surfacing” in.

Poggio Bracciolini is considered one of the most spectacular writers of the XV century Renaissance. An old portrait of his can be seen in figs. 7.8 and 7.9. He is the author of top-bracket historical and moralistic tractates. “In what concerns theological issues... he can speak in a language that would have been considered belonging to one of the Holy Fathers by anyone if it hadn’t been for Bracciolini’s signature” ([21], pages 358-363). He is the author of the historical study guide of Roman monuments and the famous *History of Florence*, which is a work that resembles the chronicle of Tacitus.

Fig. 7.8. A portrait of Poggio Bracciolini allegedly dating from the XV century taken from his book titled *De varietate fortunae*. The modern commentator has the following to say about it: “This fantastic miniature depicts Poggio, one of

the most famous adventurers of the entire XV century who had researched the Classical past. Poggio Bracciolini is walking down a street surveying the ruins of Rome” ([1374], page 92.

Fig. 7.9. A close-in of Bracciolini’s portrait allegedly dating from the XV century. Taken from [1374], page 92.

“This brilliant imitator had fully been a universal mastermind of his century. The critics equated him with the greatest Renaissance authors... Many found it possible to define the first half of the Italian XV century as the “Age of Poggio”... Florence built an intravital statue in his honour that belonged to the chisel of Donatello...

A rather splendid way of living had cost Poggio Bracciolini dearly... and put him in constant need of money. The search, preparation, and copy-editing of ancient authors were an additional source of income for him. In the XV century... this was a *very lucrative activity*. With the aid of the Florentine scientist and publisher Niccolo Niccoli (1363-1437)... Poggio Bracciolini founded a studio of sorts that occupied itself with the edition of the ancient texts, having engaged a large number of partners and counteragents, very educated ones, but most of them had been marked by obloquy...

The first findings were made by Poggio Bracciolini and Bartholomeo di Montepulciano in the epoch of the Constantian council... in a *forlorn and humid tower* of the St. Gallen monastery... “in a *forlorn and humid tower where a prisoner would not survive three days*” they managed to find a pile of ancient manuscripts – the works of Quintillian, Valerius Flaccus, Asconius Pedianus, Nonius Marcellus, Probus, and others. The discovery created more than a sensation – it initiated an entire literary epoch”. ([21], pages 358-366).

A while later Bracciolini “discovered” fragments “from Petronius” and the *Bucolic* by Calpurnius. The circumstances of these findings remain nebulous.

Apart from the originals, Bracciolini also traded in copies, which he sold for great sums of money. For instance, having sold a copy of Titus Livy's manuscript to Alphonse of Aragon, Poggio made enough money to buy a villa in Florence.

"He charged Duke D'Este a hundred ducats (1200 francs) for the letters of St. Jerome, and that with great irritation... Poggio's clients were the Medici, the Sforza, the D'Este, the aristocratic families of England, the Duchy of Burgundy, cardinals Orsini and Colonna, rich people like Bartolomeo di Bardi, universities, which... either started to set up libraries, or were busy extending their old book storages". ([21], pages 363-366).

Let us now regard the history of the discovery of Tacitus' books.

The main copies of Tacitus' works – the so-called First and Second Medicean Copies – are kept in Florence, in a book storage which had Poggio amongst its founders. According to Scaligerian chronology, these copies are the prototypes of all the other ancient copies of Tacitus.

The first printed edition of Tacitus is supposed to have come out in the alleged year 1470, based on the Second Medicean copy or a copy thereof that is supposed to have been kept in the St. Marcus library in Venice. "However, it has disappeared from there, or maybe wasn't kept in the library in the first place" ([21], pages 366-368).

"The two Medicean copies... contain the complete historical works of Tacitus that have reached our days" ([21], pages 366-368).

Scaligerian chronology is of the opinion that Tacitus was born between 55 and 57 A.D. "The year Tacitus died remains unknown" ([833], Volume 2, pages 203, 211). Thus, it is presumed that Tacitus lived in the I century A.D.

After that, his name disappears for many centuries, until the Renaissance epoch ([833]). Hochart and Ross have collected all the references to Tacitus made before Poggio's discovery in the XV century. It turns out there are very few such references, and they are all general and vague enough that they could refer to people who have nothing in common with the author of *History*. Thus, even in Scaligerian chronology there is no real information about Tacitus – the author of *History* – that would predate the XV century.

How did the "discovery of Tacitus" really occur? "In November 1425 Poggio notified Niccoli in Florence from Rome that "some monk" was offering him a batch of old manuscripts... including 'several works of Tacitus unknown to us' " ([21], page 382). Niccoli agrees upon the deal immediately. However, the actual purchase takes several months for some reason.

"Poggio procrastinates, giving different excuses... He gives a rather meandrous answer to Niccoli's inquiry that

only makes clear the fact that he had not been in the possession of the Tacitus' book yet... In what concerns the monk, Poggio blatantly lies and appears confused: the monk is allegedly a friend of his, but for some reason failed to have visited Poggio while in Rome... the books were in Hersfeld, but had to be collected in Nuremberg, etc.”([21], page 382).

Niccoli demanded the book catalogue “discovered” by Poggio, being rather irritated. It turned out that “there were no works of Tacitus in the catalogue”!

“Such strange rigmarole of miscomprehensions that look clearly artificial marks the years 1427 and 1428” ([21]). Finally, Poggio notifies Niccoli in 1428 that the mysterious monk had arrived in Rome again – but without any book!

“The almost quinquennial procrastination led to the situation where Poggio’s discovery had been made public prior to having actually been made, and many strange rumours surrounded it. The latter made Niccoli worry greatly, to which Poggio replied: “I know all the songs that are sung in this respect... so this is what I’ll do: once Cornelius Tacitus arrives, I shall hide him well from strangers.” One would think – as Hochart justly remarks – that the most natural protection of the manuscript from vicious rumours would be making it public for the scientists, explaining all the ways, means, and secrets of its appearance. Poggio, on the contrary, promises to palter yet again...” ([21], pages 374-382).

Hochart and Ross have found that “in a much later edition of his letters to Niccoli, Poggio, having lost track of the dates of his Tacitus-related correspondence of the years 1425-1429, had for some reason *forged the dates* of 28 December 1427 and 5 June 1428 in two of the letters that were made public” ([21], pages 374-382).

In these letters Poggio asks Niccoli to send him (!?) another copy of Tacitus that had allegedly already been in Niccoli’s possession. Comparing the dates of the correspondence and the texts of the letters, Hochart claims the mysterious “second copy” to have been nothing else but the First Medicean copy that had allegedly been discovered many years after!

Hochart is of the opinion that “*the letter dates are counterfeited*, they have been composed post factum after Niccoli had made Tacitus public in order to validate the reputation of the first... copy [the so-called Second Medicean one – A. F.] that had entered the collections of several palatine libraries, and prepare the way for the second copy” ([21], pages 374-382). Today’s historians are of the opinion that these two copies were discovered in a reverse order.

Amphitheatrov, whom we often quote here, wrote the following:

“Studying the history of the origins of the First Medicean Copy [the second to have been discovered – A. F.]... one cannot fail to notice the recurrence of the legend that had engulfed the copy of Niccolo Niccoli 80 years

ago... a northern monastery figures here again, as well as some mysterious, unnamed monks. Some German coenobite brings the first five chapters of the *Annals* to Pope Leo X. The Pope is delighted, and presumably designates the monk as the editor of the work. The coenobite refuses, pleading semi-literacy. One clearly sees the resurrection of the legend about the provisioner of the Second Medicean Copy [the first to have been discovered – A. F.] and the Hersfeld monk... the legend calls Arcimboldi the intermediary in this deal... however, Arcimboldi doesn't mention this with a single word, despite the fact that he is supposed to have received 500 sequins from Leo X in order to pay for it – that amounts to 6000 francs, an entire fortune considering the cost of money [this makes chronology irrelevant! – A. F.]. All of these mysterious monks with no name, origin, and place of residence are the perpetrators of the falsification system started by Poggio Bracciolini in the eyes of Hochart. No one ever sees them or knows anything about them, yet today one of them brings a lost decade of *Titus Livy* from Sweden or Denmark, tomorrow another one comes from Corbea or Fulda with a work of Tacitus, etc. – they always come from the North that is far away and hard to reach, and they always bring the very goods that are sought after and that the book market of the century is starved for” ([21], pages 374-382).

The study of Poggio's correspondence leads to stronger suspicions. The authors of the letters either fail to mention the findings, or give mutually exclusive versions.

“Bayle tells us [already in the XVIII century – A. F.] that Pope Leo X wanted to find the missing chapters of Tacitus so much that he promised an *indulgence of sins* for them as well as money and power. Is it surprising that they were found with haste? [Chronology is of little relevance here – A. F.]. Therefore, both parts of the Tacitus' codex are of equally *mysterious origins*. Hochart assumes that the relation of legends and mystery that surrounds them indicate a common origin and family, namely, that they have been *forged in the Roman studio of the Florentine Poggio Bracciolini*”. ([21], pages 374-382).

Hochart and Ross provide information that speaks unequivocally about Poggio's penchant for transformation. For Poggio Latin is a mother tongue. “He doesn't write in any language but Latin, and how he does it! His imitational flexibility makes him the Prosper Mérimée of the XV century... when the reader wants it, Poggio becomes Seneca, Petronius and Titus Livy; he can write like anyone, a true chameleon of word and spirit” ([21], page 385).

The analysis of the books by Tacitus shows serious discrepancies between their content (in what concerns the history and the geography of “ancient” Rome) and the consensual Scaligerian version of “ancient” Roman history.

“A great list of contradictions is cited by Gaston Boissier... Having listed a great number of mistakes [have they really been mistakes? – A. F.] that couldn't have been made by a I century Roman [according to Scaligerite historians – A. F.], Hochart points out the ones that give the author away as *someone adhering to the XV century traditions and Weltanschauung*”. ([21], pages 387-390).

This is an important moment. For Hochart, Ross, Gaston Boissier and other critics of Tacitus all of this signifies the *History* to be a forgery. Being raised on Scaligerian history and certain of the fact that “the real Tacitus” must have lived in the I century A.D., they cannot interpret the XV-century relics found in the text of the *History* by

Tacitus in any different way. For us, there is no contradiction here. It suffices to suppose the following: the “History” of Tacitus refers to real events of the XIII-XV century A.D. Tacitus, being a XV century author, naturally “adheres to the XV century traditions and Weltanschauung”; thus, the “misses” found by the historians become evidence of the fact that Tacitus’ *History* is *genuine*, albeit with the condition that we transfer the time period that it covers into the Middle Ages.

At the same time, Hochart and Ross have found some extremely peculiar circumstances of the unearthing of Tacitus’ *History*. They consider these to be indications of forgery; our take is that they indicate a tendentious editing of the real text of the *History* by Poggio Bracciolini. However, it is possible that Tacitus was a nom de plume used by Poggio Bracciolini. He could really have described the “ancient” Roman events that occurred in the XIII-XV century A.D. having read about them in some genuine documents that he managed to lay his hands on. See for yourselves:

“His [Poggio’s – A. F.] sojourn in London was marked by greatly frustrated hopes for Beaufort’s generosity... In 1422... Piero Lamberteschi offers him a project of some historical work that is supposed to have been based on Greek sources and done in the utmost secrecy over the period of three years, for which Poggio would receive a fee of 500 golden ducats. “Let him pay me six hundred, and I’m game” – writes Poggio, leaving Niccoli to take care of the matter. “The task that he offers pleases me greatly, and I hope to produce something worthy of reading.” A month later he writes: “if I see... that Piero backs up his promises with deeds, it shall not just be the Sarmatians that I shall study, but the Scythians as well... Keep the projects that I’m telling you about secret. If I shall indeed go to Hungary, it should remain unknown to everyone except for a few friends”.

In June: “Rest assured that if I’m given enough time... I shall write something that shall please you... When I compare myself with the ancients, I believe in myself. If I really get to it, I shan’t lose my face before anyone...” His subsequent location remains a mystery. According to Corniani, he had really lived in Hungary for some reason. Tonnelli tells us that he went straight to Florence. Whether his mysterious deal with Lamberteschi reached any results at all remains an enigma as well. Lamberteschi’s name disappears from Poggio’s correspondence, which Hochart explains by the fact that Poggio himself was the editor of his collected letters.

Even if the deal had fallen through and come to nothing, what possible residue could have been left by this episode? The following: “Lamberteschi was offering Poggio the creation of some secret historical work. The secrecy was planned to be great enough to make Poggio work in Hungary while everyone would think him to have still been in England. For this work he would have to study the Greek authors... and compete with the ancient historians, which he both feared and yearned for. And, finally, all the demands for secrecy that he had been ready to comply with demonstrate that the deal,

albeit literary and scientific, had been a murky one”. ([21], pages 393 ff).

Lamberteschi had a moral right to confront Poggio with such a suggestion, since the latter had already been caught red-handed at the *manufacture of a forgery*. Several years before, Poggio had published the *Commentaries of Q. Asconius Pedianus* via Niccoli.

“The original for these *Commentaries* wasn’t seen by anyone, and all the copies have been made by Niccoli from another copy that Poggio had sent him from Constance. It was a great success, despite the fact that... the world of science soon sensed that something was wrong... The success of the sham Asconius Pedianus had ensued in an entire series of forgeries bearing the name of the same fictitious author, but they were all too rough, and immediately got exposed as fakes. Poggio... simply turned out more artful than the others...

Prior to his involvement in the Tacitus business, he tries to sell some amazing copy of Titus Livy to Cosmas Medici and Leonello D’Este – again in an atmosphere of mystery, with a faraway monastery on some North Sea island, Swedish monks and the like somewhere in the background. It is improbable that we’re speaking of an actual oeuvre being forged, but a forgery of a copy may well have taken place. It is known that Poggio had been a master of Lombardian handwriting, which the manuscript that he tried to entice the princes with had been written in... however, something went wrong there, and the precious copy disappeared without a trace... It is significant that over this period the usually prolific Poggio fails to write anything of his own... However, he spends lots of time educating himself – systematically and unidirectionally, apparently training himself for some serious task of great responsibility concerning the Imperial period in Roman history. Niccoli barely manages to send him the works required: Ammianus Marcellinus, Plutarch, Ptolemy’s *Geography*, etc”. ([21], pages 394 and ff).

Hochart is of the opinion that Poggio had been alone when he began the forgery, but was probably soon forced to engage Niccoli as well. They must have planted the so-called Second Medicean Copy first, holding the First one back hoping to “skin the same steer twice.” However, the market had soon been addled by a great number of exposed forgeries. Poggio refrained from risking it the second time. The First Copy must have entered circulation by proxy of his son Giovanni Francesco after he had made away with the fortune of his father.

Apart from the works mentioned, the Poggio-Niccoli syndicate has put the following “Classical” texts into circulation:

The complete Quintillian, some tractates by Cicero, seven of his speeches, Lucretius,

Petronius, Plautus, Tertullian, some texts of Marcellinus, Calpurnius Seculus, etc.

The market became agitated after the finding of Tacitus. In 1455 “Enoch D’Ascoli found Tacitus’ *Dialogue of Orators*, *Agricola’s Biography*, and *Germany* (a monastery in the north yet again), whose language and character differ from the *History* and the *Annals* significantly... The *Facetiae* ascribed to Tacitus appeared on the market, and the sham took a long time to expose” ([21], pages 350-351).

Let us reiterate – Hochart and Ross insisted that the *History* of Tacitus was a sham exclusively because of their unswerving trust in Scaligerian chronology. Rejecting it and transferring “ancient” Roman events into the XIII-XV century A.D. cardinally changes our attitude even to such events as Poggio’s mysterious involvement in the discovery of Tacitus’ books.

Finally, let us cite an ancient miniature from the *Historiarum ab Urbe condita* by Titus Livy that was published in Italy in the alleged XV century ([1485], page 264). The miniature is on the very first page of the book (see fig. 7.10). The inscription below says “Titi Livii...” What we see on the miniature is a typically mediaeval interior of the house of a writer who is working on a book (see fig. 7.11). The artist must have tried to draw the author of the oeuvre, namely, Titus Livy. However, learned historians prefer to assure us that it isn’t the “ancient” Titus Livy, but, rather, an anonymous humanist writing some book. Modern historians archly comment that “On top of the first page of the text we see a writer who finishes his work... The picture shows a humanist scientist in his study” ([1485], page 264). However, most probably, the picture represents the author of the book, or the mediaeval writer Titus Livy. He may have been a contemporary of Poggio, or Poggio Bracciolini himself, who had been a humanist scientist after all.

Fig. 7.10. The first page of the *Historiarum ab Urbe condita* by Titus Livy published in the alleged XV century. The picture probably portrays the author himself. The entire ambience is clearly mediaeval. Taken from [1485], ill. 349.

Fig. 7.11. A close-in of a fragment portraying a mediaeval writer, most probably, Titus Livy himself. Taken from [\[1485\]](#), ill. 349.

What one has to note in this respect is that on the pages of the books by the “ancient” Titus Livy and other “Classical authors” one keeps coming across mediaeval symbolism, Christian crosses and coats of arms, for instance (see fig. 7.12). The modern commentators naturally noticed this phenomenon a long time ago. For instance, the current edition of the book by Titus Livy is commented upon in the following matter: “The beginning of Book 21... one sees a coat of arms with a cross and some angels” ([\[1485\]](#), page 265). However, today the commentators prefer to assure us that all these visible late mediaeval relics have been introduced into the “ancient” books by the artists just in order to please the mediaeval book-owners. The real explanation is most probably a different and more natural one – namely, that the mediaeval Christian artists used the mediaeval Christian symbols in order to illustrate a mediaeval book of a late mediaeval author who was describing contemporary mediaeval events.

Fig. 7.12. A Christian cross on the page of a book by the “ancient” Titus Livy. Taken from [\[1485\]](#), ill. 350.

3. The mediaeval Western European Christian cult and the “ancient” pagan Bacchic celebrations

According to our reconstruction, the “ancient” Dionysian (Bacchic) pagan cult prevailed in Western Europe in the Middle Ages, that is, in the XIII-XVI century, and not in “distant antiquity.” This may have been one of the forms of mediaeval Western European Christianity. Can we find support for this theory in the original sources that have reached our time? We can, and rather substantial support at that.

N. A. Morozov in his analysis of ecclesiastical history has paid attention to the known, albeit oftentimes withheld, fact of the *openly Bacchic practise of Christian officiations* in mediaeval Italy and France, where liturgies often transformed into orgies, convents would frequently serve as houses of ill repute, etc.

What does Scaligerian history tell us about mediaeval Western European monasticism? Let us turn to the book by Alexander Paradisis titled *The Life and Activity of Balthazar Cossa (Pope John XXIII)* ([\[645\]](#)).

“Nothing remained of the reclusion and the piety of the first centuries of Christianity, the decadence of the church and its morals attained grandiose proportions... The nuns’ clothing didn’t help austerity, either, since it served to emphasize their natural beauty and gracefulness... Nearly all Italian monasteries [according to Rodocanachi] allowed male visitors... As for Venetian monasteries – Casanova is not the only source of information in what regards those; St. Didier writes that “nothing attracted as much interest in Venice as the monasteries.” Noblemen have been frequent visitors there, too. Since all of the nuns were beautiful and clean-limbed, none of them went without a lover. The care of the dominae about the morals manifested as aiding the nuns in finding more elaborate ways of meeting their lovers and providing necessary alibis. During the Venetian carnival (which would last almost half a year over there), convents would turn into dance halls filled with masked men... The dresses have been narrow, fitting tight around the waist, with large scoop necklines which demonstrated the white and voluptuous bodies of the nuns.” (see Rodocanachi (E.), *La femme Italienne, avant, pendant et après la Renaissance*, Paris, 1922.)

Charles Louis Pölnitz writes that Venetian nuns curled their hair, wore short dresses that failed to cover their shapely legs, and that their bosoms were only covered when they sang in church choir. The garments worn by the Roman nuns also weren’t exactly characterized by demureness; as for the Florentine nuns, the prior of a friary who had

visited Florence writes that they resembled mythical nymphs rather than “brides of Christ” (see Pizzichi, *Viaggio per l’alta Italia*. Firenze, 1820). There were theatres at many monasteries where it was allowed to give performances, however, only the nuns could take part in those. The nuns of Genoa weren’t exactly known for continence, either. One of the Papal edicts aggrievedly stated that “the sisters from the convents of St. Philip and St. Jacob roam the streets of Genoa, committing whatever ribaldries their hotspurred imaginations dictate” ([645], pages 160-162).

Finally, the church began to persecute this Bacchic form of the Christian cult in the West.

“The dissoluteness of the nuns in the Bolognese convent of John the Baptist had been so great that the authorities were forced to disperse the nuns and close down the convent. The nuns from the convent of St. Leonard were given into custody of the St. Laurence convent which had gained prominence due to its austere and harsh regulations, known as “the tormentor of the nuns”... The amount of nuns persecuted by the justice was growing with the day. Every Bolognese convent had a nickname: “the convent of the dolls” “the convent of the gossipers,” “the convent of the repenting Magdalenes,” “the convent of the wenches,” “the monastery of the Messalinas,” etc. (see Frati (Lodov.), *La vita private di Bologna nel Medio Evo*, Florence, 1898)...

The eminent humanist Giovanni Pontano tells us that in Valencia the Spaniards had free access to the convents, and that it was hard to differentiate between these holy tabernacles and houses of ill repute. Settenbrie, who studied the last collection of Masuccio’s works, writes that the book *The Conjugalilty of Monks and Nuns* has been withdrawn from circulation, and entered the list of the books forbidden by the Catholic Church, while its author was anathematized” ([645], pages 162-164).

Let us stop for a moment and think. A natural question arises, namely, that of the essence of the Christian cult in Western Europe prior to the introduction of the rigid sanctions of the XVI-XVII century. Did it resemble modern Christianity? Nowadays we are often told that the mediaeval clergy frequently spent time in bacchanals. We have all heard of the alleged lechery of many mediaeval monks who are supposed to have corrupted the original ideals, which were intrinsically pure. See figs. 7.13 and 7.14, for instance.

Fig. 7.13. “The Abode of the Jolly Friars” – a Dutch “caricature” of the alleged XVII century depicting monks indulging in drunken revelry. The “caricature” bears the legend “Such is the Way to the Stars”. Taken from [\[492\]](#), Volume 1, page 223.

Fig. 7.14. A “caricature” of Pope Leo X and his debauched life. Copper engraving dating from the XVI century. Taken from [\[492\]](#), p. 181.

An unprejudiced study of mediaeval documents shows this mediaeval Christian cult to have been practically identical with the one we consider the ancient Bacchic, Dionysian cult. N. A. Morozov cites plenty of data showing that, for instance, official prostitution was an integral part of the mediaeval Western European Christian liturgy. Another example is the love-cult prevalent in a number of mediaeval temples located on the

territory of modern India. Accordingly, there exists the possibility of a stance contradicting the official modern standpoint, one which would interpret the *distinct relics of the Bacchic in Christian rituals of the Middle Ages* as the corruption of archetypal Christianity. These “ancient relics” persisting in the Middle Ages strike us as odd nowadays since they contradict Scaligerian chronology. A change of the latter and the dislodgement of the “antiquity” into the Middle Ages instantly eliminates the seeming contradiction.

Scaligerian history contains many relics of the mediaeval Bacchic-Christian liturgies. According to the experts in the history of religions, the Western European Christians of the Middle Ages had (see, for instance, the review given in [\[544\]](#)) religious rituals including nocturnal congregations called “agapes,” or “nights of love.” Despite the efforts of the late mediaeval and modern commentators to convince us that these Christian “love suppers” involved nothing but “comradely libations” and “platonic cordialities,” the initial meaning of the word “agape” reveals something completely different. As N. A. Morozov duly remarks, the correct Greek word for fraternal love is “philia,” whereas “agape” is solely used for erotic love.

Therefore the “agapes” have most probably merely been the way Christians referred to the mediaeval Western European bacchanals of the Dionysian cult with all of their orgiastic attributes – the attributes considered “extremely ancient” nowadays. What Scaligerian chronology presents as an exception must have been the rule for the Western European Christian church of the Middle Ages. For instance, the numerous references to “Papal and Episcopalian lewdness” simply indicate just how widespread the Christian bacchanal cult was in the Middle Ages. This may have been a result of a distortion of the strict Christian rites of the XII century. Let us recollect that the pagan bacchanals were described by the “ancient” Titus Livy in his famous *History of the City*. And the dynastical parallels that we have discovered link the “ancient Rome” of Titus Livy to the epoch of the XI-XIII century, and also partially to the Habsburg (New Town, or Nov-Gorod?) epoch of the XIV-XVI century (see figs. 6.19, 6.20, 6.21, 6.22, 6.23, 6.24, 6.52 and 6.52 in [Chron1](#), Chapter 6).

Apparently, the necessity of curbing the Bacchic cult eventually presented itself. N. A. Morozov puts forth a hypothesis that this Christian-Bacchic practice of religious Dionysian orgies in the *Western* church may possibly have caused a wide propagation of venereal diseases in Western European countries ([\[544\]](#), Volume 5). We shan’t discuss the likelihood of this hypothesis, since it’s well beyond the scope of our work. It is however possible that the Western European church of the XV-XVI century

eventually had to return to the original, ascetic and somewhat austere style of the XII century Christianity in order to mitigate the effect of negative social aftermath of the Bacchic rites. This may have been one of the primary reasons for religious reform, as well as for the rigid celibacy edicts. This reform was later arbitrarily placed in the XI century A.D. and ascribed to “Pope Gregory VII,” or “Pope Hildebrand” (“Ablaze as Gold”), who, according to our reconstruction, is a reflection of the XII century Jesus Christ. One takes it that many events of what we know nowadays as “Hildebrand’s biography” actually pertain to the more recent periods of the XIV-XVI century.

Naturally, doing away with the “ancient” Bacchic or Dionysian cult was far from an easy task due to its great appeal, accumulated social consequences (venereal diseases, etc.) notwithstanding. Nowadays “Pope Hildebrand” is the very person who is said to have given great attention to this problem during the religious reform of the alleged XI century, which is the time period associated with the rigid edicts about the expulsion of those holy fathers who continued their married lives. This decision caused an uproar, since almost all of the Roman clergy was married. As N. A. Morozov pointed out:

“The natural facet of human existence had suffered defeat in this tragic matrimony conflict, and rigid monastic asceticism triumphed due to the influence of the Gospel according to Matthew – the actual celibacy edict must have been caused by a wide propagation of venereal diseases among the clergy as well as the laics, since it is hard to explain and justify such an innovation.” ([\[544\]](#), Volume 5)

The opposition was crushed, although it had taken years of struggle.

The necessity of crushing the orgiastic Christian cult entailed the establishment of the Inquisition for the initiation of hard-line reforms in both clerical and secular life of Western Europe. We should point out that the *Eastern Orthodox Church* and Russia in particular have never seen such open and wide dispersion of *Bacchic* practices. This is why there was no Inquisition in the Orthodox Church. The transition to the stricter modern form of the cult in the Western church may have been caused by the negative social after-effects of the Bacchic liturgies.

However, N. A. Morozov was persistent in regarding the Orthodox church as the heir of the *Western* Latin church, by and large. We consider this to be *another grave mistake of his*. The reason for this error is clear to us now: N. A. Morozov erroneously considered the Western church much *older* than the Orthodox church in general, and the Russian church in particular, since, according to the Scaligerian outlook, the formation of the Orthodox Church in Russia occurred as late as the X-XI century, whereas in Morozov’s opinion the Western church was formed in the IV-V century A.D.

However, nowadays we are beginning to understand that both the Western and the

Orthodox Church – the Russian church in particular, appeared *simultaneously* – in the XII-XIII century, qv in the new statistical chronology as related in [Chron1](#), Chapter 6. Apparently, the Orthodox and the Latin church were of the same origin, and have subsequently been developing in cardinally different ways. The very name of the Orthodox (as in conservative, or ancient) Church indicates the possibility of the Orthodox practice being closer to the proto-cult of the XII century than the Latin-Catholic liturgy.

The mediaeval descriptions of the infamous “diabolic sabbats” in Western Europe must have been based on the same archetypal “agape” Bacchanals as mentioned above, but these have already been declared “a creation of the devil” (see fig. 7.15).

Fig. 7.15. The title picture from a book on witchcraft by Pretorius dating from 1668. A propagandist representation of a “sabbat of the witches”. Taken from [\[492\]](#), Volume 1, page 95.

Let us remind the reader that dissolute orgiastic excesses had been a notable feature of

the agapes or sabbats (according to Scaligerian history). Quite naturally, the new “reformed” Western European church conveniently delegated the responsibility for the agapes (or sabbats, or Bacchanals) to “the devil” in order to smother all recollections of the recent Bacchic Christian past in the congregation. The people’s own history was thus ruthlessly severed and attributed to a “different religion”, or even to “the devil”. After that, it was further removed into an antediluvian age labelled “antiquity.” In fig. 7.16 one can see one of the numerous and rather eloquent pictures of a mediaeval “ancient” Bacchanal – the famous oeuvre by Dosso Dossi bearing that very title. Further, in fig. 7.17, one sees a relief from an “ancient” Attic sarcophagus made in the Middle Ages with an effigy of a Bacchanal feast in the honour of Dionysius. The famed “Bacchanal” by Rubens, painted around 1615, can be seen in fig. 7.18.

Fig. 7.18. “Bacchanal” by Rubens. Dating from around 1615. Taken from [\[188\]](#), sheet 44.

The history of the Bacchic Christian cult in Western Europe must have been a long one. We shall give a few quotes from the rather rare œuvre of Champfleury titled *Historie de la Caricature au Moyen*

Age (*The History of Caricature in the Middle Ages*) ([\[1064\]](#)). Caricature usually serves to reflect reality by hyperbolizing some of its facets in order to draw attention to them.

Champfleury writes: “The mediaeval cathedrals and monasteries have housed strange kinds of entertainment [as seen from the stance of the consensual conception of the Middle Ages that was inflicted upon us – A. F.] during big church feasts in the Middle Ages and the Renaissance epoch. It isn’t just the common clergy that takes part in the dancing and the singing, especially during Christmas and Easter, but even the top ranking ecclesial dignitaries. The monks from the friaries danced with the nuns from nearby convents, and the bishops joined the merrymaking.” ([\[1064\]](#), page 53. Quoted in [\[544\]](#), Volume 5)

Champfleury proceeds to cite the most modest example, presenting it as a caricature [!], which is a picture of a supper enjoyed by monks together with “their ladyloves” from a XIV century *Bible* (which is a fact we feel worthy of emphasizing), see fig. 7.19 taken from [\[1064\]](#), The National Library, Paris, No. 166. But how could this “caricature,” if this is indeed the case, wind up in the Bible, a holy book? The Holy Writ is hardly the place for jests and witticisms, especially considering the fact that the other miniatures from this edition of the Bible do not give the illustrator away as a

farceur. The miniature depicts a typically Bacchic scenario: a monk and a nun are entwined in a passionate embrace in the foreground, and the same actions are performed by a larger group in the background. Other similar mediaeval artwork can be seen in fig. 7.19, the phallic symbolic of the Indian god Shiva-Rudra in fig. 7.20, and other examples in figs. 7.21 and 7.22.

Fig. 7.19. The illustrations on top represent fragments from the capital of the Strasbourg cathedral. A bear is carrying an aspersorium, a wolf follows him with a cross, followed in turn by a hare bearing a torch etc. Further we see: a) a miniature from a moralistic mediaeval Bible (No 166 from the Imperial Library); b) mediaeval “Christian-Bacchic” subjects still adorning some Western European cathedrals. Taken from [\[1064\]](#).

 Another example – a picture of a young woman tweaking her husband’s nose, a sculpture on the portal of the Ploërmel church. Taken from [\[1064\]](#).

A Dutch “caricature” of the mediaeval Christian cult can be seen in the *History of the Papacy* by S. G. Lozinsky, for instance (fig. 7.23). A crowd of parishioners bursts into a church following a priest, while a crowd is being rampantly joyous on the square in front of the church.

Fig. 7.23. Mediaeval Dutch “caricature” of the Roman church. Taken from [\[492\]](#), Volume 1, page 17.

The number of such “caricatures” in mediaeval manuscripts that have reached our age is great enough. Incidentally, Pope Pius II, for one, was the author of “numerous erotic poems and an extremely obscene [by current standards – A. F.] comedy titled *Chrysis*” ([\[492\]](#), Volume 1, page 156). It would also be apposite to remind the reader of the “Song of Songs,” part of the Biblical canon with explicit erotic references and descriptions galore. Of course, the theologians of our age cagily interpret those as an “allegory” of sorts.

Champfleury in his attempt to make the monastic life of Western Europe in the XIII-XVI century fit modern morals and inculcated concepts of religious life and “monastic ideals” of the epoch, tries to convince us that all such phenomena in mediaeval art aren’t to be regarded as *illustrations of contemporary reality*, but rather as an admonishment against such actions ([\[1064\]](#)). However, it is most odd, since the “admonishment” is pictured in a most enticing manner indeed. Is it possible to conceive of someone who would try to restrain the public from debauchery with the aid of pornographic editions? This would most probably have the opposite effect. Furthermore, if these were “admonishments,” one would expect to see depictions of

unpleasant after-effects of such actions. However, none such are present!

Such illustrations in religious literature only make sense if they are a rendition of quotidian phenomena from the life of the mediaeval clergy – events considered normal by everyone, in other words. Had the painter wanted to express his reprehension of the subject matter, he would have shown this carousal in some unappealing light, with demons dragging sinners into inferno, the revolting aftermath of diseases, etc. Instead of this, several mediaeval Bibles contain illustrations of Bacchanal dances, and ones looking perfectly “ancient,” at that. The capital headings are enwreathed in grapevines, with little angels climbing them – spitting images of allegedly “extremely ancient” cupids. And so on, and so forth. We are referring to our personal acquaintance with certain ancient Bibles that are kept in the Moscow Planetarium Library, for instance, or those from the Rare Book Museum of the National State Library in Moscow.

According to Champfleury, it was as early as the VII century A.D., 700 years after the naissance of Christianity, that the Counsel of Chalon-sur-Saône forbade women to sing obscene songs in churches ([\[1064\]](#)). The date is given as VII century in the Scaligerian chronology; according to our results, all of this occurs in the XV-XVI century, which coincides with the time of the formation of the Inquisition in the West. Gregory of Tours protests against the monastic masquerades in Poitiers that occurred during the historically ecclesial “feasts of the mad,” “feasts of the innocent” and “feasts of the ass.”

Champfleury writes that: “it was as late as [the alleged date of – A. F.] 1212, that the Paris Council prohibited the nuns to partake in the “frantic celebrations” in the following form: ‘The frantic celebrations where the phallus is worshipped are to be condemned everywhere, and we forbid partaking to monks and nuns specifically’” ([\[1064\]](#), page 57, quoted in [\[544\]](#), Volume 5, page 658). The ban didn’t seem to help much, since much later, in the alleged year 1245, the reformist bishop Odon reported, after having visited the monasteries of Rouen, that the nuns there take part in forbidden pleasures en masse ([\[1064\]](#), page 57. Quoted in [\[544\]](#), Volume 5, page 658).

The “feasts of the innocent” greatly resembled the Church “feasts of the mad,” or *festi follorum* (possibly renamed from *festi phallorum*). Apparently, the label “innocent” referred to people unaware of the difference between the allowed and the forbidden. Both feasts may have been the same old Christian agapes and bacchanals named differently. According to Champfleury, they existed in Besançon as late as the years 1284-1559 (in Scaligerian chronology), until the reformed church outlawed them in that area as well. King Charles VII forbids these religious “feasts of the mad” again in 1430,

in the Troyes Cathedral ([\[1064\]](#), page 58, quoted in [\[544\]](#), Volume 5). One sees how much labour it took the Western European church to weed out the deeply rooted Bacchic-Christian cult of the XIII-XV century.

Champfleury writes the following:

“Many a time, studying the ancient cathedrals, and trying to unravel the secret reason for their ribald ornamentation, all of my own explanation seemed to me as comments to a book written in a language that is alien to me... What could one possibly make of the bizarre sculpture that one sees in the shade of a column in an underground hall of the mediaeval cathedral in Bourges?” ([\[1064\]](#), quoted in [\[544\]](#), Volume 5, page 661, see fig. 7.19)

The sculpture in question is an effigy of human buttocks protruding from the column in a very erotic manner, done meticulously and with great expression. How could the monks and the parishioners of the times before the era when this sculpture became a tourist attraction from the days of yore, have abided it in the temple that they attended every day?

Another example is the stone sculpture allegedly dating from 1100 that is now a showpiece in the museum of the Santiago de Compostela Cathedral in Spain (see figs 7.24 and 7.25). We see a naked woman in a very explicit position. The museum plaque tells us that the sculpture had been kept inside this very cathedral prior to being made an exhibit. Then, during its reconstruction, it was taken off its original mounting and placed in the museum.

Fig. 7.24. A stone sculpture from the museum of the Spanish cathedral in Santiago de Compostela allegedly dating from 1100. We see an erotic depiction of a naked woman. Photograph taken in June 2000.

Fig. 7.25. A Bacchic sculpture of a female from the museum of the Santiago de Compostela Cathedral in Spain. Different aspect. Photograph taken in June 2000.

Attempts to explain away all these mediaeval sculptures and images (of which there are quite a few left) as “caricatures” of the clergy carved in stone on the walls of holy temples, very simply don’t hold water. Champfleury proceeds to ask us:

“Can one think of an imagination paradoxical enough to determine the correlation of such an improbable jape with the holy place that houses the carving? What authority did it take to let the sculptor carve such details with impunity?... On the walls of several ancient Christian temples we find, with great surprise, images of human genitalia compliantly displayed amidst the objects used for holy liturgy. The lapicides demonstrate great innocence in carving such pornographic sculptures, that resemble an echo of the Classical symbolism... These... phallic relics of the past that one finds in darkened halls [where the Bacchanals took place – A. F.] are especially numerous in Gironde. Léo Drouyn, an archaeologist from Bordeaux, showed me some highly peculiar specimens of brazen sculptures put on display in the ancient churches of his province that he conceals in the depths of his files and folders.” ([1064], quoted in [544], Volume 5, page 661)

N. A. Morozov was quite correct in pointing out that excess shame deprives us of valuable scientific information. Scaligerite historians, in remaining taciturn about the Christian genital symbolism present in a number of mediaeval temples, have slowed the potential for comparison of artefacts of the “Classical Age” with their mediaeval counterparts. Serious, thoroughly illustrated books on the phallic cult would pour some bright light on the matter and expose the Weltanschauung of the Christian-Bacchic cult devotees of the Middle Ages.

Most probably, all of these drawings and sculptures are the furthest thing from anti-ecclesial mockery, and serve the same invitatory purpose as foamy beer steins painted on the doors of German pubs. Naturally, all of this only made sense in the epochs preceding the large-scale repressions of the new evangelical church and the Inquisition

of the XV-XVI century against the old Western European Bacchic Christian cult.

“Classical” pornographic effigies (those from the excavations of the “ancient” Pompeii, for instance) are directly related to their Christian counterparts. Once again, the misconceived “shamefulness” keeps the scientific public from learning of those extremely interesting source materials. V. Klassovsky tells us that:

“The pictures that depict explicitly erotic and ithyphallic scenes that the ancients liked so much are kept under lock and key... In the house of the dissolute women... *someone has scraped off the obscene frescoes with a knife at night*... As of late, all of the Pompeian paintings and sculptures that contradict the modern concept of decency are kept *in the secret department* of the Bourbon museum where no visitors are allowed except for those possessing the special permission of the high officials that they have to demonstrate at the door. Obtaining such a permission by legal means is far from easy.” ([389], pages 75-76)

However, in 1836 a catalogue was published that contained engravings of some of the exhibits from this secret department ([1278]); this catalogue is an antiquarian rarity nowadays. Let us also mention that, according to Humphrey Davy, “the Pompeian painters and the Italian painters of the Renaissance epoch used *identical* paints” (quoted in [389], page 70).

Houses have been found in Pompeii – one of which is considered a hotel nowadays – that have stone phalluses in front of the entrance. The connexion between the phallus and the Christian cult is not only present in the Western European temples of the Middle Ages. “In Hieropolis there were gigantic phalluses carved out of granite, of 180 feet and higher; they used to be placed at the temple gates” ([389], page 122). V. Klassovsky was of the naïve opinion that these gigantic stone phalluses served “for the edification of the parish” [?] ([389], page 122). Most probably, the carving was a sign, or a *facia* of sorts. We can draw parallels with a similar stone effigy of the Indian Shiva Lingamurti; what one sees here is the phallic symbol of Shiva-Rudra.

If the obscene mediaeval artwork is nothing but signs whose primary purpose is to inveigle the public to partake in the Christian entertainment as was practised in Western European temples up until the XVI century – and occasionally later yet – what could the images of witches, demons, etc. that they incorporate possibly signify? The more recent ones, with demons dragging sinners to hell, are, of course, meant to intimidate. But what would be the meaning of those where the devil is playing the guitar, and naked women riding goats and asses are carried away by the momentum of sensuality? What could be the import of the stone apes dancing lewd roundels? Such are the stone sculptures on the chapters of the Magdeburg Cathedral. Or, for instance, the bas-relief from the portal dome of Notre Dame de Paris allegedly dating from the XII century, that contains obscene imagery of naked women copulating with asses, goats, and each other – a tangle

of human bodies and demons entertaining male and female members of the parish alike with their sexual callisthenics.

We should also remind the reader of the extremely well-developed erotic cult in India. Some of the Indian temples are covered with intricate erotic sculptures from top to bottom. Also, what could the sculpture from the portal of the Ploërmel church possibly mean, the one plainly visible to the public and depicting a young wife tweaking the nose of her husband who is wearing a nightcap? See figs. 7.19, 7.21 and 7.22. A Dutch “caricature” of the mediaeval Roman church can also be seen in fig. 7.23.

Champfleury, who cites all of these pictures and sculptures, and a great deal of others to boot, *does not provide a clear answer* to all these questions. However, the meaning of the last sculpture, for instance, is crystal clear. “Such a picture is far from being an inappropriate caricature; one would rather think it a sign quite appropriate for the entrance to a legal disorderly house for married women [located in a temple – A. F.]” ([544], Volume 5, page 666).

In [544], Volume 5, one encounters argumentation in favour of the theory that the Western European Christian temples of the XII-XVI century combined certain distinctives consistent with the liturgy presented to us in late Christian literature, with those of brothels from which it would have been hard to distinguish them in the Middle Ages. Thus, the initially austere Christianity of the XII century has given birth to the orgiastic and Bacchic Christian cult. After the separation of the churches from the brothels (which didn’t happen in some areas of India until the XIX century), the latter became semi-legal institutions resembling their modern counterparts. All of the above mentioned imagery on the walls and over the entrances to the XII-XV century temples could only have seemed appropriate for as long as the temples served as places of erotically-flavoured entertainment honouring the vivacious “ancient” gods, and where the Eucharist chalice had also served an orgiastic purpose. Far from the abodes of pious meditation that we deem them to be nowadays.

One finds it appropriate to make the following remark in this respect: according to the Scaligerian chronology, nearly all the mediaeval Roman Christian churches have allegedly been built “on the sites of ancient Pagan temples.” These “ancient predecessors” have for some reason shared the same purpose, and even *the same name* as the “more recent” Christian temples ([196]). The mediaeval church of St. Dionysius, for instance, was allegedly built on the site of the “*ancient* pagan temple of Dionysius,” etc. From our point of view, the picture is perfectly clear. What we see here is the same old effect of Scaligerian chronology. Having declared its own recent Bacchic past

“fallacious” for one or another objective reason, the Western Christian Church in its new reformed phase of the XV-XVI century has simply re-baptised all of its recent Christian-Bacchic gods into new Evangelical saints, occasionally even keeping their names intact, since the parishioners had been accustomed to them.

One might ask the obvious question about whether we might be right, and the Bacchanals are merely a form of the mediaeval Christian cult of the XII-XVI century, the strict edicts outlawing this cult introduced by the Inquisition in the XV-XVI century finding their reflection in the “ancient” bans of the Bacchanals. Is it really so? Are there any “ancient” documents that forbid the “ancient” bacchanals? There are indeed, and they occasionally match their mediaeval counterparts of the XV-XVI century word for word.

This is what historians tell us about the “Classical Age”: “*The Graeco-Roman decadence that started to infiltrate the lives of all the Roman estates... in 186 [the alleged year 186 A.D. – A. F.] manifested in one alarming symptom – secret Bacchus cults... these cults have spread across all of Rome and Italy*” ([304], Volume 1, page 362). Considering the Roman chronological shift of roughly 1053 years, we get the Scaligerian date of 186 A.D. actually standing for a date approximating 1239 A.D., since $186 + 1053 = 1239$. It turns out that the wide propagation of the Bacchic cult really falls on the XIII century A.D., which concurs well with the information concerning the pervasion of the mediaeval orgiastic cult of the XII-XVI century. Should this indeed turn out a manifestation of the two chronological shifts of 1383 years (a sum of 1053 and 330), the “ancient” events as mentioned above roughly fall over the middle of the XVI century, which fits our reconstruction even better.

What could have really happened later in “antiquity”? “The authorities have commenced an energetic investigation, and it turned out that the members of this cult exceeded 7,000 people in their numbers. *Many have been seized and done away with quick and severe executions.* . . . A large number of the women that took part in the criminal cult have been handed over to their relations for the execution, and if none of their kin could bring themselves to execute the *death sentence*, they would be claimed by the henchman.

A *most valuable relic* of the time is given to us by an important governmental edict of the Senate in its original edition. The Roman Senate *forbade all manner of manifestation* of the Bacchic cult on the territory of the United Roman State *under pain of death*... The Senate’s edict *forbidding Bacchanals explicitly* had been carved on a copper plaque and sent to all of the districts in such a fashion in order to be put up in

public places for everybody's information. One of such plates was unearthed in a rather secluded place, the ancient Bruttian country.” ([304], Vol. 1, pp. 362-363)

We reproduce this “ancient” document in fig. 7.26. According to our reconstruction, this “ancient” decree is one of the imperial Inquisitional prohibitions of mediaeval Bacchanals issued in the XV-XVI century, which was found in 1640, right about the time Scaligerian chronology was establishing itself. It was immediately declared “ancient” and attributed to the distant past.

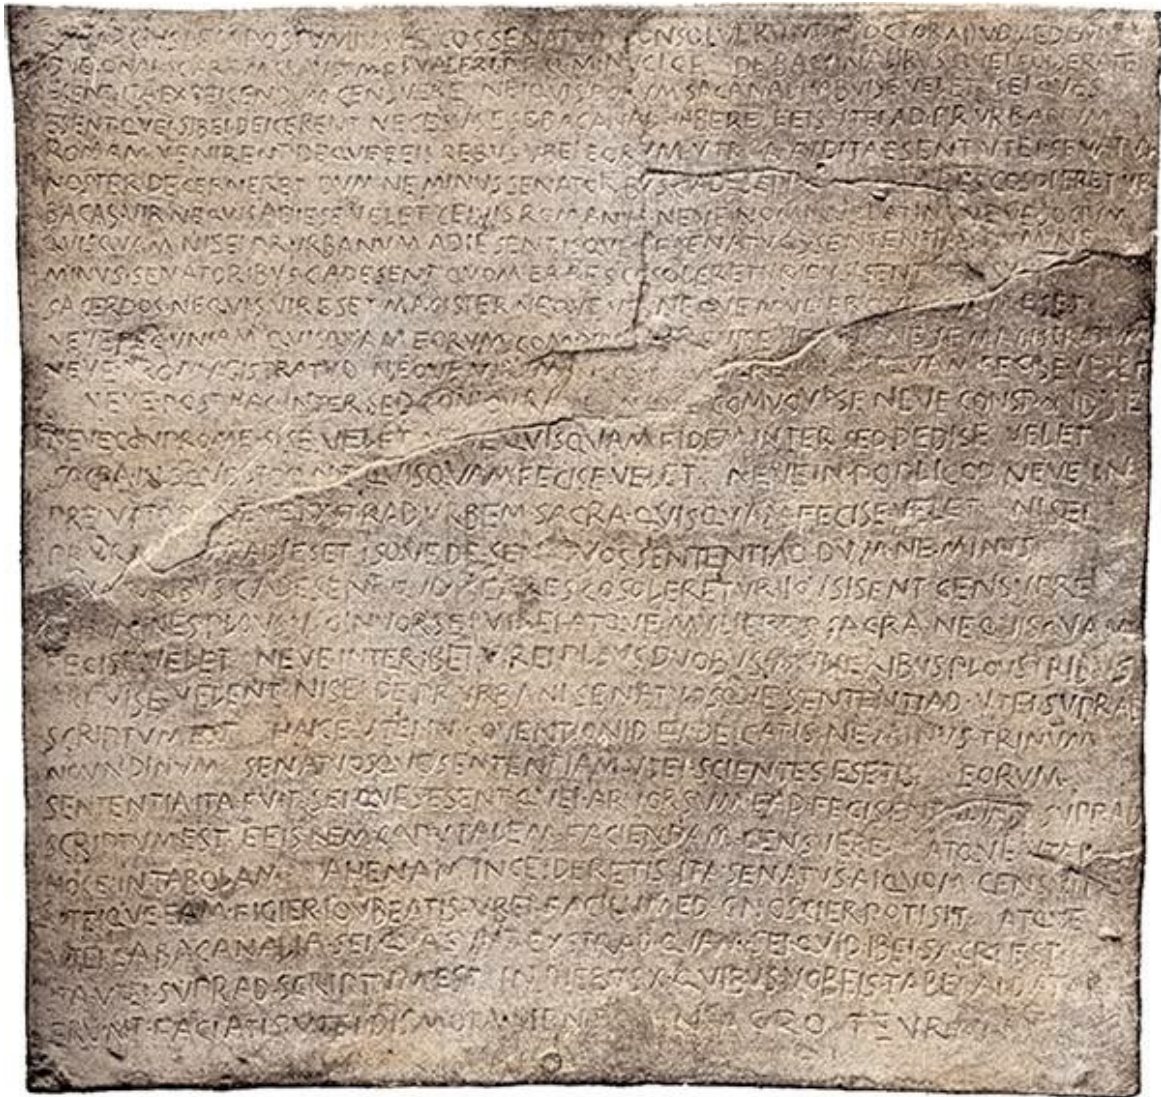

Fig. 7.26. A bronze plaque outlawing bacchanals. Copied from the “ancient” original kept in the Royal Imperial Museum of Antiquities in Vienna. Taken from [304], Volume 1, page 363.

4. Petrarch (= Plutarch?) and the “Renaissance of Antiquity”

4.1. How Petrarch created the legend of the glorious Italian Rome out of nothing

According to our reconstruction, the “Classical Age” is merely another name applied in Scaligerian chronology to the mediaeval epoch of the XI-XV century A.D. As we have already mentioned, the Italian Rome was apparently founded as a capital as late as the XIV century of the *new* era, and not in the VIII century B.C. as Scaligerian chronology tells us. It would thus be most interesting to regard the history of the mediaeval Rome from the point of view of this reconstruction. Nowadays we are told that the Italian Rome entered “the age of decline” ([196]) in the epoch of the XIII-XIV century. Our take is that there is really a very simple explanation. Before the XIV century A.D., Rome, if it had existed at all, had been a rather small town; this is why the mediaeval documents that have reached our age fail to see anything worthy of mentioning. The historians of a later age, raised on Scaligerian chronology, began to interpret this mutism as evidence of “the utter decline of the Roman capital and all of its former splendour.”

According to our reconstruction, in the early XIV century the small Italian town of Rome was officially decreed (on paper!) to be the capital of “the Great Ancient Rome.” To this end, the events which had really occurred in a completely different Rome – the Rome on Bosphorus, the City of the Czars, Constantinople, *a truly great city of the Middle Ages* – were transferred to the Italian Rome (again, only formally, on paper). A large part of Constantinople’s history was severed and attributed to the Italian Rome. Interestingly enough, we are in a position to give a more or less precise assessment of when this “surgical transplantation of history” really took place. Let us turn to the XIV century history.

In 1974 the world celebrated 600 years since the death of Francesco Petrarch (1304-1374), the first prominent writer of the Middle Ages who, according to Leonardo Bruni, “had been the first who... could understand and bring into light the ancient elegance of the style that had been *forlorn and forgotten* before” ([927]). The actual personality of Petrarch is nowadays perceived as mysterious, vague and largely unclear, and reality often becomes rather obfuscated. But we are talking about the events of the XIV century here! The true dating of the texts ascribed to Petrarch often remains thoroughly unclear.

Already an eminent poet, Petrarch entered the second period of his life – the period of wandering. In the alleged year of 1333 he travelled around France, Flanders and Germany. “During his European travels, Petrarch became directly acquainted with scientists, searching the libraries of various monasteries *trying to find forgotten ancient manuscripts and studying the monuments to the past glory of Rome*” ([644], page 59). Nowadays it is assumed that Petrarch became one of the first and most vehement advocates of the “ancient” authors who, as we are beginning to understand, were either his contemporaries, or preceded him by 100-200 years at the most.

In 1337 he visited the Italian Rome for the first time ([644], page 59). What did he see there? Petrarch writes (if these are indeed his real letters, and not the result of subsequent editing), “Rome seemed even greater to me than I could have imagined – especially the greatness of her ruins” ([644]). Rome in particular and XIV century Italy in general had met Petrarch with an utter *chaos* of legends, from which the poet had selected the ones he considered congruent to his a priori opinion of “the greatness of Italian Rome.” Apparently, Petrarch was among those who initiated the legend of “the great ancient Italian Rome” *without any solid basis*. A significant amount of real mediaeval evidence of the correct history of Italy in the Middle Ages was rejected as “erroneous.” It would be of the utmost interest to study these “mediaeval anachronisms” considered preposterous nowadays, if only briefly.

According to mediaeval legends, “Anthenor’s sepulchre” was located in Padua ([644]). In Milan, the statue of Hercules was worshipped. The inhabitants of Pisa claimed their town to have been founded by Pelopsus. The Venetians claimed *Venice to have been built of the stones of the destroyed Troy!* Achilles was supposed to have ruled in Abruzzo, Diomedes in Apulia, Agamemnon in Sicily, Euandres in Piemont, Hercules in Calabria. Apollo was rumoured to have been an astrologer, the devil, and *the god of the Saracens!* Plato was considered a doctor, *Cicero a knight and a troubadour*, Virgil a mage who blocked the crater of the Vesuvius, etc.

All of this is supposed to have taken place in the XIV century or even later! This chaos of information obviously irritated Petrarch, who had come to Rome already having an a priori idea of the “antiquity” of the Italian Rome. It is noteworthy that Petrarch left us no proof of the “antiquity of Rome” that he postulates. On the contrary, his letters – if they are indeed his real letters, and not later edited copies – paint an altogether different picture. Roughly speaking, it is as follows: Petrarch is convinced that there should be many “great buildings of ancient times” in Rome. *He really finds none of those*. He is confused and writes this about it:

“*Where* are the *thermae* of Diocletian and Caracalla? *Where* is the *Timbrium* of Marius, the *Septizonium* and the *thermae* of Severus? *Where* is the forum of Augustus and the temple of Mars the Avenger? *Where* are the holy places of Jupiter the Thunder-Bearer on the Capitol and Apollo on the Palatine? *Where* is the portico of Apollo and the basilica of Caius and Lucius, where is the portico of Libya and the theatre of Marcellus? *Where* are the temple of Hercules and the Muses built by Marius Philip, and the temple of Diana built by Lucius Cornifacius? *Where* is the temple of Free Arts of Avinius Pollio, where is the theatre of Balbus, the Amphitheatre of Statilius Taurus? *Where* are the numerous constructions erected by Agrippa, of which only the Pantheon remains? *Where* are the splendorous palaces of the emperors? One finds everything *in the books*; when one tries to find them *in the city*, one discovers that they either *disappeared* [sic!] or that *only the vaguest of their traces remain*”. ([644])

These countless inquiries of “where” this or the other object might be, especially the final phrase, are amazing. They indicate clearly that Petrarch came to Italian Rome with an a priori certainty that the great Rome as described in the old books is the *Italian* Rome. As we are now beginning to understand, these books were most probably referring to the *Rome on the Bosphorus*. However, in the early XIV century or even later, it was *ordered to assume* that the ancient manuscripts referred to *Italian* Rome. Petrarch had to find “field traces” of the “great Roman past” *in Italy*; he searched vigorously, found nothing, and was nervous about this fact.

However, the letters attributed to Petrarch contain traces of Roman history that differs considerably from the history we are taught nowadays. For instance, Petrarch insists that the pyramid that is now considered “the Pyramid of Cestius” is really the *sepulchre of Remus*, see fig. 7.27. Could Petrarch have been correct? Really, Scaligerian history doesn’t know the location of the grave of the “ancient” Remus. Since this pyramid was built in the alleged XII century, q.v. in [138], page 41, it would be logical to assume that the “ancient” Remus couldn’t have lived before the XII century A.D. – which is a far cry from the didactic dating of the VIII century B.C.

Fig. 7.27 The Pyramid of Cestius in Rome. The pyramid's height is 27 metres. It is assumed that it was erected in the XII century nowadays; we are told that the Pretor Caio Cestiu Epulon is buried here. The pyramid is presumed to be "homage to the Egyptian fashion". Taken from [\[138\]](#), page 41. Petrarch, on the other hand, used to claim that the grave belonged to the "ancient" Remus.

The real parochial Italian Rome of the XIV century surprised the poet greatly, since it strangely failed to concur with his a priori impressions based on the interpretation of the ancient texts which he considered correct. This most probably means that he rejected other evidence contradicting this "novel" opinion. The gigantic Coliseum, for instance, proved to be the castle and the fortress of a mediaeval feudal clan, and the same fate befell such "ancient" constructions as the mausoleum of Hadrian, the theatre of Marcellus, the arch of Septimius Severus, etc. Plainly speaking, all of the "ancient" buildings turned out to be mediaeval. This presents no contradiction to us; however, for Petrarch, who had apparently already perceived Rome through the distorting prism of the erroneous chronology, this must have been extremely odd.

Apparently, we have thus managed to pick out the moment in the Middle Ages when the creation of the consensual erroneous version of the history of Italian Rome began. This couldn't have preceded the first half of the XIV century – although we should add that it is possible that all of these events occurred significantly later, namely, in the XVI-XVII century.

According to Jan Parandowski, "*Petrarch's arrival marks a new era in the assessment of the state of the great city's decline*. Petrarch had been the first person of the new era whose eyes *filled with tears* at the very sight of the destroyed columns, and at the very memory of the forgotten names" ([\[644\]](#)). Having wiped off the tears, Petrarch became quite industrious in what concerned the creation of the "true history" of the Italian Rome. He searched for statues, collected Roman medals, and tried to recreate the topography of Rome. Most of Petrarch's energy was however directed at finding and commenting on the oeuvres of the "ancient" authors. The list of books that he allegedly

owned survived until our days, the list that he compiled himself in the alleged year 1336 A.D., on the last page of the Latin codex that is now kept in the National Library of Paris. Whether or not Petrarch had been in the possession of the original works of the authors, remains unknown. The following names are mentioned in the list:

Horace, Ovid, Catullus, Propertius, Tibullus, Percius, Juvenal, Claudian, Ovid, the comedians Plautus and Terentius; the historians Titus Livy, Sallustius, Suetonius, Florus, Eutropius, Justin, Orosius, Valerius Maximus; the orators and philosophers Quintillian, Varro, Pliny, Apuleius, Aulus Gellius, Macrobius, Vitruvius, Marcian Capella, Pomponius Mela, Cassiodorus, Boetius. As well, the names of a large number of holy fathers are listed.

We ask the following questions:

- Can we trust in Petrarch's ownership of these volumes?
- How was the list dated?
- Did Petrarch actually hold any of the oeuvres written by the abovementioned authors in his hands, or did he just collect the names?

Do we interpret Petrarch's statements correctly nowadays? After all, they reach us via a filter of the Scaligerite editors of the XVI-XVII century. We perceive them through the glass of a distorted chronology. Petrarch's letters need to be studied again, if they really are his and weren't written or edited on his behalf a great while later. One also has to emphasize that Petrarch didn't specifically occupy himself with the dating of the texts he found. He was looking for the "works of the ancients" – apparently without questioning whether they preceded him by a hundred years, two hundred, or a thousand. Let's not forget that a hundred years, let alone three hundred, is a long period of time.

With the growth of his income, Petrarch *founded a special workshop* with scribes and secretaries, which he often mentions in his letters. Everyone knew about his infatuation with collecting old books. He mentions it in every letter he writes to his every friend. "If you really value me, do as I tell you: find educated and trustworthy people, and let them rake through the bookcases of every scientist there is, clerical as well as secular" ([644]). *He pays for the findings bounteously*. And they keep coming to him from all directions. He makes some important discoveries himself – thus, in the alleged year of 1333 he finds two previously unknown speeches of Cicero's in Liège, and in 1334, Cicero's letters to Atticus, Quintus and Brutus in Verona ([927] and [644]). Let us remind the reader that according to the mediaeval legends, *Cicero was a knight and a troubadour*, qv above.

“Petrarch had reasons for considering himself to be responsible for the *revival* of interest in the philosophical works and essays of the great Roman orator” ([927], pages 87-88). Petrarch wrote: “as soon as I see a monastery, I head that way in hope of finding some work by Cicero.” The history of how he “discovered” the Cicero’s lost tractate titled *De Gloria* is very odd indeed. Its existence became known from a letter to Atticus that is attributed to Cicero. Petrarch claimed that he had discovered this priceless manuscript, but gave it to his old friend Convenevole. Who is supposed to have *lost* it.

Nowadays Petrarch’s endeavours are usually written about with great pathos:

“It had really been the first one of those glorious expeditions rich in discoveries that shall be undertaken by the humanists of the generations to follow, who have journeyed like Columbus... in their search for parchments gobbled by numerous rats” ([644]). Cicero’s letters were allegedly discovered by Petrarch in the Chapter Library of Verona, where *no-one had been aware* of their existence. For some reason, *the original was soon lost by Petrarch, and he demonstrated a copy instead*.

R. I. Chlodowsky wrote that:

“Petrarch proved a naturally born philologist. He had been the first to study the oeuvres of the ancient Roman poets, comparing different copies and using data provided by the neighbouring historical sciences... It was Petrarch the philologist who had destroyed the mediaeval legend of Virgil the mage and sorcerer, and accused the author of the *Aeneid* of a number of anachronisms; he had deprived Seneca of several works that were ascribed to him in the Middle Ages, and proved the apocryphal character of Caesar’s and Nero’s letters, which had *a great political meaning* in the middle of the XIV century since *it gave authority to the Empire’s claims for Austria*”. ([927], pages 88-89).

This is where the really important motives become clear to us – the ones that Petrarch may have been truly guided by in his “archaeological endeavours.” These motives were political, as we have just explained. We have ourselves been witness to countless examples from contemporary history when “science” was used as basis for one political claim or another. This makes chronology largely irrelevant. However, today when the characters of that epoch have long left the stage, we must return to the issue of just how “preposterous” the letters of Caesar and Nero were, and what was “wrong” in the mediaeval legends of Virgil.

The poet’s attitude to the ancient documents was far from critical analysis. Petrarch’s declarations of “antiquity” may have been made for meeting the conditions of some political order of the Reformation epoch in Western Europe (the XVI-XVII century). The order was given to create a dichotomy between “barbaric contemporaneity” and “beauteous antiquity”. See [Chron6](#) for details. At any rate, one clearly sees that either Petrarch or someone else acting on his behalf was creating the mythical world of the antiquity without bothering about the exact epoch when Cicero’s speeches were written,

and whether it had preceded that of Petrarch by 200 years, or 1400. It is possible that all of this activity really took place in the XVI-XVII century and not the XIV, during the Reformation in the Western Europe, and was archly shifted into the XIV century and ascribed to Petrarch so that it would gain the “authority of antiquity.” The reality of the XVI-XVII century, which Petrarch cites as the antithesis of “ancient civilization,” was later baptized “feudal barbarism.”

4.2. Petrarch’s private correspondence with people considered “ancient characters” nowadays

We proceed to encounter facts that seem to defy all reason. Apparently, *Petrarch writes a letter to Titus Livy* ([644] and [1340]). The commentators of today try to assure us that this *private letter* written by the mediaeval Petrarch to the “ancient” Titus Livy is but a manifestation of the poet’s exalted imagination, since poets are supposed to be fantasy-prone in general. We are told that Petrarch communed with characters from the “distant past” as if they were his contemporaries. His letters to the heroes of the “distant past” are thus not to be taken literally. What is the truth here? Could such a letter simply mean that Petrarch and Titus Livy were contemporaries, and that the XIV century original was later altered by the Scaligerite editors of the XVI-XVII century in order to “sever” Livy from Petrarch and “send” the former into a distant epoch? Petrarch is supposed to have made remarks of great pathos, such as “O, why did destiny deny me life in your age... in my sweetest dreams I see myself living amongst these greatest of men, and not the thieves and rogues [sic! – A. F] that surround me nowadays” ([644]). And further on: “ancient studies have always been... a matter of great interest and importance to me, and I have pursued them with great zeal, for the time I live in had always seemed loathsome to me, and so... I have always wanted to have been born in any other age and forget about this one, and have always tried to let my soul live in different epochs” ([644]).

This letter to Titus Livy is far from being the only such example. Modern Petrarch scholars point out a peculiar facet of his epistolary legacy that they fail to comprehend. Petrarch wrote quite a few letters to his contemporaries, and it turns out that in his Latin correspondence he tried, as we are now being convinced, to *deliberately obfuscate mediaeval reality, referring to “antiquity” instead*. We proceed to learn that Petrarch used *ancient* names and nicknames – Socrates, Lelius, Olympius, Simonide, etc. His letters have an air of antiquity about them in the modern interpretation of Scaligerian chronology. That is to say, he wrote as if he had “lived in the Classical Age.” We are

told nowadays that he deliberately Latinised his letters to make them seem explicitly ancient. He allegedly even *obscured* current events from sight, “dressing them in ancient garments”.

We have the following comment to make. Apparently, the pages of Petrarch’s letters, even after being “caringly” edited in the XVI-XVII century, demonstrate to us the true epoch of the XIV century – which, as we see, was the “Classical Age” that Scaligerite chronologers hastened to send into distant past. This makes their heirs of today resort to theories about Petrarch being *deliberate* in his attempts to make mediaeval contemporaneity “resemble antiquity.” That is to say, he isn’t supposed to be taken literally.

We shall summarize, reiterating that there had most probably been no false fronts here. Petrarch wrote letters to his contemporaries whose names were “ancient” because he and his colleagues were living in the “Classical Age,” which may really have fallen on the first half of the XIV century or even later, and all the “ancient characters” bearing such names as Titus Livy, Socrates, Lelius, Olympius, etc. were Petrarch’s *actual contemporaries*. This point of view eliminates many “oddities” from his biography.

Furthermore, Petrarch wrote a series of biographies titled *The Lives of Famous Men*. This appears to be a kind of “repetition” of the work of the “ancient” Plutarch titled *Comparative Biographies*. One wonders whether Plutarch might have merely been a different name of Petrarch’s? It is well known – see more on this in [Chron5](#) – that the sounds “R” and “L” were often subject to flexion in old texts, which may have made the name of Plutarch sound like Prutarch, which sounds similar to the name Petrarch. Thus, Petrarch may well have gathered a doppelganger on the pages of the mediaeval chronicles, who was exiled into the distant past under the name of Plutarch.

Nearly all of Petrarch’s heroes are to be found among the eminent statesmen of the “ancient” Republican Rome, namely, the “ancient” Junius Brutus, Horace Cocles, Camillus, Manlius Torquatus, Fabricius, Fabius Maximus, Cato the Elder, Scipio Africanus. Nowadays it is assumed that Petrarch’s sources were the works of Titus Livy, Suetonius, Justin, Florus, and Caesar. Is this really so? Could Petrarch – or Plutarch – have merely written a series of biographies of his *contemporaries*? In other words, all of the “ancient” characters listed above must have lived in the epoch of the XII-XVI century. And it was only much later that the Scaligerite editors of the XVI-XVII century raked through these mediaeval biographies, inserting remarks that transferred them into the distant past, which may have created an “ancient” reflection of the mediaeval Petrarch by the name of Plutarch.

Finally, we shall cite two portraits of Petrarch (or Plutarch?) from a mediaeval book allegedly dated at 1388 ([1485], pages 252-253), seen in figs. 7.28 and 7.29. It is therefore possible that more or less accurate graphical representations of the ancient “Plutarch” have reached our age.

Fig. 7.28. A portrait of Petrarch (Plutarch?) from a book titled *De Remediis utriusque Fortunae* allegedly dating from 1388 (Milan, Italy). The commentary given by historians is as follows: “An initial to the first chapter of the first book with a portrait of Petrarch” ([1485], page 252). Taken from [1485], ill. 330.

Fig. 7.29. Another portrait of Petrarch (Plutarch?) from *De Remediis utriusque Fortunae* allegedly dating from 1388 (Milan, Italy). The historians tell us that we see “the beginning of the second book with a miniature depicting Petrarch over a bookrack in his studio” ([1485], page 252). Taken from [1485], ill. 331.

5. “Ancient” Greece and mediaeval Greece of the XIII-XVI century

5.1. The history of the mediaeval Athens is supposed to be obscured by darkness up until the XVI century

In what concerns integrality, the history of mediaeval Greece has even got more problems than that of Italian Rome. Since Greek chronology is largely determined by the history of Athens, we shall give a brief account of Athenian chronology without considering other Greek cities here. Let us consider the fundamental work of F. Gregorovius titled *The History of the City of Athens in the Middle Ages* ([195]), where many mediaeval documents on the history of Greece are collected. A propos, the “ancient” history of Greece lacks a source that would resemble the *History of the City* of Titus Livy in fundamentality and the span of time that it encompasses. This is why the Scaligerian history of Greece has to be reconstructed from a number of chaotic fragments that were put into a sequence via tying them to the Roman chronology ([195] and [196]).

As is the case with the history of the absolute majority of “ancient” cities, the history of Athens is characterized by an “ancient” period of splendour and prosperity, and subsequent slide into the mediaeval darkness that the city begins to come out of as late as the XV-XVI century – even later than the Italian Rome.

We shall begin with the most remarkable utterance of F. Gregorovius:

“In what concerns the actual city of Athens, its fate in this epoch [the Middle Ages – A. F.] is covered by such *impenetrable darkness* that it even led to the naissance of the horrendous opinion which does sound rather plausible, namely, that the city of Athens had *grown over with trees and weeds* between the VI and the X century, and ended up *burnt to the ground by the barbarians*. There is some firm evidence of the existence of Athens in the darkest era, but hardly anything can serve as *more surprising proof* of the city’s *complete disappearance* from the historical horizon than the very fact that one has to *prove the actual existence* of what used to be one of the *greatest* cities in a country that is historical for the most part”. ([195], page 41.)

This is coming from none other than F. Gregorovius, who tried to collect everything that was left from the mediaeval history of Athens in his work ([195]).

This amazing information about the fate of Athens in the Middle Ages had first been formulated with clarity by Falmerayer in the XIX century. In order to explain such an enigmatic “catastrophe” as the disappearance of the entire “splendorous ancient

Greece,” he suggested that the Avaro-Slavs had “slaughtered the entire populace of the ancient Greece” ([195], page 41). However, there are no documents whatsoever that would prove this “slaughter.” ([195])

F. Gregorovius proceeds to tell us the following:

“From the VII century and on Greece becomes so *unimportant for history* that the names of the Italian towns... are mentioned a lot more often by the Byzantine scribes than those of Corinth, Thebe, Sparta, or Athens. All of that notwithstanding, *there isn't a single word from any scribe that would mention the city of Athens conquered or destroyed by invaders*”. ([195], page 42).

It is assumed that there is no information whatsoever about Athens in the period of the V-X century A.D. in Scaligerian history. F. Gregorovius tells us that “the city [of Athens – A. F.] became desolate and poor, its naval supremacy and political life were *as lacklustre as life in the entire Hellas*” ([195], pages 2-3). Also, “the foundation for the glory of the modern [mediaeval – A. F.] town is provided by honey-traders, and not sages... Sinesius *doesn't write a single word* about the famous monuments of the city in his letters from Athens” ([195], page 22). Most probably due to the fact that they haven't been built yet.

Also: “The twilight that engulfed Athens and Hellas grew ever dimmer... political life has become nonexistent, trade and industry hardly galvanized any Greek cities at all, except for the spry marketplace of Thessalonica” ([195], pages 26-27).

The famous “ancient” Parthenon amazingly turns out to be a mediaeval Christian church. See figs. 7.30 and 7.31. The historians try to “explain” this fact in the following way: “Blessed Virgin Mary already began her victorious war for Athens with the ancient Pallas... The Athenians built a splendid church [in the alleged X century – A. F.] having mounted this figure [of the Christian Holy Mother, Virgin Mary – A. F.] upon it and called it Athenaia” ([195], page 24). In other words, we are being told that Virgin Mary was baptized Athena!

Fig. 7.30. Parthenon in the Athenian Acropolis. Its XIX century condition. Taken from [\[304\]](#), Volume 1, page 150.

Fig. 7.31. Parthenon in the Athenian Acropolis. Its modern century condition. Taken from [\[930\]](#), page 60.

Furthermore, the historians proceed to tell us that “oral tradition calls the figure of the Holy Mother Athenaia [Athena – A. F.]; this name later began to be used for referring to the “Panhagia Atheniotisse” figure that had been revered highly in the mediaeval temple of Parthenon” ([\[195\]](#), page 25, also see fig. 7.32). Apart from finding that the “*ancient*” *Athena* was associated with the *Christian Holy Mother of God*, we find out that the “*ancient*” *Parthenon* was built in the Middle Ages as a *Christian temple* dedicated to the *Christian Virgin Mary* = *Athena*. As we are now beginning to understand, *Athena* was just another name given to *Virgin Mary*. The classical “ancient” figure of *Athena Parthenos*, or the *Athena of Parthenon*, can be seen in fig. 7.33.

Fig. 7.32. A reconstruction of the inner sanctum of the Parthenon with a statue of Athena by the “ancient” Phidias. The reconstruction was done by H. Ralender. Taken from [\[304\]](#), Volume 1, page 153.

Fig. 7.33. The “ancient” Athena from the Parthenon. According to the historians, this marble figurine that was discovered in Athens in 1880 “represents a copy from the colossal effigy of the goddess that used to stand in the

F. Gregorovius carries on: "The noblest of human cities *immersed into its darkest Byzantine age with utter hopelessness...* the New Rome on the Bosphorus became to look at the fallen Greece, a former leader, with growing scorn, as well as *the small provincial town of Athens*" ([\[195\]](#), pages 27-28).

Also:

"In what concerns the fate of the Athenian monuments – they have remained in obscurity for the most part... *for centuries the Greeks have wallowed in the ruins of their ancient history...* some of the most beautiful ancient constructions have tempted the Athenian Christians to *transform them into churches*. We know nothing of where the first transformation of an ancient Athenian temple into a Christian church occurred. *The history of the Athenian churches is extremely unclear*" ([\[195\]](#), pages 29-31).

The following is told about the "ancient" Parthenon: "The Christian religion had made *the holiest place of the ancient goddess* on the Acropolis [the temple of Parthenon – A. F.] *serve its ends almost without causing any harm to it...* the entire history of transformation of ancient beliefs and holy places into Christian ones knows *no other example of such easy and complete* transformation as Athena Pallas had to undergo in order to become the Christian Blessed Virgin Mary... the Athenian populace didn't even have to change the nicknames for its divine virgin protectrix, since *the Blessed Virgin Mary retained the ancient name of Parthenos*" ([\[195\]](#), page 31).

However, the hypnotic suggestion of Scaligerian chronology is strong enough to restrain Gregorovius the historian from drawing any conclusions from the fact that the "ancient" Athena Pallas is identical to the Christian Mother of God, Virgin Mary. Let us draw this conclusion ourselves. We have really just been told that the history of "Classical" Greece and its "ancient" deities is but a reflection of the mediaeval Greek history of the XII-XVI century and its Christian deities.

As was the case in Italian Rome, many "ancient" temples in Athens were "turned into" Christian churches in the Middle Ages. In addition to this, the names of these mediaeval churches are "for some reason" exceptionally close to those of the "pagan shrines" that "occupied the sites of these churches" at some point in time. For example, "the Church of *St. Dimitrios...* became identified as the temple of *Demeter* [by modern archaeologists – A. F.]" ([\[195\]](#), page 34). This example is a most typical one ([\[195\]](#)).

We eventually find out that "the miraculous Erechtheum temple was transformed into a *Christian church* during an age that remains unknown to us" ([\[195\]](#), pages 46-47). Apart from this, "*the entire Acropolis became a holy place of the Blessed Virgin Mary*" ([\[195\]](#), page 36). Documented history only seems to reflect the Parthenon

starting as the temple of the Virgin Mary. All attempts at tracing its history further back run into considerable complications ([195]).

Mediaeval Athens only appears in the mediaeval arena after many centuries of presumed oblivion as a small Byzantine fortification “reconstructed” by Justinian in the alleged VI century A.D. on territory populated exclusively by the Avaro-Slavs ([195], pages 36-40). *There is not a single trace of the “ancient Hellenic Greeks” here.* Moreover, according to an old document allegedly dated from the X century A.D., the Avaro-Slavs had “made it [the Peloponnesus – A. F.] so alien to the Byzantine empire, that there is not a single Romaeon bold enough to set foot there” ([195], pages 40-41).

We learn the following about the Athens of the alleged VI-VII century: “we have *no factual proof* of the existence of *either schools or public libraries* in Athens. The same obscurity covers the *mechanisms of civil rule* of the city of Athens in this epoch” ([195], page 48).

Why did “Classical thought” evaporate from Greece? Where did the “Classical Greeks” go? Why had the famous “ancient” military naval potential of Athens disappeared? This potential was as a matter of fact “revived” in the XII-XIII century, the crusade epoch, as was the potential of the mediaeval Venice, or the “ancient” Phoenicia.

According to the documents, the Byzantine emperors who ruled in Greece in the Middle Ages were far from persecuting sciences. There are no facts to indicate the existence of the Inquisition in Byzantium ([195]). The “closure” of the famous Academy in Athens occurred “without a sound,” as Gregorovius tells us with some embarrassment in [195], Chapter III. There were no global military coups or genocides in this epoch, either.

It is significant that the very term “Hellenes” appears very late in documented history: “It is only in the XV century that Laonic Chacocondil of Athens gives his fellow countrymen the name of “Hellenes” [after the alleged centuries of oblivion – A. F.]” ([195], page 51).

One feels like asking the reasonable question of whether the Hellenes who originally inhabited Greece were really virtually wiped out by the Slavs, as Scaligerian history tells us? Could it be instead that the Avaro-Slavs who lived there in the late Middle Ages became Hellenised? The theory of Slavs gradually taking over the “Classical Greeks” is based on nothing but guesses made by Scaligerian chronology. On the other hand, Shafarik, the Byzantine historian of the alleged X century, explicitly states that “*nowadays almost all of Epirus and Hellas, as well as the Peloponnesus and*

Macedonia are populated by the Scythians and the Slavs” ([195], page 54, also comment 5). F. Gregorovius adds that “due to the existence of such evidence from the part of the Byzantines, the population of the ancient Greek lands by the Slavs should be considered a historical fact” ([195], pages 54-55).

Slavic names of cities, rivers, mountains, etc. cover the entire history of mediaeval Greece in abundance – Volgasta, Goricy, Granicy, Krivicy, Glokhovy, Podagory, etc. ([195]). “The names of areas, rivers and mountains show that Elis, Arcadia and Laconia have been populated by the greatest amount of the Slavs” ([195], pages 57-58). It was only in the XVI-XVII century that the Graeco-Hellenic names started to appear, the ones declared extremely ancient in the XVII-XVIII century.

It was only afterwards, starting with the alleged VIII century A.D., that Constantinople began to gradually take this faraway province in hand. “The country had to be conquered anew; Greece was treated as an enemy country” ([195], page 62). Empress Irene sent troops to Greece in the alleged year of 783. “Stauracius returned... with plenty of loot, as if he were coming back from a conquered land... *Neither Corinth, nor Thebe, nor Athens are even mentioned*” (ibid). In the alleged VIII century *Greece served as an exile for political criminals*.

It is only in the alleged VIII century A.D. that Greece enters the real political arena as a country of revolts and mixed populace that was Slavic for the most part ([195], pages 62-63). However, “after the fall of the empress Theophano, Athens, as well as the rest of Hellas, *leaves the historical scene in such a radical way that one can barely find a mention of the town’s name anywhere*... The Slavs, who have rooted themselves in Peloponnesus, provided the Byzantines with the main reason to mingle in Greek affairs” ([195], page 66).

“In the middle of the [alleged – A. F.] X century, Hellas as well as Peloponnesus may have struck emperor Constantine as... countries that *fell into barbarism*; the Frankish conquerors of the XIII century have found *Slavic residents* in Morea” ([195], page 71). We keep moving forward in time using the Scaligerian chronology of Greece, and still fail to encounter any substantive information about the country.

F. Gregorovius frankly writes the following about Greece in the alleged VIII-X century:

“Neither history, nor tradition break the silence that the fate of the glorious city is bathed in. This quietude is so impenetrable that the historian that looks for signs of life [sic! – A. F.] of the famous city during the centuries in question rejoices at the sight of the most exiguous pieces of information, such as the mention of St. Luke visiting Athens in the hagiography of the thaumaturge”. ([195], pages 74 and 76).

It is only as late as the XV century that Greece and Athens emerge from the “darkness.” Greece gains special importance in the crusade epoch, beginning with the alleged XII-XIII century. Possessing a good haven in Piraeus, and being in league with Venice, Athens becomes the key city of the region ([195]). A propos, there are quite a few reasons to identify the mediaeval Venice with the “ancient” Phoenicia, qv in [904] and [908]. Athens broke the equilibrium that reigned in Greece by gaining prominence; Peloponnesus opposed such a swing in influence, which led to prolonged wars on the territory of Greece which the crusaders and the Normans took part in [195]. It is significant that this is the period of the Middle Ages that we associate with the astronomical dating of the eclipse triad mentioned in the famous *History* by Thucydides – the work describing the “ancient” Peloponnesian wars. Nothing is known about the wars that broke out on the territory of Greece in the XII-XIII century according to Scaligerian chronology.

An unimaginable scantiness of information on mediaeval Greece is most probably explained by the fact that many of the principal mediaeval sources of the epoch, such as the works of Thucydides, Xenophon, etc. have been arbitrarily transferred into “antiquity” by the Scaligerian chronology. Mediaeval history of the XI-XV century Greece thus became covered in “blind spots,” gaping abysses and “dark ages.”

It is important that “*the chronological dates in Greece are only given in the Christian era starting with 1600 [sic! – A. F.], and in decimal (Arabic) notation at that*” ([195], pages 100-101). We have thus been told that the modern chronological system only began to function in Greece as recently as the *seventeenth* century of the new era.

Rather meagre chronological landmarks provide us with very little data, as it turns out. F. Gregorovius notes that:

“The effect that time and the weather had on these *scarce inscriptions* made their interpretation considerably harder... *they fail to do so much as shed light on the history of the city of Athens in the Christian epoch...* A historian researching the mediaeval past of the city of Rome is in a much better situation in this respect [we have mentioned the problems of Roman chronology already – A. F.]... The chronicle of the dead carved in stone is *altogether absent* in Athens”. ([195], page 101).

“Unlike Rome, we encounter no marble effigies of dead bishops and monastery priors, senators, judges and citizens in Athens; *a few tombstones, a sarcophagus or two without any statues at all, and a few inscriptions comprise all of the relics of times gone by to remain in Athens*” ([195], page 101). As well as a few “ancient ruins” to boot.

There are several contradictory versions concerning Athens in the XII-XIV century in Scaligerian history, each of which assesses the role of the city differently. According to one of them, it was still covered in *impenetrable darkness* as well as the rest of Greece ([195]). Another version has it that this is the period when Athens gradually began to gain prominence as a large cultural centre. The English chronicler Matthew Paris informs us that in 1202 several Greek philosophers who had allegedly reappeared in Athens after many centuries of oblivion, arrived in the English court and engaged in theological dispute ([195], page 111). Later on English scientists, among others, studied in Athens (*ibid*).

5.2. Greece and the Crusades

Crusades have not just been great religious and military endeavours – they have also had stupendous secular importance. The “Latin crusade,” for instance, was initiated not just by Innocent III, but also by the Europeans who possessed great secular power as well – including the French, the Belgians and the Germans ([195]). Among the initiators were such names as Count Baldwin of Flandres, Geoffrey of Villehardouin, Marshal of Champagne, Count Hugues de Saint Paul, Louis de Blois and many others. All of them have been the top ranking members of European aristocracy ([195], page 129). The crusades were transformed utterly – from a holy endeavour into one of the most secular events of the Middle Ages.

The crusades created a mosaic of feudal states in the territory of Greece. The role of the mediaeval Latin states in Greece is usually assessed as largely negative in the Scaligerian history ([195]). On the one hand, it is considered that the barbaric and ignorant conquerors buried the great “ancient” legacy of Greece. On the other hand, the same F. Gregorovius who had just accused the crusaders of barbarism, makes the sudden statement that “it is to the Latins that it [Greece – A. F.] owes the discovery of contemporary history – which, however, turned out almost just as farraginous as that of antiquity” ([195], page 138).

Since the Republic of St. Mark, for instance, proved unable to take possession of the entirety of the Greek lands, it offered them to its noblemen to divide between themselves as inheritable fiefs ([195], page 150). These events may have reflected in Russian history as the difficulties encountered by the imperial administration during the divide of the vast lands of Novgorod and the trophies brought back by the Russian army in the XV century under Ivan III The Terrible. See more about this in [Chron6](#).

“The Venetian noblemen have longed for adventure, and set forth to sail the Greek

seas fancying themselves as the Argonauts of the XIII century” ([195], page 150). These mediaeval journeys may have provided the basis for the subsequent “Classical Greek” Argonaut myth poetized by the “ancient” blind Homer. This is the conclusion that one arrives at after a study of the global map of chronological shifts, qv above.

It is important that the history of the Frankish state in the territory of mediaeval Greece is only known to the Scaligerian history of the XII-XV century with lots of gaps and blind spots due to the “insufficiency of historical documentation” ([195], page 158). The only thing that’s known is that “Feudalism... was powerful, and could create a viable... and durable state” ([195], page 158). According to F. Gregorovius, “that was the time when tales and legends became reality” ([195], page 164). This must have been the mediaeval epoch when “ancient” Greece flourished. Many “ancient Greek events” are thus mediaeval occurrences that took place in the Balkans, in particular, in the territory of Bulgaria.

“The princely court of Geoffrey II of Villehardouin... possessed the reputation of a school for exquisite manners” ([195], pages 167 and 182). Genoese traders settled in Thebe and in Athens, and came to compete fruitfully with their Venetian colleagues ([195], page 184). Literature and arts flourished as well; however, according to Scaligerian history, nothing has reached our age ([195]). Our version is that all of this was thrown back into “antiquity.”

Nowadays it is considered that the title of the Duke of Athens was *first* introduced during the mediaeval Frankish rule in Greece. On the other hand, according to Scaligerian history, *this very title* had existed in “antiquity” as well ([195], pages 188, comments 4 and 5).

It is likely that the next heyday of “ancient” Greece and the Balkans falls over the epoch of the XV-XVI century after the fall of the Byzantine Empire in 1453, as a result of its being conquered by the Ottomans = Atamans. However, let us get back to the Frankish epoch.

The historian Ramon Muntaner, a contemporary of Dante’s, relates the following fact, apparently being perfectly unaware that it contradicts Scaligerian history blatantly. However, the latter came into existence after Muntaner’s age, in the XVI-XVII century. “One of the Trojan outposts was located on Cape Atraki in Asia Minor, near Isle Tenedos, a place that the nobility of Romania... made frequent pilgrimages to... for the adoration of the divine effigy. One day *Helen, the wife of the Duke of Athens* went there guarded by a hundred knights. *Paris, the son of the Trojan king, noted her, killed all the knights in the hundred, and abducted the beautiful duchess*” ([195], page 188,

comment 6). Thus, mediaeval chronographers have been of a significantly different opinion on what concerned “ancient” events and their chronology, than Scaliger and his adherents.

If we turn our attention to the chronological map on fig. 6.43 in [Chron1](#), Chapter 6, we shall see that the mediaeval prototype of the Trojan war falls in the middle of the XIII century A.D. Which means that Muntaner was perfectly right in his relating the events of the Trojan war as occurrences of the epoch of *knights and dukes*.

“The condition of the Frankish states in the early XV century Greece can be described as favourable in general” ([\[195\]](#), page 188, comment 34). One shouldn’t imagine this epoch as a period of constant wars and military campaigns. Peace reigned for most of the time, and trade flourished. “The Latins must have felt... safe in Greece; a splendid knightly life evolved, which can be proved... by the existence of a parliament... in May 1305, in Corinth... on the isthmus where *in ancient times the Games of Poseidon took place in the holy pine grove... the knights now engaged in jousts, dedicating their deeds of bravery to beautiful women... the clamorous festivities lasted for twenty days*” ([\[195\]](#), page 188, comment 34).

It is significant that the Frankish barons “adorned their constructions with *Greek* [sic! – A. F.] inscriptions” ([\[195\]](#), pages 204-205). Some of them may have been declared “extremely old” nowadays. Scaligerites themselves point out the numerous parallels between the “ancient” and the “mediaeval” events in Greece. F. Gregorovius, for instance, mentions the famous battle at Cephissus dated to 15 March of the alleged year 1311 A.D. It is described in practically the same words in both the mediaeval sources of the XIV century and the “ancient” biography of Emperor Sulla written by the “ancient” Plutarch (Petrarch?). Nowadays both Sulla and Plutarch are dated “days long gone.” However, both the “ancient” and the mediaeval descriptions of the battle are practically identical: the geographical localization of the battle, the opposing sides, and the victor ([\[195\]](#)). F. Gregorovius cannot help noticing the parallel here: “The banks of Cephissus saw the recurrence of the fate of the troops of Mithridates which had once been chased into these very swamps by Sulla” ([\[195\]](#), page 198). Let us point out that this parallelism concurs fully with the global chronological map falling into the sum of the three shifts.

The Frankish states on the territory of XII-XIV century Greece may be (at least) a partial reflection of the *Ottoman* states of the XV-XVI century that appeared in Greece and the Balkans after the fall of Constantinople in 1453 and the birth of the Ottoman = Ataman Empire. “Greek antiquity” may have similar Ottoman-Balkan roots going back

to the epoch of the XV-XVI century.

It is significant that the history of the Frankish states in the territory of Greece hadn't been studied until the XIX century. According to W. Miller, "these archives only provide us with a skeleton of the romantic drama that Greece served as theatre for during 250 years [in the alleged XIII-XV century – A. F.], the one where the leading roles were played by a motley crowd of Burgundian nobility as well as German knights, the Catalan filibusters... the Florentine plutocrats... and, finally, the princesses and noblewomen from the oldest families of France" ([1274], quoted in [544], Volume 4, page 750).

We are further told that in the XII century the "ancient" Parthenon functioned as a Latin temple of the Athenian *Virgin Mary*, "as if it had just been built" ([1274], page 16, quoted in [544], Volume 4, page 805). The famous XIII century statue of the *Catholic Virgin Mary* stands in the mediaeval Parthenon as if playing the role of the duplicate [!] of the famous "ancient" statue depicting the pagan "Virgin of Athens by Phidias" (see figs 7.32 and 7.33), whose loss is lamented greatly by the Scaligerian history ([544], Volume 4, page 806).

Modern historians are of the opinion that "in 1460 Muslim rulers added a *prayer-tower* to the Parthenon, turning the ancient temple of Athena Pallas *into a mosque*" ([198], page 14). However, as we are beginning to understand nowadays, it is possible that the Parthenon had originally been a Christian temple where the elements that were subsequently separated and declared exclusively Muslim, Orthodox, or Catholic, still existed in fusion with each other. Thus, a high belfry may well have been baptized the "minaret of the Parthenon."

Another "ancient" temple that was active in the XIII century – also seemingly built only recently – was dedicated to the Holy Mother of God, and is called "the ancient Erechtheion Temple" nowadays ([1274], page 17, quoted in [544], Volume 4, page 807).

The same XIII century sees the temple of St. George, which is called "the ancient temple of Theseus," operational and active. Its "undisputable antiquity" was estimated as recently as the XVII century ([1274], page 17; quoted in [544], Volume 4, page 807).

The entire Athenian Acropolis is perfectly functional in the XIII century as an active fortress protecting Athens. In fig. 7.34 one sees a later theoretical reconstruction of the Acropolis performed by H. Ralander. It was relatively recently that the fortress became declared "extremely ancient." The ruins of the Acropolis can be seen in fig. 7.35 the way they were in the XIX century. See similar examples in [1274] and [544], Volume 4.

Fig. 7.34. The general view of the reconstruction of the “ancient” Athenian Acropolis. The reconstruction was performed by H. Ralender from the surviving ruins. Taken from [\[304\]](#), Volume 1, pages 148-149.

Fig. 7.35. General view of the ruins of the Athenian Acropolis from its southern side. Its XIX century condition. Taken from [\[304\]](#), Volume 1, page 160.

F. Gregorovius tells us that “The famous Byzantine George Gemisto (Pleto) – an ancient Hellene born again... the fantastical admirer of the ancient gods – lived at the court of Theodore II” ([\[195\]](#), pages 308-309).

According to historians, that was the time when the “concept of Hellenism” came to existence, whose main goal was the unification of the mediaeval Greeks against the Ottoman = Ataman conquerors ([\[195\]](#)).

We are also told that “The total absence... of foreign chroniclers in Athens and Hellas in general is most woeful indeed. Since the Byzantine chronographers didn’t consider the Hellenic history worthy of attention, the Hellenes were the only ones that

their descendants could turn to for this kind of information” ([195], page 326).

We also find out that the genesis of “ancient” Greek history can be traced to Florence of the alleged XIV century. “The Strozzi and the Medici... have been philhellenes, they have invested their funds into... Greek literary studies... Cosimo conceived of the plan to revive the academy of Plato in Arno” ([195], page 330). The head of this undertaking was *Pleton*, the double of the “ancient” Plato in both name and occupation (see [Chron1](#), Chapter 1). It is assumed that the propagation of the “ancient” Greek literature across Europe started in Florence.

5.3. The history of Greek and Athenian archaeology is relatively short

Archaeology first came to Athens in 1447 – the XV century! Furthermore, there is hardly any information left in what concerns those “origins.” In the XV century Ciriaco d’Ancona arrived in the city. He is also known as Ciriaco de Pizzicolti nowadays ([198], page 14). He was the first to “introduce Western science into the world of the Athenian ruins... he thus occupies an honorific place” ([195], page 331). He created the *first* catalogue of inscriptions and local monument names. *However, these documents perished* ([195], page 339). Modern historians are only familiar with the data obtained by Ciriaco *from paraphrases done by later authors of the XV-XVII century*. “The notebooks [of Ciriaco – A. F.] were *destroyed in a blaze* in 1514, as it is assumed. There is only one fragment that is written by his own hand” ([198], page 14).

F. Gregorovius tells us the following: “After the passage of some time, the initial names of most Athenian monuments have been forgotten... the fantasy of certain archaists... tried to link them to the names of great men of the past” ([195], pages 340-342).

The ruins of the “ancient” Olympion used to be called a *basilica* in the Middle Ages, since, according to F. Gregorovius, “*nobody knew* [sic! – A. F.] that these were the ruins of the famous Olympian temple. Ciriaco calls this colossal wreck... the palace of Hadrian, *as the Athenians did*” ([195], pages 340-342). The latter apparently were wrong; only the historians of the subsequent generations managed to “learn the truth” and “correct” the allegedly ignorant inhabitants of mediaeval Athens.

Gregorovius also tells us that “as early as 1672 Babine had no idea as to the correct location of the Temple of Zeus in Athens... in a few years... Spone would be similarly confused... The Stoa ruins were fancied as the palaces of Themistocles or Pericles; the walls of the Odeon of Herod Atticus – as the palace of Milthiades, the ruins of other

unidentified buildings – as the residences of Solon, Thucydides, and Alcmeones.

As early as 1647... Pointel was shown the ancient ruins of the palace of Pericles; the tower of the winds was called the tomb of Socrates. The memories of Demosthenes were associated with the monument to Lisicrates... this monument of the choir patrons... was called... the Lamp of Demosthenes...

The Academy, the Lycaean, Stoa, and the Epicurean gardens... were gone without a trace. In the times of Ciriaco, some group of basilicae, or large ruins, was called “Academy”; nowadays, this site is impossible to locate...

Plato’s “didascalion” in “the garden” had also been shown; it may have been a tower in the Ampelokipi gardens... there were legends about the schools of a certain Caisarini on this hill... the Lycaean or the Didascalion of Aristotle would be located in the ruins of the Dionysian theatre...

Stoa and the Epicurean School have been *moved* as far as the Acropolis, to the large buildings that *possibly* constitute part of the Propylaea, and the Nike temple... had *seemingly been taken for*... the school of Pythagoras.

To the West of the Acropolis the school of the Cynics was shown, as well as the school of the Thespians that *wound up in its vicinity in defiance of all comprehension*. The ruins by Kalliroe *turned out to be* the remnants of the scene of Aristophanes.” ([195], pages 340-342)

We shall cease with quoting. This list goes on for several pages. The general picture of *archaeological chaos* and confusion in the history of Athens is perfectly clear. And all of this happens *in the XVI-XVII century a.d.*

Byzantium fell in 1453. The last of the Franks defended the Acropolis for some time; however, the Ottoman warlord Omar, infuriated by the resistance of this stronghold, ordered the Acropolis and its environs *to be shelled* (!), which resulted in the demolition of the Acropolis and its temples [195]. This great destruction, which claimed many beautiful monuments of the XIII-XV century, created many ruins in the territory of Athens that were subsequently declared “ancient” – see figs. 7.30, 7.31, and 7.35.

After the Ottoman conquest of the XV century, Athens become *obscured by darkness* yet again. “The historian studying Athens and Greece in the period of Turkish rule has *as formidable a task before him as it is mirthless*. What he sees before himself is a *desert*” ([195], page 362). It is possible that the XV-XVI century documents describing the events in Greece and the Balkans, which belonged to the Ottoman empire in the XV-XVI century, were destroyed after the defeat of the Ottomans and their withdrawal from

the Balkans. The Ottoman period in the history of Greece thus became immersed in utter obscurity.

“The West... had become reconciled to the decline of Greece, and *had almost completely forgotten it*... Already in 1493 a German humanist had considered it sufficient to make the following passing remark in his chronicle: “the city of Athens used to be the most glorious one in all of Attica; only a few traces of its existence remain”” ([195], pages 364-365).

Finally, towards the end of the XVI century, “the need of the scientists for possessing veracious and exact information about the fate of the splendorous town could be formulated by just one question, that of *whether Athens still existed*. The person to ask this question was Martin Kraus, a German philhellene... this is how his name became *immortalized*. Martin Crusius... *rediscovered* Athens. In 1573 he had written a letter to Theodosius Zygomalas, the chancellor of the Patriarch of Constantinople, asking him to tell whether the mother of all knowledge could have indeed reached complete decline, as German historians claimed; whether the great city of Athens could really have *vanished* and whether it were true that *nothing remained of it but a few fishermen’s huts* standing on its former site.

The answer of the illuminated Byzantine, together with the letter from the Akarnan Simeon Cabasilas that followed... proved *the first exact information* that reassured the German scientist in what concerned the city’s existence; it was *the first dim light* shed on its monuments and their condition, as well as the *obscure vegetation of its inhabitants*”. ([195], pages 364-366).

Obscure vegetation or not, the inhabitants, according to the Scaligerian history, still kept the tradition that the Parthenon had been built by the “ancient” architects Ictinus and Kallicrates in the time of the famous orator and warlord Pericles, the leader of the democratic party that had allegedly originated in Athens as early as the V century B.C., and expired of the plague together with its dux in the alleged year 429 B.C. However, the month when this is supposed to have happened remains unknown.

All knowledge of “ancient Greece” remained rudimentary up until the beginning of the XVII century. In 1607, for instance, the *Geographical Atlas* of H. Mercator and J. Hondius was published. It contained a map of Greece, with the following written on its reverse, among other things: “Back in the days of yore Athens gave the world well-educated scientists who wrote books on all subjects of all sciences, which were kept in Athenian libraries, public and private. However, nowadays *no one in either Greece or any other barbaric country studies or even understands belles letters and science*. It

is *impossible* to find a town that would have an academy... the people of Greece remember *nothing* of their history nowadays” ([90], page 71).

Scientific Athenian archaeology developed *as late as the middle of the XVII century* – that is to say, when Scaligerian chronology had already been in existence.

Archaeology first reached Athens by the agency of the Dutchman Jaan de Maer ([195], page 366). Nevertheless, “as late as 1835, a German scientist... had voiced the opinion that after Justinian, Athens had remained a *wasteland* for four centuries. In comparison to the Roman studies, the archaeology of Athens was about *two centuries late*...

Only immediate acquaintance with the matter could destroy the superstition *that Athens didn't exist anymore*, which was rather widespread in Europe: the French Jesuits and Capuchins are to be credited for it, since they were the first to come to Athens in 1645.” ([195], pages 364-66)

In the second half of the XVII century, the French monks drew the first (!) plans of the city. That was the moment when the uninterrupted and more or less scientific studies of Athens really began. This happened in the environment where Scaligerian chronology had already existed for the most part; therefore, the historians of the XVII-XVIII century who began the reconstructions of Greek history based their research on the Roman chronology, ipso facto distorting the history of Greece.

5.4. The tendentious distortion of the image of mediaeval Athens in the “restoration works” of the XIX-XX century

Let us now divert our attention to the moment in the XIX century when the Europeans achieved a hard and final victory over the Ottomans, and come to the territory of Greece in general and Athens in particular. One would wonder what they saw, in the Athenian Acropolis, for instance? They witnessed the most natural things of all. It turned out that Athens (including the Acropolis) were full of *Ottoman buildings, towers and temples*. Many of them were damaged in the Ottoman wars of the XVII-XVIII century. For instance, we are nowadays told that “when war broke out between Venice and the Ottoman empire, a shell from a cannon hit the Parthenon, where the Turks kept their ammunition. It detonated, and many of Phidias’ sculptures were shattered” ([198], page 19).

However, it isn't exclusively the Ottomans who are portrayed as culprits responsible for the majority of destructions that occurred in the territory of Greece. Lord Elgin, for instance (fig. 7.36), and the Italian painter Lusieri, who headed the International Commission for the Restoration of Athens, uttered loud public lamentations about “the

state of the surviving statues being truly deplorable... which is to be blamed on the *Turkish garrison* of the Acropolis; some of the Statues were *smashed to bits* by the Ottomans for the production of shells [? – A. F.]. The actual ancient Parthenon remained untouched for the most part even after the explosion of 1687, and was baptised ‘the ancient idol temple’ by the Turks, who had periodically ransacked it in search of lead” ([198], page 19). That is to say, the benevolent and righteous West Europeans have gone out of their way in order to keep the “ancient” Greek masterpieces for posterity – masterpieces which, as we are beginning to understand, were created there by none other but the Ottomans in the “Mongolian” period of the XIV-XVI century.

Fig. 7.36. A portrait of Lord Elgin. Modern historians say the following about this picture: “the nonchalant posture of the young lord is filled with self-assurance which had allowed him to claim some of the greatest treasures of Greece as his own – primarily, the sculptures from the Parthenon and some other constructions from the Acropolis – and ship them to England. His Lordship was ailing greatly sometime later, having become covered with sores (possibly as a result of treating syphilis with mercurials) and lost his nose almost entirely. He became so ill-looking that the very sight of him invoked pity” ([198], page 19).

Modern accusations of the Ottomans that incriminate them in a total destruction of Greece are hardly wholly justified. Some of the destructions may have occurred during the Ottoman = Ataman conquest of the XV-XVI century, of course; however, a lot had obviously perished in the “liberation wars” against the Ottomans in the XVII-XVIII century. As we have already learnt, *the famous Parthenon, for instance, was destroyed by the Venetians, and not the Ottomans* (see above and in [198], pages 15-16).

Let us now regard the preservation of the ancient legacy of the past in the interpretation of the civilized XIX century West Europeans. Having thrown a cursory glance over the Acropolis, for instance, they would claim with absolute certainty that some of the constructions had doubtlessly been “ancient Greek” –and the others, ugly, barbaric-Ottoman. Nowadays we possess no knowledge of just how the noble lords and

dainty artists separated “antiquity” from the Middle Ages. Most probably, their judgement was quite simple. Everything that bore visible signs of Christianity or Islam was declared a distortion of the classical city of Athens. The belfries, minarets, Christian crosses, Ottoman crescents, Slavic and Arabic inscriptions, “irregular” sepulchres, etc. were clearly “travesties.” Everything else was confidently declared “ancient.”

After the separation of the “untainted” buildings from the “corrupt” ones, the second stage soon commenced. The buildings that could be authoritatively declared priceless, Greek, and ancient would naturally have to be preserved for posterity, to serve as tourist attractions for everyone in the whole world. As for the ugly and preposterous Ottoman constructions – those were to be blown up immediately so as not to spoil the refined classical shapes of antiquity revived.

In the XIX century, a wave of the noblest destructions archly dubbed “restorations” swept over the entire Acropolis. Incidentally, “Heinrich *Schliemann*, the discoverer of Troy, had been among the numerous restorers [of Athens – A. F.]... He *financed the demolition* of the 21 metre tall tower built on the site of the Propylaea in the Middle Ages since *he had understood that the tower distorted the harmonious outline* of the entire Acropolis” ([198], page 99). We shall give a detailed account of Schliemann’s actual “discovery” of Troy, and tell the reader what exactly it was that he had unearthed, in [Chron2](#).

And so it came to pass that the Ottoman buildings, towers and other constructions were destroyed on a great scale, zealously, and with the feeling of total impunity, primarily in Athens. Some of the rarest photographs reflecting the state of the Acropolis in the XIX century are still in existence, and they can show us the final stages of this “scientific restoration.” In fig. 7.37 we can see a panoramic photograph of the Parthenon’s environs in 1869. The commentary given by historians is as follows: “On the landscape snapshot made by Stillman in 1869 we can see the Parthenon in the Acropolis with only a small part of the Turkish dwellings, which have covered the ancient relic from top to bottom, cleared away. The restoration of the temple and the methodical liquidation of ground layers had not yet begun” ([198], page 34).

Fig. 7.37. A rare photograph of the Parthenon's environs dating from 1869. It is reported that this territory had already been "slightly cleared" from the Ottoman buildings ([198], page 34). However, one can still observe the last Ottoman tower on the right. Taken from [198], pages 34-35.

Fig. 7.38. A close-in of a photograph dating from 1869. A mediaeval tower can be seen in the distance, to the right from the Parthenon. It isn't there today, since the Western European restorers were forethoughtful enough to demolish it. Taken from [198], page 35.

As we understand nowadays, a lot had been demolished before that, and therefore couldn't be photographed. However, we can see a tall Ottoman tower on this old photograph, to the right of the Parthenon. Nowadays it doesn't exist anymore. The restorers destroyed it after 1869 in order to keep the classical landscape with its harmony of lines, as we are told nowadays. Other vulgar Ottoman fortifications have also been destroyed, qv below.

Another valuable photograph of the 1860s can be seen in fig. 7.39. The historians comment as follows: "the foundation of the small temple of Athena Nike (top right-hand corner on the right photograph) was only unearthed in 1835, when *the Turkish bastion had been destroyed*. The square mediaeval tower behind the temple *would be demolished in 1875, in order to reconstruct the ancient image of this part of town*" ([198], page 38).

Fig. 7.39. A rare photograph dating from the 1860's. This part of the Acropolis owes its condition to the destruction of the Ottoman=Ataman bastions that once stood here ([198], page 38). One sees the fundament of the Athena Nike temple and the mediaeval tower behind it, whose demolition occurred somewhat later. There isn't so much as a trace of the Ottoman tower nowadays. Taken from [198], pages 38-39.

Fig. 7.40. A close-in of a fragment of an old photograph dating from the 1860's. It is clearly visible that the mediaeval Ottoman tower and the "ancient" foundation of the Athena Nike temple have identical masonry and are built of the same kind of stone. These constructions obviously belong to the same epoch. Taken from [198], page 39.

However, the close-up of a fragment of the photograph that can be seen in fig. 7.40

makes it plainly visible that the masonry of the mediaeval tower is identical to that of the “ancient” temple foundation. One gets the idea that all of this was erected around the same time by the same masters who had used similar construction materials – around the XV-XVI century. Why would the Ottoman tower have to be demolished then, and the foundation of the nearby temple left intact? One would think it needed to be pulled down as well, since it was just as mediaeval as the tower. Apparently, the sole reason for this was the existence of some columns upon the mediaeval foundation, which were simply declared “ancient” and classical ipse dixit.

Furthermore, the demolition of the Ottoman tower had been an absolute necessity, since its proximity to the “ancient” foundation with identical masonry posed a danger for Scaligerian history. Any unprejudiced observer would have the right to ask the historians about the difference between the mediaeval constructions and the ancient ones, and they would have nothing to say in reply.

After the destruction of all the buildings that had obvious mediaeval, Christian, or Ottoman indicia, the ones remaining could not be compared to anything anymore. All the dangerous questions became impossible when the debris of the Ottoman buildings and fortifications had been pulled away. The old photographs of these parts aren’t really available to that many people. The German, English and French restorers ([198]) were thus certain of their impunity, and didn’t have to worry about anyone asking them the reasons why the “ancient” and the mediaeval buildings were made of the same stone and in a similar manner.

A few years later the Athenian guides have all started to assure the tourists that the city has “always been like this.” It isn’t difficult to understand the guides, since that was how the historians had taught them.

The scale of the “restoration works” in Athens was truly impressive. In figs. 7.41 and 7.42 one can see another rare old photograph taken in 1865. The comment of the historians is as follows: “on this snapshot of the Acropolis made in 1865 one can observe the uneven trenches going from top to bottom that remained *after the Turkish buildings had been pulled down and shipped away*. The Propylaea and *the mediaeval tower that hadn’t been demolished yet* can be seen on the left” ([198], page 40). In fig. 7.43 we see a close-up of a photograph fragment showing this mediaeval Ottoman construction that was pulled down shortly afterwards.

Fig. 7.41. A rare photograph of the Acropolis dating from 1865. One sees the aftermath of the demolition of a large number of Ottoman buildings. Great piles of stone and rubble flow over the walls of the fortress in some places. One sees the mediaeval tower, still intact, on the left. Taken from [\[198\]](#), pages 40-41.

Fig. 7.42. A close-in of a photograph dating from 1865. We see the Propylaea, and an Ottoman fortification next to it, as well as piles of rubble from the buildings demolished by the caring restorers. Taken from [\[198\]](#), page 40.

Fig. 7.43. A close-in of a photograph dating from 1865. The mediaeval Ottoman tower clearly belonged to the same group of buildings as the Propylaea. Nevertheless, it hadn't survived to our day. Taken from [\[198\]](#), page 40.

We also came across a photograph of the Athenian Acropolis taken in 1896 during the Olympic Games in Athens (see fig. 7.44). One still sees the tall Ottoman tower on it, *rising higher than the Parthenon*. This means there were still many remnants of Ottoman buildings in the Acropolis towards the end of the XIX century, and considerable ones at that.

Fig. 7.44. A picture taken from 1896 depicting the subsequently demolished Ottoman tower on the Acropolis. *It was taller than the Parthenon*. Taken from [\[340\]](#), page 40.

Fig. 7.45. A modern view overlooking the Acropolis. It is plainly observable that the “ancient” buildings left intact by the restorers comprise a visible minority of the entire architectural group that had occupied the entire top of the rock in the Ottoman epoch. Apparently, most of the buildings were too obviously Christian, dating from the XV-XVI century. This is why they had to be demolished “so that the ancient landscape could be restored”. Taken from [\[198\]](#), pages 100-101.

In fig. 7.45 we can see a modern bird’s-eye view of the Acropolis. It is plainly visible that the entire surface of the rock had once been occupied by buildings of some sort. Only the remnants of their foundations remain. The “restorers” of the XIX century have left nothing but a few buildings intact – the ones they declared “ancient” – namely, the Parthenon, the Propylaea, and some others. The remaining, and clearly predominant, part of the constructions obviously failed to satisfy them – most probably due to their indisputably mediaeval or Ottoman origins. They have been nonchalantly demolished and taken away. The landscape contours became harmonic, according to the frank and somewhat cynical statement made by Schliemann ([\[198\]](#), page 99). The remnants of the foundations were, with some foresight, left intact, since these silent stones barely seen above the ground couldn’t tell anything to anyone anymore, and were declared “very old indeed” on the spot. The awed tourists have been visiting them ever since the end of the XIX century. They would be told that the great Plato used to sit and meditate on “this very stone,” whereas the legendary Demosthenes would deliver his inspired orations standing on another one nearby. The tourists posture happily, and take countless photographs.

The tendentious “restoration” of Athens continued well into the XX century. “The Acropolis *only* assumed its modern world-famous shape *after* the Greek engineer Nikolaos Balanos had started his work here in the late XIX and early XX century” ([\[198\]](#), page 99). He had done a great body of work; however, we learn that his

“reconstruction” of the Parthenon, for instance, had very little to do with the original image of the temple. “Thanks to Balanos, Parthenon regained its primary shape by 1933, to the extent feasible by that time, and began to look the way it had *presumably* 250 years ago, although the opinions of the scientists as to whether such an achievement should be commendable were *polarized*. As early as 1922, Anastasios Orlandos, the personal assistant of Balanos, *protested against the reconstruction of the colonnade...* and publicly ceased all relations with his superior. Others have accused Balanos of wanting to *build* [and not reconstruct – A. F.] an imposing evidence of the glory of the Periclean Athens, *not caring too much about the information concerning the true shape of the temple*.

What Balanos has really done was to use the first pieces of marble he could find for the reconstruction, *without paying much attention to the original locations of the stones*. Furthermore, if the shape of the fragments failed to satisfy him, Balanos *would cut them the way he needed* so that they would fit his master plan” ([198], page 104). As we can see, Balanos basically built the surviving fragments of the Parthenon anew, guided by his subjective concept of “antiquity.”

There is good evidence of the blatantly tendentious “reconstruction” of the Acropolis by Balanos, who had based his work on Scaligerian chronology. Exempli gratia, he thought it a travesty to reconstruct the parts of the Parthenon that the historians had considered a Moslem mosque ([198]). Everything is perfectly clear. Scaligerian chronology considers it a crime to so much as assume that *the Parthenon had originally been a Christian temple, and was subsequently transformed into a mosque*. All the evidence of the Parthenon having served as a Christian or Islamic temple that we cite above is declared to be a result of its “barbaric reconstruction in the Dark Ages” by modern historians.

However, nowadays we may be seeing the signs of changes for the better. A couple of years ago, the eminent architect Manolis Korres, who took charge of the Parthenon’s restoration, declared his intention to reconstruct the “Parthenon mosque.” It is needless to say that he immediately faced strong opposition on the part of the historians. It is said that “the greatest debates arose in regard to the plans of Korres to keep the relics of some of the changes done to the Parthenon over the many centuries. For instance, he intends *to make the Muslim mosque erected inside the temple partially visible*” ([198], page 102). As far as we know, the attempts of Korres to make the Parthenon look the way it did in the XIV-XVI century, even partially, haven’t led to anything as to yet.

We shall conclude with a minor, but most edifying example, which clearly demonstrates that many of the modern “restorations” are to be treated with caution. In fig. 7.46 we can see the famous composition depicting Laocoon that was “found near Rome during the Renaissance” ([\[198\]](#), page 12). It is supposed to be a marble copy of the alleged I century A.D. made from an original presumably dated II century B.C. Antediluvian times, in other words. Nevertheless, the style and the quality of the composition greatly resemble the works of Michelangelo, for instance; that is to say, they look very much like the works of art created in the Renaissance epoch.

Fig. 7.46. A reconstruction of the statue of Laocoon allegedly dating from the XVI century. The right hands of all three statues are raised. This is most probably an original made in the XVI century, and not a reconstruction on any sort. Taken from [\[198\]](#), page 13.

It is also considered that the composition showing Laocoon is a XVI century reconstruction ([\[198\]](#), page 13). However, it was most probably simply made in the XVI century.

Let us pay attention to the fact that the *right arms of all three statues are raised*. This may have had some meaning – religious, for instance. It is difficult to say anything certain about it nowadays. However, the most interesting fact concerns what we observe in fig 7.47, which shows another photograph of the same composition that had already undergone “restoration” in 1960 ([\[198\]](#), page 12).

Fig. 7.47. A 1960 “reconstruction” of the statue of Laocöon. Modern restorers broke off all three raised statue arms. The largest received some fragment instead of the arm which was authoritatively declared “the spitting image of the ancient original”. Taken from [\[198\]](#), page 12.

What we see is that the modern restorers broke off the right arms of all the statues for some reason. Two of them now have useless stumps instead. As for the central statue, the largest one, it received some curved fragment in lieu of an arm after long scientific considerations. Historians claim it to be the very fragment that they needed so much, one that had remained buried in the ground for many centuries. It is supposed to have been found in the “Vatican storage rooms” ([\[198\]](#), page 11). Modern historians finally managed to recognize it amongst thousands and thousands of similar fragments without the merest shadow of doubt, and have confidently declared it to be the missing right arm of Laocöon – a much more congruous one than the arm that he had possessed for three centuries, ever since the XVI century. The incongruous arm had then been assertively sawed off, as well as half of the snake, see figs. 7.46 and 7.47. The sawed-off bits were probably thrown away as useless rubbish, with the congruous fragment taking their place. Obviously, an article had to be written in order to provide scientific basis for the absolute necessity of such an improvement. However, the historians have involuntarily disclosed that *in order to make the found fragment fit they had to damage the actual statue of Laocöon*. The cautious commentary runs as follows: “the extended arm was replaced by the newly-found genuine fragment... *it took a marble inset* to meet the due proportions” ([\[198\]](#), page 13).

In our opinion, it is very hard to perceive all of this activity as scientific research.

6. Strange parallels in the Scaligerian history of religions

6.1. Mediaeval Christianity and its reflection in the Scaligerian “pagan antiquity”

Let us give a brief account of the situation in what concerns the history of ancient religions. We are being convinced nowadays that every chronological epoch possessed individual religious cults of its own, with hundreds and even thousands of years between them. The XIX century historians and ethnographers have performed a great deal of comparative studies of global religions and cults. It was discovered that certain religions separated by centuries and even millennia in Scaligerian chronology have a great number of “parallels” between them, or even coincidences, as amazing as they are complete. This indisputable fact spawned a great number of theories postulating influences, naturalization, infiltration, etc. However, all of these latter-day speculations are based on Scaligerian chronology exclusively. A chronological change shall lead to the revision of the prevailing point of view on the genesis and formation of religions. We shall just cite a few typical examples of parallels in order to explain the peculiar effect of “duplicate religions” that we observe. This effect is most probably a child of Scaligerian chronological shifts.

The so-called “Celtic monument” that was discovered in 1771 is nowadays considered to be an effigy of some pagan pre-Christian Gaulish god of the woods ([\[966\]](#), Vol. 2, p. 465; see fig. 7.48). However, what we see above the head of this deity is a carving that clearly says ESUS. That should very plainly stand for “*Jesus*.” However, the pressure of Scaligerian chronology made the historians claim this to be “a totally different Jesus.” Just some pre-Christian god bearing the same name, nothing more. See also [\[544\]](#), Volume 5, page 683.

Fig. 7.48. A “Celtic” monument found under the choir loft of Notre Dame de Paris in 1771 which is now an exhibit of the Cluny Museum. One clearly sees the semi-obliterated but still quite visible inscription saying ESUS, or Jesus. However, the archaeologists consider this deity to be some pagan Gaulish god of the woods, pre-Christian and “very ancient”. Taken from [\[966\]](#), page 465.

Arthur Drews, an eminent specialist in comparative history of religions, used to claim that nearly all of the principal allegedly pre-Christian “ancient” religious cults are really nearly identical parallels (and, by our reconstruction, merely later reflections, repercussions and modifications) of the Christian cult of Jesus Christ ([\[259\]](#) and [\[260\]](#)). He wrote that he had “ascribed... great meaning to the mythological *parallels between Christianity and paganism*. Anyone who cannot see the commonly known relation between the resurrection story told by the gospels and the rites of the religion of Attis-Adonis-Osiris etc., anyone who claims that “there is nothing remotely resembling” entombment and resurrection in the myths of Attis and Adonis, anyone who tries to prove the death of Jesus to have been different from the way his cousins from Asia Minor had died... anyone who fails to recognize Mary Magdalene and other Maries that stood vigil near the cross and at the casket of the Saviour in the Indian, Asianic, and Egyptian mother goddesses named Maia, Mariamme, Marithale... Marianne... Mandane, the mother of Cyrus the “Messiah,” the “Great Mother” of Pessinunt, the grieving Semiramis, Mariam, Merris, Myrrah, Myra (Mera) and Maya... should ‘jolly well keep away from the issues of religious history’ [as Weis puts it].” ([\[259\]](#), page 150)

A. Drews cites many spectacular parallels identifying the holy family of Jesus Christ with other “holy families” of Asiatic gods allegedly preceding the new era by many centuries. If we step aside from Scaligerian chronology, we shall see that all of these parallels indicate the *simultaneity* of these cults, whose differences are merely a consequence of the ethnic distinctives of their localization. All of them probably hail back to the same common source – that is, they are a reflection of the life and the deeds

of Jesus Christ in the XII century A.D. The XIX-XX century historians who have discovered these parallels, but remained bound by the erroneous Scaligerian chronology, had to turn everything upside down. As a result, they have interpreted the parallels as “late Christianity” drawing heavily upon the numerous “ancient cults” and failing to produce anything original worthy of mentioning.

In fig. 7.49 we can see a picture of the allegedly Mesopotamian Assyro-Babylonian king Ashur-Nazareh-Khabal, who had allegedly lived 930 years before the birth of Christ ([508], also see [544], Volume 4, page 673). However, what he has on his chest is simply a *Christian cross*, very much like the one worn by the present-day Orthodox eparchs. This is most probably a mediaeval king.

Fig. 7.49. The allegedly Mesopotamian Assyro-Babylonian king Ashur-Nazareh-Khabal who had allegedly lived around 930 B.C. Taken from [508]; see also [544], Volume 4, page 673, ill. 139. However, the “ancient Assyrian king” has a Christian cross on his chest, very much like the ones worn by modern Orthodox eparchs.

In fig. 7.50 we see an old image of the “extremely ancient” Phoenician goddess Astarte ([508] and [544], Volume 4, page 673). However, she has a sceptre with a *Christian cross* in her hands. It is only Scaligerian chronology that keeps the experts in the history of religions from identifying this as a mediaeval Christian effigy.

Fig. 7.50. The allegedly ancient Phoenician goddess Astarte ([508] and [544], Volume 4, page 673, ill. 140). However, she has a sceptre with a Christian cross in her hand.

In fig. 7.51 we see the allegedly “ancient” Gaulish figurine of the “ancient” Frankish god Jupiter. However, his clothing is all covered by regular Christian crosses ([\[508\]](#), [\[544\]](#), Volume 4, page 674).

Fig. 7.51. An allegedly ancient Gaulish figurine of the “ancient” Frankish god Jupiter. All of his clothing is nevertheless covered in Christian crosses. See [\[508\]](#) and [\[544\]](#), Volume 4, page 674, ill. 141.

In fig. 7.52 we see an “ancient” Egyptian effigy of the goddess Isis breast-feeding her son who has a *Christian ankh* in his hand ([\[544\]](#), Volume 4, page 675). It is hard to get rid of the impression that this really is a mediaeval representation of Virgin Mary with her son Jesus Christ – however, misdated by Scaligerian history and transferred into the “distant past.”

Fig. 7.52. The “ancient” Egyptian goddess Isis breast-feeding her son who holds a Christian ankh in his hand. Taken from [\[544\]](#), Volume 4, page 675, ill. 143.

In fig. 7.53 we cite the most popular *mediaeval* anagrams of the name Jesus Christ from the Roman catacombs ([\[544\]](#), Volume 4, page 675, ill. 144). Anagram 8 is *clearly an ankh*. We see those in great abundance on the “*ancient*” *Egyptian* drawings and sculptures, dated as preceding the new era by centuries and even millennia nowadays. Ankhs were worn as pendants, the way they are today, or held in a hand. The mediaeval Christian ankh was also occasionally interpreted as symbolizing *a key*.

Fig. 7.53. Mediaeval anagrams of the name of Jesus Christ from the Roman catacombs. Taken from [\[544\]](#), Volume 4, page 675, ill. 144.

In fig. 7.54 we cite an extremely interesting table showing different shapes of mediaeval Christian crosses ([\[1427\]](#), page 5). The “*ancient*” *Egyptian* ankh can be seen as number 20. Note also the T-cross (number 3), and the fork cross (number 5). We shall repeatedly encounter these apparently rather old versions of the Christian cross in the future. Let us also point out number 25, which is practically the Ottoman crescent with a cruciform star.

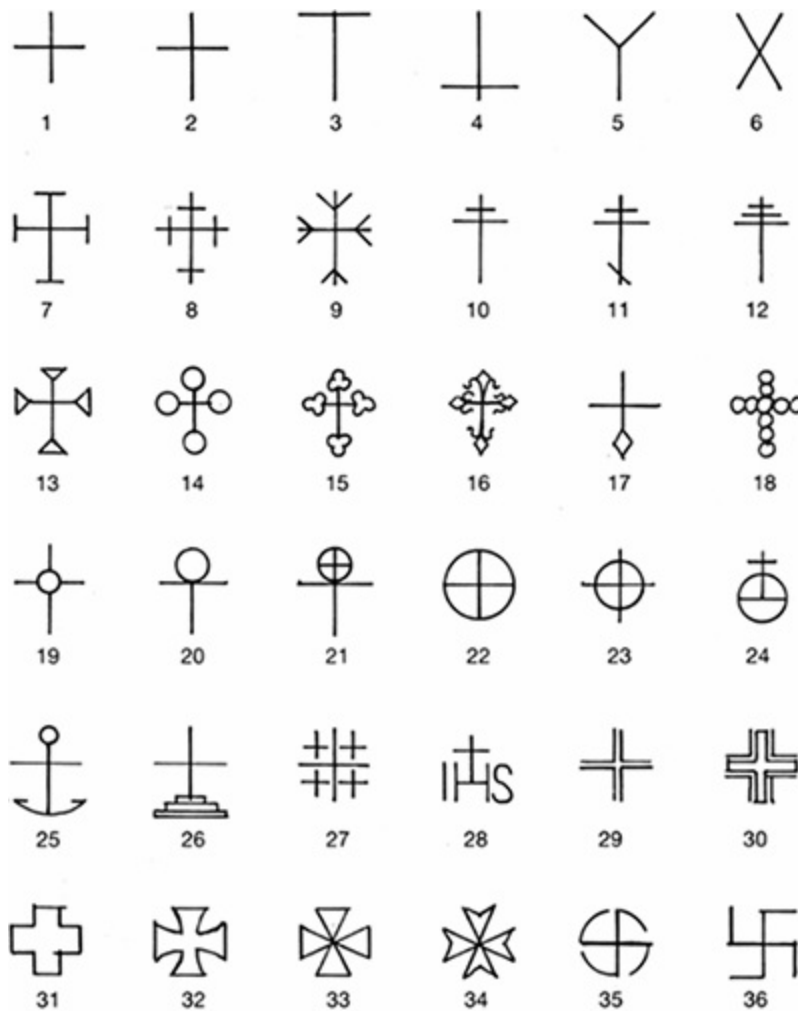

Fig. 7.54. Various shapes of the Christian cross. We shall point out the old T-shaped cross (number 3 in the table) as well as the forking cross (number 5). The “ancient” Egyptian ankh can be seen as number 20. Taken from [\[1427\]](#), page 5.

Cross shapes: 1) Greek cross; 2) Latin cross (High cross); 3) Tau cross, St. Anthony’s cross; 4) St. Peter’s cross; 5) Forked cross; 6) St. Andrew’s cross (Saltire); 7) Sprag cross; 8) Repeated cross, German cross; 9) Branching cross; 10) Double cross, patriarchal cross, Lotharingian cross; 11) Orthodox cross, or the Cross of Lazarus; 12) Papal cross; 13) Pawed cross; 14) Club cross or Apple cross; 15) Clover cross; 16) Lily cross; 17) Diamond cross; 18) Circular cross; 19) Nimbus cross; 20) Handle cross; 21) Coptic cross; 22) Wheel cross, Solar Wheel; 23) Celtic cross; 24) The Orb; 25) Anchor cross; 26) Graded cross; 27) Jerusalem cross; 28) Monogram of Christ; 29) Angled cross, or Gamma cross; 30) Angled cross; 31) Red Cross; 32) Iron cross; 33) Equilateral cross; 34) Maltese cross; 35) Swastika; 36) Crooked cross.

In fig. 7.55 we see a print of an “ancient” Syrian sigil allegedly dated as *the second millennium before Christ* ([\[533\]](#), Volume 1, page 457). In its centre we can clearly observe the *Christian ankh*, whose loop may have been used for wearing it as a pendant.

Fig. 7.55. A copy of a Syrian sigil allegedly dating from the middle of the second millennium B.C., Berlin, the Middle East Museum. Taken from [\[533\]](#), Volume 1, page 457. In the centre of the sigil we see an ankh with a loop on top that facilitates its use as a pendant.

In fig 7.56 is an “ancient” statuette found in Hissarlyk, Asia Minor, portraying the goddess Maia ([\[544\]](#), Volume 4, page 676, ill. 145). This is most probably Virgin Mary that is represented as Jesus Christ’s mother-to-be. The *Christian cross* is drawn as a swastika here.

Fig. 7.56. Apparently a mediaeval picture of the Virgin Mary as Christ’s mother-to-be which is considered to be an effigy of the “ancient” goddess Maia nowadays. Taken from [\[544\]](#), Volume 4, p. 675, ill. 145.

In fig. 7.57 we see a fragment of a brass statuette of the “ancient” Buddha. However, what we see on his chest is a Christian gammadion. Russian Museum of Ethnography and the museum of Gimet in France ([\[544\]](#), Volume 4, page 677, ill. 146).

Fig. 7.57. A copper statuette of the “ancient” Buddha with a Christian gammadion cross on his chest. Taken from [\[544\]](#), Volume 4, page 677, ill. 146.

In fig. 7.58 is an amazing “ancient” picture of the allegedly “ancient” Bellerophon^{tes} battling a chimera ([\[508\]](#) and [\[544\]](#), Volume 4, page 687, ill. 150). This is merely the mediaeval *St. George fighting the dragon*! Only the hypnotic effect of Scaligerian chronology has kept the admirers of “great antiquity” from seeing this.

Fig. 7.58 An “ancient” picture of the Classical Bellerophon^{tes} battling an “ancient” chimera. This picture is virtually identical to the numerous mediaeval representations of St. George slaying the dragon. Taken from [\[508\]](#) and [\[544\]](#), Volume 4, page 687, ill. 150.

Many of the mediaeval Christian symbols are related to the so-called *keys* of St. Peter which he is supposed to use for opening the Pearly Gates ([\[259\]](#)). Let us remind the reader that the key is but another form of the mediaeval Christian ankh (see fig. 7.53, anagram 8). However, it turns out that “classical ancient mythology” is also full of deities whose primary attribute is either a key, or a key-shaped cross – the mediaeval ankh, that is. Such are the “ancient” Greek Helios, the “ancient” Roman Pluto, the “ancient” Egyptian Serapis and the “ancient” infernal queen Hecate ([\[259\]](#), page 58). Dupuis and Volnay point out the de facto identity of apostle Peter and the “ancient” Roman god Janus.

In fig. 7.59 we see the allegedly “ancient” effigies of various “ancient” goddesses with infants. They are the “ancient” Roman Juno with Mars (according to Malver), the

Indian Devas with the infant Krishnu (according to Jeremias), Demetre with Bacchus, or simply “D-Mother,” or “Deo-Mater,” or Mother of God (Malver). Further on we see the “ancient” Diana with a cross on her head, and the Ottoman crescent with a cruciform star nearby. After that comes the “ancient” Egyptian goddess Athyr, or Hathor, with the infant Osiris (Jeremias). Finally, we see the so-called “Our Lady of Salisbury” (according to M. Brocas). See [\[544\]](#), Volume 3, page 631, ill. 101.

Fig. 7.59. “Ancient” effigies of goddesses with infants; what we see are most probably various mediaeval representations of Virgin Mary with the infant Christ. Taken from [\[544\]](#), Volume 3, page 631, ill. 101.

6.2. Mediaeval Christianity and the “ancient” Mithraism

A. Drews provides an illustration for [\[259\]](#) that portrays the “ancient” god Mithras on a so-called “Mithraist icon,” q.v. in fig. 7.60. Mithras’ head has a *halo* with sunrays – exactly like the halos on the icons of Christ. The halo is obviously Christian in its origin. Failing to realise the profound inveracity of Scaligerian chronology, Drews

makes the following cautious comment: “It is hardly a coincidence that many Christian icons resemble this effigy. There is a *circle, or a halo*, around the head of the deity.”

Fig. 7.60. “Ancient” effigy of the god Mithras. We see a halo and sunrays around his head, just like the ones observable on the mediaeval icons of Jesus Christ. Taken from [\[533\]](#), Volume 2, page 154.

To this comment we reply that it isn’t a case of Christ resembling the “ancient” Mithras, but rather that Mithraism was a form of the Christian cult after the XI century A.D. As we know, Scaligerian history considers Mithras to be an “ancient” Aryan god from the Orient, and subsequently an “ancient” Persian deity, whose cult spread across all of Asia Minor ([\[966\]](#), Volume 2, page 416). One of the effigies of the “extremely ancient” Mithras can be seen in fig. 7.61. Mithras is shown here slaying an ox. It is possible that bullfighting, which is still popular in Spain and parts of France, is a reflection of this archetypal subject – possibly also Mithraist, but clearly *Christian in origin*, and reflected on many Orthodox icons. One can observe an Orthodox Trinity icon in fig. 7.63. The foreground of this icon is identical to the “ancient” bas-reliefs representing Mithras slaying an ox.

Fig. 7.61. An effigy of the “ancient” Aryan and “ancient” Persian god Mithras slaying a bull. Taken from [\[966\]](#), Volume 2, page 416.

Fig. 7.62. “The Holy Trinity”, Russian icon dating from the first half of the XVII century. In front we see the “ancient” Mithras killing a bull, which makes this subject Christian and Orthodox (this theme is often linked to Abraham nowadays). Taken from [\[647\]](#), page 36.

Fig. 7.63. A close-in of the fragment of the Orthodox Holy Trinity icon with Mithras killing a bull. Taken from [\[647\]](#), p. 36.

A. Drews says this about strong and extensive parallels between “ancient” Mithraism and mediaeval Christianity:

“The main Roman sanctuary of Mithras was *in the Vatican*, on the site of *St. Peter’s Cathedral*. That is where he was worshipped, together with Attis, who had been recognized officially even earlier... . Mithras, or Attis, was called *Pater*, or *Father*. The High Priest of this deity was also called “*Pater*” (or the Father of Fathers); the Roman Pope is still called the *Holy Father*. The latter wears a tiara, or a mitre, on his head, which is a head-dress of Mithras, or Attis... and red soldier shoes of the priests of Mithras, as well as keeping the keys of the “Rock God” [or St. Peter – A. F.], and has “the power to bind, and the power to permit”... . The Catholic Pope’s equal in rank was the Pater, the Pope of the Mithraist cult. This *pagan Pope* resided in the Vatican, worshipped the sun as the *saviour*, and Cybele as the virginal Mother of God, who was usually depicted sitting *with a child on her lap* – her Christian double is the *Virgin Mary*.” ([\[259\]](#), page 69)

Like mediaeval Christianity, “ancient” Mithraism had a concept of purgatory; the two also shared the use of the aspersion, and the tradition of crossing oneself ([\[259\]](#), page 70). Ecclesial ceremonialism and public forms of church office are similar – the liturgy was read in a dead language that the masses did not understand, both services used hosts (wafers, or altar bread), albs, wide cingula, episcopal hats, etc. This parallelism was discovered by the eminent scientist J. Robertson ([\[1371\]](#) and [\[259\]](#), pages 70-71). He wrote that “the oriental saviour deities are all brothers of Jesus Christ” ([\[1371\]](#) and [\[544\]](#), Volume 4, page 695).

N. A. Koun also tells us that “the Mithraist oblation is virtually similar to the Christian Eucharist... Christians, as well as Mithraists, considered Sunday a Holy Day, and celebrated... Christmas in the Christian tradition, on the 25 December, as the day their ‘Invincible’ deity was born” ([454] and [544], Volume 4, pages 701-703). Some monuments depicting a clandestine Mithraist Lord’s Supper have reached our age. We can see altar bread with Christian crosses on these “ancient” pictures ([259], page 3). The famous Cathedra Petri, or the Chair of Peter in Vatican, also appears to belong to the Mithraist cult.

We conclude that the “ancient” cult of Mithras was *virtually identical* to the mediaeval cult of Jesus Christ, and the gap of several centuries that separates them is merely a Scaligerian chronological simulacrum.

“The concept of Mithras coming to Europe from Asia and not vice versa is based on the fact that we find a particularly large number of the cult’s traces in the *Veda*, where Mithras is one of the key figures” ([544], Volume 4, page 704). This implies that the famous Veda, which was actually discovered relatively recently, dates from the end of the Middle Ages and not some hypothetical antediluvian age. Mithraism is also present in Zoroastrianism, or the religion of Zoroaster, which is supposed to have been prevalent in “ancient” Persia before its conquest by Alexander the Great. It is also supposed to have made a sudden disappearance for the period of six centuries (!) in order to be “revived” under the Sassanides in the alleged IV century A.D. ([544], Volume 4, pages 715-716). This all leads one to the conclusion that Zoroastrianism is also mediaeval in its origin, dating to the XI century A.D. at the earliest.

J. Frazer says, on the subject of the “ancient” Attis: “Attis... had been the same for Phrygia as Adonis was for Syria... the tradition and the cults of both deities were so similar that *the ancients often used to identify them with each other*” ([917], page 19).

The “ancient” Greek religion also echoes the various attributes of Jesus Christ. In particular, experts in the history of religions point out that “the figure of the dying and resurrecting saviour was embodied in Dionysus and Bacchus” ([743], page 41).

6.3. References to Jesus Christ contained in “ancient” Egyptian artefacts

Ancient Egypt is considered to have been a “classical cross country.” Mesopotamia, Persia and India all have similar Christian crosses. As we have already pointed out, many “ancient” Egyptian gods are portrayed in drawings and bas-reliefs holding the mediaeval Christ glyph – an ankh ([259]). Such are the deities Re-Horakhty (fig. 7.64),

Tefnut, the goddess of moisture and dew (fig. 7.65), and the divine lions Shu and Tefnut (fig. 7.66). In fig. 7.67 we can see an incumbent effigy of the “ancient” Egyptian god Osiris surrounded by Christian ankhs. The “ancient” Egyptian pharaoh statue (fig. 7.68, on the right) is particularly impressive. There is a large Orthodox Christian cross on the back-rest of his throne, see fig. 7.69. The “ancient” statue is exhibited in the Metropolitan museum of New York.

Fig. 7.64. “Ancient” Egyptian deities Re-Horakhty and Hathor with Christian crosses in their hands. Taken from [\[486\]](#), page 119.

Fig. 7.65. The “ancient” Egyptian goddess Tefnut with a Christian cross in her hand. Taken from [\[486\]](#), page 119.

Fig. 7.66. “Ancient” Egyptian lion deities Shu and Tefnut with a Christian cross between them. Taken from [\[486\]](#),

Fig. 7.67. “Ancient” Egyptian effigy of the god Osiris incumbent surrounded by Christian ankhs. Taken from [\[533\]](#), Volume 1, page 425.

Fig. 7.68. “Ancient” Egyptian pharaoh sculpture exhibited in the Metropolitan Museum of New York. One can clearly see a broad Orthodox Christian cross on the back of the Pharaoh’s throne. Picture taken by A. T. Fomenko in 1995.

Fig. 7.69. A close-in of the back of the Pharaoh's throne. New York, the Metropolitan Museum.

N. V. Rumyantsev compiled a table that includes 32 different versions of the Christian cross. These crosses were abundant in the entire “ancient” Mediterranean region in particular, and are often dated to hypothetical distant B.C. epochs. The apparent unity of this symbol is so amazing that this alone, proved as it is by a great body of facts, suffices to question the veracity of Scaligerian datings of all these “ancient” cults.

It turns out that the cult of Isis was also exceptionally similar to the mediaeval Christian cult, since “her idolaters had... morning, afternoon, and evening masses which were extremely similar to Catholic and occasionally even Orthodox liturgy” ([259], page 71). The expert in the history of religions N. V. Rumyantsev doesn't question Scaligerian chronology which arbitrarily moves the cult of Isis, Osiris and Serapis into a distant age, but is nonetheless forced to make the observation that “this semblance between the Egyptian liturgy and the Christian is *too great and too stunning to be a coincidence*” ([259], page 72).

Let us also point out that the name of the famous “ancient” Egyptian god Osiris most probably originates from “*Esu-Rex*,” or *Jesus the King*.

This is how N. V. Rumyantsev comments on one of the “ancient” Egyptian pictures that clearly refer to *evangelical* events: “This is Osiris rising from the dead after having been buried for three days. He is portrayed at the moment of his resurrection, stepping out of the coffin... Next to him we see his wife and sister... Isis” ([743], page 10).

Another Egyptian deity is handing *a* cross to the rising Osiris. “The resurrection of Osiris... occurs on the third day after his death. This feast would end with the “mounting of the stake of Osiris.” The stake would be elevated with the aid of special contraptions... and *mounted vertically*” ([\[743\]](#), pages 10-11). This “death of Osiris at a stake” is probably a reflection of the crucifixion of Christ. We shall cover this in more detail later.

There’s a *woman* standing next to the rising Osiris – just like the Christian Virgin Mary and Mary Magdalene who are often depicted bearing holy oil at the coffin of Christ.

In figs. 7.70, 7.71 and 7.72 we see five “ancient” Egyptian bas-reliefs portraying five different moments in the birth of the Pharaoh Amenope ([\[576\]](#) and [\[544\]](#), Volume 6). This is supposed to have happened in 1500 B.C., a millennium and a half before Christ was born. N. V. Rummyantsev writes: “In the first picture we see a divine messenger who is standing before the *virgin* queen Met-em-ve [Mary? – A. F.] and gives the Annunciation of the birth of her son [see fig. 7.70 – A. F.]”.

Fig. 7.70. An “ancient” Egyptian picture using the evangelical subject of Christ’s birth. The Annunciation. Taken from [\[576\]](#), page 81.

Fig. 7.71. An “ancient” Egyptian picture using the evangelical subject of Christ’s birth. Immaculate Conception. Taken from [\[576\]](#), page 81.

Fig. 7.72. An “ancient” Egyptian picture using the evangelical subject of Christ’s birth. The birth of Christ and the Wise Men of the East bearing gifts.

In the second illustration we see the explanation of the pharaoh’s parentage: his virgin mother and the chief solar god Amon hold each other in a lovers’ embrace.

The third illustration elaborates on the meaning of the previous one and provides details of the immaculate conception from the divine seed. This idea is conveyed through the cross that is held near the nose of Met-em-ve [the author makes a reference to the polysemy of the Russian word *dukh*, which means both “breath” and “spirit” or “ghost,” and expresses the opinion that the cross symbolizes the immaculate conception from the olfactory perception of the Holy Ghost], and the roundness of her stomach [see fig. 7.71 – A. F.]... the Egyptian priests would thus write the first pages of the divine ruler’s biography on the wall of their temple.” ([\[743\]](#), page 130)

Commenting on this amazing, but hardly unique, series of *Christian and Evangelical* bas-reliefs of the “ancient” Egypt, J. Robertson, the prominent expert in the history of religions, wrote that “the most exact analogy of the Egyptian myth of the divine royalty birth is that with the Christian Annunciation” (quoted in [\[743\]](#), page 130).

We have just covered three bas-reliefs out of five. What about the remaining two?

“Three out of these five subjects depicting various moments of his [Amenope’s] birth show us the Annunciation, the coition of the lovers... and its result – *immaculate conception*... .

In the fourth illustration we see the actual birth of the divine royalty, and the fifth shows us the *adoration* of the child by the Magi [exactly the way the Gospel has it, qv in fig. 7.72 – A. F.]. The three genuflected human figures [or the evangelical magi accompanied by a king who is also on his knees, see [Chron6](#) – A. F.] say benedictions and present him [the infant Christ? – A. F.] with gifts, and there are gods near them doing likewise... We consider further commentary to these five effigies unnecessary.” ([\[743\]](#), page 149)

Historians point out that “they [the evangelical subjects of the Annunciation and the immaculate conception – A. F.] bear the greatest resemblance to similar subjects pertinent to the biographies of other famous mythical saviours of the past – the Jewish... Samson, the Babylonian and Phoenician Tammuz, or Adonis, and the Indian... Buddha” ([\[743\]](#), page 132).

Also “the Egyptian chrismation, or the baptism of the pharaoh by kings Horus and Thoth... they pour holy water over the king, which is represented as a stream of crosses here... with the king himself holding another cross in his hand” ([\[743\]](#), page 198). A similar “ancient” Egyptian picture can be seen in fig. 7.73.

Fig. 7.73. A magical resurrection of a dead man by the “ancient” Egyptian gods. The dead man is portrayed between Anubis and a god with an undefined name. Taken from [\[486\]](#), page 66.

In fig. 7.74 we see mediaeval Coptic representations of Christian crosses ([\[544\]](#), Volume 6). Let us remind the reader that the Copts were the mediaeval Egyptian Christians. It is clearly visible that the mediaeval Coptic ankhs are virtually identical to the “ancient” Egyptian ones.

Fig. 7.74. Mediaeval Coptic crosses. The drawing is ours. Taken from [\[544\]](#), Volume 6, pages 1048-1049.

In fig. 7.75 one sees an “ancient” Egyptian obelisk that stands in Italian Rome nowadays, in Minerva Square ([\[1242\]](#), page 43). We see a *Christian cross* on its top. Nowadays historians assure us that this cross is a later addition. We are extremely sceptical about that. Most probably the obelisks, including the “ancient” Egyptian ones, were built as tall pedestals for the specific purpose of bearing crosses or other

Christian symbols. Therefore, they were manufactured in the XVI-XVI century.

Fig. 7.75. “Ancient” Egyptian obelisk in Minerva Square in Rome. There’s a Christian cross on its spire. Taken from [\[1242\]](#), page 43.

A similar Egyptian obelisk with a *Christian cross* on top was erected in St. Peter’s square in Rome ([\[1242\]](#), page 43. See fig. 7.76). In fig. 7.77 we see an ancient engraving depicting the same obelisk in the Vatican. Here we also see a Christian cross upon the spire, qv in fig. 7.78. However, another ancient engraving dating from 1585 (fig. 7.79) allegedly depicts the very same Vatican obelisk, but looking completely different, as is its setting, although it is supposed to be depicted as standing close to St. Peter’s cathedral in this picture as well ([\[1374\]](#), page 121). The spire of this Egyptian obelisk in the Vatican is crowned with a large sphere, possibly solar imagery (see fig. 7.79). This symbolism is Christian, since Jesus Christ was referred to as “the Sun.”

Fig. 7.76. “Ancient” Egyptian obelisk in St. Peter’s square in Rome. Taken from [\[1242\]](#), page 42.

Fig. 7.77. Ancient engraving depicting the “Egyptian” obelisk in Vatican with a Christian cross on its spire. It is presumed that this engraving pictures a “new consecration” of the obelisk. Taken from [1374], page 21.

Fig. 7.78. A close-in of a fragment of the engraving depicting the “Egyptian” obelisk topped by a Christian cross. Taken from [1374], page 21.

Fig. 7.79. A mediaeval picture depicting the Vatican obelisk in St. Peter's square in Rome allegedly dating from 1585. It differs from the ones given above, since its spire is crowned by a globe. The globe must have symbolized the sun, which was one of Christ's symbols. Taken from [\[1374\]](#), page 121.

It is possible that Christian crosses or solar spheres were taken off the “ancient” Egyptian obelisks in the XVII-XVIII century, in the tumultuous epoch of the Reformation, so as to facilitate dating them to some hypothetical “ancient” period long before Jesus Christ.

Furthermore, there's a XVIII century obelisk in front of the façade of the “ancient” Roman Pantheon, which dates from the alleged II century A.D. (fig. 7.80). However, its style isn't any different from that of the other “ancient” Egyptian obelisks that one sees in other Roman squares and in Egypt. All of them most probably belong to the same epoch and tradition of the XV-XVIII century.

Fig. 7.80. A XVIII century obelisk in front of the façade of the “ancient” Pantheon allegedly built in the II century A.D. One can clearly see that the XVIII century obelisk resembles other “ancient” Egyptian obelisks in style. Apparently, the recent XV-XVII century tradition of building similar Christian obelisks still existed in the XVIII century. Taken from [\[726\]](#), page 61.

In fig. 7.81 we see a picture allegedly dating from 1650 which shows an “ancient” Egyptian obelisk covered in hieroglyphs from top to bottom. The obelisk of Pamphilius can be seen in the centre with either an alectryon or a dove on its top (fig. 7.82). Both are well-known Christian symbols. The same “ancient” Egyptian alectryon symbolism can be seen topping many Western European Christian temples. In [Chron6](#) we demonstrate that the alectryon used to symbolize the Ottoman=Ataman crescent. Also, modern commentators assure us that Kircher, the author of the XVII century book this picture is taken from, interpreted the hieroglyphs in a “fanciful manner” ([\[1374\]](#), page 123). It would be interesting to find out what exactly it is that the present day historians dislike in Kircher’s translation. We haven’t had the opportunity of studying this issue yet.

Fig. 7.81. An “ancient” engraving of 1650 depicting “ancient” Egyptian obelisks covered in hieroglyphs. The obelisk of Pamphilius at in the centre; we can clearly see an alectryon or a dove on its spire – a Christian symbol, in other words. One can still see such ornithic images on tops of many mediaeval cathedrals. As we shall demonstrate in [Chron6](#), it used to symbolize the Ottoman crescent. Taken from [\[1374\]](#), page 123.

Fig. 7.82. A close-in of the image of an alectryon or a dove on top of the “ancient” Egyptian obelisk of Pamphilius. The ornithic image is a Christian symbol. Taken from [\[1374\]](#), page 123.

In fig. 7.83 we see an engraving allegedly dating from 1499 that shows an “ancient” Egyptian obelisk mounted upon an elephant ([\[1374\]](#), page 119). Once again, we observe a *spherical solar symbol on the top of the obelisk* that symbolizes Jesus Christ. This engraving is taken from a book by Francesco Colonna which never fails to irritate the present day commentators. For instance, they have the following to say about this “ancient” Egyptian obelisk: “This romantic *pseudo*-Egyptian image *was very popular in the XVI century*. The book that [the drawing] was taken from originally is called the *Hypnerotomachia*, and really is a romantic *fantasy* text written in a strange mixture of languages – Italian, Latin, babelized Hebrew, and imaginary hieroglyphs. However, the illustrations are very artful; the ascetic style was considered authentically Classical by many readers” ([\[1374\]](#), page 119).

Fig. 7.83. An “ancient” Egyptian obelisk topped by a sphere, which probably symbolized the sun – one of the most common symbols of Jesus Christ. The engraving allegedly dates from 1499. Taken from [\[1374\]](#), page 119.

In other words, despite the fact that this old book is written in a rather austere manner, modern historians know the exact nature of “real Egyptian antiquities” better than the mediaeval author. Their consensual decision treats Francesco Colonna in a patronizing manner, deftly withdrawing his book from scientific circulation.

6.4. Researchers of the ancient religions commenting on the strange similarities between the cults of the “antiquity” and of the Middle Ages

The “ancient” Greek legends would have it that the “ancient” god Dionysius (fig. 7.84) performed the miracle of transforming water into wine ([\[743\]](#), page 198). Experts in the history of religions have noted this to be a perfect analogue of the famous evangelical miracle, or the transformation of water into wine by Jesus Christ in Canaan, Galilee. Could Galilee refer to “Gaul,” or France, and the well-known city of Cannes? Saintyves wrote that “after this, no one could possibly fail to see the origins of the matrimonial miracle in Galilean Canaan... ever since the Dionysian cult and during the age of the Christian cult, water never ceased to turn to wine on the 9th of January” (quoted in [\[743\]](#), page 259).

Fig. 7.84. An allegedly “ancient” sculpture of the “ancient” god Dionysius. The sculpture is most probably mediaeval and dates from the XIV-XVI century. Taken from [\[304\]](#), Volume 1, page 102.

A great body of scientific literature is dedicated to the discovery of parallels between the legends of the “ancient” Indian Buddha and Jesus Christ. Buddha’s “biography” doesn’t only include the principal *evangelical* myths, such as the immaculate conception, the birth miracles, Candlemas etc, but finer details as well – the baptism, the temptation in the desert, and so forth. Lists of such parallels can be seen in the works of Drews, Frazer, Saintyves, Rummyantsev, etc.

N. V. Rummyantsev wrote the following as a summary of his research:

“An entire caravan of suffering, dying and resurrecting ancient gods has passed in front of our eyes; we have seen their mythology, studied their feasts and rites. However, despite the fact that they have different names, individual mythological characteristics, countries of origin, or specialization, one feels a clear presence of something that unites them all. The ancients themselves have marked this fact... .

Indeed, if we regard the last centuries before Christ and the first centuries of the new era we shall see a most peculiar tableau. All of the deities that we have listed with all their attributes appear to have blended into each other, often to the extent of becoming *indistinguishable*. Osiris, Tammuz, Attis, Dionysius and a host of others appear to have formed a *common gestalt* of sorts, transforming into some syncretic deity that reigned supreme over the entire territory of the Roman state... the deities have transformed into a single eclectic, but de facto *unified saviour figure*. This intense merging occurred during the age of the Roman Empire, and affected Rome itself in particular.” ([\[743\]](#), pages 44-45)

Let us conclude with a discussion of another issue that is of great interest to us. N. A. Morozov paid special attention to the evangelical fragments where “our translations speak of the crucifixion of Jesus. I emphasize ‘our translations’ in particular, since the original Greek text of the Gospels uses the word *stavros* instead of ‘cross,’ and the verb

stavroo instead of ‘crucifixion.’ However, *stavros* is used to refer to a stake or a pale, and not cross” ([544], Volume 1, page 84). N. A. Morozov suggests the translation “execution at the stake” instead of crucifixion – as in being tied to a stake. The semantic transformation of the Greek word for “stake” (*stavros*) occurred in the Latin translation of the Bible where, according to Morozov:

“The word *crux*, or cross, was used instead of the Greek *stavros*, and the feedback from this transformation affected the interpretation of the original Greek word *stavros*. The Slavic translation is actually somewhat more precise, since it tells us Jesus was “pinioned to a tree”... Contemplating a possible solution to my quandary, I decided to go by the Church Slavonic text and translate the Greek word *stavros* as “stake,” and the verb “stavroo” as “execute at a stake,” since it reports no details of the execution.” ([544], Volume 1, page 85)

In fig. 7.85 one sees an ancient miniature taken from *The Great French Chronicle* titled “Kings Hildebert and Lothar Laying Siege to Saragossa and the Death by Stoning Inflicted by the Franks upon the Roman Prince Belisar [Belisarius – A. F]” ([1485], page 156). We see the execution of Belisarius (the great Czar?). He was *tied to a stake* and stoned to death (see fig. 7.86).

Fig. 7.85. An ancient miniature from a book allegedly dating from the mid-XV century and titled *Les Grandes Chroniques de France*. It depicts the execution of Prince Belisarius [the name bears some semblance to *Velikiy Czar*, which stands for “the Great Czar” in Russian]. He was tied to a stake and stoned to death. Taken from [\[1485\]](#), ill. 186.

Fig. 7.86. A close-in of the miniature depicting the stoning of Prince Belisarius (the Great Czar?). Taken from [\[1485\]](#), ill. 186.

Let us now turn to the allegedly pagan “ancient” Greek myths. Heracles is one of the protagonists of the “ancient” Greek mythology. Drews points out that “Heracles carrying pillars used to be a symbol greatly favoured in antiquity... Furthermore, the mystical meaning ascribed to those columns is the same as that of Christ’s cross. We can see God stoop under... the weight of the pillars and recognize him as the Saviour from the New Testament” ([\[259\]](#), page 49). Thus, the pictures of the “ancient” Hercules bent over under the weight of the cruciform pillars are probably mediaeval pictures of Christ carrying a cross and suffering from its great weight. See the mediaeval paintings by Tintoretto in fig 7.87, for instance [\[1472\]](#), or those by Marko Palmezano allegedly dating from the XVI century, seen in fig. 7.88 ([\[713\]](#), ill. 129).

Fig. 7.87. Jesus Christ carrying his cross to Golgotha. A painting by Tintoretto (XVI century)(fragment). Taken from [\[1472\]](#), No. 27.

Fig. 7.88. Jesus Christ bearing a cross. A painting by the XVI century artist Marco Palmezzano. Taken from [\[713\]](#), ill. 129.

A. Drews continues, telling us that:

“The cross made of two bars in Christianity is as much of a symbol of the new life and all things divine... as both of the pillars in the Tyrean or Libyan cults of Heracles, Shamash, or Simon... . One of the drawings portrays Christ bearing both pillars in such a way that *they form a slanting cross*.” ([\[259\]](#), page 49)

The “ancient” Heracles bearing a cross is present in Scaligerian history as yet another phantom reflection of Jesus Christ. We are referring to the “mediaeval Emperor *Heraclius*” who, as we learn, is also often portrayed bearing a cross, the scene of

action being *Jerusalem*, no less. The names Heracles and Heraclius are virtually identical. Allow us a short reminder in this respect – Jesus was often called Horus, which was where the “ancient” Egyptian name Horus originates from (see [Chron6](#), Ch. 3). In fig. 7.89 we see a painting by Michael Wohlgemut allegedly created in 1485-1490. Modern commentary is as follows: “*King Heraclius in Jerusalem...* we have a simultaneous representation of the king approaching the city gate on a horse... and then *carrying a cross barefoot*” ([\[1425\]](#), page 8). See a close-up detail in fig. 7.90. King Heraclius is also depicted barefoot and bearing a cross in an ancient picture that can be seen in fig. 7.91.

Fig. 7.89 A fragment of a painting by Michael Wohlgemut on the right wing of Catherine’s Altar (1485-1490). According to historians, we see the king Heraclius (or Heracles) here ([\[1425\]](#), page 8). He approaches Jerusalem on a horse, and is then portrayed at the gates of Jerusalem, barefoot and in a plain shirt, bearing a large cross. Taken from [\[1425\]](#), page 8.

Fig. 7.90. A close-in of a fragment portraying king Heraclius = Heracles bearing a large cross near the city of Jerusalem. Taken from [\[1425\]](#), page 8.

Fig. 7.91. An ancient picture of king Heraclius = Heracles bearing a cross near Jerusalem. “King Heraclius barefoot at the city gates”. Taken from [\[1427\]](#), page 103. See also [\[1425\]](#), page 9.

The crucifix that one sees in the Cologne Cathedral is called “The Gero Crucifix,” see [Chron6](#), Chapter 3. Let us point out that the “Grave of Jesus” located on Mount Beykos near Istanbul is also called the “Grave” or “Resting Place of Heracles” ([\[240\]](#), pages 76-77). More about this in [Chron6](#).

Most probably, the “ancient” Heracles, as well as the mediaeval king Heraclius, are phantom duplicates of the XI century Christ = Horus. Both ancient pictures of king Heraclius show him bearing a T-shaped cross, which must be the original shape of the Christian cross.

In fig. 7.92 we see an ancient sculpture from Palmyra, the so-called “Palmyra God Triad” allegedly dating from 150 B.C. ([\[1237\]](#)). The characters that we observe, however, are clearly Christian saints. Two of them have Christian halos over their heads. Furthermore, the saint on the left has got an Ottoman crescent behind his head. One should mark the fact that the right arm of every statue is broken off, but the rest of the sculpture is in a good condition. Could their right hands have been raised in Christian benediction? It is possible that some devout Scaligerite broke their fingers that were raised in the familiar Christian gesture in order to eliminate such blatantly mediaeval relics from “antiquity.”

Fig. 7.92. An “ancient” sculpture from Palmyra, the so-called “Palmyra Deity Triad” allegedly dating from 150 B.C. It is very likely that it really depicts Christian saints with halos around their heads. One of them has an Ottoman crescent over his head. Taken from [\[1237\]](#).

This array of facts proves that Christianity and the “ancient” symbolism share the same mediaeval origins that can be traced back to the XI-XIII century A.D.

In fig. 7.93 we see an archaeological finding from Iran allegedly dating from the XIII-XII century B.C. ([\[1237\]](#)). It is kept in the Louvre nowadays and considered an “ancient” figure of some “fantasy monster.” However, the unprejudiced observer will instantly recognize it as the bicephalous eagle, which was a well-known imperial symbol in the Middle Ages.

Fig. 7.93. An “ancient” effigy found in Iran and allegedly dating from XIII-XII century B.C. We are being told that this is an effigy of some “prehistoric fantasy monster”. It is however hard to fail seeing the well-known mediaeval Imperial symbol here, namely, the dicephalous eagle. Taken from [\[1237\]](#).

6.5. Moses, Aaron and their sister Virgin Mary on the pages of

the Koran

As one sees from folding the “Scaligerian History Textbook” into a sum of four shorter chronicles, we get several options for dating the beginning of the Muslim Hijra era, that is dated at 622 A.D. nowadays. All of them supersede the Scaligerian version. N. A. Morozov cites a great number of exceptional oddities pertinent to Muslim as well as Christian history. Let us give an example.

The chronology of the Koran is often radically different from the Scaligerian chronology of the Bible. The Koran insists on Aaron (Arius?) being the *uncle* of the evangelical Jesus, no less. Mary, the mother of Jesus, is declared to be the *sister* of Moses and Aaron. Thus, according to the Koran, these Old Testament characters belong to the generation that *immediately* preceded Jesus Christ. Naturally, this is in drastic contradiction of the Scaligerian chronology, the discrepancy comprising *several centuries*. However, it concurs well with our abbreviated chronology. Let us turn to the 19th Sura of the Koran ([\[427\]](#), page 239). The Koran commentator I. B. Krachkovsky writes that it is “the oldest Sura that mentions such evangelical characters as... Mary and Jesus” ([\[427\]](#), page 560). The 19th Sura refers to the birth of Jesus, the son of Mary, in the following manner: “O Mariam, thou hast performed a feat unheard of! O sister of Harun [Aaron – A. F.]...” ([\[427\]](#), the 19th Sura, 28(7); 29(28), pages 240-241). The commentary to this fragment is as follows: “*the sister of Moses and Aaron is the mother of Jesus*” ([\[427\]](#), page 561, No. 17).

6.6. The XII century as the apparent epoch of St. Mark’s lifetime. The history of Cathedral of San Marco in Venice

The gigantic Venetian cathedral of San Marco is a true architectural gem adorning the city. It is also one of the most popular mediaeval buildings in Italy. Its history proves to be particularly fascinating in light of the new abbreviated chronology. Let us begin with reminding the reader of the official history of San Marco as it is related in the books titled *Basilica of San Marco* ([\[1265\]](#)) and *Venice* ([\[1467\]](#)). This is what we learn from [\[1265\]](#):

“The Basilica of San Marco is an object of adoration of the Venetians that also symbolizes their historical unity. This is doubtlessly the *main symbol of Venice* that attracts visitors from afar by the uniqueness of its beauty and its oriental splendour.

The Basilica of San Marco had been a ducal chapel until the end of the XVIII century and has thus absorbed the secular and the ecclesial history of the Venetian republic.

Ever since 1807, when the church transformed into the city cathedral having substituted the church of San Pietro de Castello in this capacity, it became a Mecca not only for the Venetians, but also visitors from across the world. Its bishop bears the *ancient title of the Patriarch*.

The initial construction of the Church of St. Mark occurred... after 828 A.D., when the body of St. Mark was saved from desecration and delivered from Alexandria on a ship by some Venetians”. ([1265], page 7).

The story unfolds as follows: nowadays St. Mark is supposed to have been the first of the four canonical evangelists ([765]). His Gospel – The Gospel According to Mark – is presumed to be the *oldest*, written around 50 A.D. at the insistence of either St. Peter or the Christian community. Sometime later Mark returned to Alexandria in Egypt, which is where he died on 25 April of the alleged year 68 A.D. ([1265], page 26).

Scaligerian chronology contains an informational gap of *many centuries* in what concerns St. Mark, whose name allegedly resurfaces from oblivion in the IX century A.D. – a millennium later, in other words. His body is supposed to have been *secretly* delivered to the Italian Venice from the Egyptian Alexandria. The canonical legend runs as follows ([1265]): two Venetian traders paid a chance visit to a Christian church in Alexandria that was consecrated to St. Mark and housed his ossuary. Some monk, as well as the prior, complained to them about the constant desecrations inflicted upon the church by the Muslims seeking to convert all Christian churches into mosques. The Venetian traders then uncoffined the body of St. Mark and *smuggled* it out of Alexandria in a basket full of vegetables and pork. After a sea journey full of deadly perils, the salvaged holy relic was delivered to Venice, where the construction of a new temple instantly began, designed as a shrine for St. Mark. All the episodes of this abduction are illustrated by inlays covering the walls of the Venetian cathedral.

The *first* church of St. Mark was thus constructed after the alleged year 828 A.D. as a shrine for his body that was “miraculously salvaged” from Alexandria. However, alack and alas, *there are no traces* of the first Venetian church of St. Mark anywhere. The historians say: “There is a large number of different *hypotheses* concerning the shape of this original church, all of them based on a very limited number of archaeological findings” ([1265], page 7).

The *first* Basilica of San Marco is supposed to have burnt down in the alleged year 976. According to [1265], page 7, “it was immediately reconstructed.” As a result, the second San Marco Basilica was built in Venice, allegedly towards the end of the X century. *It was destroyed as well* ([1265]).

Then, allegedly around 1063, the doge Domenico Contarini began the construction of *a new and much larger church* of St. Mark on the site of the second basilica. It is assumed that this *third* basilica was built in the fashion of the Basilica of the Twelve Apostles in Constantinople.

This is where oddities begin, well shrouded in mystery. See for yourselves, we are quoting verbatim:

“The *rediscovery* [sic! – A. F.] of St. Mark’s body is the last episode of the Venetian legend. During the construction of the third basilica, the ossuary was *hidden so well* [?! – A. F.] that several years later, after the death of the doge, *no one had a clue about their possible location*. It was only in 1094, after several days of ardent prayers of the doge Vitali Falier, the Patriarch, *and the entire populace*, that the holy relic [the body of St. Mark – A. F.] had *manifested itself miraculously from inside a column* [sic! – A. F.]”. ([1265], page 67).

This miraculous event is also represented on one of the inlays inside the Cathedral of St. Mark. Below one can see the famous painting on this subject by the XVI century artist Tintoretto.

Now then, we are being assured in a poised, no-nonsense manner that the XI century Venetians erected the gigantic cathedral of St. Mark *without having the slightest notion* of the location of the holy relic that had served as the *very reason* for the cathedral’s construction. And all the while, *the body of St. Mark the evangelist was right there, on the building site!*

Apparently, the cathedral was erected first; after that, the loss of the holy relic was suddenly noticed, and the search for it was long and fruitless. It took the fervent prayers of the doge, the Patriarch, and all of the population of Venice to make the body of the evangelist manifest itself *inside a stone column* (?). It was taken out with the utmost care (does that mean the stone pillar had to be shattered?) and solemnly buried by the altar.

This is where the body of St. Mark lies *until the present day*, being the central object of adoration in the cathedral. Scaligerian chronology of the events that we have related is shown in fig. 7.94. It is noteworthy that the eminent XVI century artist Tintoretto had *an altogether different concept* of the history of St. Mark’s burial in this cathedral. His famous painting with this exact subject can be seen in fig. 7.95 ([1472]). Mark the fact that St. Mark does not resemble a desiccated mummy the least bit, looking like a man who has *just died* and is going to be buried, q.v. in the left corner of the painting. According to the opinion that prevailed in the XVI century, St. Mark the evangelist was buried in the cathedral built specifically for this purpose in the alleged XI century *as befitting a person who has just died and earned great honours*. As we can see, there

wasn't any "millenarian vagrancy of St. Mark's body" in Tintoretto's perception.

Fig. 7.94. Scaligerian chronology of the events related to the burial of the evangelist Mark in Venice.

Fig. 7.95. A XVI century painting by Tintoretto titled "The Discovery of the Body of St. Mark". It may have had a different title at some point, something along the lines of "The Burial of St. Mark". Taken from [\[1472\]](#), ill. 17.

Apparently, the bizarre legend of the "pilgrimage of Mark's body" was a product later historians' efforts to delve deeper into the real events of the XII century and make them concur with the erroneous Scaligerian chronology. This is what we think really

happened:

St. Mark, the first evangelist, lived in the XII century A.D. and died in the second half of that century. He was buried for the first and the last time in the Cathedral of St. Mark, erected in his honour. This opulent inhumation, which took place in the alleged year 1094 (around 1194, most likely) with the doge, the patriarch, and the entire city present, was later misinterpreted as the rediscovery of his body, since Scaligerian chronology had already shifted the lifetime of St. Mark into the I century A.D.

There were no mysterious disappearances or miraculous rediscoveries. These legends date from a much later age, when historians attempted to make Scaligerian chronology concur with the documents that explicitly pointed to the XII century as the age of St. Mark's life and activity.

The cathedral of St. Mark obviously assumed its current shape a great deal later than the XII century. When we look at this cathedral nowadays we see a building whose construction was finished by the XVI century. On its walls we see inlays illustrating the rather airy legend of the fate of St. Mark's body. Even within Scaligerian chronological paradigm, the cathedral's construction continued well into the XIII century, when it was adorned with an equine sculptural group that was allegedly smuggled from the hippodrome of Constantinople in Byzantium ([\[1467\]](#), page 39).

It is difficult to pinpoint the exact place of St. Mark's residence. It may have been Asia Minor or Constantinople, as Scaligerian history insists, and not Italy. But, at any rate, his lifetime falls within the XII century A.D. and not the first.

The idea that St. Mark could have lived in Venice for some time is indirectly substantiated by the fact that "for many centuries the town was associated with the symbol of the winged lion that the Christian tradition ascribes to St. Mark the evangelist. Venetian banners, churches, palaces and ships, as well as the lands that the Venetians conquered all bore the sigil of the winged lion" ([\[1265\]](#), page 27).

It is however possible that Italy received the "copyright" for St. Mark merely as a result of a chronological and geographical transfer of Byzantine events from Constantinople (on paper, naturally).

This conclusion fits our hypothesis that Jesus Christ lived in the XII century A.D. Mark, the first evangelist, lived in the same century and died near its end.

The implication is that the other three evangelists – Luke, Matthew, and John – also couldn't have lived earlier than the XII century, since they wrote their Gospels after Mark, according to Scaligerian history. It would be very interesting indeed to find the *real* graves of these three evangelists as well.

7. The “ancient” Egypt and the Middle Ages

7.1. The odd graph of demotic text datings

We give a detailed account of Egyptian history in [Chron5](#). Presently, we shall limit ourselves to several brief introductory notes.

As we have already mentioned in [Chron1](#), Chapter 1, Scaligerian chronology of Egypt contains gigantic gaps and actually consists of assorted fragments, either linked in an arbitrary manner or altogether independent. [\[1069\]](#) contains a complete list of all dated demotic texts for 1966. It goes without saying that certain Egyptian texts can be ascribed no exact dating; we shall refrain from considering them here and turn to the ones described in [\[1069\]](#) instead. It is most edifying to observe their distribution across the time axis of Scaligerian history. The result can be seen in fig. 7.96. The resulting graph is extremely noteworthy.

Fig. 7.96. Quantity distribution graph for dated demotic Egyptian documents compiled from the data collected in [\[1069\]](#). One's attention is instantly drawn to the strange gaps in the beginning and at the end of the Second Roman Empire, as well as a suspicious lack of such documents pertinent to the Third Roman Empire epoch.

Primo, one sees that the majority of dated demotic Egyptian texts falls over the epoch of the Second Roman Empire allegedly covering the period of the I-III century A.D. It is significant that the gaps in the graph fully correspond to the chronological framework of the Second Roman Empire. Some of them are dated to earlier epochs, but those are separated from the Second Roman Empire by a strange gap in the middle of the alleged I century A.D.

Secundo, the graph in fig. 7.96 shows a complete absence of dated demotic documents in the epoch of the Third Roman Empire.

The Scaligerian chronology of demotic texts ipso facto reveals itself as several groups of documents whose relation to each other is rather far-fetched and fanciful.

These groups are separated by gaps whose boundaries most peculiarly coincide with the break points between the dynastic duplicates that we have discovered with the aid of completely different methods – those based on statistical analysis, qv in [Chron1](#), Chapter 5. Ergo, the folding of the European chronological scheme results in a corresponding abbreviation of the “ancient” Egyptian chronology.

7.2. The enigmatic “revival periods” in the history of “ancient” Egypt

In [Chron1](#), Chapter 1, we have already discussed the fact that the chronology of Egypt counts amongst the youngest of historical disciplines. Its formation was based on the existing Scaligerian chronology of Rome and Greece, and has therefore been dependent on it from the very start. The Egyptologists who initiated the compilation of the Egyptian chronology did not possess the objective criteria necessary for the verification of their hypotheses. This led to major discrepancies between the “different chronologies” of Egypt, amounting to 2-3 *millennia*, q.v. in [Chron1](#), Chapter 1.

The few dynastic lists that have survived until our day occasionally indicate reign durations for certain pharaohs, but the pharaohs are often referred to by different names; moreover, these numbers change *drastically* from list to list.

For instance, Eusebius gives 26 years as the reign duration for Amenmesse (second version), as it is pointed out in [\[544\]](#), whereas Africanus gives 5 years. The durations differ from each other by a *factor of five*.

Eusebius indicates 40 years for Amenope (both versions), Africanus indicates 20, and Ophis only 8. And so on, and so forth.

Nevertheless, all of these data can still provide the basis for some speculation at least, the obvious and numerous distortions notwithstanding, and it is little wonder that the XIX century Egyptologists attempted to use these numbers for the construction of chronological scales. However, their calculations were afflicted by discrepancies of several millennia, as we have seen above, not to mention the inaccuracy of the very concept of Scaligerian “elongated history.”

However, for most Egyptian dynasties, reign durations of the pharaohs remain a complete mystery ([\[99\]](#), pages 725-730). The entire sixth dynasty can be cited as an example (according to Brugsch). There is no chronological data for most of its pharaohs, which makes it all the more peculiar to observe Brugsch ascribing reign durations of 33.3 years to every pharaoh of this dynasty with some determined and glum exhilaration, counting 3 pharaohs per century. His datings of the sixth dynasty are as

follows:

- Userkaf – reigned from 3300 B.C. onwards,
- Teti – from 3266 B.C.,
- Pepy I (Meryre) – from 3233 B.C.,
- Merenre – from 3200 B.C.,
- Neferkaf – from 3166 B.C.,
- Merenre Zafemzaf – from 3133 B.C. (see [\[99\]](#), page 725).

Furthermore, Brugsch used the very same principle – numbers ending in 00, 33, and 66, for the “dating” of *every dynasty* starting with the first and ending with the twenty-fourth inclusive. Only the pharaohs of the last seven dynasties (out of thirty!) that enjoyed some sort of heterogeneity in the dating of their reigns ([\[99\]](#), pages 725-730).

This “dating method” is so ludicrous one feels embarrassed to so much as discuss it nowadays. Nevertheless, this is the very method, with a number of minor later modifications, *that the consensual version of Egyptian chronology was based upon*. Brugsch’s datings haven’t ever been revised in any cardinal way. See [\[1447\]](#), page 254, for instance.

The dynastic history of Egypt is anything but continuous. Some of the gaps that it contains swallow entire dynasties ([\[99\]](#) and [\[544\]](#), Volume 6). At the same time, the researchers of the “ancient” Egyptian history have noted that it has an uncannily cyclic nature. Scaligerian history of Egypt demonstrates a strange “renaissance effect,” much like its European cousin. This effect is well known to us already – we constantly encounter phantom duplicates of the same mediaeval events that were cast far back into the past.

Chantepie de la Saussaye, for one, wrote:

“If we are to turn to later ages in Egyptian history, we shall be surprised to discover that the culture of the Sais epoch is a spitting image of the culture of the pyramid epoch. The texts used *almost 3000 years ago* [sic! – A. F.] enter circulation once again, and the ancient fashion of decorating graves makes a comeback”. ([\[966\]](#), page 99)

H. Brugsch pointed out the following:

“As Mariett-Bey justly noted, the names typical for the twelfth and especially the eleventh dynasty come back on the monuments of the eighteenth dynasty in the same shape and form as they had once possessed, and *similar sepulchres* with identical ornamentation were used in both these periods. What we have in front of us is a *historical enigma* that we sadly lack the means to solve so far”. ([\[99\]](#), page 99)

Egyptologists find inscriptions referring to pharaohs and kings set apart by millennia in

Scaligerian chronology, coexisting side by side on the walls of Egyptian temples. In order to provide some kind of explanation, the Egyptologists have thought up the following hypothesis:

“The temples, constructed recently by the Ptolemaic rulers and adorned by the Romans, have all been built on the sites of the ancient shrines; all the ancient inscriptions found on temple walls were meticulously and devoutly *copied onto the walls of the new temple*,” suggests Brugsch in [\[99\]](#), page 145.

The practice of copying old and unintelligible inscriptions from the walls of ancient temples hasn’t been noted in any veracious historical period. One has to think no such nonsense occurred in “ancient” Egypt, either.

All of these recurrences and renaissances have received the legitimate and earnest title of “restorations.” We are told, for instance, that the nineteenth dynasty was followed by a restoration when “Egypt... returned to the ancient epoch of pyramid construction, which becomes regarded as an age worthy of imitating. The ancient religious texts are *resurrected*, although *the ability of the Egyptians to understand them is supposed to be limited*. The funereal rites of the fourth dynasty are adhered to *once more*. Their pyramids are *restored*; the ancient titles of the kings that have remained in complete obscurity for *over two millennia* are celebrated in quotidian use *yet again*. Art comes back into the solid realistic manner of the Old Kingdom” ([\[966\]](#), page 166).

It is obvious that Scaligerite historians should want to find some sort of explanation for these bizarre “mass recurrences” of ancient rites, failing to recognize them for the products of an erroneous chronological system that they are. The “explanation” offered by historians is the alleged *extreme conservatism* of the Egyptians. It is written that “the Sais *restoration* can be counted amongst the most significant periods in the history of the Egyptian culture, and provides for the best possible illustration of just how *conservative* the Egyptian national spirit was” ([\[966\]](#), page 166).

This is what B. A. Turayev has to say about the “restorations”:

“Attempts were made to edit all of the official texts using an *archaic language* that is hardly understood by many... the forgotten ranks and offices are *revived*, the inscriptions made during the epoch, even the *private* ones, can be taken for those made during the epoch of the Old Kingdom [sic! – A. F.]... . The most typical phenomenon here is the appearance of the pictures of agricultural works, pastoral scenes, etc., on the sepulchral wall that are familiar to us from the Old Kingdom epoch.” ([\[853\]](#), Volume 2, pages 102-103)

All of this after *two thousand years*?

Imagine having to write a message to your friends using *the language of I B.C.* This hardly seems possible, even if one were to express such a volition.

The new chronology eliminates the necessity of inventing such absurd explanations. Apparently, there have been *no “global renaissances”* on such a scale.

N. A. Morozov gives a consecutive analysis of all thirty dynasties of the Egyptian pharaohs. He comes to the conclusion that nearly all of the dynasties preceding the IV century A.D. are phantom duplicates of several mediaeval dynasties.

We shall refrain from quoting his speculations here. It isn't Morozov's conclusions that our research is ultimately based upon, but, rather, our mathematical and statistical research, qv in the bibliography of our publications. Our research has shown, among other things, that N. A. Morozov was really very far from concluding his research. He stopped at too early an epoch – the beginning of the IV century A.D. – having adhered to the erroneous opinion that subsequent Egyptian history doesn't need to be revised.

He turns out to have been wrong. Apparently, the entire “Scaligerian Textbook of Egyptian History” preceding the X-XII century A.D. is compiled from phantom duplicates of the mediaeval history of Egypt of the XIII-XVII century A.D., as well as the XIV-XVII century history of the Great=Mongolian empire, qv in [Chron5](#). Furthermore, the Biblical “Land of Egypt” apparently has got nothing to do with the territory of modern Egypt, since the Biblical Egyptian events apparently took place in an altogether different location. See [Chron6](#) for more details.

7.3. The ancient Hittites and the mediaeval Goths

It is commonly known that the “ancient Hittites” were “discovered” as late as 1880, when Professor Archibald Sayce read his lecture proclaiming the existence of “the ancient nation of the Hittites,” basing his research on analysis of the Bible, q.v. in [\[291\]](#), page 21. Sayce was granted the title of the Inventor of the Hittites ([\[291\]](#)). The Biblical studies of Archibald Sayce and William Wright led them to the conclusion that the “Hittites” used to live to the north of the Biblical Promised Land. Being raised on Scaligerian history and adhering to the erroneous opinion that the Promised Land was located on the territory of modern Palestine, Sayce and Wright confined the “ancient Hittites” to Asia Minor, which lies to the north of Palestine. However, nowadays we are beginning to understand that the Biblical Promised Land covers large territories in Southern Europe and the Mediterranean lands, q.v. above and in [Chron6](#). However, in this case the “Hittites” would have lived to the north from Southern Europe – in the lands populated by *the Goths*. What we witness here is a superimposition of the “ancient Hittites” over the mediaeval Goths.

We can now see the roots of the mistake made by Sayce and Wright. They suggested

searching for Hittite relics in Asia Minor, which was the place of the erroneous XVII century Scaligerian localization of Biblical events, and not in Europe, where one wouldn't have to search for them since these "Hittites" were already perfectly well known under the name of Goths. The "Hittite studies" were conducted in the same manner as previous Biblical research, with archaeologists going to Asia Minor in search of ruins and finding plenty to ascribe to "Hittites." This is how another error of Scaligerian chronology received "archaeological proof."

8. Problems inherent in the Scaligerian chronology of India

Scaligerian history of the East is closely related to the history of Europe and Egypt as presented by Scaliger and Petavius. Thus, all possible alterations of the European chronology automatically affect the chronology of “ancient” India. Let us give a brief summary of Scaligerian chronology of India. The historian N. Gousseva writes that “historical science runs into such problems in India as the researchers of the ancient history of other countries and peoples cannot even conceive of [this confession was made in 1968 – A. F.]. The primary difficulty here is the absolute lack of dated monuments” ([433], page 5). Apparently, all of the main “chronological landmarks” in Indian history are a product of a rather recent age, and they are directly dependent on the previously compiled Scaligerian chronology of Rome, Greece, and Egypt. Hence the obvious necessity for the revision of Scaligerian history of India.

The historian D. Kosambi reports:

“There is virtually *nothing* of what we know as historical literature in India... all we have is a vague oral tradition and an extremely limited number of documented data, which is of a much greater value to us than that obtained from legends and myths. This tradition gives us *no opportunity* of reconstructing the names of all the rulers. The meagre remnants that we do possess are *so nebulous* that no date preceding the Muslim period [before the VIII century A.D. – A. F.] can be regarded as precise... the works of the court chroniclers didn’t reach our time; only Cashmere and Camba can be regarded as an exception of sorts... all of this leads some rather earnest and eminent scientists claim that India has *no history of its own*”. ([433], pages 19-20).

For instance, this is what the historians tell us about the “ancient” culture of the Indus valley:

“Written memorials of the Indus culture *defy decipherment to this day... not a single finding can be associated with an actual person or historical episode*. We don’t even know the language that was spoken by the inhabitants of the Indus valley”. ([433], pages 65-66).

We are told that Scaligerian chronology of “ancient” India contains *gaps larger than 600 years* ([433], pages 65-66). Likewise the Scaligerian “ancient” Europe, India “suddenly” rolls back to barbarism around the beginning of the new era, and then “resumes” its ascension to the mediaeval “position of eminence”; which is suspiciously similar to the fate of the culture of “ancient” Europe, allegedly forgotten by everyone and only achieved once again in the Middle Ages.

The VII century A.D. is the time when the alleged “renaissance” of the Indian culture began – rather gradually, based on the Aryan culture (possibly the Christian-Arian

ideology). The famous “ancient” Indian “Aryans” can apparently be identified as the Arian Christians of the XII-XIV century, according to our reconstruction. The mysterious Aryans began to haunt an antediluvian age courtesy of Scaligerian chronology.

Furthermore, it turns out ([\[433\]](#)) that the texts concerning the cult of Krishna in India are of a relatively recent origin. Specialists in the history of religions have long since confirmed the existence of a vast number of parallels between Krishna and Christ ([\[544\]](#), Volume 4). This is why certain statements made by latter day historians reek of ambiguity, such as “the complete biography of Krishna was completed as late as the *XII century A.D.*” ([\[433\]](#), page 122). It is possible that the Indian Krishna cult is nothing but the cult of Jesus, brought to India by the Christian missionaries of the XII-XIV century.

It is assumed that the god Krishna is mentioned in the Bible ([\[519\]](#), Volume 4, page 17). According to some Indian sources, the god “Krishna” can practically be identified as Christ ([\[519\]](#), Volume 4).

Mediaeval authors occasionally located India in Africa or Italy (!). See more details in [Chron5](#). We should point out another very odd fact of Scaligerian history in this respect. It is presumed that the “ancient” Alexander the Great had reached India and defeated the Indian king Porus, having conquered many lands in India ([\[433\]](#)). One would think an event of this calibre would leave some trace in Indian history at the very least. However, this doesn’t seem to be the case. “This invasion... appears to have *remained unnoticed* by the Indian tradition, although some foreign historians consider it to be the *only* large-scale event in the ancient history of India” ([\[433\]](#), page 143).

One feels like asking the obvious question of whether the “India” of the mediaeval manuscripts really is the same country as the modern India? Could it have been an altogether different country that Alexander had conquered?

We are told further on that many vital issues concerning the “ancient” history of India are based on the manuscripts found as late as the *XX century*. It turns out, for instance, that “the *main* source of knowledge in what concerns the governmental system of India and the policy of the state in the epoch of Maghadhi’s ascension is the *Arthashastra* – the book... that had only been found in 1905, after many a century of *utter oblivion*” ([\[433\]](#), page 146). It turns out that this book is basically the Indian version of the famous mediaeval oeuvre of Machiavelli. However, in this case the “ancient Indian *Arthashastra*” couldn’t have been written before the Renaissance. This could have happened in the XVII-XVIII century, or even the XIX.

Scaligerian history of India resembles its European cousin in that it rolled back to

barbarism in the beginning of the new era, and had to “resume” its “long ascension to the heights of civilization” ([433]). We are also told that the “first significant Sanskrit inscription was found in Ghirnar and dates from roughly 150 A.D.” ([433], page 172). However, we instantly discover that the heyday of *Sanskrit* literature in India began around the XI century A.D. This is most probably a result of the chronological shift of a thousand years that we so familiar with by now. A propos, could “Sanskrit” stand for “Saint Script,” or the Holy Writ?

Scaligerian history of mediaeval India also contains a great number of centenarian chronological gaps, and is confusing and chaotic.

“The apathy of the Brahmans to everything real in the past and the present ... had *erased the history of India from human memory*... The reconstruction of the history and the realities ... of the ancient India ... we have to rely on the reports of the Greek geographers and Arab travellers ... there isn't *a single Indian source* that would equal the reports of the foreigners in value”. ([433], page 180).

Thus, Scaligerian history of India is wholly dependent on the consensual chronology of Rome and Greece and will have to be reconstructed in turn.

Historians characterize the dynastic history of India thusly: “The names of individual kings are obscured by the *quaint haze of legends*. We possess *nothing* that would remotely resemble palace chronicles” ([433], page 192). We fail to see the quaintness of historical haze. Could it reside in the freedom it gives to one's fantasy?

The famous *Mahabharata*, a collection of the “ancient” Indian epos, is relegated to a distant B.C. epoch by Scaligerite historians. On the other hand, the work is supposed to have been based on the “ancient” Greek epos. A large number of parallels between the *Mahabharata* and the poems of Homer were discovered quite a while ago ([519]). Historians claim that the Indians were “rephrasing Homer” ([520], page 13). If this be the case, the dating of the *Mahabharata* becomes completely dependent on the datings of the poems written by the “ancient” Homer. We have already demonstrated that events that occurred in “ancient” Greece were most probably really mediaeval, that is, dating to the XIII-XVI century A.D.

An in-depth analysis of the *Mahabharata*, the great body of epic text, as seen from the stance of the new chronology, is performed in our new book titled *The Chronology of India. Ptolemy's 'Geography'. The 'Atlas' of Ortelius*, 2003.

9. Was the artificial elongation of ancient history deliberate?

According to the results obtained by the new methods of dating, virtually all of the old documents that have reached our age are copies from ancient originals, presumed lost. These originals were written in order to reflect the current events of the XI-XVI century A.D., and not for the purpose of confusing future historians. It seems that earlier documents simply failed to have survived until the present day. However, the overwhelming majority of XI-XVI century originals either got destroyed, or were subjected to tendentious editing in the XVI-XVII century, during the creation of Scaligerian chronology. Whatever meagre genuine evidence of antiquity escaped such editing (or re-writing in the light of the veracious Scaligerian Chronology) are declared to be forgeries or creations of ignorant authors.

In [Chron5](#) and [Chron6](#) we give examples of how our revised chronology acquits several old documents from accusations of forgery, such as the famous Gift of Constantine, the Gift of Alexander the Great, and so on. In other words, many of the documents declared counterfeits nowadays turn out to be original, concurring perfectly well with the new chronology. Such is the case with the “Privileges” given to the mediaeval Ducal House of Austria by Caesar and Nero (see [Chron1](#), chapter 1). In our opinion, nearly all of the events described in the ancient chronicles really *did take place*. The question is one of their exact *location and timing*. This is precisely where chronological and geographical confusion began, aided by the deliberate distortions of Scaligerite chronologers, which has led to the “elongation of history.” However, the key role was most probably played by the tendentious “editing of history” in the XVI-XVII century.

Summary.

1. Most of the documents that have reached our age – the ones referring to pre-XVI century events – are based on old originals. However, nearly all of the latter went through the hands of the tendentious editors of the XVI-XVII centuries. Their reading and interpretation are ambiguous, and an altered chronology leads to a new understanding.
2. Some chronological errors were accidental. A millenarian shift of the years of Christ’s life from the XII century A.D. to the I might be an example of such an error.

3. Some of the distortions of mediaeval history preceding the XVI century A.D. were deliberate and verged on blatant falsification. We shall provide more details in [Chron5](#), [Chron6](#) and [Chron7](#).

HISTORY: FICTION OR SCIENCE?

THE ISSUE WITH ANTIQUITY

ANATOLY FOMENKO

Are History and Astronomy incompatible? By Béla Lukács

Preface by Anatoly T. Fomenko

PART ONE: The Middle Ages referred to as the “Antiquity”. Mutual superimposition of the Second and the Third Roman Empire...

1. Identifying the Second and the Third “ancient” Roman Empire as the same state. A chronological shift of 330 years

1.1. A dynastic description of the Second and the Third Roman Empire

1.2. Biographical parallelism between the Second and Third Roman Empires. The 330-year shift

2. The correlation between two different dating methods illustrated by the superimposition of two epochs from the history of Roman Papacy one over the other. A brief scheme

3. The superimposition of the Israelite (Theomachist) Kingdom over the Third Roman Empire in the West. A shift of circa 1230 years

4. Identifying the theocratic Kingdom of Judah as the Third Roman Empire in the East. A shift of circa 1230 years (short diagram)

5. Saint Basil the Great in the alleged IV century a.d. and his prototype in the XII century A.D. – Jesus Christ. The resulting shift of 820 years

PART TWO: The famous reform of the Occidental Church in the XI century by “Pope Gregory Hildebrand” as the reflection of the XII century reforms of Andronicus (Christ). The Trojan war of the XIII century A.D.

6. “Pope Gregory Hildebrand” from the XI century A.D. as a replica of Jesus Christ (Andronicus) from the XII century.

6.1 Astronomy in the Gospels

6.1.1. The true dating of the evangelical eclipse

6.1.2. The Gospels apparently reflect a sufficiently advanced level of astronomical eclipse theories, which contradicts the consensual evangelical

history

6.2. The Roman John Crescentius of the alleged X century a.d. as a reflection of the Evangelical John the Baptist from the XII century a.d. A biographical parallelism

6.3. “Pope” Gregory VII Hildebrand from the Roman chronicles dated to the XI century a.d. as the reflection of Jesus Christ (Andronicus) from the XI century a.d. A biographical parallelism

6.4. The Bethlehem Star of the alleged I century and the famous supernova explosion of circa 1150 (subsequently shifted to 1054 by the chronologists)

6.5. The Crucifixion of Jesus on Mount Beykos, or the evangelical Golgotha, which is located outside Constantinople, near the shore of the Bosphorus

7. Identifying Livy’s “Ancient Imperial Rome” as the Third Roman Empire after a 1053-year shift

Overview of the e-Series

PART ONE

The Middle Ages referred to as the
“Antiquity”.

Mutual superimposition of the Second and
the Third Roman Empire, both of which
become identified as the respective
kingdoms of Israel and Judah

1.

Identifying the Second and the Third “ancient” Roman Empire as the same state. A chronological shift of 330 years

1.1. A dynastic description of the Second and the Third Roman Empire

Let us recall that under the First Roman Empire we understand the “ancient” kingdom as founded by Romulus and Remus, presumably about 753 B.C. ([\[72\]](#)). It had ended with the reign of the Roman King Tarquin the Proud, sometime around the alleged year 509 B.C. ([\[72\]](#)).

The Second Roman Empire is the kingdom which was actually founded by Lucius Sulla in the alleged years 83-82 B.C. and ended with the reign of Emperor Caracalla in the alleged year 217 A.D.

Under the Third Roman Empire we understand the newly founded kingdom that is supposed to have been “restored” by Emperor Lucius Aurelian in the alleged year 270 A.D. and ended with King Theodoric in the alleged year 526 A.D.

The comparison of the Second and Third Roman Empires reveals dynastic currents twined by an explicit dynastic parallelism, qv in Fig. 1.1. See also [Chron1](#), Chapter 6. The chronological shift that separates those empires approximately equals 330 years. In this case, a dynastic current from the Second Empire includes virtually every ruler of the empire. The respective dynastic current from the Third Empire comprises the best-known rulers of the Third Roman Empire. We provide complete lists of both dynastic currents below.

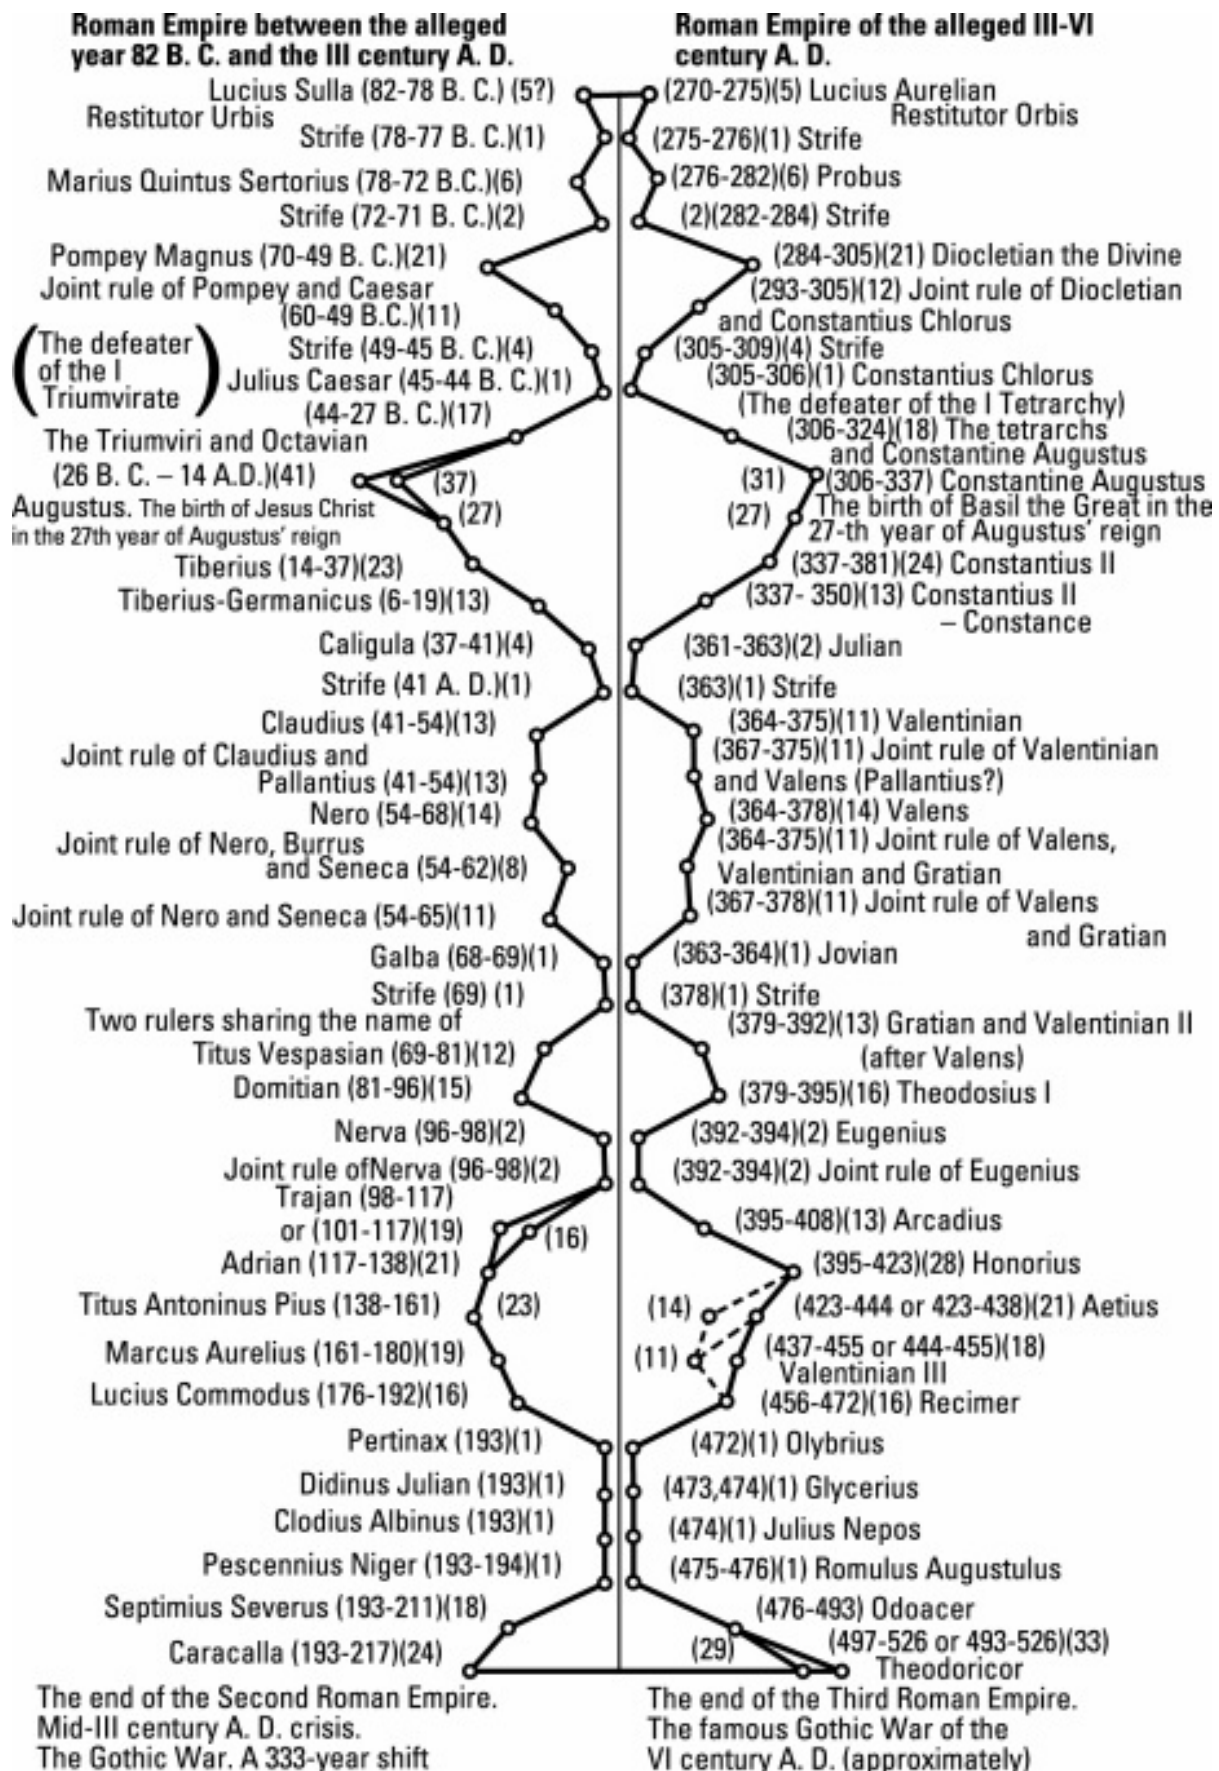

Fig. 1.1. The dynastic parallelism between the Second “ancient” Roman Empire of the alleged years 82 B. C. – 217 A.

N. A. Morozov had been the first to point out the parallels between the Second and the Third Roman Empire in [\[544\]](#). However, lacking a prejudice-free methodology for the selection and comparison of parallel dynastic currents, he had to contend himself with mere selection. As a result, the sequences of kings proposed by him prove to be far from optimal, and happen to be outright erroneous at times. The author of the present book found the optimal parallel dynastic currents whose details differ from the parallels proposed in [\[544\]](#). Moreover, it soon became clear that the parallel between the Second and Third Roman Empires was by no means basic. It is of a secondary nature, that is, both empires themselves are phantom reflections of a much later mediaeval kingdom. Nevertheless, we decided to begin our list, which contains the most important dynastic parallelisms with this example, since it is a sufficiently vivid one, and also useful for further understanding.

Let us recall the parallelism table (see [Chron1](#), Chapter 6). The rulers of the Second Roman Empire are listed in the first position, and the respective rulers of the Third Roman Empire that they’re identified as, in the second. All the reign durations are indicated in parentheses (see also [\[72\]](#), pages 236-238). Besides reign durations, the table contains other curious numeric data, which were not taken into account in the calculation of the proximity coefficient $c(a, b)$ – we were only proceeding from reign durations.

The Scaligerian history considers the first three emperors of the Second Roman Empire – Sulla, Pompey and Caesar – to have been “fictitious emperors”, bearing the title of emperor just formally, as if something about it had been “out of the ordinary”. However, this opinion is at odds with a number of “ancient” sources calling those rulers emperors very perspicuously. See Plutarch, for instance ([\[660\]](#), Volume 2, pages 137-138).

1a. *Lucius Sulla*, ruled for 4 years: 82-78 B.C.

■ 1b. *Aurelian (Lucius Domitian Aurelian)* ruled for 5 years: 270-275 A.D.

2a. *Strife*, less than 1 year: 78-77 B.C.

■ 2b. *Strife*, less than 1 year: 275-276 A.D.

3a. *Marius Quintus Sertorius*, 6 years: 79-72 B.C.

■ 3b. *Probus (Marcus Aurelius Probus)*, 6 years: 276-282 A.D.

4a. *Strife*, 2 years: 72-71 B.C.

■ 4b. *Strife*, 2 years: 282-284 A.D.

5a. *Gnaeus Pompey the Great*, 21 years: 70-49 B.C.

■ 5b. *Diocletian the Divine (Caius Aurelius Valerius Diocletian)*, 21 years: 284-305 A.D.

6a. Joint rule of *Pompey* and *Julius Caesar* (first triumvirate), 11 years: 60-49 B.C.

■ 6b. Joint rule of *Diocletian* and *Constantius I Chlorus* (first tetrarchy), 12 years: 293-305 A.D.

7a. *Strife*, 4 years: 49-45 B.C.

■ 7b. *Strife*, 4 years: 305-309 A.D.

8a. *Julius Caesar*, the conqueror of the first triumvirate, 1 year: 45-44 B.C.

■ 8b. *Constantius I Chlorus (Marcus or Caius Flavius Valerius Constantius)*, the conqueror of first tetrarchy, 1 year: 305-306 A.D. or 13 years: 293-306 A.D.

9a. *Triumvirate*, 17 years: 44-27 B.C.

■ 9b. *Tetrarchy*, 18 years: 306-324 A.D.

10a. *Augustus (Caius Julius Octavian Augustus)*, the conqueror of the second triumvirate, 41 years: from 27 B.C. to 14 A.D., or 37 years: from 23 B.C. to 14 A.D.

■ 10b. *Constantine I (Caius Flavius Valerius Constantine Augustus)*, the conqueror of the second tetrarchy, 31 years: 306-307 A.D., or 24 years: 313-337 A.D., with the defeat of *Licinius* taking place in 313 A.D., or 13 years: 324-337 A.D., where year 324 A.D. marks the death of *Licinius*.

10'a. The birth of *Jesus Christ* in the 27th year of *Octavian Augustus*.

■ 10'b. The birth of *Saint Basil the Great (The Great King)* in the 27th year of *Constantine I*.

11a. *Tiberius (Tiberius Claudius Nero Julius)*, 23 years: 14-17 A.D.

■ 11b. *Constantius II*, 24 years: 337-361 A.D., or 21 years: 340-361 A.D.

12a. Struggle between *Tiberius* and *Germanicus* (assassination of *Germanicus*), 13 years: 6-19 A.D.

■ 12b. Struggle between *Constantius II* and *Constans* (assassination of *Constans*), 13 years: 337-350 A.D.

13a. *Caligula* (*Caius Julius Caligula Germanicus*), 4 years: 37-41 A.D.

■ 13b. *Julian*, 2 years: 361-363 A.D.

14a. The strife after the death of *Caligula* (brief unrest with the emperor present), less than 1 year: 41 A.D.

■ 14b. The strife after the death of *Julian* (brief unrest with the emperor present), less than 1 year: 363 A.D.

15a. *Claudius* (*Tiberius Claudius Nero Drusus Germanicus*), 13 years: 41-54 A.D.

■ 15b. *Valentinian I*, 11 years: 364-375 A.D.

16a. “Joint rule” of *Claudius* and *Pallas* within the “triumvirate”: *Claudius*, *Pallas*, *Narcissus*; not more than 13 years: 41-54 A.D.

■ 16b. “Joint rule” of *Valentinian I* and *Valens* within the “triumvirate”: *Valentinian I*, *Valens*, *Gratian*; 11 years: 367-375 A.D.

17a. *Nero* (*Lucius Domitian Ahenobarbus Tiberius Claudius Drusus Germanicus Nero*), 14 years: 54-68 A.D.

■ 17b. *Valens*, 14 years: 364-378 A.D.

18a. Joint rule of *Nero* with *Burrus* and *Seneca*, 8 years: 54-62 A.D.

■ 18b. Joint rule of *Valens* with *Valentinian I* and *Gratian*, 11 years: 364-375 A.D.

19a. Joint rule of *Nero* and *Seneca*, 11 years: 54-65 A.D.

■ 19b. Joint rule of *Valens* and *Gratian*, 11 years: 367-368 years A.D.

20a. *Galba* (*Servius Sulpicius Galba*), 1 year: 68-69 A.D.

■ 20b. *Jovian*, 1 year: 363-364 A.D.

21a. *Strife*, less than 1 year: 69 A.D.

■ 21b. *Strife*, less than 1 year: 378 A.D.

22a. Two *Tituses Flaviuses Vespasians* (the names are completely identical), 12 years: 69-81 A.D.

■ 22b. *Gratian* and *Valentinian II* (after the death of *Valens*), 13 years: 379-392 A.D.

23a. *Domitian (Titus Flavius Domitian)*, 15 years: 81-96 A.D.

■ 23b. *Theodosius the Great*, 16 years: 379-395 A.D.

24a. *Nerva (Marcus Cocceius Nerva)*, 2 years: 96-98 A.D.

■ 24b. *Eugenius*, 2 years: 392-394 A.D.

25a. Joint rule of *Nerva*, 2 years: 96-98 A.D.

■ 25b. Joint rule of *Eugenius*, 2 years: 392-394 A.D.

26a. *Trajan (Marcus Ulpius Trajan Nerva)*, 19 years: 98-117 A.D., or 16 years: 101-117 A.D.

■ 26b. *Arcadius*, 13 years: 395-408 A.D.

27a. *Hadrian (Publius Aelius Hadrian Trajan)*, 21 years: 117-138 A.D.

■ 27b. *Honorius*, 28 years: 395-423 A.D.

28a. *Antoninus Pius (Titus Aurelius Fulvius Boionius Arrius Antoninus Hadrian)*, 23 years: 138-161 A.D.

■ 28b. *Aetius*, 21 years: 423-444 years A.D., or 14 years: 423-438 the years A.D.

29a. *Marcus Aurelius (Marcus Annius Catilius Severus Aelius Aurelius Verus Antoninus)*, 19 years: 161-180 A.D.

■ 29b. *Valentinian III*, 18 years: 437-455 A.D., or 11 years: 444-455 A.D., or 32 years: 423-455 A.D.

30a. *Commodus (Lucius Marcus Aurelius Commodus Antoninus)*, 16 years: 176-192 A.D., or 12 years: 180-192 A.D.

■ 30b. *Recimer*, 16 years: 456-472 A.D.

31a. *Pertinax (Publius Helvius Pertinax)*, less than 1 year: 193 A.D.

■ 31b. *Olybrius*, less than 1 year: 472 A.D.

32a. *Didius Julian (Marcus Didius Severus Julian)*, less than 1 year: 193 A.D.

■ 32b. *Glycerius*, less than 1 year: 473-474 A.D.

33a. *Clodius Albinus (Decimus Clodius Albinus Septimius)*, less than 1 year: 193 A.D.

■ 33b. *Julius Nepos*, less than 1 year: 474 A.D.

34a. *Pescennius Niger (Caius Pescennius Justus Niger or Nigrus)*, 1 year: 193-194 A.D.

■ 34b. *Romulus Augustulus*, 1 year: 475-476 A.D.

35a. *Septimius Severus (Lucius Septimius Severus Pertinax)*, 18 years: 193-211 A.D.

■ 35b. *Odoacer*, 17 years: 476-493 A.D.

36a. *Caracalla (Septimius Bassianus Marcus Aurelius Antoninus Caracalla)*, 24 years: 193-217 A.D., or 6 years: 211-217 A.D.

■ 36b. *Theodoric the Great*, 29 years: 497-526 A.D., or 33 years: 493-526 A.D.

Besides reign durations, this table contains additional data irrelevant for the calculation of the $VSSD = c(a, b)$ proximity coefficient, and hence not taken into account in computation. $VSSD = 10^{-12}$ in the statistical model that we present and prove correct in [Chron1](#), Chapter 5; it indicates a manifest dependence between the discovered dynastic currents.

Aggregate timelines of the empires under comparison are somewhat different. Namely, the Second Empire spans 299 years. This figure equals 256 years in case of the Third Roman Empire, qv in fig. 1.2. Although a 43-year difference is minute as compared with the total timeframe, it should be taken into account nevertheless. The

Second Empire turns to have zero joint rules of any significance, by which we mean joint rules comparable to the duration of the corresponding reign, while the Third Empire has four pairs of such rulers (8, 9), (12, 13), (16, 17) and (19, 20).

Fig. 1.2. A representation of the dynastic parallelism between the Second Empire and the Third on the time axis. The numbers on the graph correlate to the numbers given to the rulers on the previous illustration as well as in the table from Chapter 6 of [Chron1](#).

Let us present both dynasties on the time axis. If every ruler is represented by a section whose beginning and end would correspond to the beginning and the end of said ruler's reign, four "major joint rules" shall separate the Third Empire into five blocks. What would happen to the chart of the Third Empire if we eliminated these joint rules – as in dividing the respective pairs of emperors and placing them one after the other in succession instead? Let us perform these four unidirectional shifts by the length of respective joint rules, keeping the individual sections unchanged. After such separation, the reign tables of the Second and the Third Empire turn out to be virtually identical, qv in fig. 1.2. The calculation of joint reign durations separated by the authors of the present book (with ruler number 29 made redundant, qv in the list) yields the exact difference of 43 years between the durations of the empires' existence. Thus, the difference became accumulated due to four prominent joint rules. Having made the distinction between the co-rulers, we find that the difference disappears, the durations

of empires begin to coincide, and the two dynasties become virtually identical.

The mechanism of duplication becomes clear. Two different chroniclers would ascribe “extra age” to two different copies of the same mediaeval dynasty of the X-XIII or XIV-XVI century. Or, alternatively, one of the chroniclers, whilst transposing a mediaeval dynasty into the past, would separate its co-rulers, recording them in succession for the sake of simplicity; another chronicler would do the contrary and “combine rulers” by superimposing them one over the other, thus reducing the total timeframe of the entire dynasty. This was how the two phantom duplicates – namely, the Second and Third Roman Empires – had come into existence.

As we have already mentioned, the dynastic current of the Second Empire included in the parallelism virtually covers the entire *Second Empire*. Namely, it is only the following four emperors that remain outside the parallelism:

- *Otho (Marcus Salvius Otho)*, 69 A.D.,
- *Vitellius (Aulus Vitellius Germanicus)*, 69 A.D.,
- *Lucius Verus (Lucius Ceionnius Commodus Verus Aelius Aurelius)*, 161-169 A.D.,
- *Geta (Lucius or Publius Septimius Geta)*, 209-212 A.D.

It is clear why they had fallen out of the parallelism. They had all ruled jointly with political figures of greater prominence included in the parallelism. Namely, Lucius Verus is “covered” by Marcus Aurelius (161-180), and Geta by Caracalla (193-217). Both Otho and Vitellius had ruled for less than a year.

Let us now consider the Third Roman Empire and produce a complete list of its emperors, with all versions of their rules, and the strife periods. We use the data from [\[767\]](#), [\[327\]](#), [\[76\]](#), [\[579\]](#). The list uses CAPITAL LETTERS for highlighting the emperors covered by the parallelism.

1. Tetricus, 270-273 A.D.,
2. LUCIUS AURELIAN, 270-275,
3. Tacitus, 275-276,
4. STRIFE, 275-276,
5. Florian, 276 year,
6. PROBUS, 276-282,
7. STRIFE, 282-284,
8. Carus, 282-283,
9. Julian, 283,

10. Carinus, 283-285,
11. Numerian, 283-284,
12. Carausius, 286-293,
13. DIOCLETIAN, 284-305,
14. Allectus, 293-296,
15. Maximian, 286-305,
16. Constantius I Chlorus, 293-306, first version,
17. Galerius 293-311, first version,
18. CONSTANTIUS I CHLORUS, 305-311, second version,
19. Flavius Severus, 306-307,
20. Galerius, 305-311, second version,
21. STRIFE, 305-309,
22. Maximinus Daia or Daza, 306-313,
23. Maxentius, 307-312,
24. Alexander, 308-311,
25. TETRARCHY, 306-324,
26. Licinius, 308-324, first version,
27. Licinius, 313-324, second version,
28. CONSTANTINE I, 306-337, first version,
29. Constantine I, 313-337, second version,
30. Constantine I, 324-337, third version,
31. Constantine II, 337-340,
32. Constans, 337-350,
33. CONSTANTIUS II, 337-361, first version,
34. Constantius II, 340-361, second version,
35. Magnentius, 350-353,
36. JULIAN, 361-363,
37. JOVIAN, 363-364,
38. VALENTINIAN I, 364-375,
39. VALENS, 364-378,
40. Gratian, 367-383, first version,
41. STRIFE, 378,
42. GRATIAN, 379-383, second version,
43. Valentinian II, 375-392, first version,
44. VALENTINIAN II, 379-392, second version,

45. Magnus Maximus, 383-388,
46. Flavius Victor, 384-388,
47. THEODOSIUS THE GREAT in the West and in the East, 379-395,
48. EUGENIUS, 392-394,
49. ARCADIUS in the West and in the East, 395-408,
50. HONORIUS, 395-423,
51. Marcus, 407 year,
52. Gratian II, 407,
53. Constantine III, 407-411,
54. Priscus Attains, 409-410, first version,
55. Heracleon, 409-413,
56. Jovian, 410-413,
57. Priscus Attains, 414, second version, second attempt to seize power,
58. Constantius III, 421,
59. John, 423, first version,
60. John, 423-425, second version,
61. AETIUS, 423-444, first version,
62. Aetius, 423-438, second version,
63. Valentinian, III 423-455, first version,
64. VALENTINIAN III, 437-455, second version,
65. Valentinian III, 444-455, third version,
66. Petronius Maximus, 455,
67. Avitus, 455-456,
68. Majorian, 457-461,
69. RECIMER, 456-472,
70. Libius Severus, 461-465,
71. Anthemius Procopius, 467-472,
72. OLYBRIUS, 472,
73. GLYCERIUS, 473-474,
74. Anarchy and strife, 472-475,
75. JULIUS NEPOS, 474 or 474-475?,
76. ROMULUS AUGUSTULUS, 475-476,
77. ODOACER, 476-493,
78. Theodoric the Goth, 493-526, first version,
79. THEODORIC THE GOTH, 497-526, second version.

Many of the emperors that remained outside the parallelism are the so-called “short-term” ones, in other words, they had ruled for 1-2 years each, and some are only known from coins. Furthermore, some of them did not rule in Rome, but rather in the Roman provinces – Gaul, Africa, etc.

1.2. Biographical parallelism between the Second and Third Roman Empires. The 330-year shift

Alongside the statistical superimposition, there are amazing biographical parallels which all but identify the map-codes of these two dynasties as one another. We feel obliged to reiterate that the detection of a separate isolated pair of “similar biographies” certainly does not mean anything. However, the occurrence of two long sequences of such biographies spanning a total of several hundred years gives one plenty of food for thought.

The biographic parallels that we have discovered, or the proximity of the relevant map-codes (see [Chron1](#), Chapter 5), compelled us to compile a number of rather extensive tables and to compare them to each other. In order to save space, we shall only list the focal points of this multi-centenarian parallelism. Naturally, the royal biographies that we have compared were written by different scribes. These scribes would sometimes contradict each other in their evaluation of a given ruler’s endeavours to a great extent. One scribe would praise an emperor, while another would pour scorn over said figure. However, the most remarkable fact in this long chain of coincidences is that all of them were discovered as a result of a continuous formal comparison of kings that had possessed identical numbers in their dynasties over the length of nearly three hundred years.

A) The parallelism between the Second and Third Roman Empires begins with prominent political figures. They both bear the name of Lucius as well as similar, almost identical, honourable titles, not applied to anyone else in these empires: Restitutor Urbis and Restitutor Orbis.

B) The parallelism ends with prominent political figures that accomplish fairly similar deeds. For instance, both of them had granted civil rights to the entire free populace.

C) Superimposition transforms empires and periods of joint rule into near-clones. Official collective joint rules, like triumvirates, are identified as similar joint rules, such as tetrarchies.

D) The “biographic parallelism”, which often surprises us by the amazing uniformity

of “conspiracy backbones”, lasting for nearly 300 years.

The letter “*a*” stands for the Second Empire, and the letter “*b*” – for the Third.

1a. *Lucius Sulla*.

■ 1b. *Lucius Aurelian*.

1.1a. *Second Empire*. The official title of Sulla: Restitutor Urbis, or “the restorer of the city”. This title was given to no one else in the *Second Empire*. First name, *Lucius*.

■ 1.1b. *Third Empire*. The official title of *Aurelian*: Restitutor Orbis, or “the restorer of the world” (the state). This title was given to no one else in the *Third Empire*. First name, *Lucius*. The names coincide.

1.2a. *Second Empire*. Sulla is a *Roman Emperor*, according to Plutarch, for instance ([660], Vol. 2, pages 137-138). In the Scaligerian history, Sulla is not formally considered an emperor [327]. This, however, does not conform to direct references of the “ancient” authors who distinctly refer to Sulla by his *emperor’s* title, qv in Plutarch’s work ([660], Vol. 2, pages 137-138). Modern historians believe the emperor’s title to have had a “different meaning” when applied to Sulla ([660], Vol. 2, page 514, commentary 61).

■ 1.2b. *Third Empire*. Aurelian – a *Roman Emperor*, according to the Scaligerian history ([76]).

1.3a. *Second Empire*. Sulla becomes emperor as a result of a civil war ([327]), being the most successful military leader. It was one of the bloodiest wars seen by the *Second Empire*. It had raged on for many years ([327], page 197).

■ 1.3b. *Third Empire*. Aurelian seizes power as a result of a war against the Goths ([327]), being the most capable military leader. The war with the Goths is one of the bloodiest wars seen by the *Third Empire*. It had also lasted for many years ([327]).

1.4a. *Second Empire*. The war is predominantly civil and external to a lesser degree ([327]). The *troops* crown Sulla emperor ([660], Volume 2). The senate pronounces Sulla the dictator ([327]).

■ 1.4b. *Third Empire*. The war is both civil and external. It completes a major

civil war in Italy that dates to the middle of the alleged third century A.D. The *troops* pronounce Aurelian the emperor ([327]). The Roman senate approves the election of Aurelian under the pressure of the troops ([327]).

1.5a. *Second Empire*. Sulla *actually establishes* the Second Roman Empire after a period of anarchy and republican rule. He is thus the *first* emperor, *regnant for 4 years*: 83-78 B.C., or 82-78 B.C. The beginning of Sulla's reign is dated back to either 83 B.C. ([327], page 197) or 82 B.C. – the year of his victory at the walls of Rome ([327], pages 197-202).

■ 1.5b. *Third Empire*. Aurelian “*restores*” the Roman Empire after a severe period of strife. He is the *first* emperor of the *Third Empire*. He *rules for 5 years*: 270-275 A.D.([327] and [76], table 15). The two reign durations are of a virtually *similar length*.

2a. *Period of strife*.

■ 2b. *Period of strife*.

2.1a. *Second Empire*. After the death of Sulla, the *civil war* flares up again – actually, a series of wars fought by Pompey et al. *Two* brilliant military leaders gain prominence – Junius Brutus and Marcus Aemilius Lepidus. The troops of both leaders are *defeated*.

■ 2.1b. *Third Empire*. After the death of Aurelian, the stability of the state is lost again, and a *mutiny* begins. Tacitus, the successor of Aurelian, is murdered. Two new emperors gain prominence: Florian and Probus. The troops of one of the military leaders (Florian) are *defeated*.

2.2a. *Second Empire*. The strife lasts for *approximately 1 year*: 78-77 B.C. ([327], pages 207-208).

■ 2.2b. *Third Empire*. The strife lasts for *approximately 1 year*: 275-276 A.D. ([327], pages 446-447). The lengths of the periods coincide.

3a. *Marius Quintus Sertorius*.

■ 3b. *Probus*.

3.1a. *Second Empire*. After the death of Sulla and a brief period of strife, Marius

Quintus Sertorius – the emperor of the troops, comes to power. However, he gets *murdered* as a result of a *plot*.

■ 3.1b. *Third Empire*. After the death of Aurelian and a period of anarchy, Probus becomes emperor. Soldiers *riot* against Probus and *murder* him.

3.2a. *Second Empire*. Sertorius *rules for 6 years*: 78-72 B.C. ([327], pages 208-209).

■ 3.2b. *Third Empire*. Probus *rules for 6 years*: 276-282 years A.D.([327], page 413). The two reign durations coincide.

4a. *Period of strife*.

■ 4b. *Period of strife*.

4.1a. *Second Empire*. After the death of Sertorius in 72-71 B.C. a *great embroilment* begins, marked by the uprising of Spartacus in particular. Over the course of these two years, *two military leaders* attain prominence – Pompey and Crassus. The two are the most brilliant warlords of those years.

■ 4.1b. *Third Empire*. The death of Probus in 282-284 A.D. was followed by a *violent civil unrest*. In the course of these two years, *two military leaders* manage to distinguish themselves – Aurelius Carinus and Numerian. The two are the most eminent public figures of the period, who are identified as the duplicates of Pompey and Crassus.

4.2a. *Second Empire*. The strife *lasts for 2 years*: 72-71 B.C. ([327], page 215).

■ 4.2b. *Third Empire*. The strife *lasts for 2 years*: from the end of 282 to the beginning of 284 A.D. ([327], pages 647-648, and [76], table 15). The durations of the periods *coincide*.

5a. *Gnaeus Pompey Magnus*, the organizer of the first triumvirate.

■ 5b. *Diocletian the Divine*, the organizer of the first tetrarchy.

5.1a. *Second Empire*. After the strife 70 B.C. the power passes into the hands of the Emperor Pompey the same year. He enjoys a splendid triumph and becomes honoured with the consul's title ([660], Volume 2, page 338). The period of Pompey's reign is known as the epoch of *Pompey's Principate* ([767], Volume 1,

Chapter XI). For Pompey, the situation with his imperial title is similar to Sulla's. Although contemporary historians do not consider Pompey to have been "an actual emperor", Plutarch uses the title to refer to him without any hesitation whatsoever, qv in [660], Volume 2, page 338. There are also numerous ancient inscriptions in existence that call Pompey *emperor* without any double-talk at all ([873], page 91, No. 34).

■ 5.1b. *Third Empire*. After the strife of 284 A.D., Diocletian is crowned emperor ([76]). With Diocletian coming to power, "a new epoch begins in the history of the Roman Empire – *The Epoch of Dominate*" ([327], page 413).

5.2a. *Second Empire*. Pompey is one of the *most famous rulers* in the history of Rome. He accomplishes large-scale democratic reforms, in particular, the reformation of the court and the troops ([327], page 277). Pompey was *declared divine* in his lifetime ([767], Volume 1, p. 279).

■ 5.2b. *Third Empire*. Diocletian is one of the *most eminent rulers* in Roman history and the initiator of several important democratic reforms. He reforms the court as well as the military bodies; he is also the author of a monetary reform ([767], Volume 2, page 649 etc). Diocletian was also *deified* in his lifetime ([327], pages 422-424).

5.3a. *Second Empire*. In the alleged year 49 B.C., the Roman senate strips Pompey of all his powers. This marks the end of Pompey's reign; he dies in several years.

■ 5.3b. *Third Empire*. In the alleged year 305 A.D., Diocletian abdicates, which marks the end of his reign ([327], page 424). He dies a few years after that.

5.4a. *Second Empire*. Pompey ruled for 21 years: 70-49 B.C. ([76]).

■ 5.4b. *Third Empire*. Diocletian ruled for 21 years: 284-305 A.D. The reign durations *coincide*.

6a. *Joint rule of Pompey and Julius Caesar. The First Triumvirate.*

■ 6b. *Joint rule of Diocletian and Constantius I Chlorus. The First Tetrarchy.*

6.1a. *Second Empire*. a) Pompey, b) Julius Caesar, c) the first triumvirate, d) Crassus. At the peak of his fame in 60 B.C., Pompey founded the *First Triumvirate* to resist his enemies. For this purpose he had granted authority to two important military

leaders, entering an agreement with them – Julius Caesar and Crassus ([327], p. 227).

■ 6.1b. *Third Empire*. a) Diocletian, b) Constantius Chlorus, c) the first tetrarchy, d) Maximian. At the peak of his popularity, allegedly in 293a.d., Diocletian creates the *First Tetrarchy* to hold his opponents at bay. Three major political figures rise to positions of authority as a result – Constantius I Chlorus, Caius Galerius, and Maximian ([327], page 420).

6.2a. *Second Empire*. Pompey signs a pact with Crassus first, and then they include Julius Caesar in the coalition. This coalition is officially called the *First Triumvirate* in historical literature ([327], page 227).

■ 6.2b. *Third Empire*. Diocletian unites with his co-ruler, Maximian. Then they include Constantius I Chlorus in the group, and later on, Galerius. However, Galerius played no important part under Diocletian. In Roman history, this coalition is called the *First Tetrarchy* ([327]).

6.3a. *Second Empire*. In terms of popularity and importance, Julius Caesar is considered to rank second after Pompey, leaving Crassus behind ([327], pages 226-228). With Pompey being overthrown, the power passes on to Julius Caesar, his co-ruler.

■ 6.3b. *Third Empire*. In the hierarchy of power, Constantius I Chlorus (Julius Caesar's double) is considered to rank second after Diocletian (the double of Pompey) and leave Maximian (the double of Crassus) behind. After the abdication of Diocletian, Constantius I Chlorus, his co-ruler, comes to power.

6.4a. *Second Empire*. The joint rule of Pompey and Julius Caesar *lasts for 11 years*: 60-49 B.C.

■ 6.4b. *Third Empire*. The joint rule of Diocletian and Constantius I Chlorus *lasts for 11 years*: 293-305 A.D. The durations *coincide*.

Commentary. Fig.1.3 shows “the statue of Pompey, at the foot of which, as they assume, Caesar had been killed”. (Rome, Palazzo Spada – see [304], Volume 1, page 464). Fig.1.4 shows an “ancient” bust of Diocletian, Pompey’s double, kept in the Capitol museum ([304], Volume 1, page 565). However, it is difficult to expect any semblance between the two sculptures, since they were hardly portraits in the contemporary sense. Moreover, they were most likely made as late as in the XVI-XVIII

century to serve as “visual aids” for the “new Scaligerian history” introduced in that epoch – the epoch of Reformation.

Fig. 1.3. The “ancient” statue of the emperor Pompey (the Second Empire). Kept in the Palazzo Spada, Rome. Taken from [\[304\]](#), Volume 1, page 464.

Fig. 1.4. The “ancient” sculpture of his double – emperor Diocletian (the Third Empire). Kept in the Capitol Museum. Taken from [\[304\]](#), Volume 1, page 565.

7a. Period of strife.

■ 7b. Period of strife.

7.1a. *Second Empire*. Pompey becomes overthrown in 49 B.C., and a great *strife* begins, one that *lasts for 4 years*: 49-45 B.C. ([\[327\]](#), pages 244-247). The strife covers the entire period of Julius Caesar’s rule and the *Second Triumvirate*, ending with the rise of Octavian Augustus ([\[327\]](#), pages 244-247).

■ 7.1b. *Third Empire*. Diocletian abdicates in 305 A.D., which leads to a *four-year period* of strife (305-309 A.D., qv in [\[767\]](#) and [\[327\]](#)). The strife covers the

entire rule of Constantius I Chlorus (Julius Caesar's double) and the *Second Tetrarchy*. Towards the end of the period of strife, Constantine I gains prominence ([767], Volume 1, pages 330-332, and [76], table 12). The durations of the two strife periods coincide.

8a. *Julius Caesar, the conqueror of the First Triumvirate.*

■ 8b. *Constantius I Chlorus, the conqueror of the First Tetrarchy.*

8.1a. *Second Empire.* Julius Caesar comes to power after a strife and a dynastic struggle, destroying his former companions-in-arms. In the Scaligerian history, Julius Caesar, likewise Sulla and Pompey, is considered to have been "an irregular emperor". However, Plutarch, for example, explicitly calls Julius Caesar *King* ([660], Volume 1, pages 486-487). There are also "ancient" coins and "ancient" inscriptions in existence that refer to Julius Caesar as to *Emperor*, and sans hesitation at that ([873], page 184, No.137).

■ 8.1b. *Third Empire.* Constantius I Chlorus seizes power during the strife. A party struggle destroyed many of his former friends and supporters. He was honoured with the title Augustus.

8.2a. *Second Empire.* Julius Caesar adopts and elevates the nineteen-year-old Octavian. Octavian soon becomes the famous Augustus, ranking amongst demigods.

■ 8.2b. *Third Empire.* Constantius I Chlorus enthrones his twenty-year-old son, Constantine. Note the similarity between respective ages of nineteen and twenty years. Constantine I soon becomes the famous Augustus, declared a saint and a demigod.

8.3a. *Second Empire.* Julius Caesar ruled for 1 year: 45-44 B.C.

■ 8.3b. *Third Empire.* Constantius I Chlorus ruled for 1 year: 305-306 A.D. We shall remind the reader that he was pronounced Augustus in 305 A.D.

9a. *The triumvirs and the increasing importance of one of their number – Caius Julius Caesar Octavian (Augustus).*

■ 9b. *The tetrarchs and the increasing importance of one of their number – Caius Flavius Valerius Constantius I (Augustus).*

9.1a. *Second Empire*. After the death of Julius Caesar, the *nineteen-year-old* Octavian, *adopted* by Caesar and supported by his troops, claims the throne for himself and soon attains it. In doing so, he relies on the Roman *legions* that he was tremendously popular with.

■ 9.1b. *Third Empire*. After the death of Constantius I Chlorus, allegedly in 306 A.D., the *twenty-year-old* Constantine, *son* of Constantius I Chlorus, is appointed the Caesar of the West. It is the support of his *troops* that earned Constantine the title of Caesar.

9.2a. *Second Empire*. After a certain period of time, the *Second Triumvirate* is created with the participation of Octavian Augustus. Antonius, a member of this triumvirate, initially *despises* Octavian.

■ 9.2b. *Third Empire*. The *Second Tetrarchy* with the participation of Constantine I is soon formed. Galerius, a member of this tetrarchy, also treats Constantine, the son of Constantius I Chlorus, *with disdain* at the beginning.

9.3a. *Second Empire*. Antony, considering the influence of Octavian Augustus' army and his popularity in Rome, is forced to negotiate and make peace with Octavian. The end of the *Second Triumvirate*: Octavian defeated Antony and Cleopatra in a *sea battle* and became the *sole ruler* of the Second Empire.

■ 9.3b. *Third Empire*. Galerius, “considering the strength of the Gallic army and Constantine’s popularity among the Gallic aristocracy... was forced to recognize him as the Caesar” ([327], page 424). End of the *Second Tetrarchy*: in a *sea battle* of 324, Constantine crushes the fleet of his enemies, remaining the *sole emperor* of the Third Empire. It is possible that “Gaul” might have formerly been used to refer to both the territory of France and *Galicia*.

9.4a. *Second Empire*. The duration of the strife and the reign of the triumvirs *equals 17 years*: 44-27 B.C. ([767], Volume 1, pages 346, 351-352, 424-425).

■ 9.4b. *Third Empire*. The duration of the strife and the tetrarchy *equals 18 years*: 306-324 A.D. ([327], pages 249-258, 289-291). The durations are similar.

10a. *Caius Julius Caesar Octavian Augustus. Conqueror of the Second Triumvirate.*

■ 10b. *Caius Flavius Valerius Constantine Augustus. Conqueror of the Second*

Tetrarchy.

10.1a. *Second Empire.* In the *sea battle* of Accium, Octavian Augustus defeats Antony, his *last* enemy, completely. With this victory, “the period of civil wars in the history of Rome ends” ([327], page 259). Octavian Augustus is one of the *most widely known* emperors of Rome in its entire history. First name, *Caius*.

■ 10.1b. *Third Empire.* In the *sea battle* of Adrianopolis, Constantine I finally defeats Licinius, his *last* competitor. This victory marks the end of the civil war epoch in the alleged III century A.D. ([327], page 429). Constantine I Augustus is one of the *most famous* rulers in the history of Rome. First name, *Caius*. The names of the doubles coincide.

10.2a. *Second Empire.* Antony, defeated by Octavian, had been his close *friend and co-ruler* initially, subsequently having become Octavian’s worst *enemy*. Before his coronation, Octavian had served in the troops in the *East*.

■ 10.2b. *Third Empire.* Defeated by Constantine I, Licinius, who had earlier been his *companion-in-arms and co-ruler*, later became Constantine’s *enemy*. Before his coronation, Constantine I had served in the troops in the *East*.

10.3a. *Second Empire.* At the beginning of Octavian’s career, the key position of power was occupied by the *Second Triumvirate*, whose members had plotted against him. Then Octavian Augustus became *canonized* ([579], page 339). A *new stage* in Roman history is considered to begin with Augustus. It is often written that “this moment [27 B.C. – A.F.] signifies the very beginning of the Roman Empire” ([579], page 339).

■ 10.3b. *Third Empire.* In the biography of Constantine I Augustus (the *Second Tetrarchy*), a political struggle ensues between its participants, known as one of the key events that had taken place at the beginning of his rule. Constantine I was pronounced a son of the God of the Sun ([767], Volume 1, page 674). Everything related to the person of the emperor in one way was declared divine. The Christian Church is considered to have recognized Constantine I as a *Saint* equal to the Apostles in his rank ([767], Volume 2, page 674). Constantine I is also believed to have initiated a *new stage* in the history of “the revived empire”, sometimes called “the holy period”. Christianity had got to enjoy the state support and grown considerably stronger – presumably, for the first time.

10.4a. *Second Empire*. Octavian Augustus concentrated all the important functions of military, civil and religious power in his hands ([579], page 339). Octavian's legislative activity was highly popular. Not only were new laws issued, but the former Roman codices also got "revised" ([767], Volume 2, page 408).

■ 10.4b. *Third Empire*. Constantine I is considered to have got hold of all military, civil and religious power ([767], Volume 2, page 668). Constantine's legislative activity is renowned in particular. He published new laws, and also restored the codices of the "pre-Diocletian epoch" ([767], Volume 2, page 669).

10.5a. *Second Empire*. Initially, Octavian Augustus hasn't got any permanent residence of any sort. After the end of the civil war, Augustus settles down in Rome and "transforms her into a new city". Rome is considered to have become a highly urbanized centre of paramount importance under Octavian Augustus ([767], Volume 2, page 408).

■ 10.5b. *Third Empire*. In the first years of his rule, Constantine I *has got no permanent capital*. He later transfers the capital of the Roman Empire from Rome to the *New Rome* on the Bosphorus. "New Rome" is the official name of the new capital founded by Constantine I. The city received the name of Constantinople a few years later ([327], page 436, [240], page 26).

10.6a. *Second Empire*. Chronicles especially emphasize that Augustus transformed Rome (allegedly in Italy) into a rich city. "Under Augustus, Rome was rebuilt in marble instead of wood and brick, having undergone a radical reorganization" ([767], Volume 2, page 408). Under Augustus, 82 temples had been erected and restored ([767], Volume 2). The foundation of the New Rome on the Bosphorus is mentioned as follows: "Byzantium, with its seven hills, had looked very much like Rome" ([240], page 225). However, the question would arise: which one of the cities had really resembled the other? The conclusions that ensue from the decomposition of the global chronological map into a sum of four chronicles, qv in [Chron1](#), Chapter 6, suggest that it had most likely been the Italian Rome that was built in the XIII-XV century A.D. in the image of Czar-Grad on the Bosphorus.

■ 10.6b. *Third Empire*. Constantine I transforms the New Rome into a luxurious capital city ([240], page 26). The city was built as a "capital of stone" and a powerful sea fortress. The settlement of Byzantium located at that site underwent a

radical reconstruction. A specific administrative structure was introduced, which is known to have existed in the Italian Rome. Constantine had built a large number of palaces, a hippodrome, and a great many temples ([\[327\]](#), page 436).

10.7a. *Second Empire*. In the 27th year of the rule of Octavian Augustus, Jesus Christ was born. It is from his birth that we count “the new era” nowadays.

■ 10.7b. *Third Empire*. In the 27th year of the rule of Constantine I, the famous Saint Basil the Great was born, apparently a reflection of Jesus Christ. The parallelism between Jesus and Basil was first pointed out by N.A. Morozov ([\[544\]](#)).

10.8a. *Second Empire*. Augustus had ruled for 41 or 37 years. There are two versions of the beginning of his reign – either the year 27 or 23 B.C. Let us note that the year 23 B.C. marks the beginning of the absolute power period for Augustus: he is granted dictatorship, a lifelong consulate, and unlimited legislative powers ([\[327\]](#) and [\[579\]](#), page 304).

■ 10.8b. *Third Empire*. Constantine I had ruled for 31 years. We have three reign duration versions in his case. We consider the basic version here: 306-337 A.D. The reign durations are similar.

Commentary. Fig.1.5 shows a triumphal statue of Emperor Octavian Augustus, located in Rome. On fig.1.6 we see an enormous “ancient” statue of Constantine I, the double of Octavian Augustus, in a portico of the Lutheran basilica in Rome ([\[304\]](#), Volume 1, page 572). We shall repeat what we have said about the statues of Pompey and Diocletian. Most likely, the statues of Augustus and Constantine, as well as every similar sculptural image of “antiquity”, are not lifetime representations at all, but rather were made in the XVII-XVIII century, the epoch of Reformation, as “visual aids” illustrating Scaligerian history introduced en masse at that time.

Fig. 1.5. The triumphal statue of emperor Octavian Augustus made of bronze (Rome, Via dei Fori Imperiali). Nowadays it is considered to be a copy from an “ancient” marble original which is kept in the Vatican Museum (see photograph in [Chron1](#), Chapter 7). However, a comparison between the “original” and the “copy” demonstrates the two to be ostensibly different from each other. Apparently, in the XVII-XVIII century the manufacture of such “visual aids to the Scaligerian history textbook” assumed the character of mass production, and there was little care about such trifles as similarity between copies and originals. A possible reason may be that the creators were well aware of the fact that there hadn’t been any originals anymore – most of them faced destruction in the Reformation epoch of the XVI-XVII century. Taken from [\[1242\]](#), page 60.

Fig. 1.6. The “ancient” statue of Constantine I, the double of Octavian Augustus, from the portico of the Lateran Basilica in Rome ([\[304\]](#), Volume 1, page 572).

11a. *Tiberius*.

■ 11b. *Constantius II*.

11.1a. *Second Empire*. “Right after the death of Augustus, who had left *no direct heir*... the issue of succession arose immediately” ([767], Volume 2, page 412). A struggle for power begins. In face of the uncertainty concerning the identity of his successor, Tiberius, having acceded to the throne, had to fight other pretenders, Germanicus in particular, “on equal terms”.

■ 11.1b. *Third Empire*. Constantine I leaves *no direct heir*, but “dividing the empire between his three sons and two nephews” ([327], page 438). Naturally, after the death of Constantine I, a furious power struggle had flared up. Constantine I had brought major confusion afoot, since he had specified no single successor to the throne. Constantius II, having captured “Constantinople, exterminated the families of the two stepbrothers of Constantine” ([327], page 438).

11.2a. *Second Empire*. A while ago Tiberius was *adopted* by Octavian Augustus ([767], Volume 2, page 412). Tiberius is known to have died being “strangled with blankets” [767], Volume 2, page 423. In a sense, this death may be considered *unexpected*.

■ 11.2b. *Third Empire*. Constantius II is the *son* of Constantine I ([327], page 438). Constantius II, as historians tell us, “died *unexpectedly*” ([327], page 440).

11.3a. *Second Empire*. Tiberius had *ruled for 23 years*: 14-37 A.D.

■ 11.3b. *Third Empire*. Constantius II had *ruled for 24 years*: 337-361 A.D. The reign durations of the duplicates are similar.

12a. *Struggle between Tiberius and Germanicus. The assassination of Germanicus.*

■ 12b. *Struggle between Constantius II and Constans. The assassination of Constans.*

12.1a. *Second Empire*. Tiberius and Germanicus appear on the political scene simultaneously, as of 6 A.D.([767], Volume 2, page 414). Both come from royal families. Germanicus is Tiberius’ *nephew* ([767], Volume 2, page 414). Their destinies are inseparable, with Tiberius playing the *key part*.

■ 12.1b. *Third Empire*. Constantius II and Constans appear in the political life of the empire virtually at the same time, namely, in 337 A.D. Constans is the co-ruler of his *brother* Constantius II in the West ([327], page 439). Constantius II had always

been *dominant* in this pair ([327]).

12.2a. *Second Empire*. At the beginning of his career, Germanicus had accomplished several great victories over barbarians ([767], Volume 2, page 414). He had fought in the West. The ensuing competition and struggle between Tiberius and Germanicus result in Tiberius accusing Germanicus of plotting against him ([767], Volume 2, page 417).

■ 12.2b. *Third Empire*. At the beginning of his political career, Constans defeats the barbarians several times ([327]). Likewise Germanicus, he fights successfully in the West. Then a great discord flares up in the empire, allegedly one of a religious nature. As a result, Constantius II and Constans find themselves in *different camps* ([327], page 439).

12.3a. *Second Empire*. Germanicus was soon *assassinated* by Piso, governor-general in Syria. Tiberius, presumably wishing to ward off suspicions of Germanicus' assassination, had arranged a trial over Piso and *executed* him.

■ 12.3b. *Third Empire*. Constans was soon *assassinated* by Magnentius the impostor ([327]). Constantius II launched a campaign against Magnentius in retribution against the assassin of Constans. He took him prisoner and *executed* him ([327]).

12.4a. *Second Empire*. The joint rule of Tiberius and Germanicus *lasted for 13 years*: 6-19 A.D.

■ 12.4b. *Third Empire*. The joint rule of Constantius II and Constans *lasted for 13 years*: 337-350 A.D. The lengths of the duplicates' reigns coincide.

13a. *Caius Caesar Caligula*.

■ 13b. *Caesar Julian*.

13.1a. *Second Empire*. Information about Caligula is scarce ([767], Volume 2). It is known, though, that he had suffered from some mental disease, imagined himself to be a *deity incarnate*, and pursued correspondent behaviour by extremely insalubrious means ([327], page 300, [767], Volume 2, pages 423-422).

■ 13.1b. *Third Empire*. Information about Julian, on the contrary, is plentiful. He is considered to have been an important reformer of religion. However, the actual

data concerning the nature of his reforms are rather contradictory. Some Byzantine historians even called him “*The Lord Incarnate*” ([327]). Julian is considered to have been the “restorer of pagan worship”. His reforms ended in a failure.

13.2a. *Second Empire*. Caligula is *assassinated* as a result of a plot ([327], page 301). The details of the plot are unknown. Legend has it that Caligula had received his name – “Caligula”, or, allegedly, “*Soldier’s Boot*”, for having worn *soldier’s boots* as a child.

■ 13.2b. *Third Empire*. Julian is *assassinated* on a march, allegedly with a dart. The assassin remains unknown. By and large, there are many legends about his death ([327], page 441). Julian is considered to have been an ardent worshipper of Mithras, and a priest of this god. One of important distinguishing features of the Mithraist priests was that the latter had worn red *soldier’s (!) boots*, or *caligulae* ([260], page 69).

13.3a. *Second Empire*. Caligula had *ruled for 4 years*: 37-41 A.D.

■ 13.3b. *Third Empire*. Julian had *ruled for 2 years*: 361-363 A.D. We see similar reign durations.

14a. *Strife after Caligula’s death*. Short strife under the emperor.

■ 14b. *Strife after Julian’s death*. Short strife under the emperor.

14.1a. *Second Empire*. In 41 A.D., *after Caligula’s death*, a civil discord begins in the Second Roman Empire. The *troops* elect Claudius as emperor ([327], page 301).

■ 14.1b. *Third Empire*. In 363 A.D., *after Julian’s death*, a strife begins in the Third Roman Empire. The *legionaries* elect Jovian as emperor ([327], page 441).

14.2a. *Second Empire*. The strife lasts for *several months only*. The senate fails to resist the will of the troops ([327], page 301).

■ 14.2b. *Third Empire*. Jovian had “ruled” for *7 months maximum*, and only in the East, as he had had no time for returning to the capital of the empire. We shall recall that at the moment of the election he was on a march ([327], page 441, [76], table 16). The reign durations are thus similar.

15a. *Claudius*.

■ 15b. *Valentinian I*.

15.1a. *Second Empire*. During the *strife* that had lasted for several months, the troops pronounced Claudius emperor. *One year after* Claudius' accession, the *uprising* of Scribonianus flares up in the *northern provinces* of the empire ([327], page 301). This uprising is one of the *most famous* ones in the history of the Second Empire. Scribonianus is a governor-general in Illyria ([327], page 301).

■ 15.1b. *Third Empire*. After the *strife* related to the actions of Jovian in the East, far away from the capital, legions pronounce Valentinian I emperor. *One year after* the accession of Valentinian I, the *uprising* of Procopius begins in the *northern and eastern provinces* of the empire ([327], page 442). This mutiny is one of the *most notorious* events in the history of the Third Empire. Procopius is a relative of Julian ([327], page 442).

15.2a. *Second Empire*. *Simultaneously* with the uprising of Scribonianus, a *plot organized by his supporters is uncovered in Rome* ([327], page 301). The troops of Scribonianus and the conspirators are *crushed*.

■ 15.2b. *Third Empire*. *Simultaneously* with the mutiny of Procopius, a *plot organized by his supporters was uncovered in Rome* ([327], page 442). The troops of Procopius and the conspirators were also *defeated*.

15.3a. *Second Empire*. Claudius begins mass repressions against the residents and the former administration of Rome ([327]). The repressions encounter serious opposition in the troops. The praetorians and the legionaries rebel. The Roman nobility, too, rises against Claudius ([327]). Claudius is *poisoned* ([327]).

■ 15.3b. *Third Empire*. Valentinian I launches the prosecution of large groups of the supporters of Procopius. As a response to the repressions, discontent in the troops flares up, involving “many strata of the society” ([327], page 442). The only report about the death of Valentinian I tells us that “he had *died unexpectedly*” ([327], page 442).

15.4a. *Second Empire*. Claudius had *ruled for 13 years*: 41-54 A.D.

■ 15.4b. *Third Empire*. Valentinian I had *ruled for 11 years*: 364-375 A.D. The reign durations are similar.

16a. *“Joint rule” of Claudius and Pallas within the “Triumvirate”*: Claudius, Pallas, Narcissus.

■ 16b. *“Joint rule” of Valentinian I and Valens within the “Triumvirate”*: Valentinian I, Valens, Gratian.

16.1a. *Second Empire*. The three characters mentioned above are normally ranked by their influence in this empire as follows: 1) Claudius, 2) Pallas, 3) Narcissus. Under Claudius, the “triumvirate” comes to power, namely, Claudius himself and his two influential minions – Pallas (Valens?) and Narcissus (Gratian?). They exert a great influence upon the policy of the empire ([\[767\]](#), Volume 2, page 426).

■ 16.1b. *Third Empire*. The ranking of these characters by their influence is as follows: 1) Valentinian I, 2) Valens, 3) Gratian. Valentinian I organizes the “triumvirate” in the following way: he appoints Valens his co-ruler, with Gratian assisting him in the West, from 367 and on ([\[327\]](#), pages 441-442). One cannot but note the similarity between the names of the duplicates: *Pallas* and *Valens*. The names of Gratian and Narcissus may also be related to each other in some way.

16.2a. *Second Empire*. The “joint rule” of Claudius and Pallas *does not exceed 13 years in duration*.

■ 16.2b. *Third Empire*. The “joint rule” of Valentinian I and Valens *lasts for 11 years*. The reign durations are similar.

17a. *Nero (Tiberius Claudius Nero)*.

■ 17b. *Valens*.

17.1a. *Second Empire*. After the *poisoning* of Claudius, Nero, the stepson of Claudius, becomes emperor ([\[767\]](#), Volume 2, page 789). Nero is notorious for confiscations, persecutions and numerous murders that took place during his reign ([\[767\]](#), Volume 2, page 431). This notably distinguished Nero among the emperors of the Second Empire. He repeatedly replenished the treasury by means of mass expropriations.

■ 17.1b. *Third Empire*. After the “*unexpected death*” of Valentinian I in 375, Valens, Valentinian’s brother, remains the sole ruler. He stands out for terrorizing the country: murders, persecutions and “political purges”. Like Nero, he had often used

mass confiscations in order to replenish the state treasury ([327]). Valens was also known as *Valens the Goth* ([269], page 7).

17.2a. *Second Empire*. Nero's policy causes resentment in the Second Empire and results in the so-called "plot of 65". This *plot* is headed by the representatives of the empire's *supreme nobility* ([767], Volume 2, page 437). However, the plot becomes *uncovered*, and the would-be uprising suppressed. After this, Nero launches major repressions. This leads to mass denunciations ([767], Volume 2).

■ 17.2b. *Third Empire*. The cruel actions of Valens had increased tension in the Third Empire. A *plot* against Valens resulted in the uprising of Procopius to flare up. The plot was headed by the *supreme nobility* of the empire ([327], page 442). However, the plot was *uncovered* and the rebellion of Procopius got suppressed ruthlessly, with mass repressions coming in its wake. Numerous public denunciations followed as a result [327].

17.3a. *Second Empire*. Nero is known to have been a vehement *persecutor of the Christians*. They describe the ill-famed burnings of Christians – the so-called “Nero's torches of tar” ([767], Volume 2). Anti-Christian repressions were especially commonplace in Rome. At the end of Nero's rule, the position of the Second Empire is noted to have seriously worsened.

■ 17.3b. *Third Empire*. Valens persistently *persecutes Christians*. Certain sources consider him to have been an Aryan. During his reign, the famous Saint Basil the Great suffers from repressions (the “Passions” of St. Basil the Great, qv in [544], Volume 1). Since Basil the Great is a phantom reflection of Jesus Christ ([544]), it is possible that these events reflect the Gospels. In that case, “vicious Valens” is a reflection of the Evangelical “vicious King Herod”.

17.4a. *Second Empire*. The *uprising* of Julius Vindex became the culmination of this troubled period ([327], page 306). It flared up in Aquitania, *on the border of the empire*. Let us note that there had been no conspiracy in Rome. The rebels sought help in the *western provinces* of the empire calling out to dethrone Nero ([767], Volume 2, page 438). Governor-generals of the Pyrenean peninsula provinces joined the uprising ([327], page 306).

■ 17.4b. *Third Empire*. The *insurrection* of the Goths on the river Danube in 376 is regarded as a special event of that troubled epoch ([327], page 443). The uprising

took place *on the borders of the empire*. However, there was no conspiracy in Rome. The Goth rebels had sought help in the *western provinces* of the empire, calling for the dethronement of Valens ([767], Volume 2, page 443). Moesia and Thracia had joined in the insurrection ([767], Volume 2).

17.5a. *Second Empire*. Upper-German legions had destroyed Vindex, but turned against Nero right away, demanding a new emperor ([327], page 306). Nero *attempts to escape*, but *perishes* during the pursuit. Let us note that the full names of Nero and his predecessor, Claudius, *resemble each other*, qv above. The full names both contain *the same* formula: Claudius Tiberius Nero Drusus Germanicus ([72]).

■ 17.5b. *Third Empire*. The rebels destroy the troops sent against them by the government ([767], Volume 2, page 443). Valens also *attempts to escape*, but *ends up killed* ([767], Volume 2, page 443). The names of Valens and his predecessor – Valentinian I – are very similar: *Valens* and *Valentinian*.

17.6a. *Second Empire*. Nero rules for 14 years: 54-68 A.D.

■ 17.6b. *Third Empire*. Valens rules for 14 years: 364-378 A.D. The reign durations coincide.

18a. *Joint rule of Nero with Burrus and Seneca. Death of Burrus.*

■ 18b. *Joint rule of Valens with Valentinian I and Gratian. Death of Valentinian I.*

18.1a. *Second Empire*. In this empire, the three indicated characters are ranked by their influence as follows: 1) Nero, 2) Burrus, 3) Seneca. “Policy management in the first half of Nero’s rule had been in the hands of philosopher Seneca and praetor prefect Burrus” ([767], Volume 2, page 430). At this time, Burrus had even held the key position in this “triumvirate”, since he educated Nero ([327], page 305). But in reality Nero, the emperor, had been the key figure of authority.

■ 18.1b. *Third Empire*. The ranking of these characters is as follows: 1) Valens, 2) Valentinian I, 3) Gratian. In the very beginning of the rule of Valens, Valentinian I had managed the policy as the elder. He is similar to Burrus in this respect. Thus, Valentinian I had been the first in the “triumvirate” during this period ([76], table 16). Gratian took the third place after Valens. But, of course, it is actually Valens the emperor who had been first there. Therefore, we list him first.

18.2a. *Second Empire*. Nero reigned jointly with Burrus for 8 years, 54-62 ([327], page 305). Seneca had been the co-ruler of Nero for most of his term as emperor, that is, 54 to 65 A.D.

■ 18.2b. *Third Empire*. Valens had ruled together with Valentinian I for 11 years: 364-375 ([327]). Gratian, the double of Seneca, had ruled together with Valens virtually throughout the entire term of Valens as emperor, 367 to 378. The reign durations are similar.

19a. “Joint rule” of Nero and Seneca: 54-65 A.D.

■ 19b. *Joint rule of Valens and Gratian*: 367-378 A.D. Both joint rules last for 11 years. Durations coincide.

20a. *Servius Sulpicius Galba*.

■ 20b. *Jovian*.

20.1a. *Second Empire*. Galba was pronounced emperor by the troops. He abolished nearly all the orders and decisions of his predecessor (767], Volume 2).

■ 20.1b. *Third Empire*. Jovian was declared emperor by the troops. He had decisively “broken with the past” and abolished the orders and decisions of his predecessor (767], Volume 2).

20.2a. *Second Empire*. Galba had ruled for about 1 year: 68-69 ([767], Volume 2, page 789, [327], page 208).

■ 20.2b. *Third Empire*. Jovian had ruled for about 1 year: 363-364 A.D. ([767], Volume 2, page 793). The durations are similar.

21a. *Strife*.

■ 21b. *Strife*.

21.1a. *Second Empire*. In the year of 69, after the death of Galba, a *civil* war breaks out. Its duration *does not exceed 1 year* ([327], page 309).

■ 21.1b. *Third Empire*. In the year 378, right after the death of Valens, a *civil* war breaks out. Its duration *does not exceed 1 year*, either ([327], page 443). The strife periods have similar durations.

22a. *Two Titus Flavius Vespasians*: Titus Flavius Vespasian and his successor, another Titus Flavius Vespasian.

■ 22b. *Gratian* – after the death of Valens; *Valentinian II* – also after the death of Valens.

22.1a. *Second Empire*. The names of these two rulers coincide. They are considered to have been father and son ([\[767\]](#), Volume 2, page 789; also [\[327\]](#), pages 309-310). This “double Titus” had ruled for a total of 12 years, 69-81, *in the West*.

■ 22.1b. *Third Empire*. After the death of Valens in 378, Gratian and Valentinian II remain the only rulers of the empire. Both *rule in the West*. The duration of their joint rule equals 13 years: 379-392 (see [\[767\]](#), Volume 2, page 793). The duplicate reigns have similar durations.

23a. *Titus Flavius Domitian*.

■ 23b. Theodosius I the Great.

23.1a. *Second Empire*. Domitian becomes emperor after the “double Titus”. Chronicles ([\[327\]](#), page 313) emphasize the fact that he had concentrated enormous power in his hands. Domitian demanded that “he, when addressed, was to be called Lord and God” ([\[327\]](#), p. 319).

■ 23.1b. *Third Empire*. Theodosius I the Great comes to power in the east of the empire while the pair of emperors – Gratian and Valentinian II – rules in the west. He acquires enormous influence throughout the empire, and considerably enhances its influence in the east ([\[327\]](#), page 444, and [\[767\]](#), Volume 2, page 793). Theodosius I is known to have been an extremely pious ruler, also in full control of the ecclesiastical power in the empire [\[327\]](#).

23.2a. *Second Empire*. Under Domitian, “the Roman provinces of the *Balkan Peninsula* had found themselves threatened” ([\[327\]](#), page 314). The Dacian rebellion had made the frontier troops of Domitian suffer bitter defeat ([\[327\]](#)). The Second Empire enters a lengthy and hard war against Dacians thereafter.

■ 23.2b. *Third Empire*. Under Theodosius I, the uprising of the Visigoths set the Roman provinces of the *Balkan Peninsula* in turmoil. The troops dispatched by

Theodosius I were put to rout ([327]). The Third Empire had started arduous and prolonged war against the Visigoths.

23.3a. *Second Empire*. Domitian negotiates a *truce* with the Dacians, which is considered to be unfavourable for the Second Empire. Although the Dacians were considered “allies” at that time, relations between the two parties remained extremely strained ([327], page 316). Nevertheless, this peace pact with the Dacians is regarded as one of the *most important* ones ever signed by the Second Empire ([327]). The truce in question was signed in *the eighth year* of Domitian’s rule.

■ 23.3b. *Third Empire*. Theodosius I had bribed the Goths and signed a *peace treaty* with them ([327], page 444). The treaty is considered to have been unsuccessful for the Third Empire, since the Goths “formed a semi-independent state within the Roman Empire” thereafter ([327], page 444). The treaty with the Goths also ranks among the *key treaties* of the Third Empire ([327]). The treaty was signed in *the seventh reign year* of Theodosius I ([327], page 444). Thus, if we superimpose the Second Empire over the Third, we shall see that a very important treaty had been signed the same year. This, among other things, identifies the *Dacians* as the *Visigoths*.

23.4a. *Second Empire*. The war of the Second Empire against the Dacians was followed by a domestic uprising – the plot of Saturninus etc. Severe repressions had followed as Domitian’s response. The emperor had died in the atmosphere of discontent and confusion that prevailed throughout the Second Empire ([327]).

■ 23.4b. *Third Empire*. After the war against the Visigoths, unrest flares up in the Third Empire, allegedly of a religious origin; we see reports of massacre, plunder, and arson ([327], page 444). Theodosius commences sweeping repressions. He dies in the atmosphere of overall civil unrest and rumblings in the Third Empire ([327]).

23.5a. *Second Empire*. Domitian had ruled for 15 years: 81-96 ([327], pages 444-445; also [767], Volume 2, page 793).

■ 23.5b. *Third Empire*. Theodosius I had ruled for 16 years: 379-395 ([76], table 16). The reign durations are similar.

24a. *Marcus Cocceus Nerva*.

■ 24b. *Eugenius*.

24.1a. *Second Empire*. Immediately after the death of Domitian, Nerva becomes emperor in the west. His reign *lasts for 2 years*: 96-98 ([\[327\]](#), page 317).

■ 24.1b. *Third Empire*. After Theodosius I, Eugenius becomes emperor in the West. He *rules for 2 years*: 392-394 ([\[767\]](#), Volume 2, page 793). The reign durations coincide.

25a. *Joint rule of Nerva*.

■ 25b. *Joint rule of Eugenius*.

25.1a. *Second Empire*. Throughout his entire reign, Nerva had ruled jointly with Trajan, and the famous emperor eventually “outshone” Nerva. The duration of this joint rule is *2 years*: 96-98.

■ 25.1b. *Third Empire*. Throughout his entire reign, Eugenius had ruled jointly with Theodosius I the Great – the famous emperor that had “stolen Eugenius’ thunder”. This joint rule lasts for *2 years*: 392-394. Durations coincide.

26a. *Marcus Ulpius Trajan*.

■ 26b. *Arcadius*.

26.1a. *Second Empire*. Trajan’s rule is considered to have been the beginning of the “golden age” in the Second Empire ([\[327\]](#), page 317). While still in power, Trajan wages *three major wars*.

■ 26.1b. *Third Empire*. In 395, Emperor Arcadius (the name translating as “joyful”) assumes power over “the rich and civilized East” ([\[327\]](#), page 445). Arcadius also wages *three major wars* during his reign.

26.2a. *Second Empire*. Trajan’s enemy in the Balkans is Decebalus, a well-known chieftain of the *Dacians* ([\[327\]](#)). The war against Decebalus is Trajan’s *first* one, one he had waged right after his accession – or, more precisely, in the third year of his rule. As we stated above, little is known about the first three years of Trajan’s rule. Decebalus is a well-known commander in the history of the Second Empire. His name may possibly hail back to “Daci-bella”, or the war with the Dacians.

■ 26.2b. *Third Empire*. The famous Alaric, chief of the Visigoths, is Arcadius’ enemy in the Balkans. Again, *we identify Visigoths as the Dacians*, as seen in

paragraph 23 above. The war against Alaric is the *first* one waged by Arcadius, one that started immediately after his accession ([767], Volume 2). Alaric is a legendary commander in the history of the Third Empire. His name might possibly have been pronounced “Ala-Rex”. Thus, Decebalus and Alaric may have not been names in the contemporary sense – aliases, more likely.

26.3a. *Second Empire*. The Great Roman Army of Trajan engages in an all-out war with Decebalus, one that had lasted for 2 years ([327] and [767], Volume 2). Finally, the Second Empire forged a truce with Decebalus ([767], Volume 2, page 789). Decebalus had taken advantage of this armistice to consolidate his army, and became the commander of a large body of troops in several years’ time. Then he violated the truce by having started the second war against the Dacians.

■ 26.3b. *Third Empire*. A large Roman army, headed by Roman general Stilicho, had been fighting Alaric for *two years*. As a result, the Third Empire had signed a peace treaty with Alaric [767], Volume 2, page 793. During the armistice, Alaric had built up his strength and formed a powerful army in several years. Afterwards, he also violated the truce, and started the second war with the Goths.

26.4a. *Second Empire*. The second war against the Dacians rages for *several years*. The outcome of the war is rather uncertain. Rome arranges for another armistice. After a short lull, a *third* war begins, this time against Parthia; this one also takes a few years to finish.

■ 26.4b. *Third Empire*. The second war against the Visigoths rages on for *several years*. The outcome of the war is uncertain. The empire forges another truce with the Visigoths. After a fairly calm period, the *Third Gothic War* flares up, also lasting for several years.

26.5a. *Second Empire*. The empire loses the third war. Rome suffers a bitter defeat ([767], Volume 2). We can conclude by saying that Trajan’s main enemy had been Decebalus in *the Balkans*.

■ 26.5b. *Third Empire*. The Third Empire loses the last war as well. Moreover, this had been an actual defeat of Rome, since it was Stilicho, the Roman commander that loses the war. Thus, Arcadius’s main enemy had been Alaric, who also came from the *Balkans*.

26.6a. *Second Empire*. Trajan had ruled for either *19 years*: 98-117, or *16 years*: 101-117. It has to be noted that very little is known about the first three years of his rule ([\[327\]](#), page 318; also [\[767\]](#), Volume 2).

■ 26.6b. *Third Empire*. Arcadius had ruled for *13 years*: 395-408 ([\[767\]](#), Volume 2, page 793; also [\[76\]](#), tables 16-17). Reign durations are similar.

27a. *Publius Aelius Hadrian*.

■ 27b. *Honorius*.

27.1a. *Second Empire*. Hadrian was adopted by Trajan, his predecessor. Let us also note that Adrian is a relation of the emperor Trajan's wife ([\[327\]](#), page 322).

■ 27.1b. *Third Empire*. Honorius and Arcadius, his predecessor, had been *brothers* ([\[327\]](#)).

27.2a. *Second Empire*. Under Hadrian, the Roman army falls into utter decline ([\[327\]](#), page 324). As one can see below, similar events take place under Honorius, the duplicate of Hadrian. Moreover, these two processes of armies sliding into decline – under both Hadrian and Honorius – are so similar that the contemporary books on the history of Rome describe them *in virtually the same words*. We shall cite two such descriptions to illustrate. This is how historians describe the decay of the Roman army in Hadrian's epoch: "Seeing as how many Roman citizens had refused to serve in the legions, Hadrian introduced the practice of reinforcing the ranks of legionaries by representatives of a different social stratum than the residents of the provinces, who had the rights of Roman citizenship, namely, common free provincials. The legionaries had finally lost their "Roman" character and turned into a multinational force, which had been armed with Roman weapons and used Latin as the official language" ([\[327\]](#), page 324). This is how the Roman army had disintegrated under *Hadrian*.

■ 27.2b. *Third Empire*. Let us now cite the description of the Roman army in the time of *Honorius*: "The Roman troops of the time had looked nothing like the legions of early empires. Although they had carried on calling themselves legions, both the armament and the organization of the Roman army had changed completely after the massacre at *Adrianople*. They had transformed into an army of barbarian soldiers... Most of the military commanders were barbarian chieftains bearing Roman military ranks" ([\[327\]](#), page 324). Nowadays, the rout of the Roman troops near *Adrianople*,

in the alleged year 378, is linked to this deterioration in the state of army affairs. Thus, the name of *Hadrian* appears in the biography of his doppelganger Honorius precisely “in the right place”, manifest as “the massacre of Adrianople”. This is how a very demonstrative parallelism between the Second and Third Roman Empires appears on the pages of contemporary historical books, not recorded as a system previously.

27.3a. *Second Empire*. Hadrian had been afflicted by a *serious illness*. He was a very suspicious person, and had sired no children ([\[327\]](#), pages 322-325). A brief example of how he had treated his military leaders is as follows: having suddenly suspected a plot among his commanders, he inflicted a series of harsh repressions upon them. Chronicles mention no names, and only refer to schemers “among the supreme officers of the army” ([\[327\]](#), page 322).

■ 27.3b. *Third Empire*. Honorius had been notorious for his *frail health*, and also considered weak-minded. He had left no children ([\[327\]](#), page 449; also [\[64\]](#), page 33). The attitude of Honorius to his commanders exposes his paranoid tendencies. In the alleged year of 408, he treacherously murdered his best military leader Stilicho, who had been accused of plotting against Honorius. All of this “plotting” is supposed to have been slander ([\[767\]](#), Volume 2, page 793).

27.4a. *Second Empire*. Hadrian had forged his most important *truce* with Parthia. Let us recall that the war against Parthia is identified as the war against *Alaric* in the Third Empire, qv above.

■ 27.4b. *Third Empire*. Honorius had signed a very important *peace treaty* (by the order of Arcadius), namely, the treaty with *Alaric*.

27.5a. *Second Empire*. Hadrian had *ruled for 21 years*: 117-138 A.D.

■ 27.5b. *Third Empire*. Honorius had *ruled for 28 years*: 395-423.

Reign durations are fairly similar. The above data are taken from [\[327\]](#), page 325, [\[767\]](#) (Volume 2, page 793), and [\[76\]](#). Let us note that old chronicles would normally preserve nothing but a number of scraps and extracts from the rulers’ biographies. Therefore, sometimes even minor facts that have managed to survive by sheer accident acquire great importance as the only evidence of the past, and should by no means remain neglected.

28a. *Antoninus Pius*.

■ 28b. *Aetius*.

28.1a. *Second Empire*. Emperor Antoninus Pius succeeds Hadrian: 138-161 ([767], Volume 2, page 789).

■ 28.1b. *Third Empire*. After Honorius, the 6-year-old Valentinian III is proclaimed Emperor in the west. However, he did not actually rule at all, having been in the custody of Placidia, his mother, who, in turn, had obeyed the will of Aetius. It is said that Placidia “had fallen under the influence... of commander Aetius, a barbarian by birth” ([64], pages 33 and 40). Aetius thus becomes acknowledged as *the official custodian* of Valentinian III ([767], Volume 2, page 757). For many years Aetius remained *the autocrat* of the Third Empire. Theodosius II, his co-ruler in the east, is considered to have been an insignificant figure without any actual influence on the policy of the empire ([64], page 35).

28.2a. *Second Empire*. The reign of Antoninus Pius was a raging storm. Numerous chaotic wars – against the Dacians, the Germans, and in the East of the Empire ([327], page 326) – had raged all across the land during his reign. Antoninus Pius is known to have been a most successful general indeed. Despite the great number of his enemies, he had managed to guard the borders of the empire with a great deal of efficiency.

■ 28.2b. *Third Empire*. The epoch of Aetius was also filled with wars and conflicts. Waves of “barbarian hordes” had repeatedly raided the Third Empire over that period ([767], Volume 2). Chronicles also describe Aetius as an excellent professional commander. He had been the triumphant leader of the Empire’s numerous military campaigns ([64], page 34).

28.3a. *Second Empire*. Antoninus Pius was extremely resourceful in his domestic policy, considering the general instability of the Second Empire. In particular, he would make advances to the lowest strata of society, give away stocks of food, and curb the rights of masters over their slaves ([327], page 325; also [767], Volume 2, page 789).

■ 28.3b. *Third Empire*. Due to his barbarian origin, Aetius had been under pressure to keep fortifying his position in Rome. His domestic policy was very

flexible. He had also won the sympathies of the most diverse strata of the Roman populace. He is known to have been a prominent Roman politician in an epoch of civil unrest ([64]).

28.4a. *Second Empire*. Antoninus Pius had *ruled for 23 years*: 138-161 ([767], Volume 2, page 789).

■ 28.4b. *Third Empire*. Aetius had *ruled for 21 years*: 423-444 (or 14 years: 423-437, according to another version). Mark the fact that in 437 the authority of Aetius was dealt a heavy blow by Valentinian III, whose custody had then come to its end, and who had become a *de facto* ruler ([64], page 486). Nevertheless, Aetius had enjoyed a formal influence until the year 444; however, after the loss of several important battles in 444, his falling out of grace had become irreversible ([64], page 486).

29a. *Marcus Aurelius*.

■ 29b. *Valentinian III*.

29.1a. *Second Empire*. After Antoninus Pius, the power passes on to Aurelius – *the adopted son* of Antoninus Pius ([327], page 326). Marcus Aurelius *rules jointly* with Lucius Verus ([327]). Moreover, Lucius Verus *is younger* than Marcus Aurelius [327].

■ 29.1b. *Third Empire*. After Aetius, the power goes to Valentinian III – the “adopted son” of Aetius. Let us recall that Aetius was *the custodian* of Valentinian III. Valentinian III *rules jointly* with Theodosius II, who governs over the east of the empire. Although Theodosius II had been older than Valentinian III (qv in [327]), it was Theodosius II who was usually referred to as “the youngster” ([76]).

29.2a. *Second Empire*. Lucius Verus *is subordinate* to Marcus Aurelius. They say that “the empire had actually been ruled by the elder – Marcus Aurelius” ([327], page 326). Lucius Verus, his younger age notwithstanding, had died before the end of Aurelius’s reign ([327], pages 326-327).

■ 29.2b. *Third Empire*. Initially, Valentinian III had been dependent on Theodosius II, but their roles became reversed subsequently ([327]). We see the scenario from the Second Empire recurring. Furthermore, Theodosius II also died *before* the rule of Valentinian III had ended.

29.3a. *Second Empire*. Marcus Aurelius faces a number of major difficulties that “transformed almost the entire period of their [co-rulers’ – A.F.] principate... into a time of bloody wars and economic depression” ([327], page 326).

■ 29.3b. *Third Empire*. Valentinian III is also forced to face a number of serious challenges. His reign in the Third Empire is marked by truculent wars and economic troubles. The empire begins to slide into decline ([327] and [64]).

29.4a. *Second Empire*. Under Marcus Aurelius, a ferocious military campaign against the well-known King Vologaeses ([327]) begins – a long-drawn war with varying success. Finally, a peace treaty with Vologaeses is reached, in no way implying security for the *Second Empire*. Immediately after the signing of the treaty, a war against nomadic tribes, which broke through the Roman frontier fortifications, begins on the Danube ([327], page 280).

■ 29.4b. *Third Empire*. Under Valentinian III, a bloody war against King Attila ([327]) begins – a protracted one, with success favouring both sides unevenly. The empire had negotiated a truce with Attila, which brought no real peace. Right after the signing of the truce, barbarians invade the empire, which subsequently becomes involved in a series of exhausting wars – in the west and in the east, at different times ([767], Volume 2, page 38).

We have approached the final phase of parallelism between the Second and the Third Roman Empire. In both empires, the hard and troubled times set in simultaneously. As we proceed, we shall primarily follow the events that had taken place in the west of the *Third Empire*. The ties between the east and the west are considered to have gradually weakened, from Theodosius II and on.

30a. *Commodus*.

■ 30b. *Recimer*.

30.1a. *Second Empire*. After the death of Marcus Aurelius, his son Commodus becomes emperor. The rule of Commodus *stands out* against others, since several *influential minions* had emerged in his time ([579], pages 405-406).

■ 30.1b. *Third Empire*. In 455, after the death of Valentinian III, a talented commander-in-chief by the name of Recimer works his way up to the very top of the

Third Empire's hierarchy. He acquires enormous influence in Rome and becomes its actual ruler for several years. According to his contemporaries, "Recimer has by now become *the most powerful* person in Western Rome" ([579], page 487). The rule of Recimer has a *notable feature*: during his reign, there had been several *influential imperial minions*, all of them pawns of the Emperor de facto ([579], pages 487-490). The comparison of the two influential minion groups in the Second and the Third Empires exposes the two as duplicates.

30.2a. *Second Empire*. The *first* proxy ruler under Commodus was called Perennis. He had soon got killed, likewise his Third Empire double Petronius, qv below ([579], pages 405-406).

■ 30.2b. *Third Empire*. The *first* proxy emperor under Recimer had been Petronius Maximus. He was killed three months later ([579], page 487). The two names (Petronius and Perennis) may stem from the same root.

30.3a. *Second Empire*. The *second* proxy ruler under Commodus had borne the name of Cleander; he was withdrawn from his position of power by Commodus a short while later ([579], pages 405-406).

■ 30.3b. *Third Empire*. The *second* proxy ruler under Recimer was called Mecilius Avitus. Recimer had made him surrender the throne rather soon ([579], pages 486 and 488).

30.4a. *Second Empire*. The *third* proxy ruler under Commodus was named Eclectus; it doesn't take Commodus too long to strip him of his powers ([579]). Furthermore, we still have assorted data telling us about other proxy rulers under Commodus – a certain Marcia, for instance ([579]). This proxy co-ruler shuffling ends with the death of Commodus.

■ 30.4b. *Third Empire*. The *third* proxy emperor under Recimer was called Flavius Julian Majorian. Recimer had made him ruler, but soon revoked the rule ([579]). We also have rather sparse data concerning other creatures of Recimer's – such as Libius Severus and Anthemius ([579]). This endless changing of proxy co-rulers also ended with the death of Recimer in the Third Empire.

30.5a. Commodus had either *ruled for 16 years* (176-192 A.D.) or *12 years* (180-192 A.D.). 180 A.D. is the year when his father died.

■ 30.5b. *Third Empire*. Recimer ruled for 16 years (456-472 A.D.). The durations coincide (for the first version of Commodus' reign).

31a. *Publius Helvius Pertinax*.

■ 31b. *Olybrius*.

31.1a. *Second Empire*. Pertinax had ruled for less than a year, in 193 A.D. We know very little of him; the complex situation in the Second Empire is pointed out ([579], pages 406-407).

■ 31.1b. *Third Empire*. Olybrius had reigned for less than a year in 472 A.D. There is hardly anything known about him. The Third Empire's situation is critical ([579], page 490). The reign durations all but coincide.

32a. *Marcus Didius Severus Julian*.

■ 32b. *Glycerius*.

32.1a. *Second Empire*. The reign of Didius Julian is shorter than a year and falls on 193 A.D. We hardly know anything about him at all. His rule is accompanied by a great embroilment ([579], page 407).

■ 32.1b. *Third Empire*. Glycerius had reigned for less than a year in 473 A.D. We know little about him; his rule was accompanied by a great strife ([579], page 490). The reign durations in both cases are virtually identical.

33a. *Decimus Clodius Albinus*.

■ 33b. *Julius Nepos*.

33.1a. *Second Empire*. Clodius Albin had reigned for less than a year in 193 A.D. We don't know much about him; his entire reign is accompanied by civil unrest ([579], p. 407).

■ 33.1b. *Third Empire*. Julius Nepos had reigned for less than one year in 474 A.D. There is very little biographical information available of this ruler nowadays. His reign is marked by embroilment ([579], page 490). Reign durations are virtually identical.

34a. *Gaius Pescennius Niger*.

■ 34b. *Romulus Augustulus*.

34.1a. *Second Empire*. Niger's reign had lasted *one year* – 193-194 A.D. He was defeated by Severus and *deposed* ([767], Volume 2, page 790; also [579], page 407).

■ 34.1b. *Third Empire*. Romulus Augustulus had only reigned for *one year* in 475-476 A.D. Odoacer *defeated* and *dethroned* him ([767], Volume 2, page 794; also [579], page 490). Reign durations coincide.

35a. *Lucius Septimius Severus*.

■ 35b. *Odoacer*.

35.1a. *Second Empire*. Severus was proclaimed emperor after Niger, and is related to *Germany*, where had been crowned ([579], page 408). Severus had defeated Pescennius Niger, the double of Romulus Augustulus from the Third Empire. Niger got *killed* after the battle – cf. Orestes, the father of Romulus, from the Third Empire.

■ 35.1b. *Third Empire*. Odoacer, leader of the *German* Heruls in the Roman army, was crowned emperor after Romulus Augustulus. Constantinople recognizes his authority ([767], Volume 2, page 760. Odoacer had crushed the troops of Romulus Augustulus led by Orestes, the father of Romulus. Orestes was *murdered*. Odoacer deposed Romulus ([579], page 493).

35.2a. *Second Empire*. Severus had been “a strong ruler... this leader was prudent and earnest” ([579], page 409). The rule of Severus “is an important breakpoint in many regards” ([579], page 409). We are approaching the end of the Second Empire.

■ 35.2b. *Third Empire*. Odoacer is known to have been a sensible and modest ruler. He had tried to restore the unity of the Third Empire that kept falling apart ([579]). The reign of Odoacer is also considered a *breakpoint* in Roman history marking the end of the “purely Roman” dynasty. We see the first symptoms of the Third Empire's decline. Its last two rulers had been foreign – Odoacer the German and Theodoric the Goth.

35.3a. *Second Empire*. Severus had fought a single war, albeit an arduous one, struggling against the Parthian king Vologaeses IV. The course of the war kept

changing: “The North was forced to suppress the Northern peoples that had lived close to the border, which had also been a formidable task” ([579], page 410).

■ 35.3b. *Third Empire*. Odoacer’s only enemy had been Theodoric the Goth; the war between the two went down in history as long, violent and wearisome. Success would favour both parties unevenly. Finally the Goths led by Theodoric invaded the Empire from the North. Odoacer was defeated and surrendered in one of the battles. He had been made a co-ruler initially, but his assassination followed before too long ([579], page 493).

35.4a. *Second Empire*. Severus had *reigned for 18 years* between 193 and 211.

■ 35.4b. *Third Empire*. Odoacer had *reigned for 17 years* (476-493 A.D.). Reign durations are similar.

36a. *Caracalla*.

■ 36b. *Theodoric the Goth (the Great)*.

36.1a. *Second Empire*. Caracalla had been a *co-ruler* of Severus and reigned in the *West*. He had constantly struggled against his co-ruler Publius Septimius Geta. Both brothers “hated one another and sowed permanent discord amidst the troops, likewise in the court; they had even thought of *dividing the state*” ([579], page 410).

■ 36.1b. *Third Empire*. Theodoric had been the *co-ruler* of Odoacer in the *West*. The reign of Theodoric is accompanied by very abrasive relations between himself and his eastern co-ruler Anastasius. This opposition would often break out into military conflicts ([579], pages 495-496). Both co-rulers already rule in the *divided* Third Empire – the Western and the Eastern.

36.2a. *Second Empire*. The domestic policy of Caracalla is characterized by the chronicles as rather lenient. His efforts to make the army obedient resulted in the *corruption* of the latter which, in turn, had impaired the discipline, according to [579]. Caracalla “granted *full civil rights* to each and every imperial community” ([579], page 410).

■ 36.2b. *Third Empire*. Theodoric’s domestic policy was also known for its great flexibility and religious tolerance. He was renowned a patron of the arts, and had also greatly indulged in the *bribery* of the troops due to his status of a foreigner in Rome and his ambition to secure support for himself amongst wider society strata

([\[579\]](#)). Theodoric had made foreigners *equal to Romans in rights* and instigated large-scale migrations on imperial territory.

36.3a. *Second Empire*. In 217 A.D. Caracalla was *preparing a campaign* against the Parthians and died at the peak of the preparations ([\[579\]](#)).

■ 36.3b. *Third Empire*. In 526 Theodoric *launches a campaign* against the barbarians but dies before the preparations are over ([\[579\]](#), page 495).

36.4a. *Second Empire*. Caracalla had *reigned for 24 years* (193-217 A.D.) or 6 years (211-217 A.D.), 211 A.D. being the year of Severus' demise.

■ 36.4b. *Third Empire*. Theodoric's *reign lasts 29 years* (497-526 A.D.) or 33 years (493-526 A.D.). Theodoric came to power in 493, the year of Odoacer's death – however, it was only in 497 A.D. that Zeno in Constantinople had acknowledged his rule ([\[579\]](#), page 494). The durations are close enough (first versions).

This is where the dynastic currents of the Second and the Third Empire end. However, amazingly enough, the parallelism that binds them together can be traced further, spanning the alleged years 217-235 A.D. and 526-536 A.D.

37a. *Second Empire* ceases to exist in a blaze of warfare and anarchy. The period of 217-270 A.D. is officially known as that of “political anarchy of the middle of the III century, or the time of ‘soldier emperors’” in Scaligerian history ([\[327\]](#), page 406). This prolonged period of anarchy is a unique phenomenon in the history of the Second Empire.

■ 37b. The decline of the *Third Empire* (in the West) was accompanied by bloody wars and social discord. The period of 526-552 A.D. is officially known as one of “political anarchy in the middle of the III century. The Ostrogothic rule in Italy” ([\[579\]](#)). This epoch of strife and embroilment is also unique in the history of the Third Empire. As we can see, these two periods (duplicates, as we understand it now) are characterized in the same words by Scaligerite historians.

38a. *Julia Maesa*.

■ 38b. *Amalasuntha*.

38.1a. *Second Empire*. After the death of Caracalla, the power in the Second

Empire is inherited by Julia Maesa in 217 (after a very brief reign of Macrinus, a former slave) – see [\[327\]](#), pages 404-406. Julia Maesa is a *relation* of Caracalla's ([\[327\]](#)). Near Julia Maesa we see her *daughter* Mamea, occupied with matters of secondary importance.

■ 38.1b. *Third Empire*. After the death of Theodoric (the double of Caracalla), Amalasuntha inherits the power in the Third empire ([\[579\]](#), pages 498-499). Amalasuntha is one of the most famous women in the entire history of Rome ([\[196\]](#)). She is the *daughter* of Theodoric ([\[579\]](#)). Her sister Matasuntha played a secondary part as her ally. Let us emphasize that the two duplicates (Julia Maesa and Amalasuntha) are the most prominent female rulers in the history of both empires. They were the only ones who had the power to crown Roman Emperors. Their unvocalized names (MSL for Maesa Julia and MLSNTH for Amalasuntha) might be derived from the same root.

38.2a. *Second Empire*. Julia Maesa enthrones her elder son – Varius Avitus Bassianus (Marcus Aurelius Antoninus) known as Heliogabalus ([\[327\]](#), pages 405-406), who *obeys her every word*. He *dies a violent death*. Heliogabalus had *reigned for 4 years* (218-222 A.D.; see [\[327\]](#)).

■ 38.2b. *Third Empire*. Amalasuntha enthrones her son Amalaric ([\[579\]](#), pages 405-406), who *obeys her every word*. He *dies a violent death*. Amalaric had *reigned for 5 years* between 526 and 531 A.D. We observe similar reign durations.

38.3a. *Second Empire*. Julia Maesa hands the reins of power over to Alexander Severus, a meek and indecisive man and an obedient creature of Julia Maesa ([\[327\]](#)). The reign length of Alexander Severus equals *13 years* (222-235 A.D.).

■ 38.3b. *Third Empire*. In the Third Empire we observe Athalaric, the second minion of Amalasuntha, come to power. He had been perfectly obedient to Amalasuntha ([\[579\]](#)). Athalaric had *reigned for 8 years* (526-534 A.D.) – see [\[76\]](#), table 18.

Reign durations differ, but they don't affect the general correlation of the entire current of events that characterize the Second and the *Third Empire*.

38.4a. *Second Empire*. Julia Maesa was killed in 234 A.D. The end of her reign is marked by the war with the *Persians* in the East of the Empire ([\[327\]](#)). 3 years after

the death of Julia Maesa, a large-scale war against the *Goths* breaks out – the *Gothic war* of 238-251 A.D. ([64]).

■ 38.4b. *Third Empire*. Amalasuntha was killed in 535 A.D. At the end of Amalasuntha's reign, a war against the Orient breaks out – namely, with the *Persians* and with Constantinople. This is how the famous *Gothic war* of the VI century A.D. began ([579]).

Thus, in order to conclude the parallelism, we compare the period of the alleged years 217-234 A.D. at the end of the Second empire to that of the alleged years 526-535 A.D., when the Third Roman Empire ceased to exist in the West. The parallelism does in fact span subsequent epochs as well; however, it is rather difficult to relate, since we enter parallel epoch of violent civil wars, and their history is fragmentary and extremely vague; we shall therefore end our comparison table here.

However, we must point out the following important fact. Once we reach the last days of the Second Empire (the alleged year 270 A.D.), we discover having approached the first days of the Third Empire. Let us remind the reader that this is the very year that marks the superimposition of the Third Empire over the Second. The period of the alleged years 240-270 A.D. that separates the Second Empire from the Third is considered the heyday of political anarchy in Scaligerian history. It is written that “by the time Claudius II came to power [in 268 A.D. – A. F.] there had de facto been no united empire” ([327], page 410). Thus, 270 A.D., the year we discover to correspond to the beginning of the Third Empire, needed to be referred to as one of the empire's “reconstruction” after a presumed period of utter disarray. However, this very “disarray” is of a fictitious nature, and only became recorded in historical sources as a result of an erroneous chronology.

2.

The correlation between two different dating methods illustrated by the superimposition of two epochs from the history of Roman Papacy one over the other. A brief scheme

The dating method based on the principles of frequency damping and duplication was applied to the dynastic current of the Roman Popes that begins in the alleged I century A.D. with Paul the Apostle and exists until the present day. We have used the chronological tables of J. Blair ([\[76\]](#)) and the list of popes given in [\[544\]](#).

The time interval in question (amounting to some 1900 years) was divided into short 10-year intervals. Then we compiled an exhaustive list of all the names of Popes who occupied the Holy See between the alleged I century A.D. and 1700 A.D. 89 different papal names were ordered in accordance with the sequence of their first appearance in papal currents. After that, a rectangular matrix sized 89×170 was constructed by the author of the present book assisted by A. Makarov. Each row of the matrix possesses the length of 170 units and represents the frequency evolution of a single name out of the list of 89. The matrix contains 89 rows and 170 columns altogether. Each papal name is marked as corresponding to the decade of said pope's ascension. The row numbered 53, for instance, lists all the decades when the Holy See was occupied by a pope named *John*. They fall on the following years: 523-526, 532-535, 560-573, 640-642, 685-686, 704-707, 872-882, 898-900, 914-928, 931-936, 956-963, 965-972, 983-984, 985-996, 997-998, 1003, 1003-1009, 1024-1033, 1285-1287, 1316-1334, 1410-1415.

Afterwards, the duplicate localization method based on the calculation and processing of frequencies $K(Q, T)$ was applied to the resultant rectangular frequency matrix. As a result, a square frequency matrix sized 170×170 was built. Each of its rows numbered Q contains the values of $K(Q, T)$ demonstrating the manifestation frequency of names that first appeared in decade Q in the subsequent decade T as well as the exact amount of times a certain name is manifest. The value of $K(Q, Q)$ stands for the papal names from decade Q that we haven't come across in the papal list as to yet.

A study of the papal name frequency matrix immediately reveals several circumstances of the utmost interest. For example, we learn that the names of the I century popes (such as Linus, Anacletus, Clement and Evaristus) are unexpectedly "revived" in the XI century A.D., which corresponds perfectly well to the chronological

shift of 1000-1050 years.

Similarly, other duplicates spawned by the chronological shift of 333 years approximately are also manifest in the frequency matrix. Higher concentrations of the name John, for instance (qv above) fall on the middle of the VI century A.D., the end of the VII century, the X century and the end of the XIII century. As we shall demonstrate below, this corresponds excellently to how the phantom duplicates of the *T* series that we discovered in the “Scaligerian history textbook” are distributed along the time axis, qv in fig. 1.7. The matter is that *John* happens to be one of the key names in history of the XIII century war and its duplicates.

Fig. 1.7. Phantom duplicates of the *T* series and the duplication of the name John in Papal Rome between the I and the XVI century. Let us point out that higher concentrations of the name fall directly over the duplicates of the *T* series.

Further studies of name frequency matrices (as built for lists containing the names of Popes, Byzantine Pontifices, Roman and Byzantine emperors etc.) were subsequently carried out by the author together with G. V. Nosovski. The results are related in our scientific publications ([593], [594], [595], [596] and [597], in particular); see also the Annexes to [Chron7](#). These works contain a great body of numerical material as well as frequency matrices, and also a modification of the frequency damping principle formulated in terms of a “card deck shuffling” problem.

All of our results correspond to the facts discovered with the use of the dynastical parallelism method. In Chapter 6 of [Chron1](#) we indicate two isomorphic “parallel” Papal dynasties that we have discovered. Bear in mind that the list of the Pope, likewise the Imperial list, is considered to be the “spinal column” of Roman and European chronology. The modern list of Popes is based on the *Book of the Pontifices* whose origins cannot be traced further back than the XIII century A.D. ([196]).

The biography of the first pope (Peter the Apostle) and his seven successors up until St. Hyginus (137-141 A.D.) is considered quite vague in the modern “Scaligerian

textbook”. S. G. Lozinskiy, for instance, wrote that “in reality, we only encounter veracious information about the Episcopes of Rome [as the Popes were called in the alleged first centuries of the new era – A. F.] starting with III A.D. – and even this information contains many gaps... the mythical character of pre-120 A.D. pontifices is also recognized by the Protestant theologians” ([\[492\]](#), page 312).

Our method of dynastic parallelisms led us to the discovery that the Roman Episcopate period of 140-314 A.D. duplicates that of 314-532 A.D., qv in [Chron1](#), Chapter 6. VSSD coefficient here equals 8.66×10^{-8} . In particular, they turn out to be phantom reflections of a later mediaeval list of popes. Out of the 47 popes that we find in the period of 141-532 A.D., 43 are covered by the parallelism, leaving just 4 short-term popes beyond it ([\[76\]](#)). Both duplicates are therefore extremely representative.

It is important that this collation of ecclesiastical Roman chronicles concurs perfectly well with the independent secular collation of imperial chronicles that we mention above.

3.

The superimposition of the Israelite (Theomachist) kingdom over the Third Roman Empire in the West. A shift of circa 1230 years

This parallelism was also discovered by the VSSD calculation method, confirming the claim made in [\[544\]](#) that the “ancient” kingdoms of Israel and Judea can be identified as the “early mediaeval” Roman empire. VSSD here equals $c(a, b) = 1.3 \times 10^{-12}$.

One must be aware of the fact that the name Israel translates as Theomachist ([\[544\]](#), Volume 1, pages 416 and 437) – God’s warrior, in other words, or a fighter against foreign gods. Therefore, the word “Israelite” can also be translated as “Theomachist”, as we shall be doing from time to time. The word Judean translates as “Theocratic” ([\[544\]](#)); it may have been used for referring to priests. There is hardly any point in delving deep into translation details, since they are of no importance to us.

In the Scaligerian chronology, the Israelite kingdom between Jeroboam I and Uzziah is dated to the alleged years X-VII B.C., or 922-724 B.C. ([\[72\]](#), page 192). Since the Third Roman Empire is dated to the alleged IV-V century B.C. by the Scaligerites (don’t forget that the dynastical current from this empire that is of interest to us presently dates to the alleged years 306-476 A.D.), the chronological shift (or superimposition) that we discovered between the Biblical and Roman kingdoms roughly equals 1230 years here. In other words, “ancient” history of Israel and Judea needs to be moved forward in time by 1230 years at the very least – and even this result will be far from final, as we already demonstrated in [Chron1](#), Chapter 6. Biblical history needs to be moved forward by another 600 years at the very least.

According to the Bible, the kingdoms of Israel and Judea represent the two dynastical branches of a state that had initially been united, which is similar to the division of the formerly united Roman Empire into the Western and the Eastern parts. The first three Biblical kings (Saul, David and Solomon) had ruled a united state, which fell apart immediately after Solomon. Jeroboam I becomes the first independent Theomachist king, and Rehoboam – the first independent king of the Theocrats.

We already mentioned the fact that the Bible contains a “double entry system” that allows for easy conversions between respective Israelite and Judaic reigns, qv in [Chron1](#), Annex 6.4. These data shall be used in the present section as well. Bear in

mind that the parallelism between the Israelite Kingdom and the Third Roman Empire is of a secondary nature, being but a reflection of more fundamental parallelisms that we shall relate in the chapters to follow.

Let us cite two parallel dynastic currents of a secondary nature, using a single number to indicate two “parallel rulers”, qv in fig. 1.8.

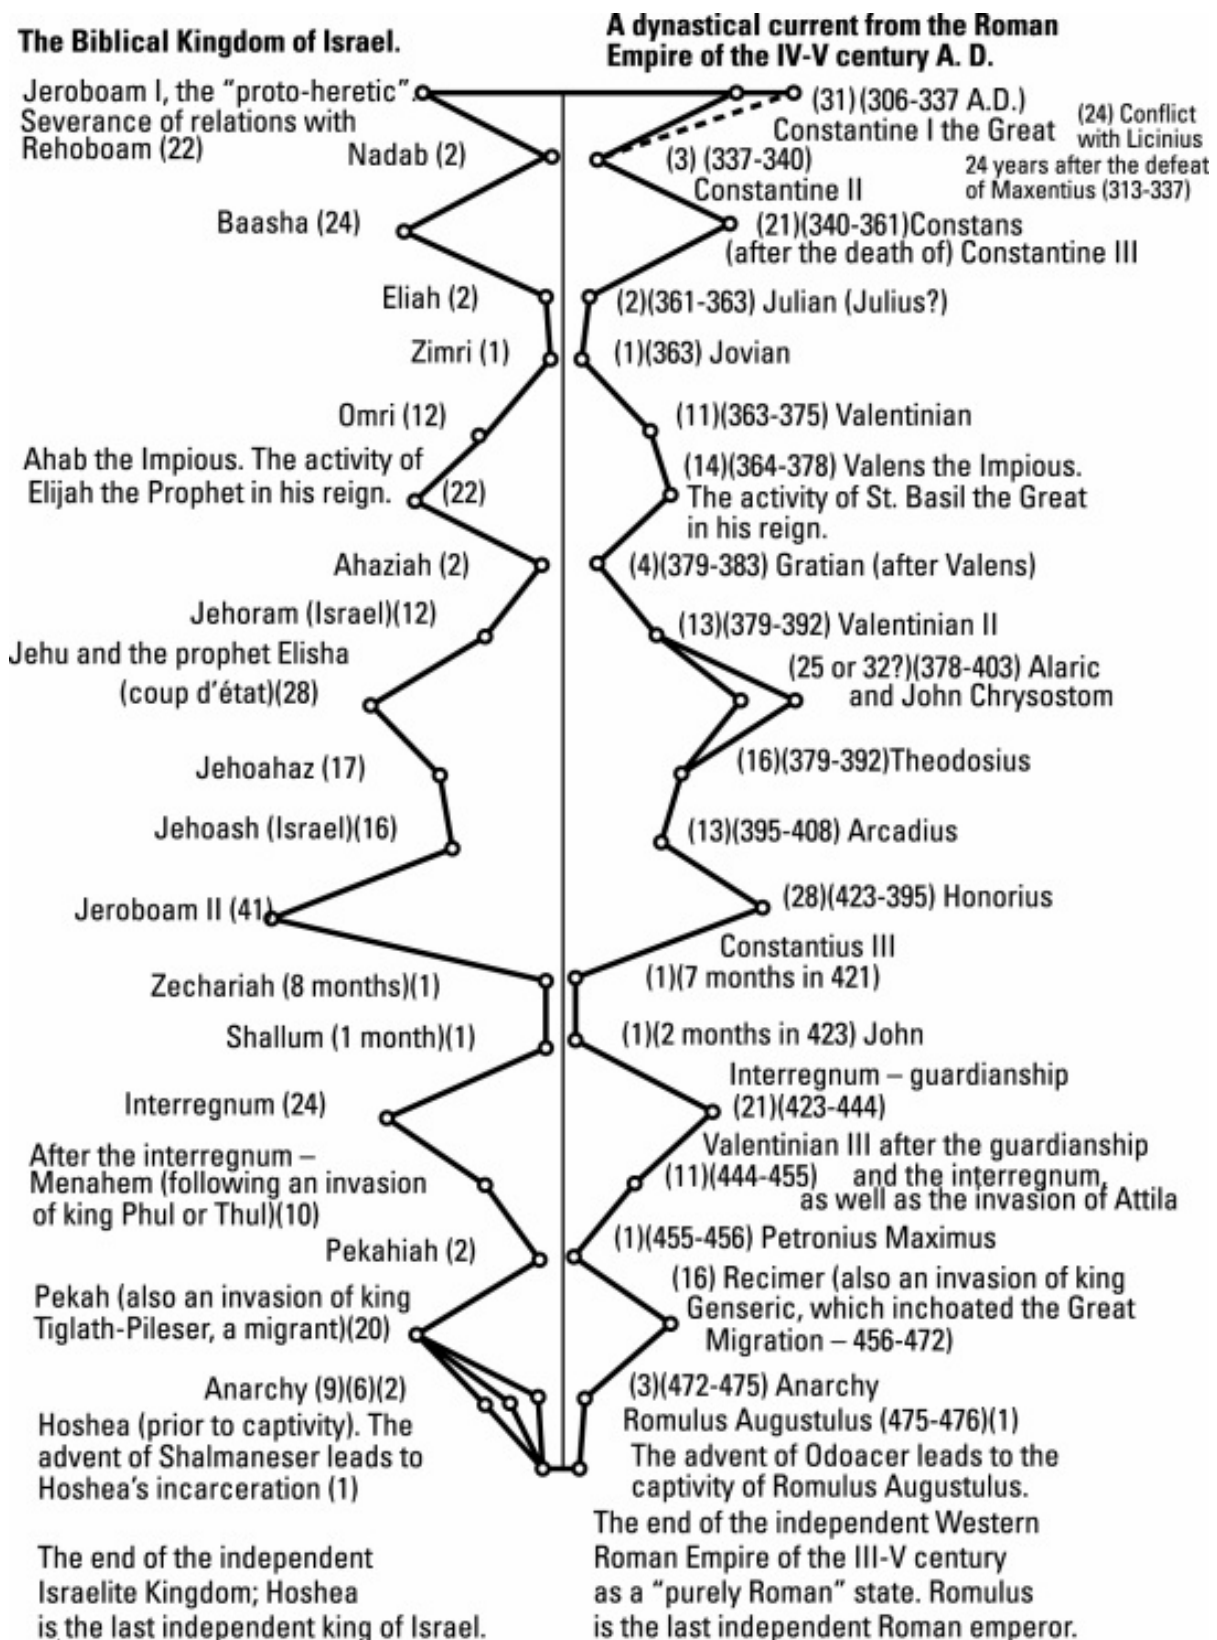

Fig. 1.8. The reign correlation of the "ancient" Biblical kingdom of Israel and the Third "ancient" Roman Empire.

1a. *Jeroboam I* – reigned for 22 years.

■ 1b. *Constantine I* had reigned for 24 after his victory over Maxentius – 313-337 A.D.

2a. *Nadab* – 2 years.

■ 2b. *Constantine II* – 3 years (337-340 A.D.)

3a. *Baasha* – 24 years.

■ 3b. *Constantius II* – 21 years (340-361 A.D.)

4a. *Ilas* – 2 years.

■ 4b. *Julian* – 2 years (361-363 A.D.)

5a. *Zimri* – less than 1 year.

■ 5b. *Jovian* – less than 1 year in 363 A.D.

6a. *Omri* – 12 years.

■ 6b. *Valentinian* – 11 years (364-373 A.D.)

7a. *Achab* (and *Elijah the Great Prophet*) – 22 years.

■ 7b. *Valens* (and the famous *St. Basil the Great*) – 14 years (364-378 A.D.)

8a. *Achaziah* – 2 years.

■ 8b. *Gratian* – 4 years (379-383 A.D.)

9a. *Joram of Israel* – 12 years.

■ 9b. *Valentinian II* – 13 years (379-392 A.D.)

10a. *Jehu* and *Elijah the Prophet* (28 years).

■ 10b. A lacuna (or, according to another version – *Alaric* and *John Chrysostom* the prophet (25 years – 378-403 A.D.)

11a. *Jehoahaz* – 17 years.

■ 11b. *Theodosius* – 16 years (379-395 A.D.)

12a. *Jehoash of Israel* – 16 years.

■ 12b. *Arcadius* – 13 years: 395-408 A.D.

13a. *Jeroboam II* – 14 years.

■ 13b. *Honorius* – 28 years (395-423 A.D.)

14a. *Zechariah* – less than 1 year (6 months).

■ 14b. *Constantius III* – less than 1 year (7 months) – 421 A.D. or 423 A.D.

15a. *Shallum* – less than 1 year (1 month).

■ 15b. *John* – less than 1 year (2 months) – 423 A.D.

16a. *Interregnum* – 24 years.

■ 16b. *Interregnum/custody* – 21 years (423-444 A.D.)

17a. *Menahem* – 10 years.

■ 17b. *Valentinian III* – 11 years (444-445 A.D.)

18a. *Pekahiah* – 2 years.

■ 18b. *Petronius Maximus* – 1 year (455-456 A.D.)

19a. *Pekah* – 20 years.

■ 19b. *Recimer* – 16 years (456-472 A.D.)

20a. *Anarchy* – 2, 6 or 9 years (three versions).

■ 20b. *Anarchy* – 3 years (472-475 A.D.)

21a. *Uzziah* (before falling captive to Shalmaneser) – 1 year or 3 years.

■ 21b. *Romulus Augustulus* (before falling captive to Odoacer) – 1 year (475-476 A.D.)

A) The emperors of the Third Roman Empire that ended up in this dynastical current have reigned in the West for the most part – presumably, in Italian Rome. Those of the emperors listed whose primary residence had been in Constantinople had been so powerful that they played a dominant role in the West of the empire as well, often even

with a Roman co-ruler present. Let us further point out that the kingdom of Israel is covered by this parallelism *completely*.

B) Both dynasties begin with prominent political and religious leaders. In particular, we have Jeroboam I, the famous progenitor of “Jeroboam’s heresy”. His double, Constantine I Augustus (or “Holy”) is presumed to be the first patron of Christianity. The naissance and the establishment of Arianism (a possible analogue of Jeroboam’s heresy) take place in his reign.

Jeroboam I struggled against Rehoboam of Judah, who had *broken away* from him, while Constantine I battled against Licinius, who had also *initiated a secession*.

Under Jeroboam I the formerly united Biblical kingdom becomes *divided in two* – the kingdoms of Judah and Israel. The same happens under Constantine I when the formerly united Roman empire becomes *divided* into two parts, the Western and the Eastern. Constantine I went so far as to move the imperial capital from Rome in Italy to New Rome on the Bosphorus.

The united Biblical kingdom had been ruled by *three prominent kings* – Saul, David and Solomon. The Third Roman Empire also has *three famous rulers* at its very beginning – Aurelian = Sulla, Diocletian = Pompey, and Constantius I Chlorus = Julius Caesar. They are the duplicates of the Biblical Saul, David and Solomon.

According to the Bible, the Israelites were *divided into 12 tribes*. Likewise, under Constantine I the Roman empire was divided into 12 dioceses, or regions. In the kingdom of Israel, a *thirteenth* tribe joined the other twelve eventually – the offspring of Dinah. The same thing happened in the Roman Empire under Constantius II, the son of Constantine I, when a *thirteenth* diocese was added to the abovementioned twelve ([\[544\]](#), Volume 7).

C) Both dynasties end with rulers who fall under the power of a foreign king. In the kingdom of Israel it’s Uzziah who becomes Shalmaneser’s (Czar Solomon’s?) captive, whereas in the Third Roman Empire we have Romulus Augustulus deposed by Odoacer, also a foreign king. Shalmaneser is King of *Assyria*, whereas Odoacer is a *German* king. What we have is the “ancient” Assyria superimposed over the mediaeval Germany (or Prussia, = White Russia?). See more on this subject in [Chron5](#).

Both of the dynasties under comparison cease their existence under these duplicate kings. Bear in mind that the last two emperors of the Third Roman Empire (Odoacer and Theodoric) aren’t Roman anymore – they are foreigners. Among other things, they are said to have practised a different religion. This circumstance may have played a certain role in how they became reflected on the pages of the Bible, which is a distinctly

religious source.

D) The anarchy and interregnum periods coincide for both dynasties.

E) There are many stunning parallels in the “biographical” currents of the Israelite and Roman rulers. The form-codes of these dynasties coincide. We must point out that we give the translations of the Biblical names according to [\[544\]](#).

1a. *Jeroboam I* (Protector of the People).

■ 1b. *Constantine I Augustus*.

1.1a. *Israel*. The name “Jeroboam” could have stood for “The *Holy* Clarion” in Greek pronunciation ([\[544\]](#), Volume 7, page 338). Jeroboam I came to power together with Rehoboam (1 Kings 11:43, 12:2-3 and 19-20). They shared the formerly united kingdom between the two of them.

■ 1.1b. *Third Empire*. The name “Augustus” of Constantine I also stands for “*Holy*”. Constantine I was declared a saint equal to the Apostles in rank. He and Licinius acquire absolute power in the East and in the West, respectively ([\[327\]](#), page 429).

1.2a. *Israel*. Jeroboam I “*rebelled*” against Rehoboam in the first year of his reign, *severing all relations between the two* (1 Kings 12:19-20). The Bible proceeds to tell us that “*there was war between Rehoboam and Jeroboam all their days*” (1 Kings 14:30).

■ 1.2b. *Third Empire*. Constantine I *severs all ties* with Licinius at the very beginning of his reign, after the victory over Maxentius in 313. This leads to a war between them ([\[327\]](#), page 429). Licinius “*was assaulted by his co-ruler Constantine already in 314*” (*ibid.*). Constantine I wages constant wars against Licinius.

1.3a. *Israel*. Under Jeroboam, “Israel rebelled against the house of David unto this day” (1 Kings 12:19). Jeroboam I *transferred the capital* of the state to the city of Sechem (1 Kings 12:25). Let us point out that Jeroboam I is the *only* king of Israel who had moved the capital city as a result of the foundation of a new state.

■ 1.3b. *Third Empire*. Around 330, Constantine I *moves the imperial capital* from Rome in Italy to New Rome on the Bosphorus. This important event signified the beginning of the Roman Empire’s division into two parts – the Eastern and the Western. Constantine I is the *only* emperor of the Third Empire to transfer the capital;

this coincided with the foundation of the new Eastern Roman Empire.

1.4a. *Israel*. In order to prevent the restoration of Rehoboam's rule, Jeroboam I also seceded from him ecclesiastically. *He had founded a new religious movement* known as "Jeroboam's heresy" (1 Kings 12:28 and 12:31). This "heresy" was adhered to by all of the subsequent Israelite kings. It played a major part in the entire history of the Theomachist Israelites. Bible refers to "Jeroboam's heresy" in the biography of each Israelite king after Jeroboam.

■ 1.4b. *Third Empire*. Constantine I Augustus (The Holy) is occasionally called the *founder of Orthodox Christianity* in Christian sources. Modern historians acknowledge the only fact out of the numerous legends about Constantine, namely, that he had founded a certain cult, possibly of a "heretical" nature. The fact that he had been a Christian is often disputed. It was under Constantine I that Arius, the founder of *Arianism*, had first emerged with his teaching ([\[579\]](#), pages 466-467). Arianism is a well-known Christian "heresy" that had made a significant impact on the entire history of the Third Roman Empire ([\[579\]](#)).

1.5a. *Israel*. The reign duration of Jeroboam I equals 22 years (1 Kings 14:20).

■ 1.5b. *Third Empire*. Constantine I had reigned for 24 years between 313 and 337, counting from the beginning of his joint rule and the struggle against Licinius, after the defeat of Maxentius. Other versions claim his reign duration to have equalled 13 or 31 years, qv above. The durations are rather close to each other.

2a. *Nadab* (The Generous).

2b. *Constantine II*.

2.1a. *Israel*. Nadab is the son of Jeroboam I (1 Kings 15:25). Nadab came to power immediately after the death of his father (ibid). The Bible emphasizes that King Nadab *adhered to Jeroboam's heresy*: "And he did evil in the sight of the Lord, and walked in the way of his father" (1 Kings 15:26).

■ 2.1b. *Third Empire*. Constantine II was the son of Constantine I ([\[327\]](#)). Constantine II came to power *immediately after the death of his father* ([\[327\]](#)). He successfully *carried on with the religious policy of Constantine I* ([\[327\]](#)). The Biblical author may well have regarded this as "walking in the way of his father".

2.2a. *Israel*. Nadab was killed by Baasha, who had seized the throne of Israel (1 Kings 15:28). Baasha became the next king. “Even in the third year of Asa king of Judah did Baasha slay him, and reigned in his stead” (1 Kings 15:28). Asa, king of Judah, might simply be a reflection of Jesus Christ.

■ 2.2b. *Third Empire*. Constantine II had launched a campaign against his brother Constans and got killed in a battle ([327], page 438). Constans, the killer of Constantine II, becomes the next Roman emperor, ruling jointly with the third brother – Constantius II ([327]). This happens immediately after the death of Constantine II in 340 ([767], Volume 2, page 468). The joint rule of the three brothers began in 337; Constantine II was killed in either the *fifth* or the *seventh* year of St. Basil the Great, or The Great King (basileus = king), who is most likely to be a reflection of Andronicus, or Jesus (Asa?) from the XII century A.D. Let us point out that there are two versions for the birth date of Basil the Great. The most common one cites the year 333; the other one insists on 335 ([544], Volume 1). We see a very good concurrence of these data with the Biblical indications.

2.3a. *Israel*. Nadab’s reign lasted 2 years (1 Kings 15:25).

■ 2.3b. *Third Empire*. Constantine II had reigned for *three years* between 337 and 340 ([327], page 792; also [767], Volume 2, page 468). Reign durations are similar.

3a. *Baasha* (The Creator).

■ 3b. *Constantius II*.

3.1a. *Israel*. Baasha came to power as the killer of his predecessor Nadab, King of Israel. King Baasha *was following Jeroboam’s heresy*, or “walked in the way of Jeroboam” (1 Kings 15:34). Baasha *initiated a massacre* of his fellow tribesmen: “And it came to pass, when he reigned, that he smote all the house of Jeroboam; he left not to Jeroboam any that breathed, until he had destroyed him” (1 Kings 15:29). Baasha chose *Tirzah* as his capital; the name might actually refer to *Turkey*.

■ 3.1b. *Third Empire*. Constantius II came to power as one of the killers of his predecessor Constantine II. Historians report that “Constantius united the entire state under his rule once again. *Church disputes, which he took part in*, had played an important part in his reign” ([579], page 469). Constantius II had *massacred the kin* of Constantine I, the double of the Biblical Jeroboam I. He had *killed all the family members* of the two half-brothers of Constantine ([327], page 438). Constantius II

resided in Constantinople, and had lived in Asian provinces for a long time; he relocated to *Turkey* in 335 ([\[327\]](#)). This is basically what the Bible tells us, qv above.

3.2a. *Israel*. Baasha's reign duration equals *24 years* (1 Kings 15:33).

■ 3.2b. *Third Empire*. Constantius II reigned for *21 years*, between 340-361 (after the death of Constantine II). Another version dates his reign to 337-361 (*24 years*), from the moment that his joint rule with Constantine II began ([\[327\]](#)). Reign durations are similar.

4a. *Elah* ("The God", or "The Sun").

■ 4b. *Julian* ("The Lord").

4.1a. *Israel*. Elah was the *son* of Baasha (1 Kings 16:8). It has to be pointed out that the Biblical formula "son" often refers to religious succession and not actual kinship. The name Elah ("The Lord") concurs well with the name of his "Roman double" Julian.

■ 4.1b. *Third Empire*. Julian is presumed to have been a *cousin* of Constantius II, the double of the Biblical Baasha. Constantius II had no children ([\[579\]](#)). Julian was *deified* while still alive; he is known as a religious reformer.

4.2a. *Israel*. Despite the fact that King Elah had possessed such a grandiloquent name ("The God"), the Bible hardly tells us anything about him at all. This is all the more egregious when compared to the detailed "biographies" of the Israelite kings whose names were a great deal more "modest". Let us remind the reader that the Bible is a religious source that pays a lot of attention to the religious policies of the rulers referred to therein.

■ 4.2b. *Third Empire*. Julian ("The God") became reflected in ecclesiastical history under the alias of "The Apostate". He is considered to have been the archenemy of Christianity and a restorer of paganism. The information on this emperor found in the Christian sources is extremely sparse and very negative. On the other hand, secular Roman historians (Marcellinus, for instance) dedicate voluminous exalted panegyrics to Emperor Julian, glorifying his deeds ([\[579\]](#)).

4.3a. *Israel*. King Elah was killed by Zimri, his *commander-in-chief* (1 Kings

16:10). The Bible gives us no details of the murder. Elah's reign lasted for 2 years (1 Kings 16:8).

■ 4.3b. *Third Empire*. Emperor Julian was killed during a campaign in the East under uncertain circumstances. The next emperor is Jovian, who had been the *commander-in-chief* of Julian's army ([579], page 472). Julian's reign lasted for 2 years (361-363, see [767], Volume 2, page 793; also [579] and [327]). Reign durations coincide.

5a. *Zimri* ("Singer of hymns").

■ 5b. *Jovian*.

5.1a. *Israel*. Zimri was the *commander-in-chief* in the army of his predecessor Elah, whom he had killed (1 Kings 16:9-16:10). Zimri came to power *in the 27th year* of Asa (Jesus?), king of Judah (1 Kings 16:10).

■ 5.1b. *Third Empire*. Jovian was the *commander-in-chief* in the army of Emperor Julian, his predecessor, and had accompanied him in the Persian campaign ([579], page 472). There are many legends about the murder of Julian. At any rate, Jovian had been Julian's successor. One of the versions claims Julian to have been a victim of a plot. Jovian ascended to the throne in 363, *in the 30th year* of St. Basil the Great – possibly a duplicate of Asa (Jesus). Bear in mind that Basil is presumed to have been "incarnated" in 333, which gives us $30 = 363 - 333$.

5.2a. *Israel*. Zimri followed Jeroboam's heresy: "For his sins which he sinned in doing evil in the sight of the Lord, in walking in the way of Jeroboam, and in his sin which he did, to make Israel to sin." (1 Kings 16:19). Also: "In the twenty and seventh year of Asa king of Judah did Zimri reign seven days in *Tirzah*." (1 Kings 16:15). Thus, Zimri's reign lasted 7 days.

■ 5.2b. *Third Empire*. "Jovian was a Christian" ([579], page 472). This might be why the Bible mentions that he had "walked in the way of Jeroboam". Jovian's reign began in the East, near *Turkey*, during the campaign. He had reigned for *less than one year* ([767], Volume 2, page 793; also [327]). The entirety of this brief period was spent on the march when Jovian was returning to the imperial capital. According to some of the sources, he never reached it. Reign durations are similar.

6a. *Omri* ("The Head").

■ 6b. Valentinian I.

6.1a. *Israel*. Omri, the successor of Zimri, had been the *commander-in-chief* in the army of his predecessor (1 Kings 16:16). Omri's *reign began in the 31st year* of Asa, King of Judah (Jesus?) (1 Kings 16:23).

■ 6.1b. *Third Empire*. Valentinian I, who became emperor after Jovian, had been the *commander-in-chief* in the army of the latter ([327], page 441. Having ascended to the throne in 364, Valentinian I *became emperor in the 31st year* of St. Basil the Great, the reflection of Jesus Christ – or, possibly, Asa of Judah, considering how $364 - 333 = 31$. In both cases we see that the ascension to the throne takes place *in the 31st year*.

6.2a. *Israel*. Omri waged a violent war against Tibni who had claimed his right to the throne of Israel (1 Kings 16:21-22). Omri ended up *winning* the war (1 Kings 16:22). Tibni the claimant was *killed* (1 Kings 16:22).

■ 6.2b. *Third Empire*. Valentinian I *battled* against Procopius, a relation of Julian who had claimed his right for the Roman throne. Valentinian I *won* this war ([327] and [767], Volume 2). Procopius was *killed* ([327], page 442).

6.3a. *Israel*. Omri had *transferred* his residence to the city of Samaria located *on a hill or near a hill* (1 Kings 16:24). Omri had been renowned for *cruelty*: “But Omri wrought evil in the eyes of the Lord, and did worse than all that were before him” (1 Kings 16:25).

■ 6.3b. *Third Empire*. Valentinian I *transferred* his residence to Rome in the west. One must bear in mind that there is a famous *mountain* near Rome – the volcano Vesuvius. Valentinian I was *distrustful and cruel*. Together with his brother Valens they created a very tense political climate in Rome, especially after the defeat of Procopius. Valentinian I had executed a large number of Romans ([327], page 442).

6.4a. *Israel*. Omri wasn't killed, but rather “slept with his fathers” peacefully (1 Kings 16:26-28). His reign had lasted 12 years (1 Kings 16:23).

■ 6.4b. *Third Empire*. Valentinian I may have died a natural death; it is however reported that “his death came suddenly” ([327]). His reign duration equals 11 years (364-375, qv in [327] and [767], Volume 2; also [76]).

7a. *Ahab* (“The Uncle”). Elijah, the great prophet, was active during his reign.

■ 7b. *Valens*. The famous prophet and saint (Basil the Great) was active in his reign.

7.1a. *Israel*. King Ahab is described in the Bible at length (3 Kings 17-22). He is one of the most notorious kings of Israel, and one of the most rigorous ones as well (1 Kings 22). The Bible characterizes Ahab as a particularly “impious king”. Apart from following “Jeroboam’s heresy” he also “went and served Baal, and worshipped him” (1 Kings 16:31-33). The term “Ahab the impious” became denominative in later literature.

■ 7.1b. *Third Empire*. Valens is one of the most notorious Roman emperors. In particular, he is presumed to have been one of the cruellest rulers of the Empire. Bear in mind that his duplicate from the Second Empire is another notorious and cruel ruler – Nero. Valens is described very negatively in Christian sources. He was a “devout Arian” – a heretic, as it were ([\[579\]](#), page 674). The wickedness of Valens and his duplicate Nero is reflected in Christian literature as a classical embodiment of all negative qualities.

7.2a. *Israel*. The famous Biblical prophet Elijah begins his career under Ahab (1 Kings 21:17 ff). The name Elijah translates as “God” ([\[544\]](#), Volume 7). The relations between Ahab and Elijah the prophet are hostile (1 Kings 21: 17-29). Opposition between them soon leads to *direct confrontation* (1 Kings 21:20-23).

■ 7.2b. *Third Empire*. Basil the Great, the famous Christian Saint, is active in the reign of Valens. Legends about him are identical to the ones told about Jesus Christ. The relationship between Basil and Valens is a very strained one, and eventually leads to an *open conflict*, qv in the *Menaion* ([\[544\]](#), Volume 1).

7.3a. *Israel*. The “biography” of Ahab as related in the Bible is the story of his interactions with the prophet Elijah for the most part (1 Kings 21:17-29). The Bible, being a religious source, naturally pays attention to such facts. Ahab had been scared of Elijah, “and went softly” (1 Kings 21:27).

■ 7.3b. *Third Empire*. Fragments of the biography of Valens as presented in the *Menaion* are covered as the story of opposition between Valens and St. Basil the Great. Valens had been “afraid of Basil”. Quotation given according to [\[544\]](#),

7.4a. *Israel*. Ahab wages war against “the King of Syria” (1 Kings 22). Ahab’s army is defeated. Ahab himself gets seriously wounded during his escape from the battlefield, and soon dies (1 Kings 22:37-38).

■ 7.4b. *Third Empire*. Valens fights the Goths ([\[327\]](#)). Once again we see the Biblical *Syrians*, or Assyrians, identified as the mediaeval *Goths*. The troops of Valens are crushed; he gets killed as he flees the battlefield, likewise his double Nero from the Second Roman Empire ([\[327\]](#) and [\[767\]](#), Volume 2).

7.5a. *Israel*. The Bible portrays the notorious Jezebel, Ahab’s wife, in the most unfavourable manner: “the dogs shall eat Jezebel” (1 Kings 21:23). Ahab’s reign duration equals 22 years (1 Kings 16:29).

■ 7.5b. *Third Empire*. Since Basil the Great is most likely to be a phantom reflection of Jesus Christ from the XII century, Valens can probably be identified as “King Herod” from the Gospels. The Gospels describe him very negatively, likewise his wife Herodias. Valens reigned for 14 years (364-378, qv in [\[327\]](#)). A propos, the pair of emperors (Valens + Valentinian I) had reigned for 25 years (14 + 11 = 25). Reign durations are similar in the second version.

8a. *Ahaziah* (“The Lord’s Owner”).

8b. *Gratian*.

8.1a. *Israel*. Ahaziah is Ahab’s successor (1 Kings 22:51). Ahaziah had reigned in Samaria (1 Kings 22:51). His reign duration equals 2 years (1 Kings 22:51).

■ 8.1b. *Third Empire*. After the death of Valens in 378, his co-ruler Gratian remains regnant in the West of the empire until his death in 383 ([\[327\]](#)). Gratian rules in Rome; once again we see the city identified as the Biblical Samaria. Gratian’s reign duration equals 4 years (379-383) or 5 years (378-383, qv in [\[327\]](#), page 444). The reign durations of the two are similar. Let us point out that although formally Gratian remained the sole ruler of the empire from 378 and on, the entire year 378 was marked by embroilment after the death of Valens. Gratian’s stable reign begins in 379, after the end of the strife and the civil war, likewise the reign of Theodosius, who was appointed in 379.

9a. *Jehoram* ("The Lord's Archer").

■ 9b. *Valentinian II*.

9.1a. *Israel*. Jehoram had reigned for *12 years* (2 Kings 3:1).

■ 9.1b. *Third Empire*. The reign of Valentinian II lasted *13 years* after the death of Valens and the civil unrest of 379 (379-392, qv in [767], Volume 2, page 793). Reign durations are similar.

10a. *Jehu* and the prophet *Elisha*.

■ 10b. *Lacuna*. No duplicate emperor here. One could think that the parallelism were interrupted here; however, it has to be pointed out that the gap instantly gets filled once we turn to the events of the alleged IV-V century that involve the famous warlord *Alaric*. Thus, we have *Alaric* and *John Chrysostom* the prophet.

10.1a. *Israel*. We see a troubled period in history of the Israelite kingdom – the *invasion* of Jehu. Elijah's successor in ecclesiastical power is the famous Biblical prophet Elisha (2 Kings 2:9). He is the inspirer and the organizer of a great religious upheaval in the kingdom of Israel.

■ 10.1b. *Third Empire*. The famous troubles in the Third Roman Empire – *Alaric's invasion*. John Chrysostom inherits ecclesiastical power from Saint Basil the Great. He is a famous religious figure in the history of the Christian church of the alleged IV-V century and the initiator of a powerful religious movement in the Third Empire ([542]).

10.2a. *Israel*. Jehu the warlord is active in the epoch of the prophet Elisha (2 Kings 9). The name Jehu can be regarded as a distorted version of "*Jehovah*" ([544], Volume 7, page 344). The invasion of Jehu is described in the Bible as a barbaric invasion, likewise the rebellion that he leads. Jehu does not belong to the regnant dynasty of Israelite kings, and is summoned into the country by Elisha (2 Kings 9). Elisha and Jehu had ruled in the Kingdom of Israel together (2 Kings 9-10).

■ 10.2b. *Third Empire*. The military leader Alaric is active in the epoch of St. John Chrysostom ([327]). Some sources inform us of his mediaeval alias "*Wrath of Lord*". His invasion was regarded as the advent of Jehovah angered by the sins of the people ([544], Volume 7, page 345; also [64]). Alaric's rebellion, as well as his invasion, are barbaric in nature. Alaric was the military commander of the Roman

Empire (likewise the Biblical Jehu), but not the formal leader of the empire ([327]). Apparently, the imperial policy was largely affected by John Chrysostom in 399-400; Emperor Arcadius is supposed to have acted in accordance with John's advice ([544]).

10.3a. *Israel*. Elisha the prophet castigated Jezebel and finally destroyed her by proxy of Jehu (2 Kings 9). Jezebel was killed (2 Kings 9:30-33). She had been a king's daughter (2 Kings 9:34). At the same time, several Christian authors (Eusebius, for instance) had used the word "wife" for referring to a confession.

■ 10.3b. *Third Empire*. John Chrysostom had vehemently criticised the official church; however, the parallel here isn't quite clear.

10.4a. *Israel*. According to the Bible, Jehu had "*reigned* over Israel" (2 Kings 10:36), anointed by Elisha the prophet (2 Kings 9:6). The allegedly *pagan cult of Baal was overthrown* under Elisha (2 Kings 10:28). "And they brought forth the images out of the house of Baal, and burned them. And they brake down the image of Baal, and brake down the house of Baal, and made it a draught house unto this day" (2 Kings 10:26-27). This is the passage where the Bible condemns and forbids the cult of Baal.

■ 10.4b. *Third Empire*. The invasion of Alaric had stunned the entire Roman Empire. He took Rome in 410. Alaric became *King* of the Goths in 396 ([327], page 446). The *pagan cult becomes downtrodden* in the empire under John Chrysostom. In the alleged year 391 the imperial edict comes out that forbids sacrifices. The last Olympic games take place in 393; all the Olympian temples are *destroyed* the same year ([327], page 444-445). The famous statue of Zeus is taken to Constantinople; pagan religious services are outlawed ([327]).

10.5a. *Israel*. Jehu took part in this religious struggle personally as the persecutor of Baal's cult. Jehu's reign duration equals *28 years* (2 Kings 10:36).

■ 10.5b. *Third Empire*. Alaric also took part in the religious struggle of this period in the Roman Empire. He had been an Arian and persecuted Orthodox Christians ([327]). The "reign" of Alaric and John Chrysostom lasted for either *25 or 32 years*. It has to be explained that the activity of Chrysostom begins in the alleged year 378, after the death of Valens and Basil the Great, the double of the Biblical Elijah. The *rebellion of the Goths* takes place the same year ([327], p. 443).

Chrysostom dies in the alleged year 403. Alaric becomes famous in the alleged year 385, and becomes King of the Goths in 398 ([327], p. 446). Alaric died in the alleged year 410 or 411. Thus, we get the 15 years as the period of 396-411 (Alaric), 32 years as the period of 378-410 (the Gothic rebellion followed by Alaric's reign), or 30 years as the period of 378-407 (Chrysostom).

11a. *Jehoash* ("The Lord's Property")

■ 11b. *Theodosius I*.

11.1a. *Israel*. Jehoash followed Jeroboam's heresy, or "walked in the sins of Jeroboam" (2 Kings 13:2), likewise the previous kings of Israel excepting Jehu. His name can be translated as "the Lord's own". He may have been considered "son of God" (Jehu, or Jehovah?). See [544], Volume 4.

■ 11.1b. *Third Empire*. Theodosius I was a *fanatical* Christian ([327], page 444). Furthermore, from the point of view of an ecclesiastical chronicler, he may have been called "the Lord's own", since the Goths led by Alaric ("Wrath of God") attacked him when they first rebelled in 378.

11.2a. *Israel*. The reign of Jehoash is marked by a single, yet arduous, war against Hazael, king of *Syria* (2 Kings 13:3). The Bible describes Hazael's invasion as barbaric (2 Kings 13). Jehoash lost the war (2 Kings 13:3), but signed a peace with Hazael (2 Kings 13:5). Jehoash *reigned for 17 years* (2 Kings 13:1).

■ 11.2b. *Third Empire*. The war against the *Goths* accompanies the entire rule of Theodosius I. This war was violent, bloody, and arduous. Roman chronicles regarded the invasion of the *Goths* as a barbaric intrusion. In 386, Theodosius I manages to negotiate a truce with the Goths ([327]; also [767], Volume 2). We see another identification of the biblical *Arameans* with the mediaeval *Goths*. Theodosius I had *reigned 16 years: 379-395* ([767], Volume 2, page 793). The reign durations are similar.

12a. *Jehoash of Israel* (God's Fire).

■ 12b. *Arcadius*.

12.1a. *Israel*. Jehoash is the *son* of Jehoahaz (2 Kings 13:10). Next to Jehoash we see the eminent prophet St. Elisha, whose orders were good as law for Jehoash (2

Kings 13:14-20). “Elisha had died... *And now* Moabite raiders invaded the country” (2 Kings 13:20).

■ 12.1b. *Third Empire*. Arcadius is a *son* of Theodosius I ([327], page 445). Next to Arcadius we find a well-known saint, John Chrysostom, whose advice Emperor Arcadius allegedly followed in 400-401 ([542]). St. John Chrysostom *died* in 407. The next year, in 408, Alaric re-invaded the empire.

12.2a. *Israel*. Jehoash wages wars against *two* kings – Hazael and Ben-Hadad (2 Kings 13:3-7, 13:22-25). The Bible calls Hazael King of *Aram* (2 Kings 13:22). Ben-Hadad is his son (2 Kings 13:25). Jehoash *did not succeed* in destroying Hazael completely (2 Kings 13:19).

■ 12.2b. *Third Empire*. Arcadius wages wars against *two* kings - Alaric and Radagaisius. Arcadius *did not succeed* in destroying Alaric’s troops completely ([327], page 447). Alaric and Radagaisius were the respective leaders of the *Goths* and the *Germans* [327]. Thus, we encounter another superimposition of the biblical *Arameans* over the medieval *Goths* and *Germans* – probably *Prussians*.

12.3a. *Israel*. Jehoash had continuously been at feud with the king of Judah, who ruled jointly with him (2 Kings 13). Eventually, a war between Jehoash and his co-ruler of Judah broke out (2 Kings 13:12). Jehoash died in the capital and not on the battlefield. His reign duration equals *16 years* (2 Kings 13:10).

■ 12.3b. *Third Empire*. Arcadius had been at feud with his co-ruler Honorius; he’d also had a hated private fiend by the name of Stilicho, the personal commander of Honorius ([327], pages 446-447). In the epoch of the co-rulers Arcadius and Honorius, “a war between Western and Eastern Rome began” ([579], page 478). Arcadius doesn’t die on the battlefield, but rather in the capital. His reign lasted for *13 years*: 395-408 [327].

13a. *Jeroboam II* (Protector of People).

■ 13b. *Honorius*.

13.1a. *Israel*. Jeroboam II rules in Samaria (2 Kings 14:23) and fights against the *Arameans*, who attack the kingdom of Israel ceaselessly (2 Kings 14).

■ 13.1b. *Third Empire*. Honorius rules in Rome. Once again we see the already familiar identification of the biblical Samaria as the mediaeval Rome. The rule of

Honorius, likewise that of his co-ruler Arcadius, is accompanied by continuous wars against the *Goths* and *Germans*. We observe yet another superimposition of the biblical Arameans over the medieval *Goths* and *Germans* (possibly *Prussians*).

13.2a. *Israel*. Jeroboam II arranges for a short *ceasefire* in this protracted invasion (2 Kings 14: 25-27). “He [Jeroboam – A. F.] *had restored the boundaries* of Israel” (2 Kings 14:25). It must have been the defeat of his enemies, Hazael and Ben-Hadad, described in the following passage of the Bible: “I will send fire upon the house of Hazael [Alaric? – A. F.] that will consume the fortresses of Ben-Hadad [Radagaisius? – A. F.]” (Amos 1:4).

■ 13.2b. *Third Empire*. Honorius manages to *stop* the invasion, arranging for a truce with Alaric in 395 ([327] and [767], Volume 2). In spite of the short duration of the ceasefire, it had led to an *expansion* of the state. Stilicho, the military commander of Honorius, drove the *Goths* back, away from the original boundaries of the Roman Empire ([327], pages 446-447). The troops of Honorius, led by Stilicho, defeated Alaric once again in the alleged year 402. Radagaisius is supposed to have been killed in 405 A.D. Thus, the defeat had been temporary for Alaric and final for Radagaisius ([327]).

13.3a. *Israel*. The “biography” of Jeroboam II mentions Hazael, King of Aram, although, according to the 2nd Book of Kings 13:24, Hazael had died in the times of Jehoash of Israel – the predecessor of Jeroboam II. This probably indicates that Jeroboam II and Jehoash of Israel were *co-rulers*.

■ 13.3b. *Third Empire*. Honorius, the double of Jeroboam II, and Arcadius, the double of Jehoash the Israelite, are considered to have been *co-rulers* in Roman history. The reign of Arcadius covers the period of 395-408, and that of Honorius - 395-423 ([327] and [767], Volume 2).

13.4a. *Israel*. During the rule of Jeroboam II, the prophet St. Jonah gains prominence – an envoy of God who liberates the land from enemies (2 Kings 14:25-27). It is most likely that *Jonah* is a slightly distorted version of the name *John*. Jonah is one of the key figures in the reign of Jeroboam II. It is through Jonah that God helps the kingdom of Israel (2 Kings 14:25). The reign of Jeroboam II *lasts for 41 years* (2 Kings 14:23).

■ 13.4b. *Third Empire*. St. John Chrysostom was active in the time of Honorius

and his co-ruler Arcadius. Let us point out that Radagaisius, the duplicate of the Biblical Ben-Hadad, had died in the alleged year 405 A.D. Furthermore, Alaric, the duplicate of the Biblical Hazael, had perished in 410 A.D. Since both Radagaisius and Alaric had died in the epoch of Honorius (The Biblical Jeroboam II), the year 407, when *St. John Chrysostom*, the duplicate of the Biblical *Jonah*, had ceased his activity, actually coincides with the end of the invasion as described in the Bible. Honorius had *reigned for 28 years*: 395-423. Reign durations differ considerably, but it does not appear to influence the correlation of entire dynasties.

14a. *Zechariah* (The Lord's Memory).

■ 14b. *Constantius II*.

14.1a. *Israel*. Little is known of Zachariah. *He is presumed to have reigned for 6 months* (2 Kings 15:8).

■ 14.1b. *Third Empire*. There is virtually no information available about Constantius II. *He had reigned for 7 months* in either 421 or 423 A.D. ([767], Volume 2, page 793). He was proclaimed Augustus in 421, being a co-ruler of Honorius. Their respective reign durations are rather close.

15a. *Shallum* or *Selom* (Peaceful).

■ 15b. *John*.

15.1a. *Israel*. Very little is known of Shallum (2 Kings 15:10, 15:13). *He had reigned for 1 month* (2 Kings 15:13).

■ 15.1b. *Third Empire*. We know virtually nothing of John, who had reigned for 2 months in 423 ([579], page 482). Reign durations are similar.

Commentary: Available sources reflect the downfall of the Western Roman Empire in a fragmentary and contradictory manner; this confusion is observable in contemporary monographs as well. For instance, [767], Volume 2, gives us the following years for Emperor John's reign: 423-425 A.D., without any comments whatsoever. Therefore we have been using an older text that was nevertheless a great deal more complete [579], which relates the events of this period (albeit briefly) specifies the duration of John's rule as equalling two months ([76]).

16a. *Interregnum* in the Kingdom of Israel.

16b. “*Interregnum-guardianship*” in the West of the Third Roman Empire.

16.1a. *Israel*. After the death of Jeroboam II, a 24-year long period of strife begins. Menahem accedes under unclear circumstances. The 2nd Book of Kings (15:17) indicates that Menahem had ascended the throne in the 39th year of Azariah, the king of Judah, and *reigned* for 10 years. On the other hand, Menahem is supposed to have “attacked Shallum, the son of Jabesh” (2 Kings 15:14). That is to say, Menahem replaced Shallum (Selom). Shallum had *reigned* for 1 month, and his predecessor Zechariah - for 6 months only, qv below. Thus, Menahem ascended the throne 7 months after Zachariah’s co-ruler or predecessor – Jeroboam II. In other words, no gap is indicated between any of these three kings. However, Jeroboam II had died in the 14th year of Azariah of Judah, as mentioned above, since: “In the twenty-seventh year of Jeroboam, king of Israel, Azariah, son of Amaziah, king of Judah, began his reign” (2 Kings 15:1). Moreover, Jeroboam II had *reigned* for 41 years, qv above. Thus, 24 years went missing between the end of Shallum’s rule and the beginning of Menahem’s rule. See also the “double entries” as described in [ChronL](#), Annex 6.4. Chronologists have long ago noted this fact and called it an interregnum. See also the survey in [\[544\]](#), Volume 7. Thus, the interregnum had *lasted for 24 years*.

■ 16.1b. *Third Empire*. As we have noted earlier, the period of 423-444 A.D. had been the time of guardianship-interregnum in the Roman Empire. Young Valentinian III was formally under the guardianship of his mother, Placidia, but actually Aetius ([\[64\]](#), page 33). The guardianship had *lasted 21 years*. Durations are similar.

17a. *Menahem* (Gift to People).

■ 17b. *Valentinian III*.

17.1a. *Israel*. During Menahem’s rule, an important event takes place – the troops of Phul, king of *Assyria*, invade the Israeli kingdom (2 Kings 15:19) *near the end* of Menahem’s rule (2 Kings 15:19, 15:21-22).

Note: In the Russian Bible used here by A. T. Fomenko (and in several other Slavonic Bibles), king of Assyria is called **FUL**. In the NIV, however, this king’s name is **PUL**. Therefore, the next sentence is provided in two versions – translation of the

actual sentence by A.T. Fomenko and a suggestion on how to deal with the varying spelling. This difference influences some of the further paragraphs, qv below.

A.T. Fomenko: Since the sounds F (phita) and T were often subject to flexion, the name *Ful* might also have been pronounced as *Tul*.

Suggestion: Since the sounds P, F, and T were frequently subject to flexion, the name *Pul* might have also been pronounced as *Ful* or *Tul*.

■ 17.1b. *Third Empire*. The rule of Valentinian III is marked by a major invasion. The troops of the famous *Attila* invade the Roman Empire ([\[64\]](#)) in the alleged year 452 – towards *the end of the reign* of Valentinian III. Let us recall that he had reigned between the alleged years 444 and 455. The name *Attila* is virtually identical with the biblical name Tul. What we get sans vocalizations is TTL – TL. Thus, by reporting the intrusion of Ful – Tul, the Bible explicitly indicates *Attila*. Attila is considered to have been the leader of the *Huns*.

Commentary: The fact is that whenever the Bible reports a Syrian (occasionally also *Aramean*) or *Assyrian* invasion, we immediately see either *Germans* (*Prussians*), or *Goths*, or *Huns* invade the Third Roman Empire from the north. As for the word Ashur or Ashr, (“Assyrian”) in [\[544\]](#), Volume 2, the following translation was offered: leader-mentor. *Ashur* and *Ashri* means “to walk straight”, “to lead others”, similar to the German form “Führer” – leader. In the Biblical Books of Kings, *Assyrians* are described as a powerful militant nation. In [Chron5](#) we have formulated the hypothesis that the country described in the Bible under the name of *Assyria* is the medieval Russia, providing argumentation in its support. Thus, the biblical names:

- *Assiria* or *Assur*, same as
- *Asur* or *Syria*, same as
- *Ashur* – being simply the reverse spelling of the three famous medieval names of the country:
- *Rossiya* (modern name of Russia) = *Assiria* or *Assur*,
- *Russ* (the archaic name of *Russia*) = *Asur* or *Syria*,
- *Russia* = *Ashur*.

Let us point towards the fact that the English name for the country (Russia) is virtually identical to “Ashur” reversed phonetically. See also [Chron6](#).

17.2a. *Israel*. Under the threat of suffering a complete rout, Menahem gave Pul “a thousand silver talents... Menahem exacted this money from Israel. Every wealthy man had to contribute... to the king of Assyria. So the king of Assyria withdrew and stayed in the land no longer” (2 Kings 15:19-20). Menahem had *reigned for 10 years* (2 Kings 15:17).

■ 17.2b. *Third Empire*. On the verge of a crushing military defeat, Valentinian III tempts Attila the Hun (Khan?) with a large sum of money, agreeing to pay a yearly levy. This event takes place in the alleged year 452 ([64], page 37). The sum of said levy is not specified, though it is said to have been large. Valentinian III had reigned for 14 years, qv above. Reign durations are similar.

18a. *Pekahiah* (The Lord’s Watchful One).

■ 18b. *Petronius Maximus*.

18.1a. *Israel*. Pekahiah had replaced Menahem (2 Kings 15:23). He was *murdered by his minions* after a plot (2 Kings 15:25). He *had reigned* in Samaria (2 Kings 15:23). Menahem had *reigned for 2 years* (2 Kings 15:23).

■ 18.1b. *Third Empire*. Petronius Maximus had replaced Valentinian III and “got murdered during a flight *by his own minions*” ([579], page 487). He *had reigned* in Rome ([579]). We see another identification of the biblical Samaria as the mediaeval Rome. However, this does not imply the Italian Rome bears any relation to the events in question at all. Petronius Maximus had *reigned for less than 1 year* ([579], pages 487-488). Reign durations are similar.

19a. *Pekah* or *Thahash* (The Watchful One).

■ 19b. *Recimer*.

19.1a. *Israel*. Under Thahash, the kingdom of Israel (Theomachist) was attacked by Tilgath-Pilneser, king of *barbarians* (2 Kings 15:29) – or king of *Assyria* (2 Kings 15:29). N. A. Morozov noted that his name (Tilgath-Pilneser), can be translated as “*migrant monster*” ([544], Volume 7, page 356).

■ 19.1b. *Third Empire*. Under Recimer the Roman Empire had suffered from the invasion of Genzeric, the leader of *barbarians* ([579], pages 487-488). In Scaligerian history, the invasion of Genzeric is considered to have been the beginning of the Volkswanderung [579], pp.487-488. Several years later, another barbarian

ruler, a “migrant monster”, will appear in the Third Empire – Theodoric king of Goths. He is believed to have performed massive relocations, shuffled the population of Italy and mixed it with Goths and Germans. We will see Theodoric described on the pages of the Bible as well, under the name “Tiglath-Pileser”.

19.2a. *Israel*. Thahash = Pekah *reigns* in Samaria (2 Kings 15:27). The duration of his reign equals 20 years (2 Kings 15:27).

■ 19.2b. *Third Empire*. Recimer *reigns* in Rome. Again, we see that the biblical Samaria can be identified as the mediaeval Rome. We have already mentioned that Recimer was the actual ruler who had replaced several “short-term” emperors on the Roman throne. Recimer’s reign lasted for 16 years: 456-472, qv above. The reign durations of the two are similar.

20a. *Anarchy* in the kingdom of the Israelites.

■ 20b. *Anarchy* in the Third Roman Empire in the West.

20.1a. *Israel*. Different researchers of the Bible estimate the duration of this anarchy in the kingdom of Israel in different ways, to be equal to some value between 6 and 9 years ([\[544\]](#), Volume 7, page 303, table XVII). Our analysis of the Bible yields two versions: 2 and 9 years (2 Kings 15:30). See the “double entry” method as described in [Chron1](#), Appendix 6.4. We put all three versions down: 2, 6, 9 years.

■ 20.1b. *Third Empire*. Recimer died in the alleged year 472 A.D. The country had been in anarchy until the alleged year 475, when, after a lengthy struggle, the patrician Orestes enthroned his son Romulus Augustulus in Rome ([\[579\]](#), page 490). The duration of the anarchy period equals 3 years.

21a. *Uzziah* (the Saviour, or Son of God).

■ 21b. *Romulus Augustulus*.

21.1a. *Israel*. After the anarchy, Uzziah ascends the throne of Israel in Samaria (2 Kings 17:1). The sacred title of the Saviour, of the Son of God was possibly given to Uzziah as a mockery. Indeed, virtually from the very beginning of his rule, Uzziah had been under the influence of a foreign king called Shalmaneser, remaining de facto deprived of real power himself (2 Kings 17:1-4).

■ 21.1b. *Third Empire*. After the anarchy (again we see a superimposition of the

biblical Samaria over the medieval Rome), the 15-year-old Romulus Augustulus ascends the Roman throne. His name “Augustulus” is derived from the famous name Augustus. Historians note: “The population of Italy gave to the adolescent “emperor” a mocking nickname ‘Augustulus’, which stands for ‘Little Augustus’ or ‘Augustus Junior’” [\[327\]](#), page 450.

21.2a. *Israel*. Almost immediately after the beginning of Uzziah’s rule, the state was attacked by Shalmaneser, a foreigner. “Uzziah had been his vassal and had paid him tribute” (2 Kings 17:3). Shalmaneser is a king of *Assyria* (2 Kings 17:3). Shalmaneser “*had seized him [Uzziah - A. F.] ... and put him into prison*” (2 Kings 17:4).

■ 21.2b. *Third Empire*. In the alleged year 476, the foreigner Odoacer destroys the troops of Rome led by Orestes and claims the royal throne for himself, displacing Romulus Augustulus ([\[579\]](#)). This event concludes the “purely Roman” dynasty in the west of the Third Empire. Odoacer is a German military commander ([\[579\]](#), pages 490-491). Again we see the Assyrians identified as Germans (Prussians, or P-Russians). Odoacer *banishes* Romulus Augustulus to his estate in Campagna, where the latter ends his days under house arrest ([\[579\]](#), pages 490-491).

21.3a. *Israel*. Uzziah had *reigned as an independent king for less than 1 year* (2 Kings 17). Although he formally *reigned* for 9 years (2 Kings 17:1), at the very beginning of Uzziah’s story (2 Kings 17:3) the Bible tells us that Uzziah became subject to a king of Assyria.

■ 21.3b. *Third Empire*. Romulus Augustulus had *reigned for a single year as an independent emperor* in the alleged years 475-476 ([\[579\]](#), pages 490-491). Reign durations coincide.

21.4a. *Israel*. Shalmaneser arranges for a mass migration of the Israelites (2 Kings 17:6). Then the Bible describes radical changes – not only in the state system of the theomachist kingdom under the rule of a foreign king, but the religious cult as well. Uzziah’s rule marks the end of the independent kingdom of Israel.

■ 21.4b. *Third Empire*. Odoacer had arranged for a major migration to Italy. German mercenaries settled throughout the country. They were given a third of the entire land. The Western Roman Empire ceased to exist as a “purely Roman” state; it was governed by two conqueror kings – the foreigners Odoacer and Theodoric. A

German-Gothic kingdom emerges, and the country receives an infusion of new customs and new religion. In Scaligerian history, the Third Empire in the west is considered to have finally collapsed after Theodoric as a result of the Gothic War of the alleged VI century.

Thus ends the biblical history of the kingdom of Israel and the “royal purity period” in the history of the Third Roman Empire in the west.

4.

Identifying the theocratic Kingdom of Judah as the Third Roman Empire in the East. A shift of circa 1230 years (short diagram)

Since the Kingdom of Israel of the alleged years 922-724 B.C. can be identified as the Third Roman Empire of the alleged years 306-476 A.D. in the west, it is a natural assumption that the kingdom of Judah of the alleged years 928-587 B.C. should be superimposed over the Eastern Empire of the alleged years 306-700 A.D. This assumption is confirmed by the method of dynastic parallelisms as described in Chapter 6 of [Chron1](#). Let us reiterate that *these parallelisms* are actually of a *secondary* nature – that is, *they are but derivatives* of the *main* parallelisms with the German and the Roman coronations of the Sacred Empire of the X-XIII century A.D. and the empire of the Habsburgs (Nov-Gorod?) of the XIV-XVI century.

The Theomachist Kingdom of Israel duplicates the Roman coronation sequence of the Holy Roman Empire in the alleged X-XIII century A.D., qv in Chapter 6 of [Chron1](#).

The Theocratic Kingdom of Judah duplicates the German coronations in the Holy Roman Empire of the alleged X-XIII century A.D., qv in Chapter 6 of [Chron1](#). Ergo, both kingdoms of Israel and Judah are, to a substantial extent, phantom *reflections of the Habsburg Empire* of XIV-XVI century A.D., qv in [Chron1](#), Chapter 6.

Thus, a general diagram of these triple reflections is as follows:

-
- 1 duplicate:** The *Roman* coronation sequence of the Holy Roman Empire in the alleged X-XIII century A.D., which is a partial reflection of the XIV-XVI century Habsburg (Nov-Gorod?) Empire.
 - 2 duplicate:** The Biblical Theomachist (Israelite) kingdom of the alleged years 922-724 B.C. ([\[72\]](#), p. 192).
 - 3 duplicate:** The Third Roman Empire in the West (the alleged years 306-476 A.D.).
-

- 1 duplicate:** The *German* coronation sequence of the Holy Roman Empire in the alleged X-XIII century A.D., which is a partial reflection of the XIV-XVI century Habsburg (Nov-Gorod?) Empire.

2 duplicate: The Biblical Theocratic = Judaic kingdom of the alleged years 928-587 B.C. ([\[72\]](#), page 192).

3 duplicate: Third Roman Empire in the East. The alleged years 306-700 A.D.

Biographical parallelisms between the Theocratic = Judaic kingdom of the alleged years 928-587 B.C. and the phantom Third Roman Empire in the east dating to the alleged years 306-700 A.D. are related in greater detail in [Chron2](#), Chapter 4, as a part of our analysis of the Bible.

5.

Saint Basil the Great in the alleged IV century A.D. and his prototype in the XII century A.D. – Jesus Christ. The resulting shift of 820 years

Let us relate an interesting parallelism between the respective biographies of Saint Basil the Great (The Great King), who had lived in the alleged IV century A.D., and Jesus Christ, who had lived in the alleged first century A.D. According to our research, qv in our book entitled *The King of the Slavs*, the Emperor Andronicus (Christ) is most likely to have lived in the XII century A.D. His reflection is Pope Gregory VII Hildebrand from the alleged XI century.

In Greek, the word “Christ” means “the anointed one”, or “the initiate” ([\[544\]](#), Volume 1, page 109). People initiated into the mysteries of sciences are presumed to have been named Christ after a ceremonial anointment with holy oil. The Hebraic translation of the Greek “Christ” is “Nazarene” ([\[544\]](#), Volume 1, page 109). The Gospel does occasionally refer to the Saviour as Jesus “the Nazarene” (Matthew 2:23). Joshua (Jesus) – allegedly Joshua, son of Nun ([\[240\]](#)), is buried upon the Beykos mountain near the outskirts of Istanbul, which is also named “Hazreti,” or “Holy” in Turkish ([\[1181\]](#)). The words “Nazarene” and “Hazreti” may have the same meaning, qv in [Chron5](#).

A propos, let us recall that the famous Orthodox Apostolic Creed had first been adopted by the Nicaean Council in the alleged year 325 A.D. (the edicts of the council haven’t reached our age), but later edited and supplemented by the Constantinople Council in the alleged year 381 A.D. (the of that council did not survive until our day, either). This is exactly the epoch over which Jesus Christ of the XII century A.D. becomes superimposed, likewise his reflection – Gregory Hildebrand, (shift value equalling 820 years, qv in [Chron1](#), Chapter 6).

Stories collected in *The General Menaion* (Monthly Readings hagiography) are of a certain interest if we study the history of the cult. We quote them after [\[544\]](#), Volume 1.

Let us recollect which saint’s holy day the European New Year begins with. The first page reads, “*January 1st. Saint Basil the Great.*” “Basil” is the Greek for “King” (“Basileus”). That is to say, the Christian year begins with a Saint Great King. Who is he? Why does he occupy this honorary position? Why is he considered to have been “the

great father of the church”? ([849], page 176.) Basil was born in the alleged year 333 A.D.; N. A. Morozov collected a vast body of intriguing materials to demonstrate parallels between St. Basil the Great and Jesus Christ ([544], Volume 1). We have composed a short table of this parallel’s form-codes.

1a. *Jesus Christ*. Jesus is the King of the Jews, according to the Gospels (Matthew 27:11) and (John 19:21). He is also the founder of a new religion. Christian crucifixes are often adorned with the letters INRI, which stand for “Iesus Nazareus Rex Iudaeorum” (Jesus Nazarene, King of the Jews).

■ 1b. *St. Basil the Great*. Basil the Great = The Great King. Basil, or Basileus, translates as “king”. He is one of the most important Christian saints. On fig. 1.9 we can see an image of St. Basil the Great on the iconostasis of the Annunciation Cathedral in the Muscovite Kremlin ([114], page 253). On fig. 1.10 we see an icon from the first half of the XVII century depicting St. Basil the Great.

Fig. 1.9. St. Basil the Great. Icon from the iconostasis of the Blagoveshchensky Cathedral of the Muscovite Kremlin ([114], page 253).

Fig. 1.10. St. Basil the Great. An icon. The Andrei Roublyov Central Museum of Art. First half of the XVII century ([\[114\]](#), page 460).

2a. *Jesus Christ*. A famous legend from the Gospel according to Luke: “After three days they found Him in the temple courts, sitting among the teachers, listening to them and asking them questions. Everyone who heard Him was amazed at His understanding and His answers” (Luke 2:46-47).

■ 2b. *St. Basil the Great*. At the age of 5, St. Basil could comprehend the entire body of philosophical works available at that epoch; since 12, he had been taught by scribes, amazing them with the profundity of his understanding. Quoted after [\[544\]](#), Volume 1.

3a. *Jesus Christ*. The wanderings of Jesus before He began his ministration. See, in particular, the time Jesus had spent in the desert (Matthew 4:1-11), (Mark 1:12).

■ 3b. *St. Basil the Great*. St. Basil had also left for Egypt and lived there, “feeding on water and vegetables.” Quoted according to [\[544\]](#), Volume 1.

4a. *Jesus Christ*. Jesus returns from his wanderings with a group of twelve followers known as the Apostles (Matthew 10:1-5).

■ 4b. *St. Basil the Great*. The Great King also returns from his travels surrounded by students. Quoted after [\[544\]](#), Volume 1.

5a. *Jesus Christ*. Jesus and his disciples (the Apostles) enter Jerusalem preaching asceticism and poverty, (Matthew 21:10).

■ 5b. *St. Basil the Great*. St. Basil and his disciples do likewise. They are said to have “given their property away to the indigent and gone to Jerusalem dressed in white”. Quoted after [\[544\]](#), Volume 1.

6a. *Jesus Christ*. The famous scene of Jesus baptized by his Precursor – Prophet St. John the Baptist (Matthew 3:13-16). In the Orthodox tradition, St. John the Baptist is usually called “Saint John the Great”.

■ 6b. *St. Basil the Great*. Here, Maximus, or “The Greatest” baptises St. Basil the Great = The Great King in the Jordan. This version may have called St. John the Baptist Maximus, or “the Greatest”. Quoted after [\[544\]](#), Volume 1.

7a. *Jesus Christ*. The scene of the baptism of Jesus is described as follows: “At that time Jesus came... and was baptized by John in the Jordan. As Jesus was coming up out of the water, he saw heaven being torn open and the Spirit descending on Him like a dove. And a voice came from heaven” (Mark 1:9-11).

■ 7b. *St. Basil the Great*. We see the exact same scenario repeated! During the baptism of The Great King, “a kind of fiery lightning came down on him, and a *dove* flew out of it, which descended upon the Jordan, troubled the water and flew back to heaven. And those standing on the shore, upon seeing this, were frightened with a great fear and glorifying God”. Quoted after [\[544\]](#), Volume 1. The lightning must have been accompanied by “a voice like thunder”.

8a. *Jesus Christ*. The key elements of the plot are as follows: baptism, the Jordan,

a dove and a voice from heaven.

■ 8b. *St. Basil the Great*. This myth is based on the same elements: baptism, the Jordan, a dove and a lightning (possibly, a voice from heaven).

9a. *Jesus Christ*. The scene of the transfiguration of Jesus: “After six days Jesus took with Him, Peter, James and John... and led them up a high mountain by themselves. There he was transfigured before them. His face shone like the sun... Just then there appeared before them Moses and Elijah, talking with Jesus... When the disciples heard this, they fell facedown to the ground, terrified” (Matthew 17:1-3, 17:6).

■ 9b. *St. Basil the Great*. The scene of the transfiguration of the Great King is just the same: the King prayed the God to bestow His grace upon him. He had made a sacrifice: he was calling upon the Lord for *six days*, and “all the high clergy saw the celestial light shed upon the altar, and men in bright garments surrounding the Great King. Those who saw it fell facedown”. Quoted after [\[544\]](#), Volume 1, page 125.

10a. *Jesus Christ*. Thus, the essence of the myth is as follows: six days, prayer, transfiguration, celestial light, prophets appearing and the disciples in fear (“falling facedown”).

■ 10b. *St. Basil the Great*. The essentials of the myth are absolutely the same: six days, prayer, celestial light, men appearing and spectators in fear (“falling facedown” as well).

11a. *Jesus Christ*. A close companion of Jesus is called Simon Peter; he is said to have been *older* than Jesus.

■ 11b. *St Basil the Great*. Next to the Great King we see his close companion Eubulus, whose name translates as “Good Advice”; he is the Great King’s *senior*. Quoted after [\[544\]](#), Volume 1.

12a. *Jesus Christ*. Next to Jesus we see *St. Peter* the Apostle. He is a *married man* (Mark 1:29), (Luke 4:38).

■ 12b. *St. Basil the Great*. Next to the Great King, we also see *Peter*, a high priest. He is *married* and has children (possibly, a double of Eubulus). Quoted after [\[544\]](#), Volume 1. The names of the doubles coincide.

13a. *Jesus Christ*. Jesus performs many miracles (such as exorcising malignant spirits, healing lepers, and raising the dead).

■ 13b. *St. Basil the Great*. Virtually the same list of miracles is attributed to the Great King [\[544\]](#), Volume 1.

14a. *Jesus Christ*. The devil tempts Jesus (Luke 4:1-13).

■ 14b. *St. Basil the Great*. We learn of a similar temptation of the Great King by the devil. Quoted after [\[544\]](#), Volume 1.

15a. *Jesus Christ*. The famous Mary Magdalene had been living a life of sin for a long time; however, when she had met Jesus, she was absolved of her sins and accompanied him as an ardent worshipper (Luke 7:36-50, 8:1-2).

■ 15b. *St. Basil the Great*. Here, a certain rich widow had been living a dissolute life for a long time - however, when she'd met the Great King, she begged him for an absolution. She received the absolution and became a worshipper of the King. Quoted after [\[544\]](#), Volume 1. The plot is very similar.

16a. *Jesus Christ*. Jesus is said to have known the secret thoughts of people: when he had met an unfamiliar Samaritan woman, he told her that she'd had five husbands, and that the man she had been with when they met wasn't in fact her husband (John 4:15-19).

■ 16b. *St. Basil the Great*. An identical plot: upon meeting a stranger by the name of Theognia, the Great King had told her that the man who was accompanying her as a husband hadn't been such. Quoted after [\[544\]](#), Volume 1.

17a. *Jesus Christ*. State authorities begin repressions against Jesus, willing to make him adhere to the previous cult. Jesus, aided by a number of the Apostles, heads an oppositional religious movement.

■ 17b. *St. Basil the Great*. Valens the Roman Emperor assaults the Great King, willing to make him adhere to Aryanism. The Great King resists and, accompanied by his followers, heads the opposition. Quoted after [\[544\]](#), Volume 1. We see an evident parallelism: both Jesus and the Great King step up against the Roman authorities.

18a. *Jesus Christ*. The Pharisees, sworn enemies of Jesus, form a group supported by the state (John 7:32).

■ 18b. *St. Basil the Great*. Aryanists are sworn enemies of the Great King. They also enjoy the support of the emperor's authority. Quoted after [\[544\]](#), Volume 1.

19a. *Jesus Christ*. The trial over Jesus and His Crucifixion (John 18-19).

■ 19b. *St. Basil the Great*. In the alleged year 368 A.D. Valens initiates a trial over the Great King, willing to sentence him to exile. Quoted after [\[544\]](#), Volume 1.

20a. *Jesus Christ*. Jesus is crucified at the age of 33. His ministration began when he had been about thirty years of age (Luke 3:23).

■ 20b. *St. Basil the Great*. The Great King was born in the alleged year 333 A.D.; therefore, at the time of Valens' trial, in the alleged year 368, he had been 35 [\[544\]](#), Volume 1.

21a. *Jesus Christ*. Pontius Pilate, the chief Roman magistrate, refuses to judge Jesus and "washes his hands". "When Pilate saw that he was getting nowhere, but that instead an uproar was starting, he took water and washed his hands in front of the crowd" (Matthew 27:24).

■ 21b. *St. Basil the Great*. Roman emperor, Valens wants to sign the sentence, but the cane "breaks in his hand" and he, frightened, tears his decree to pieces. Quoted after [\[544\]](#), Volume 1.

22a. *Jesus Christ*. The trial over Jesus takes place at the place of Pontius Pilate, that is, Pilate of Pontus. The word "pilat" used to mean "hangman, tormentor", in the old Russian language - hence Russian word "pilatit – to torture, tyrannize" (V. Dal – [\[223\]](#), see "pilatit"). Thus, Pontius Pilate is the Hangman from Pontus, or the Tormentor from Pontus. It is therefore possible that, rather than being a name, the word "Pilate" stands for occupation in the Gospels. Pilate of Pontus is merely the judge of Pontus, or the state official who administers justice and manages hangmen. According to the Gospels, there are two rulers on the historical scene: King Herod and the judge Pontius Pilate, a Roman governor.

■ 22b. *St. Basil the Great*. The trial over the Great King takes place at the residence of the high priest of Pontus. Here we also see two influential rulers: Emperor Valens and a judge – the high priest of Pontus. Quoted after [\[544\]](#), Volume 1.

23a. *Jesus Christ*. King Herod hands Jesus over to Pontius Pilate (Luke 23:8-11).

■ 23b. *St. Basil the Great*. Emperor Valens hands the Great King to the high priest of Pontus. Quoted after [\[544\]](#), Volume 1.

24a. *Jesus Christ*. The court sentences Jesus to death (Luke 23:13-5).

■ 24b. *St. Basil the Great*. The Great King is also sentenced to death according to [\[544\]](#), Volume 1.

25a. *Jesus Christ*. After the execution, or the Crucifixion, a miracle takes place, namely, the Resurrection of Jesus Christ (Matthew 28:5-20).

■ 25b. *St. Basil the Great*. A miracle saves the Great King from death (see [\[544\]](#), Volume 1). It is interesting that neither the “biography” of the Great King, nor that of Hildebrand (another reflection of Jesus Christ) should mention the execution itself – that is, the crucifixion *is not actually described at all*.

26a. *Jesus Christ*. After His Resurrection, Jesus “appears before many” - his disciples in particular (Matthew 28:16-17). The Gospel tells us nothing of the further fate of Jesus Christ.

■ 26b. *St. Basil the Great*. After the “resurrection” (having been on the verge of death, but not executed), the Great King had lived for 10 years and died in the alleged year 378 A.D., vested in the great authority of being a religious leader ([\[544\]](#), Volume 1).

27a. *Jesus Christ*. Before the “death”, or the Crucifixion, Jesus distinguishes his youngest and most beloved disciple during the Last Supper – St. John the Apostle (John 13:23 and on).

■ 27b. *St. Basil the Great*. Before his death, the Great King transfers his authority to his disciple *John*. He is said to have baptized his disciple and “communicated to him the divine Mysteries... Only then... has he committed his soul into the hands of God”. Quoted after [\[544\]](#), Volume 1.

28a. *Jesus Christ*. Jesus is considered the founder of Christianity.

■ 28b. *St. Basil the Great*. The Great King is the progenitor of the Christian mysteries ([\[544\]](#), Volume 1). The most important element of the cult is the so-called *Liturgy of St. Basil the Great* ([\[544\]](#), Volume 1).

29a. *Jesus Christ*. Jesus is the head of the Holy Family, a group of Christian saints.

■ 29b. *St. Basil the Great*. The Great King was canonized as a Christian saint together with his brothers and sisters.

30a. *Jesus Christ*. There are two traditional points of view on how old Jesus was at the moment of his “death”: 33 years, according to the most common version (Luke 3:23), and approaching 50 – “You are not yet fifty years of age” (John 8:57).

■ 30b. *St. Basil the Great*. The “ecclesiastical age” of the Great King, who was born in the alleged year 333 A.D., can be calculated in two ways: 1) either 35 years, up to Valens’ trial that allegedly took place around 368 A.D., or 2) 45 years, up to his death allegedly in 378 A.D. [\[544\]](#), Volume 1. We see sufficient conformity.

31a. *Jesus Christ*. The feast of the Nativity of Christ (Christmas) is the most important Christian holy day.

■ 31b. *St. Basil the Great*.. The feast of the Nativity of Christ is considered to have appeared among the followers of the famous Christian sect of *Basilidians* ([\[744\]](#), page 47). Today they are presumed to have been the followers of the notorious heretic Basilides ([\[744\]](#), page 47). It is however possible that the tale of “Basilides the Heretic” was just another version of the legend about St. Basil the Great.

Thus, St. Basil the Great appears to have been a phantom reflection of Jesus Christ, or Emperor Andronicus from the XII century A.D.

PART TWO

The famous reform of the Occidental Church in the XI century by “Pope Gregory Hildebrand” as the reflection of the XII century reforms of Andronicus (Christ). The Trojan War of the XIII century A.D.

6.

“Pope Gregory Hildebrand” from the XI century A.D. as a replica of Jesus Christ (Andronicus) from the XII century. A chronological shift of 100 years. The Scaligerite chronologists have subsequently moved the life of Christ 1050 years backwards, into the I century A.D.

The great ecclesiastical reform of the XI century, conceived and initiated by the famous Pope Gregory Hildebrand, is a well-known event in the history of Western Europe and the Occidental Christian Church. It is supposed to have radically altered the life of the Europeans. As we shall demonstrate in the present chapter, the XI century “Pope Gregory Hildebrand” is really a phantom reflection of Andronicus (Christ) from the XII century A.D.

Let us explain in more detail. The decomposition of the “Scaligerian history textbook” into the sum of four shorter chronicles shifted against each other implies the existence of an erroneous mediaeval tradition that dated Christ’s lifetime to the XI century A.D. This fact had initially been discovered by the author in his study of the global chronological map (the 1053-year shift that superimposes the phantom I century A.D. over the XI century A.D.). This erroneous point of view that the ancient chroniclers had adhered to was further rediscovered by G. V. Nosovski in his analysis of the Mediaeval calculations related to the Passover and the calendar, qv in [Chron6](#) and Annex 4 to *The Biblical Russia*.

One should therefore expect a phantom reflection of Jesus Christ to manifest in the “Scaligerian XI century”. This prognosis is confirmed, and we shall demonstrate the facts that confirm it in the present chapter.

Our subsequent analysis of the ancient and mediaeval historical chronology demonstrated that the epoch of Christ, which is presumed to be at a distance of 2000 years from today, to have been 1100 years closer to us, falling over the XII century A.D. See our book entitled *King of the Slavs* for further reference. Apparently, despite the fact that the mediaeval chronologists have shifted Christ’s life as reflected in the chronicles into the I century A.D., having “removed” it from the XII century, an “intermediate reflection” of Emperor Andronicus (Christ) remained in the XI century as

the biography of “Pope Gregory VII Hildebrand”.

This statement, which is of a purely chronological nature, is often misunderstood by religious people. This stems from the false impression that the re-dating of the Evangelical events that we offer contradicts the Christian creed. This is not so. The re-dating of the years of Christ’s life that we offer taken together with the alternative datings for other events recorded in ancient and mediaeval history has got absolutely nothing to do with Christian theology.

The same can be said about the parallels between the Evangelical descriptions of Christ’s life and the biography of “Pope” Gregory Hildebrand. A parallelism doesn’t imply that Hildebrand’s biography is based on reality and the Gospels are a myth that duplicates it. On the contrary – in our works on chronology we demonstrate our discovery that the history of the Italian Rome (where Pope Hildebrand is supposed to have been active in the XI century, according to Scaligerian history) only commences from the XIV century. Also, up until the XVII century it had differed from the consensual version substantially. Ergo, real history tells us that there could have been no Roman Pontiff by the name of Hildebrand in the XI century Italy – if only due to the non-existence of Rome itself at that epoch.

What are the origins of “Pope Hildebrand’s” biography, and why does it contain duplicates of a number of Evangelical events? This issue requires a separate study. It is of great interest in itself, and remains rather contentious. In any case, if we are to assume a purely chronological stance, we shall certainly become interested in the fact that the Scaligerian history of the XI century contains a distinctive parallelism with the Evangelical events.

6.1 Astronomy in the Gospels

6.1.1 The true dating of the evangelical eclipse

The issue of dating the evangelical events through the study of the eclipse described in the Gospels and other early Christian sources (Phlegon, Africanus, Synkellos etc) has a long history – it has been repeatedly discussed by astronomers and chronologists alike. There is controversy in what concerns whether the eclipse in question was solar or lunar – we shall therefore consider both possibilities. Let us ponder the possibility of a lunar eclipse first. The Scaligerian chronology suggests 33 A.D. as a fitting solution – see Ginzl’s astronomical canon, for instance ([\[1154\]](#)). However, this solution doesn’t quite fit, since the lunar eclipse of 33 A.D. was all but unobservable in the Middle East. Apart from that, the eclipse’s phase was minute ([\[1154\]](#)). Nevertheless, the eclipse of

33 A.D. is still persistently claimed to confirm the Scaligerian dating of the Crucifixion – the alleged year 33 A.D.

N. A. Morozov suggested another solution: 24 March 368 A.D. ([\[544\]](#), Volume 1, page 96. However, if we are to consider the results of our research that had demonstrated the “Scaligerian History Textbook” to fall apart into four brief chronicles collated to each other, this solution is nowhere near recent enough to satisfy our requirements. Morozov considered the Scaligerian chronology to be basically correct in the new era; therefore, he only got to analyze the eclipses that “preceded the VIII century – that is, from the dawn of history to the second half of the Middle Ages – I decided going any further back would be futile [sic! – A. F.]” ([\[544\]](#), Volume 1, page 97).

We have thus extended the time interval to be searched for astronomical solutions into the epochs nearer to the present, having analyzed all the eclipses up until the XVI century A.D. It turns out that there is an eclipse that satisfies to the conditions – the one that occurred on Friday, 3 April 1075. The coordinates of the zenith point are as follows: + 10 degrees of longitude and – 8 degrees of latitude. See Oppolzer’s canon, for instance ([\[1315\]](#)). The eclipse was observable from the entire area of Europe and the Middle East that is of interest to us. According to the ecclesiastical tradition, the Crucifixion and the eclipse were simultaneous events that took place two days before the Easter. This could not have preceded the equinox. The eclipse dating to 3 April 1075 A.D. precedes Easter (which falls on Sunday, 5 April that year) by two days, as a matter of fact. The phase of the 1075 eclipse is 4"8 – not that great. Later on, in our analysis of Gregory Hildebrand’s “biography”, we shall see that the eclipse of 1075 A.D. corresponds well with other important events of the XI century which may have become reflected in the Gospels.

Let us now consider the solar eclipse version. According to the Gospels and the ecclesiastical tradition ([\[518\]](#)), a new star flared up in the East the year the Saviour was born (Matthew 2:2, 2:7, 2:9-10), and a total eclipse of the sun followed in 31 years, in the year of the Resurrection. The Gospel according to Luke (23:45) tells us explicitly that the sun “hath darkened” during the Crucifixion. Ecclesiastical sources also make direct references to the fact of the Resurrection being accompanied by a solar eclipse, and not necessarily on Good Friday. Let us point out that an eclipse, let alone a total eclipse, is a rare event in that part of the world. Although solar eclipses occur every year, one can only observe them from the narrow track of lunar shadow on the Earth (unlike lunar eclipses that one can observe from across an entire hemisphere). The Bible scholars of the XVIII-XIX century decided to consider the eclipse to have been a

lunar one, which didn't help much, since no fitting lunar eclipse could be found, either (qv above). However, since then the consensual opinion has been that the Gospels describe a lunar eclipse and not a solar one. Let us adhere to the original point of view that is reflected in the sources, namely, that the eclipse was a solar one.

We learn that such combination of rarest astronomical events as a nova explosion and a full eclipse of the sun following it by roughly 33 years did actually occur – however, in the XII century A.D., and not the first! We are referring to the famous nova explosion roughly dated to 1150 and the total eclipse of the sun of the 1 May 1185. We relate it in detail in our book *King of the Slavs*.

Thus, astronomical evidence testifies to the fact that the Evangelical events are most likely to have taken place in the XII century A.D. – about 1100 later than the Scaligerian “dating” ([1154]), and 800 years later than the dating suggested by N. A. Morozov ([544], Volume 1).

However, later chronologists have shifted the supernova explosion (the Evangelical star of Bethlehem) 100 years backwards, declaring it to have taken place in 1054. What are the origins of this version? It is possible that the desperate attempts of the mediaeval chronologists to find a “fitting” eclipse in the XI century played some part here. A total eclipse of the sun took place on the 16 February 1086, on Monday ([1154]). The shadow track from this eclipse covered Italy and Byzantium. According to Ginzel's astronomical canon ([1154]), the eclipse had the following characteristics: the coordinates of the beginning of the shadow track were – 76 degrees of longitude and + 14 degrees of latitude (these values are – 14 longitude and + 22 latitude for the track's middle, and + 47 longitude with latitude equalling + 45 degrees for its end). The eclipse was total. Having erroneously declared this eclipse to have been the one that coincided with the Crucifixion, the XIV-XV century chronologists had apparently counted 33 years (Christ's age) backwards from this date (approximately 1086 A.D.), dating the Nativity to the middle of the XI century. They were 100 years off the mark.

Let us linger on the ecclesiastical tradition that associated the Crucifixion with a solar eclipse.

6.1.2. The Gospels apparently reflect a sufficiently advanced level of astronomical eclipse theories, which contradicts the consensual evangelical history

The Bible scholars have long ago taken notice of the claim that the eclipse had lasted about three hours made by the authors of the Gospels.

Matthew tells us the following:

“Now from the sixth hour there was darkness all over the land unto the ninth hour” (Matthew 27:45).

According to Luke,

“... it was about the sixth hour, and there was a darkness all over the earth until the ninth hour. And the sun was darkened...” (Luke 23:44-45)

Mark informs us that

“... when the sixth hour was come, there was darkness all over the whole land until the ninth hour”.

John hasn't got anything to say on the subject.

The numerous commentators of the Bible have often been puzzled by the fact that the evangelists report a solar eclipse (“the sun was darkened”) with its unnaturally long three-hour duration, since a regular solar eclipse is only observable for several minutes from each particular location. We consider the explanation offered by Andrei Nemoyevskiy, the author of the book *Jesus the God* ([\[576\]](#)) a while ago, to make perfect sense. He wrote: “we know that a solar eclipse could not have lasted for three hours and covered the entire country [it is usually assumed that the country in question is the diminutive area around Jerusalem – A. F.]. Its maximal duration could not have possibly exceed 4-8 minutes. The evangelists apparently were well familiar with astronomy and could not have uttered any such nonsense ... Luke (XXIII, 44) ... Mark (XV, 33) ... and Matthew (XXVII, 45) ... tell us that “there was darkness all over the land”, which really could have lasted for several hours. The duration of the entire solar eclipse that occurred on 6 May 1883 equalled 5 hours and 5 minutes; however, the full eclipse lasted for 3 hours and 5 minutes – exactly the time interval specified in the Gospels” ([\[576\]](#), page 23).

In other words, the three hours specified by the evangelists referred to the entire duration of the lunar shadow's movement across the surface of the Earth and not the time a single observation point was obscured – that is, the duration of the eclipse from the moment of its beginning (in Britain, for instance) and until its end in some place like Iran. It took the lunar shadow three hours to cover the entire track that ran “all over the land”, inside which “there was darkness”. The phrase “all over the land” was thus used deliberately.

Naturally, such interpretation of the Gospels implies a sufficiently advanced level of their authors' understanding of the eclipses, their mechanics et al. However, if the events in question took place in the XII century and were recorded and edited in the XII-

XIV century the earliest, possibly a lot later, there is hardly any wonder here. Mediaeval astronomers already understood the mechanism of solar eclipses well enough, as well as the fact that the lunar shadow slides across the surface of the Earth (“all over the land”) for several hours.

Let us point out that this high a level of astronomical knowledge from the part of the evangelists is an absolute impossibility in the reality tunnel of the Scaligerian chronology. We are told that the evangelists were lay astronomers at best, and neither possessed nor used any special knowledge of astronomy.

We shall consider the issue of the “passover eclipse” that occurred during the Crucifixion once again. Many old ecclesiastical sources insist the eclipse to have been a solar one. This obviously contradicts the Gospels claiming that the Jesus Christ was crucified around the time of the Passover, which also implies a full moon. Now, it is common knowledge that no solar eclipse can occur when the moon is full, since the sun and the moon face opposite sides of the Earth. The sun is located “behind the back” of the terrestrial observer, which is the reason why the latter sees the entire sunlit part of the moon – a full moon, that is.

All of the above notwithstanding, we have discovered a total eclipse of the sun that took place on 1 May 1185 falling precisely on the year of the Crucifixion, qv in the *King of the Slavs*. Let us remind the reader that a full solar eclipse is an exceptionally rare event for this particular geographical area. Centuries may pass between two solar eclipses observed from this region. Therefore, the eclipse of 1185 could have been eventually linked to the moment of the Crucifixion. Hence the concept of the “passover eclipse”. This shouldn’t surprise us since in the Middle Ages a clear understanding of how the locations of celestial bodies were related to one another had been a great rarity, even among scientists.

In fig. 2.1 we can see an ancient miniature of the Crucifixion taken from the famous Rhemish Missal. At the bottom of the miniature we see a solar eclipse that accompanies the Crucifixion (fig. 2.2). Modern commentary runs as follows: “the third scene in the bottom field depicts the apocryphal scene of the eclipse observed by Dionysius Areopagites and Apollophanes from Heliopolis” ([\[1485\]](#), page 54. We see the Sun is completely covered by the dark lunar disc, with the corona visible underneath. The sky is painted black, since “there was darkness all over the whole land”. Numerous spectators look at the sky in fear while the two sages point their fingers at the eclipse and the Crucifixion, qv near the top of the picture.

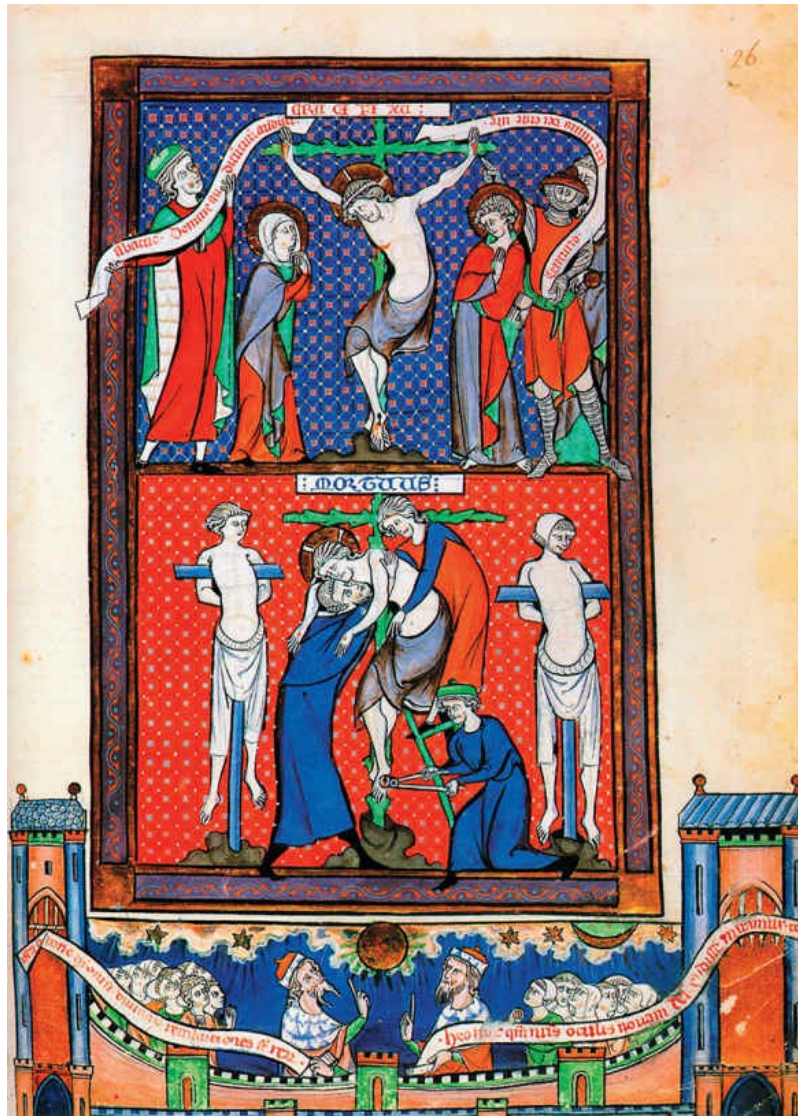

Fig. 2.1 A miniature from the *Rhemish Missal* (Missale remense. Missel à l'usage de Saint-Nicaise de Reims) dating to the alleged years 1285-1297. We see the Crucifixion accompanied by a total eclipse of the sun. Taken from [1485], ill. 25.

Fig. 2.2 A close-in of the fragment depicting a total solar eclipse on the miniature from the *Rhemish Missal* ([1485], ill. 25).

In fig. 2.3 we see the fragment of a New Testament frontispiece from *La Bible historiale*, a book by Guiart des Moulins ([\[1485\]](#), ill. 91). We see the Crucifixion accompanied by a total eclipse of the sun; we actually see a sequence of two events in the same miniature – on the left of the cross the sun is still shining bright, whereas on the right it is completely obscured by the blackness of the lunar disc. This method was often used by mediaeval artists for a more comprehensive visual representation of sequences of events – “proto-animation” of sorts.

Fig. 2.3. Frontispiece fragment from an edition of the New Testament that dates to the end of the alleged XIV century with a Crucifixion scene accompanied by a total solar eclipse. Taken from [\[1485\]](#), ill. 91.

Yet another miniature where we see the Crucifixion accompanied by a solar eclipse can be seen in fig. 2.4 – it dates to the end of the alleged XV century ([\[1485\]](#), ill. 209). We

see two events in a sequence once again. The sun is still bright on the left of the cross, and it is beginning to darken on the right where we see it obscured by the moon, which is about to hide the luminary from sight completely. We see a starlit sky, and that is something that only happens during a total eclipse of the sun.

Fig. 2.4. An ancient miniature from the book entitled *Heures de Rolin-Lévis. À l'usage de Paris*. We see the Crucifixion as well as a total eclipse (the visibility of stars being a unique characteristic of the latter). Taken from [\[1485\]](#), ill. 209.

It is interesting that the traces of references to Christ in mediaeval chronicles relating the XI century events have even reached our day. For instance, the 1680 Chronograph ([940]) informs us that Pope Leo IX (1049-1054) was visited by Christ himself: “It is said that Christ had visited him [Leo IX] in his abode of repose, disguised as a beggar” ([940], sheet 287). It is important that there are no similar references anywhere else in the Chronograph ([940]) except for the renditions of the Gospels. In the next section we shall discover evangelical parallels in the biography of Pope Gregory VII, who had died in 1085. It is possible that Gregory VII is a reflection of Jesus Christ, or Emperor Andronicus, due to the fact that the Roman history of Constantinople was relocated to Italy as reflected by historical records.

This is why the first “A.D.” year mentioned in a number of chronicles could have erroneously referred to 1054 A.D. This eventually gave birth to another chronological shift of 1053 years. In other words, some of the mediaeval chronologers were apparently accustomed to dating the Nativity to either 1054 or 1053 (instead of 1153, which is the correct dating).

A propos, the beginning of the first crusade – the one that had the “liberation of the Holy Sepulchre” as its objective – is erroneously dated to 1096 ([76]) instead of circa 1196. On the other hand, one should pay attention to the mediaeval ecclesiastical sources, such as *The Tale of the Saviour’s Passions* and *Pilate’s Letter to Tiberius*. They often relate the events involving Christ in greater detail than the Gospels. And so, according to these sources, Pilate had been summoned to Rome immediately after the Resurrection and executed there, and the Caesar’s troops marched towards Jerusalem and captured the city. Nowadays all of this mediaeval information is supposed to be of a figmental nature, since no Roman campaign against Jerusalem that took place in the third decade of the first century A.D. is recorded anywhere in the Scaligerian history. However, if we are to date the Resurrection to the end of the XII century, this statement that one encounters in mediaeval sources immediately assumes a literal meaning, being a reference to the crusades of the late XII – early XIII century, and particularly the so-called Fourth Crusade of 1204, which resulted in the fall of Czar-Grad.

Later chronologists, confused by the centenarian chronological shift, have moved the dates of the crusades of the late XII – early XIII century to the end of the XI century. This resulted in the phantom crusade of 1096, for instance, which is presumed to have led to the fall of Jerusalem ([76]).

6.2. The Roman John Crescentius of the alleged X century

A.D. as a reflection of the Evangelical John the Baptist from the XII century A.D. A biographical parallelism

As we demonstrate in our book *King of the Slavs*, John the Baptist had lived in the XII century A.D. In the present section we shall discuss the correlation between his two phantom reflections in the I and the X century A.D.

The chronicles that tell us about the origins of the Second Roman Empire dating from the alleged I century A.D. include a detailed description of the great ecclesiastical reform implemented by Jesus Christ and partially instigated by his precursor John the Baptist. This is what the Gospels tell us. As one can see in Chapter 6 of [Chron1](#), most of these events can be linked to the dawn of the X-XIII century Roman Empire – namely, the XII century A.D. One has to bear in mind that these events took place in the New Rome, or Czar-Grad on the Bosphorus. The identification of the Second Empire as that of the X-XIII century is a consequence of the chronological shift of roughly 1053 years. It can be represented as the formula $P = T + 1053$, where T is the Scaligerian B.C. or A.D. dating of the event, and P – the new one suggested by our conception. Thus, if T equals zero (being the first year of the new era), the P date becomes equal to 1053 A.D. In other words, the results related in Chapter 6 of [Chron1](#) formally imply the existence of a mediaeval tradition dating the beginning of the new to 1053 A.D. in modern chronology.

Thus, the initial dating of Christ's lifetime to the XI century made by the mediaeval chronologists was 100 years off the mark. The real date of the Nativity falls on 1152, qv in our book entitled *King of the Slavs*.

We have observed the effects of the chronological shift ($P = T + 1053$) on the millenarian Roman history. If we are to move forward in time along this parallelism, we shall eventually reach the “beginning of the new era”. What discoveries await us here? The answer is given below in numerous biographical collations and identifications. The “a” points of our table as presented below contain numerous references to the book of F. Gregorovius ([\[196\]](#), Volume 3).

In our relation of the parallelism we shall concentrate on its “mediaeval half”, since the content of the Gospels is known to most readers quite well, unlike the mediaeval version. From the point of view of the parallelism that we have discovered, the mediaeval version is important as yet another rendition of the evangelical events. One should also bear in mind that nowadays the events related to Crescentius and Hildebrand are supposed to have happened in the Italian Rome. This is most probably

untrue. The events described in the Gospels took place in Czar-Grad on the Bosphorus, and got transferred to Italy on pages of later chronicles when the Italian Rome emerged as the new capital in the XIV century A.D. This young city had been in dire need of an “ancient history”, which was promptly created.

Comparison table for the mediaeval John Crescentius and the “ancient” John the Baptist

a. John Crescentius. The alleged X century Rome (possibly the XII century Czar-Grad).

■ *b. John the Baptist.* The alleged I century A.D. See the Gospels for reference.

1a. John Crescentius. X century Rome, possibly the XII century Czar-Grad. The name is John Crescentius ([\[196\]](#), Volume 3).

■ *1b. John the Baptist.* The name is John the Baptist (Matthew 3:1). The Russian version of the name is *Krestitel*; we hardly need to be surprised by their phonetic proximity. Apparently, the tale of John Crescentius was imported to the Italian Rome from the New Rome as recently as approximately the XIV century A.D. In [Chron7](#) one can find our definition of “Classical Latin”.

2a. John Crescentius. X century Rome, possibly the XII century Czar-Grad. John Crescentius is a hero of the secular mediaeval Rome and a fighter for freedom from the foreign German rule. He presided the National-Patriotic party of Rome, which was founded around 960 A.D. He is said to have been “an eminent Roman... for several years John Crescentius had managed to hold the seat of Roman power... as the head of the National party” ([\[196\]](#), Volume 3, pages 325-326). Crescentius is the most famous representative of the mediaeval Crescentii family. He was “the secular ruler of Rome, but in no way an independent monarch” ([\[196\]](#), Volume 3, pages 326-327).

■ *2b. John the Baptist.* John the Baptist is the famous prophet and extirpator who had fought against King Herod and his clan (Herod and his brother Philip – Mark 6:17).

3a. John Crescentius. X century Rome, possibly the XII century Czar-Grad. John

Crescentius overthrows Pope John XV in Rome and thus seizes *ecclesiastical power* in Rome ([196], Volume 3, pages 325-343).

■ *3b. John the Baptist.* The leadership of the contemporary religious movement is his to a large extent. He is a greatly respected prophet and the precursor of Jesus Christ.

4a. John Crescentius. X century Rome, possibly the XII century Czar-Grad. John Crescentius is supposed to have taken vows in 972 or 981 ([196], Volume 3, page 335).

■ *4b. John the Baptist.* John the Baptist leads an ascetic monastic life. “And the same John had his raiment of camel’s hair, and a leathern girdle about his loins; and his meat was locusts and wild honey” (Matthew 3:4).

5a. John Crescentius. X century Rome, possibly the XII century Czar-Grad. John Crescentius is supposed to have ruled in Rome. Most possibly the city in question was really the New Rome, or Czar-Grad, qv in [Chron1](#), Chapter 6. According to geographical identifications that we suggest in [Chron5](#), the evangelical “Jordan river” could really have been Danube (R + DAN). The Czar-Grad region can thus prove to be the biblical “region round about Jordan”.

■ *5b. John the Baptist.* John’s sermons made a lot of people congregate around him: “Then went out to him ... all the area round about Jordan, and were baptized of him in Jordan, confessing their sins” (Matthew 3:5-6).

6a. John Crescentius. X century Rome, possibly the XII century Czar-Grad. As we have already pointed out, mediaeval chronicles would often identify Jerusalem as Rome or the New Rome.

■ *6b. John the Baptist.* John the Baptist also preaches in Jerusalem (Matthew 3:5) – Judea remains under the Roman rule all the while.

7a. John Crescentius. X century Rome, possibly the XII century Czar-Grad. The emperor Otho III is John’s main opponent. In 985 John Crescentius became the ruler of Rome in the absence of Otho III, who had been away from Rome at the time. Crescentius formally recognized the German rule as represented by Otho ([196], Volume 3, page 328). In 991, after the death of empress Theophano, John Crescentius “finally began to rule the city all by himself” ([196], Volume 3, page 342). Otho had

launched a campaign against Rome in 996 and conquered the city. Crescentius remained head of the party, but no longer an independent governor.

■ *7b. John the Baptist.* King Herod is the opponent of John the Baptist (Mark 6:27-28).

8a. John Crescentius. X century Rome, possibly the XII century Czar-Grad. Being a German emperor, Otho was crowned Emperor of Rome in 996. “This had brought an end to the patrician authority of Crescentius” ([196], Volume 3, page 346). “After a period of 13 years when there had been no one to bear the title of emperor, the walls of Rome finally saw the new Augustus” ([196], Volume 3, page 346).

■ *8b. John the Baptist.* King Herod is the ruler of the country (Matthew 2:1); John the Baptist has to recognize the secular power of King Herod.

9a. John Crescentius. X century Rome, possibly the XII century Czar-Grad. The relations between John Crescentius and Otho must have been neutral initially, despite their mutual political opposition. John remained head of the Roman National party ([196], Volume 3, page 346).

■ *9b. John the Baptist.* The relationships between John the Baptist and King Herod had been neutral initially. “... for Herod feared John, knowing that he was a just man and an holy, and observed him; and when he heard him, he did many things, and heard him gladly” (Mark 6:20).

10a. John Crescentius. X century Rome, possibly the XII century Czar-Grad. The Pope’s name is Bruno, he’s the religious leader of Rome and a *cousin* of Emperor Otho. We learn that Otho had made his cousin Pope to replace Pope John XV, who was banished by Crescentius ([196], Volume 3, pages 343 and 346).

■ *10b. John the Baptist.* The name of the ruler is Philip, and he’s King Herod’s *brother* (Mark 6:17).

11a. John Crescentius. X century Rome, possibly the XII century Czar-Grad. Bruno was *of royal blood* – namely, a grandson of Emperor Otho I (the Great – see [196], Volume 3, page 343).

■ *11b. John the Baptist.* Philip the ruler is *of royal blood*, and he’s the King’s brother (Mark 6:17).

12a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. Romans, especially members of the National party led by Crescentius, are *hostile* towards the Germans Otho and Bruno. On the contrary, Crescentius becomes a *national hero* of Rome and remains such for the next couple of centuries to follow ([196], Volume 3). “The Pope, likewise the Emperor... were relations, and both of German origin... Romans eyed these fair-haired Saxons who had come to rule their city and the entire Christian world with animosity, and the young tramontanes failed to instil due respect of their authority into the Romans” ([196], Volume 3, page 346).

■ 12b. *John the Baptist*. The Gospels mention both Herod and his brother Philip in a negative light, and treat John the Baptist with exalted reverence. The Gospels made Herod’s name a derogatory denominative in many languages.

13a. *John Crescentius*. X Century Rome, possibly the XII century Czar-Grad. John Crescentius struggles against the rule of Otho’s and Bruno’s clan.

■ 13b. *John the Baptist*. John the Baptist is a freedom fighter, a vehement opponent of Herod and Philip, and their clan in general.

14a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. John Crescentius is arrested, brought to trial and sentenced to banishment at the order of Otho, the Roman Emperor. “After the ascension of the Pope [Bruno – A. F.], who had been of the same blood as the emperor, the city needed pacification... Renegade Romans who had banished John XV were tried... Some of the popular leaders [of the rebellion – A. F.] were sentenced to banishment, among their number Crescentius” ([196], Volume 3, page 347).

■ 14b. *John the Baptist*. The arrest and incarceration of John the Baptist by King Herod. “For Herod himself had sent forth and laid hold upon John, and bound him in prison...” (Mark 6:17).

15a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. Official amnesty given to John by Otho (and Bruno). John remains in Rome, albeit withdrawn from political power – a house arrest of sorts ([196], Volume 3, page 347).

■ 15b. *John the Baptist*. “Amnesty” given to John by Herod and Philip. Indeed, although John remains incarcerated, he isn’t executed – moreover, King Herod still respects him, after a manner (Mark 6:20 and 6:26).

16a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. The “insult” to Pope Bruno credited to John Crescentius: John banishes Bruno from Rome ([196], Volume 3, page 351). The banishment of Pope Bruno, Otho’s placeman and cousin, was clearly an insult to their entire clan.

■ 16b. *John the Baptist*. John the Baptist “insults” the clan of Philip, accusing Herod and Herodias, Philip’s wife, of being in an unlawful liaison: “For John had said unto Herod, It is not lawful for thee to have thy brother’s wife” (Mark 6:18).

17a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. The name of John’s wife is Stephanie; however, according to several mediaeval legends, she was Otho’s concubine [Otho himself being a possible double of the Biblical King Herod] ([196], Volume 3, p. 404).

■ 17b. *John the Baptist*. The daughter of Herodias (Mark 6:22) takes part in these events, being also a relation of King Herod (Mark, 6:17-22). Let us remind the reader that Herodias was the name of Herod’s wife.

18a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. Stephanie is supposed to have “hexed” Otto (which is a legend of a latter mediaeval epoch). The chronicles of the Middle Ages tell us that after the death of John Crescentius Stephanie was given to mercenaries “as prey” – however, Gregorovius tells us that “this tale is nothing but pure fiction stemming from national pride and hatred of the Romans. There is another legend of an altogether different nature where Stephanie plays the fairylike role of the concubine of John’s conqueror [becomes Otto’s lover, that is – A. F.], qv in [196], Volume 3, page 404.

■ 18b. *John the Baptist*. The daughter of Herodias “charms” King Herod with her dances: “Herod on his birthday made a supper to his lords ... the daughter of Herodias came in, and danced, and pleased Herod... the king said unto the damsel, Ask of me whatsoever thou wilt, and I will give it thee” (Mark 6:21-22).

19a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. The events in Rome take a turn that is to prove catastrophic for John Crescentius eventually, for he becomes the leader of an uprising ([196], Volume 3, page 352). “Having established his judicatory in the Eternal City, and having calmed the Romans by his amnesty, Otho III... had returned to Germany. His withdrawal had soon served

as a signal for the Romans to rebel: the National party had made another desperate attempt to rid the country from the German yoke... Crescentius plots against the German Pope and his minions. The folk had reasons to be discontent – these foreigners were unfamiliar with Roman laws and appointed judges who weren't subsidized by the state and were corrupt and inequitable... there was an uprising, and the Pope had to flee on 29 September 996... the bold rebel [John Crescentius – A. F.] hurried to stabilize his position of power in Rome... when the Pope had fled, the Roman government was revolutionized completely... Crescentius declared himself a patrician and a consul of the Romans once again” ([196], Volume 3, pages 348-352). In 998 Otho and his troops approached the Roman fortifications. The city had capitulated, except for the Castle of St. Angelus where John Crescentius and his supporters decided to “make their last stand to the bitter end... Otho had demanded that Crescentius lay down his weapons” ([196], Volume 3, page 355). Having received a defiant reply, Otho commanded to storm the castle, which was conquered on 29 April 998.

■ 19b. *John the Baptist*. Events take a fatal turn for John: Herodias demands his execution. Her daughter “went forth and said unto her mother, What shall I ask? And she said, The head of John the Baptist. And she came in straightway with haste unto the king, and asked, saying, I will that thou give me by and by in a charger the head of John the Baptist” (Mark 6:24-25).

20a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. The execution of Crescentius at the order of Otho ([196], Volume 3, pages 358-359).

■ 20b. *John the Baptist*. The execution of John the Baptist at the order of King Herod: “And immediately the king sent an executioner, and commanded his head to be brought: and he went and *beheaded* him in the prison, and brought his head in a charger, and gave it to the damsel: and the damsel gave it to her mother” (Mark 6:27-28).

21a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. The severed head of John Crescentius became an important narrative element in the mediaeval chronicles of the X century. There were many legends about the death of Crescentius ([196], Volume 3, pages 358-359). “Crescentius was beheaded, thrown on the ground, and then hanged... Italian chroniclers tell us that prior to this Crescentius had been blinded with his every limb broken, and he was then dragged

across the streets of Rome on the hide of a cow” ([196], Volume 3, pages 358-359).

■ 21b. *John the Baptist*. The severed head of John the Baptist became a popular mediaeval subject, which was extensively used in Christian paintings and mediaeval art (John’s head on a dish).

22a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. “It is even said that he [John Crescentius – A. F.] became disillusioned in further resistance due to its futility, and *took the vows*” ([196], Volume 3, page 358).

■ 22b. *John the Baptist*. “And the same John had his raiment of camel’s hair, and a leathern girdle about his loins” (Matthew 3:4). John the Baptist had led a *monastic* life.

23a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. John Crescentius is a famous martyr in the Roman history of the X century A.D. “His [John’s – A. F.] demise after a brief but valiant stand served to cover his name in glory... the Romans had wept for the unfortunate Crescentius for a long time; in the municipal acts of the XI century *we come across the name Crescentius extremely often* [sic! – A. F.], which was for a good reason – many families called their sons after Crescentius. This must have been a tribute to the memory of the intrepid Roman freedom fighter. The epitaph on the grave of Crescentius has survived until our day, and it is one of the most remarkable mediaeval Roman epitaphs” ([196], Volume 3, page 360).

■ 23b. *John the Baptist*. John the Baptist is a famous Christian saint and martyr of the alleged I century A.D. The chronological shift here equals about a thousand years.

24a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. The Scaligerian chronology informs us of a great “evangelical upsurge” of the late X – early XI century A.D. It coincides with the beginning of the crusade epoch (in reality, all of this took place later – in the late XII – early XIII century). The Gospels are the main ideological weapon of the time. There is even a special term – “the evangelical *Renaissance* of the X-XI century A.D.”

■ 24b. *John the Baptist*. The story of John the Baptist is one of the main evangelical legends. These texts served as a basis for the “evangelical” movement, or early Christianity of the alleged I century A.D. A chronological shift of 1053 years places this epoch exactly at the end of the X – beginning of the XI century. Thus, the

shift in question identifies the two main “evangelical upsurges” in the Scaligerian history as two doubles. This “peak” can really be dated to the end of the XII – beginning of the XIII century, qv in our book entitled *King of the Slavs*.

25a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. The legend of treachery that resulted in the death of John Crescentius. In this mediaeval version we see “treachery” from the part of the emperor Otho (the evangelical King Herod?) himself: “there was no shortage in versions that ascribed the fall of Crescentius to despicable perfidy demonstrated by Otho” ([196], Volume 3, pages 358-359). It is said that Otho traitorously offered Crescentius a free pardon via Tammus the knight, and when John had trusted him and capitulated, Otho gave orders to execute him as a proditor. The execution of Crescentius proved a political event serious enough to tie the death of the emperor Otho that ensued in 1002 to the name of John Crescentius in legends ([196], Volume 3, page 404).

■ 25b. *John the Baptist*. Above we have referred to the evangelical tale of perjury that led to the death of John the Baptist. According to the Gospels, John’s death was the result of treachery from the part of Herodias, who had used her cunning to get the prophet executed with the assistance of her daughter (Mark 6:21-28).

26a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. Stephanie is *blamed for the death of Otho*, and considered to have been *the wife of John Crescentius*. Other versions of the story call her emperor Otho’s concubine. When we compare the Gospels to the mediaeval Roman chronicles, we see that they use the term “wife” in all the wrong places; there is definitely confusion in the plot. This must have led to the fact that the husband was confused for his opponent. “The death of Otho... soon took on the hues of a legend. It was told that the new Medea incarnate as the widow of Crescentius managed to get Otho under her spell [a parallel with the Gospels telling us about Herod charmed by the daughter of Herodias – A. F.]; she is supposed to have pretended that she wanted to heal the emperor, and, according to various sources, had either wrapped him up in a poisoned deer hide, poisoned his drink, or put a poison ring on his finger” ([196], Volume 3, page 404).

■ 26b. *John the Baptist*. St. Mark the evangelist directly refers to Herodias as *the one to blame for the death of John the Baptist* (Mark 6:24-25). Let us remind the reader that Herodias had allegedly been the wife of King Herod (the double of Otho?).

27a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. It is possible that Gregory Hildebrand was born in the time of John Crescentius. Below we shall demonstrate a very vivid parallelism between the mediaeval reports of the famous “Pope” Gregory VII Hildebrand and the evangelical story of Jesus Christ. The period when Hildebrand had been politically active in Rome falls on the epoch of 1049-1085 A.D. He is supposed to have been born in 1020 ([64], page 216), which is very close to the epoch of Crescentius (991-998 A.D.). One has to point out that there is another Crescentius in the Scaligerian history of Rome, namely, “John Crescentius the Second” ([196], Volume 3). He had allegedly been the son of “John Crescentius the First” whose biography we have studied above. This “son” is said to have ruled in Rome between 1002 and 1012. We know very little about him except for the fact that he “followed in his father’s footsteps”. This “John Crescentius Junior” may prove to be a second version of the same old legend about the first Crescentius, in which case the activities of Crescentius (the Baptist) precede the birth of Hildebrand immediately. Such a “duplication” of Crescentius shouldn’t really surprise us. Above we have demonstrated the two duplicates of the war that broke out in the XIII century A.D., which were placed in the X century A.D. by the chronologists. They are shown on the global chronological map in [Chron1](#), Chapter 6, as the two black triangles that mark the X century A.D. This narrative duplication of the war could have duplicated John Crescentius as well.

■ 27b. *John the Baptist*. Jesus Christ is said to have been born in the time of John the Baptist who had baptized Jesus (Matthew 3:1-3 and 3:13).

28a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. Hildebrand’s death *follows* the death of John Crescentius. Hildebrand “carries the banner” of John. We shall return to this below (see [196], Volume 3).

■ 28b. *John the Baptist*. The death of Jesus Christ *follows* the death of John the Baptist. Christ carries on with what was started by John the Baptist, who is therefore called his precursor. John used to preach “saying, There cometh one mightier than I after me, the latchet of whose shoes I am not worthy to stoop down and unloose. I indeed have baptized you with water: but he shall baptize you with the Holy Ghost” (Mark 1:7-8).

29a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. The

epoch of John Crescentius falls on the end of the X century. He had been in a mature enough age when he died; his activity (political and religious reforms) had started substantially earlier than 990 – somewhere in the middle of the alleged X century ([196], Volume 3).

■ 29b. *John the Baptist*. Major religious events in the history of the mediaeval states were connected with the name of John the Baptist. Let us point towards the well-known *baptism* of Russia somewhere around 980-990 A.D.

30a. *John Crescentius*. X century Rome, possibly the XII century Czar-Grad. If John the Baptist had something to do with the naissance of the rite of baptism, this rite must have had few “Jesus elements” around that time (allegedly the late X – early XI century; XII century in reality), since the epoch of Jesus Christ, or Andronicus (who became reflected in the Roman history as Hildebrand) was just dawning. It falls over the second half of the XII century.

■ 30b. *John the Baptist*. The main rite recorded in the chronicles telling us about the baptism of Russia refers to a *water baptism*. However, this rite had been introduced by John the Baptist before Jesus. By the way, this also implies that the baptism of Russia in the alleged X century (the XII century in reality), as well as the crusades of the alleged XI-XIII century (late XII – early XIII century really) didn’t “wait for a thousand years to happen”, but had rather proved a fast and immediate reaction to the principal religious events of that age.

6.3. “Pope” Gregory VII Hildebrand from the Roman chronicles dated to the XI century A.D. as the reflection of Jesus Christ (Andronicus) from the XI century A.D. A biographical parallelism

In the present section we demonstrate the famous “Pope Hildebrand” from the alleged XI century A.D. to be a phantom reflection of Andronicus (Christ) from the XII century A.D.

Scaligerian history considers “Pope” Hildebrand to have been the most eminent reformist of the mediaeval Christian church in the west. He is counted amongst the greatest European popes; his name is most commonly associated with the greatest reform of the mediaeval Christian church in the Western Europe that had made a tremendous political impact. “Contemporaries compare the renowned votary to Marius,

Scipio and Caesar” ([196], Volume 4, p. 119).

Hildebrand is considered to have been the author of the famous celibacy edict that led to large-scale upheavals all across Western Europe. He had been the first to conceive of the crusades and make this concept a reality, which had defined the style and character of the three centuries to follow ([196], Volume 4). These “reborn Gospels” were the official ideological documents to serve as foundations of this crucial XI century reform; Scaligerian history dates them to the I century A.D. which precedes this epoch by a millennium.

This reform was enforced *manu militari* and led to a violent struggle between the devotees of the old church and the supporters of the new confession (the so-called reformist or evangelical church in the West) that had raged across the Western Europe for fifty years on end. Despite the fact that influential strata of European society had opposed his actions vehemently, Hildebrand made both the ecclesial and secular authorities conform to the new doctrine. He is considered the first organizer of the church in its evangelical format ([196], Volume 4).

One mustn’t get the idea that Hildebrand’s “biography” really pertains to the XII century A.D. It had most probably been compiled a great deal later, around the XIV-XVI century A.D. – especially since the very foundation of the Italian Rome as a capital can be relatively safely dated to the XIV century. This consideration stems from our discovery that the First Roman Empire, or Livy’s “Imperian Rome”, can be identified as the Holy Roman Empire of the X-XIII century A.D. and the Habsburg (Nov-Gorod?) Empire of the XIV-XVI century A.D.

Let us relate in brief the parallels between the biographies of Jesus Christ (Andronicus) and “Pope Hildebrand”. They became identified as one and the same person by formal methods described in [Chron1](#), Chapter 6. Let us point out that the name Hildebrand can be a derivative of “Ablaze with Gold” (“Hilde” being related to such words as “gilded”, “golden” etc; as for “Brand” – the igneous connotations of the word are obvious enough). Bear in mind that Christ would also be referred to as “The Sun”, qv in fig. 2.9. The name *Hilde-Brand* may also be a reference to the Slavic word *Kolyada* – another name of Christ, qv in our book entitled *King of the Slavs*.

Comparison table for Hildebrand and Jesus Christ (Andronicus)

a. Hildebrand (Ablaze with Gold). Presumably XI century Rome, possibly the XII century Czar-Grad.

■ *b. Jesus Christ (Andronicus)*. The alleged I century A.D. (the XII century in reality). Active in Jerusalem, or Czar-Grad.

1a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. The approximate date of Hildebrand's birth is 1020 ([64], page 216) – the 12th year of the reign of Henry II the Holy, or Augustus, qv above – the emperor who is identified as none other but Octavian Augustus in the parallelism between the Roman Empire of the X-XIII century and the Second Roman Empire. Pope Octavian is another reflection of this character, qv below.

■ 1b. *Jesus Christ (Andronicus)*. According to the Scaligerian chronology, Jesus Christ (Andronicus) was born on the 23rd reign year of Octavian Augustus in the Second Roman Empire (or the 27th year, according to another version – see [76]). The discrepancy between this date and the 12th year of Henry II the Holy equals a mere 5-10 years if we are to consider the 1053-year shift. We see a very good date correlation.

2a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. The death of Hildebrand in the alleged year 1085 ([196], Volume 4).

■ 2b. *Jesus Christ (Andronicus)*. The death of Jesus Christ (Andronicus) in the alleged year 33 ([76]). We give a comparison of dates with the effects of the 1053 year shift taken into account. The latter can be expressed by the formula $P = T + 1035$. Thus, the death of Jesus Christ (Andronicus) in the alleged year 33 A.D. ([76]) occurs right in 1086, since $33 + 1053 = 1086$. The death of both these characters occurs in the same year – 1085-1086 A.D. We must point out that Andronicus (Christ) was really crucified a century later, in 1185 (qv in our book entitled *King of the Slavs*).

3a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. Hildebrand arrives in Rome in 1049. This moment marks the beginning of his ecclesiastical reformist activity, and can therefore be considered the year of his making into the greatest reformer even seen in the ranks of the clergy ([196], Volume 4, page 57). Another important date in Hildebrand's biography is 1053, qv below.

■ 3b. *Jesus Christ (Andronicus)*. A 1053 shift forwards in time shall transpose the birth of Jesus Christ (Andronicus) to 1053 A.D. This date differs from 1049 A.D., the date of Hildebrand's arrival to Rome, by a mere 4 years. The same shift moves the

date of Christ's death (33 years later according to the Gospels) to 1086 A.D., whilst Hildebrand's death is dated to 1085 A.D. We see that the discrepancy only equals one year. Therefore, *a 1053 year shift makes the principal dates virtually identical*. Let us point out that the main date related to Jesus Christ (Andronicus) is usually considered to be the date of his death (Crucifixion, or the Passions). The date of his birth was calculated somewhat later, with the date of the Crucifixion used as source information. It is said that a monk by the name of "Dionysius Exiguus" (Dionysius the Little) had first calculated the year of Christ's death, and then subtracted 33 years to obtain the date of the Nativity according to the Gospels, qv above. Therefore the brilliant correlation between the dates of the Crucifixion and Hildebrand's death with a shift of 1053 years is extremely important to us. We are led to the idea that the A.D. chronological scale only actually begins in the year referred to as 1053 A.D. nowadays. A deliberate or accidental 1053-year shift buried it under a load of many additional years. Thus, one gets the idea that, according to the erroneous mediaeval tradition, the "new era" had really been counted from the phantom year 1053 in modern chronology for some time. It was only in the XVI-XVII century that the phantom year 1053 "travelled backwards in time" as a result of another deliberate or accidental chronological shift of 1053 years. This is how "year zero" of the new era was calculated (with a 1100-year discrepancy).

4a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. 1053 is a famous date in global ecclesiastical history. The notorious schism between the Occident and the Orient, or the "ecclesial schism", which exists to this day, took place in 1053 or 1054. This is considered to be the moment when a new epoch began for Western Europe ([\[196\]](#), Volume 4).

■ 4b. *Jesus Christ* (Andronicus). The "dawn of the new era" is the time the new church was born – the Christian (Evangelical) one. This "evangelical hue" of the epoch corresponds very well with the XI century "Evangelical Renaissance" if we are to consider the 1053-year shift. The crusades are of a particular interest to us since their ideological basis was defined by the Gospels.

5a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. Hildebrand is considered to have been "the son of a carpenter" ([\[196\]](#), Volume 4, page 139). Mediaeval chronicles give us a distinctly divine description of Hildebrand (Ablaze with Gold) as an infant: "there were flames of fire coming from his head" etc ([\[196\]](#),

Volume 4, page 179, comment 1). Chronicles mention no other pope who'd be the "son of a *carpenter*". This is a characteristic as unique as its evangelical counterpart in the biography of Jesus.

■ *5b. Jesus Christ* (Andronicus). The Gospels tell us that Christ's father had been a carpenter: "Is not this the carpenter's son?" (Matthew 13:55). Mark calls Jesus himself a carpenter: "Is not this the carpenter, the son of Mary?" (Mark 6:3). The birth of Christ is described as an incarnation of God in the Gospels.

6a. Hildebrand. XI century Rome, possibly the XII century Czar-Grad. We didn't manage to find any information about Hildebrand's mother; however, his maternal uncle is supposed to have been the abbot of St. Mary's monastery ([196], Volume 4, page 139). Moreover, Hildebrand is supposed to have lived in the monastery of St. Mary ([459], Volume 1, page 64). This may be a distorted reflection of the fact that Jesus had been the son of Mary. "Hildebrand's biography" made Mary the mother disappear; however, a reference to living in St. Mary's monastery has taken its place.

■ *6b. Jesus Christ* (Andronicus). The mother of Jesus was called Mary (Matthew 1:18) – thus, the name "accompanies" the birth of both characters in question. In figs. 2.5 and 2.6 we see some interesting mediaeval artwork – namely, a mediaeval relief depicting Our Lady with *two long braids* ([992], pages 20, 21 and 211). This is a XII-XIII century relief from the Liebfrauenkirche church in Halberstadt (Germany). "Likewise her close relation from Hildesheim, Our Lady of Halberstadt belongs to the well-known Romanesque iconographic type of *Our Ladies with braids*" ([992], page 23).

Fig. 2.5. A statue of Our Lady with two long braids. A relief from the Liebfrauenkirche church in Halberstadt, Germany. Taken from [992], page 20, ill. 15.

Fig. 2.6 Blessed Virgin Mary with braids. A fragment of the previous photograph. Taken from [992], pages 21 and 211.

7a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. The consensual opinion is that Hildebrand had been born in Italy ([196], Volume 4). There is a town

in Italy by the name of Palestrina – the name must date to XIV century or a later epoch, when the legends of Jesus Christ (Andronicus) (under the alias of Hildebrand) came to these parts. The evangelical Christ is said to have been active in Palestine (White Camp or Babylonian Camp?). Furthermore, ever since the XIII century the Catholic Church has been claiming that Archangel Gabriel came to Mary the Mother of Christ who had allegedly lived in the town of Loreto (or Loretto) in Italy ([\[444\]](#), page 198). Christ's mother may have really lived in Italy – however, this legend is most probably a planted one and reflects the transposition of events that took place in the New Rome to the Italian Rome, founded rather recently (in the XIV century), an in urgent need of an “ancient history” at the time. An indirect proof of this can be found in the rather remarkable mediaeval tradition telling us that Mary's house used to be in an altogether different place and was *brought* to Loreto later. This tradition is manifest in such works of art as the ancient painting by Cesare Nebbia (circa 1536-1614) and his apprentices, titled candidly and unequivocally “The Holy House of Our Lady Carried to Loreto” (The Geographical Card Gallery, Vatican – vaulting artwork detail). The picture shows angels *carrying* Mary's house to Italy (fig. 2.8).

Fig. 2.7. “The Holy House of Our Lady Carried to Loreto” by Cesare Nebbia and apprentices, depicting angels carrying Mary's house to Italy. This may be a reflection of the “paperwork migration” of Constantinople events to Rome in Italy during the epoch when the “ancient history” of this city was being created. Taken from [\[713\]](#), page 438, ill. 417.

Fig. 2.8. A fragment of the picture entitled “The Holy House of Our Lady Carried to Loreto” by Cesare Nebbia and apprentices. Taken from [\[713\]](#), page 438, ill. 417.

■ *7b. Jesus Christ (Andronicus).* “The angel Gabriel was sent from God unto a city of Galilee, named Nazareth, to a virgin... and the virgin’s name was Mary” (Luke 1:26-27). Let us remind the reader that Nazareth may well have the same meaning as the Turkish word Nazreti – “holy” ([\[1181\]](#)).

8a. Hildebrand. XI century Rome, possibly the XII century Czar-Grad. Hildebrand’s reforms were preceded by the endeavours of John Crescentius, *qv* above. Both were focussed on the same goal: the glorification of Rome and the foundation of a new church whose influence would spread across the entire Europe ([\[196\]](#), Volumes 3 and 4).

■ *8b. Jesus Christ.* Christ’s precursor is John the Baptist. Both of them have contributed to the creation of the new religion to some extent – see the comparison table for the biographies of Crescentius and John the Baptist above.

9a. Hildebrand. XI century Rome, possibly the XII century Czar-Grad. Hildebrand is the author of a radical ecclesiastical reform in the Middle Ages, as well as the organizer and supervisor of its implementation. He was a vehement antagonist of the old cult and its devotees ([\[196\]](#), Volume 4).

■ *9b. Jesus Christ* (Andronicus). Jesus is the founder of a new religion that led to a radical reform in the old church. He had also opposed those who followed the Orthodox Judaic tradition. Some of the reforms implemented by Jesus and Hildebrand are very similar, qv below.

10a. Hildebrand. XI century Rome, possibly the XII century Czar-Grad. The well-known decree against simony, or the sale of ecclesial positions ([\[196\]](#), Volume 4).

■ *10b. Jesus Christ* (Andronicus). Jesus banishing vendors from the temple. “And he went into the temple, and began to cast out them that sold therein, and them that bought” (Luke 19:45).

11a. Hildebrand. XI century Rome, possibly the XII century Czar-Grad. Hildebrand’s activity is allegedly confined to Rome for the most part, likewise that of his precursor John Crescentius ([\[196\]](#), Volume 4). We have already mentioned the identification of Rome as Jerusalem above – see [Chron2](#), Chapter 1.

■ *11b. Jesus Christ* (Andronicus). Christ preaches in the same geographical area as his predecessor John the Baptist – Jerusalem, Judea and Samaria. According to our reconstruction, the Jerusalem mentioned in the Gospels is really Czar-Grad on the Bosphorus.

12a. Hildebrand. XI century Rome, possibly the XII century Czar-Grad. Hildebrand had “served” the church between 1049 (the year he first came to Rome) and 1085 (the year of his death – see [\[196\]](#), Volume 4). If we are to consider 1054, the year of the Great Schism, to have marked the beginning of his ministry, the correlation with the datings valid for Jesus (shifted by 1100 years) becomes ideal given the 1053-year shift, qv below.

■ *12b. Jesus Christ* (Andronicus). Jesus had lived for 33 years – that is, between 0 and 33 A.D. in Scaligerian chronology ([\[76\]](#)). A 1053-year shift forward in time gives us the interval between 1053 and 1086 A.D. Theology differentiates between the two periods of Christ’s ministry: the first one starting from his birth and ending with his death, and the other covering the period between his 30th year and the Crucifixion.

13a. Hildebrand. XI century Rome, possibly the XII century Czar-Grad. Hildebrand initiated the ecclesial reform in 1049, when he had been 29 or 30 years

of age ([\[196\]](#), Volume 4). Let us remind the reader that he was born in the alleged year 1020 ([\[64\]](#), page 216).

■ 13b. *Jesus Christ* (Andronicus). Luke the Evangelist tells us that “Jesus himself began to be about thirty years of age” (Luke 3:23). We see a perfect correlation with the “Hildebrand” dates.

14a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. Hildebrand was “born twice”: in 1020 de facto, with his initiation into priesthood occurring in either 1049 or 1053. This provides us with the following versions of his age: 32 or 36 as the age his ecclesial career began, or 65 years of actual age.

■ 14b. *Jesus Christ* (Andronicus). The Gospels also provide two versions of Christ’s age: 33 years and approaching 50. The former version is considered to have higher authority, qv above. The second is derived from St. John’s indication saying “Thou art not yet fifty years old” (John 8:57). A comparison with “Hildebrand” tells us that 33 years of Christ are very similar to “Hildebrand’s” 32, and “not yet fifty” may also refer to the age of 65.

15a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. The official beginning of Hildebrand’s reform and the ecclesiastical schism are usually dated to 1054 ([\[196\]](#), Volume 4). All of this is supposed to follow the death of the Roman emperor in 1039 by roughly 15 years – or in the 15th year of the *autocracy* of Henry III the Black in Rome. Let us remind the reader that he had been a co-ruler of Conrad II prior to that date, qv in Table 8, which is to be found in Chapter 6 of [Chron1](#).

■ 15b. *Jesus Christ* (Andronicus). Christ’s reforms begin when he is 30 years of age (Luke 3:23) – right in the 15th year of the reign of Tiberius, the “Black Emperor” (see Table 8 in Chapter 6 of [Chron1](#)). Now, according to the Scaligerian chronology, Tiberius ascended the throne in 14 A.D. Thus, Christ’s 30th year falls exactly over the 15th year of Tiberius’ reign. Another important fact is that an independent dynastic superimposition of the Second Roman Empire over the Roman Empire of the X-XIII century identifies Tiberius as Henry the Black, no less! We see perfect date correlation for Christ and “Hildebrand”.

16a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. Roman chronicles dated to the XI century nowadays contain numerous references to a well-

known ally of Hildebrand – Countess Matilda, whose influence and finances had always been ready at hand whenever support was called for. She is said to have owned half of Italy [!] All of her estate was at Hildebrand’s disposal ([\[196\]](#), Volume 4, pages 148 and 192).

■ 16b. *Jesus Christ* (Andronicus). The Gospels tell us a lot about the woman who had accompanied Jesus Christ (Andronicus) constantly – Mary Magdalene, the repentant sinner. She is always found by his side ready to support him: “and certain women... Mary, called *Magdalene*... and many others, which ministered unto him of *their substance*” (Luke 8:2-3).

17a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. We learn that Countess Matilda’s name is spelt MATHILDA ([\[196\]](#), Volume 4, page 180, comment 12. A slightly distorted reading could make this name sound like “Madgilda” (MDGLD without vocalizations), or “Magdalene”.

■ 17b. *Jesus Christ* (Andronicus). The name of Christ’s ally is Magdalene. MGDNL without vocalizations, which corresponds well with the MDGLD version offered above.

18a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. F. Gregorovius tells us there were no findings of coins from the Papal Rome that can be dated to the period between 984 A.D. and Leo IX (mid-XI century). F. Gregorovius points out specifically that “it is all the more surprising that not a single coin from the period of Gregory VII was to be found anywhere” ([\[196\]](#), Volume 4, page 74, comment 41). We shouldn’t be surprised - as we’re beginning to understand, there has never been any pope by the name of Hildebrand, since he is a mere reflection of the XII century figure of Jesus Christ (Andronicus). Hence the absence of “Pope Hildebrand’s” coins – no one ever minted them.

■ 18b. *Jesus Christ* (Andronicus). We learn that there are mediaeval coins with Jesus Christ (Andronicus) bearing respective inscriptions. One of them can be seen in fig. 2.9. Jesus Christ (Andronicus) has a halo around his head, and the reverse of the coins says “Jesus Christ (Andronicus) Basileus” (King). The coin is presumed to have been minted under John I Tsimisces (taken from [\[578\]](#), Volume 1, page 177, ill. 153). In fig. 2.10 we can see another such coin ([\[684\]](#), table 21). As V. M. Potin points out, images of Christ are “characteristic for mediaeval coins”. In this case we see Jesus Christ (Andronicus) at the bottom, and two mediaeval rulers on top of the

flip side. They are allegedly Leo VI and Constantine VII, and their portraits on the coin are those of “Christ’s legates” who had received their power from him.

Fig. 2.9 A mediaeval coin depicting Jesus Christ (with the words “Jesus Christ Basileus” on the flip side). Taken from [\[578\]](#), Volume 1, page 177, ill. 153.

Fig. 2.10 A mediaeval coin depicting Jesus Christ. Taken from [\[684\]](#), table 21.

19a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. Hildebrand comes to Rome in 1049 with the party of Leo IX, which can be considered the beginning of “Hildebrand’s ministry” ([\[196\]](#), Volume 4). He was about 30 years of age at the time. Commentators compare this advent of the reformer-to-be to an apostolic advent, or the Evangelical “entry into Jerusalem”. According to Gregorovius, “in February 1049 the new pope [Leo IX – A. F.] arrived in Rome and proceeded along the streets barefoot, reading prayers in humility, accompanied by a very modest entourage. A sight as uncommon as this couldn’t fail to leave the Romans completely flabbergasted. It seemed as though an apostle... had entered the city... no aristocrat was seen in his party – this bishop came as a simple pilgrim who knocked on the doors of the Romans asking them whether they desired to accept him in the name of Christ... But one of his satellites had such spiritual power that its beacon had shone a great deal brighter than that of any royalty... it was Hildebrand” ([\[196\]](#), Volume 4, page 57).

■ 19b. *Jesus Christ* (Andronicus). The entry of Jesus and his disciples into Jerusalem is the beginning of “Christ’s ministry”. He was about 30 at the time (Luke 3:23). As Jesus was entering Jerusalem, “many spread their garments in the way: and

others cut off branches off the trees, and strawed them in the way... And Jesus entered into Jerusalem” (Mark 11:8 and 11:11).

20a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. At the peak of the reforms, a certain Cencius tries to assassinate Hildebrand in 1075. We thus see an *attempt to assassinate “Hildebrand”* ([196], Volume 4, page 155).

■ 20b. *Jesus Christ* (Andronicus). A plot against Christ is organized in Jerusalem by Judas Iscariot, one of the apostles. The plot results in the arrest of Jesus and his subsequent crucifixion.

21a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. Roman chronicles of the XI century refer to Cencius with the utmost scorn and distaste ([196], Volume 4, pages 126-127). According to Gregorovius, “the chronicles of the time [the ones dated to the XI century nowadays, if we are to be more precise – A.D.] portray Cencius as... a godless robber and philanderer... this unflattering characteristic of the head of Cadalus’ party might well be the furthest thing from exaggeration” ([196], Volume 4, pages 126-127).

■ 21b. *Jesus Christ* (Andronicus). The Gospels characterize Judas in a very negative manner, and his name transformed into a negative denominative in the entire Christian tradition.

22a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. Cencius had initially participated in Hildebrand’s reformist activities, and been in a close bond with Hildebrand’s party ([196], Volume 4, page 126). Stefan, the father of Cencius, had been a Roman prefect and maintained good relationships with the allies of “Hildebrand” the reformist. Moreover, Cencius belonged to the family of Crescentii ([196], Volume 4) – that is, the same family as John the Baptist – the precursor of Christ, whose identification with the “Roman” John Crescentius is related above in detail.

■ 22b. *Jesus Christ* (Andronicus). Judas was related to Jesus in the most direct manner possible, having been his disciple – one of the twelve Apostles.

23a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. Cencius soon heads the Roman party of malcontents, which opposes “Hildebrand” ([196], Volume 4, page 155).

■ 23b. *Jesus Christ* (Andronicus). A short while later, Judas betrays his teacher and joins the ranks of those in Jerusalem who are dissatisfied by the reforms of Jesus. Judas makes a deal with the high priests, or “Pharisees”.

24a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. The alleged chronicles of Rome relate further actions from the part of Cencius as a betrayal of Hildebrand. Cencius is portrayed as a detestable ingrate – as early as around the beginning of 1075 Cencius was plotting against Hildebrand. The plot had proved a failure, and the city prefect launched a process against Cencius – however, the latter had received the unexpected support of Hildebrand himself, likewise Countess Matilda (MDGLD). Only the protection of the great reformist had secured Cencius’ freedom ([\[196\]](#), Volume 4, page 155).

■ 24b. *Jesus Christ* (Andronicus). The Gospels describe the actions of the former Apostle Judas as a betrayal of Jesus and his cause. Judas treats Jesus with the utmost ingratitude, hence the numerous negative connotations of the name that is used as a denominative nowadays.

25a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. “For the meantime, he [Cencius – A. F.] was plotting his revenge. Seeing that a severance of relations between the Pope [Hildebrand – A. F.] and Henry was inevitable, Cencius had thought up a plan to dethrone Pope Gregory. He had made Henry [the emperor – A. F.] an offer on behalf of the Romans to seize Rome, promising to capture Gregory and hand him over to Henry as a captive” ([\[196\]](#), Volume 4, page 155).

■ 25b. *Jesus Christ* (Andronicus). “Then one of the twelve, called Judas Iscariot, went unto the chief priests, and said unto them, What will ye give me, and I will deliver him unto you?” (Matthew 26:14-16). “And he went his way, and communed with the chief priests and the captains, how he might betray him unto them” (Luke 22:4). See also (Mark 14:10-11).

26a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. “The scene that took place on Christmas Day in 1075 is one of the most gruesome episodes in the entire history of mediaeval Rome. On Christmas eve the Pope [Hildebrand – A. F.] had been preparing to say mass in the subterranean church of S. Maria Maggiore; suddenly, there were cries and weapon noises all over; the church was invaded by Cencius, who brandished a sword in his hands, surrounded by aristocratic intriguants”

([\[196\]](#), Volume 4, page 155).

■ 26b. *Jesus Christ* (Andronicus). “And immediately, while he [Jesus – A. F.] yet spake [bear in mind that Jesus was reading a sermon to his disciples, or saying mass in a way – A. F.], cometh Judas, one of the twelve, and with him a great multitude with swords and staves, from the chief priests and the scribes and the elders” (Mark 14:43). Let us re-emphasize that, likewise Hildebrand, Jesus was giving orders to his disciples when the enemy came.

27a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. “Having seized the bruised and battered Pope [Hildebrand – A. F.] by the locks, Cencius dragged him out of the church, heaved him onto a horse and hurried to his castle through the dormant streets of Rome” ([\[196\]](#), Volume 4, page 155). All of this happens *at night*.

■ 27b. *Jesus Christ* (Andronicus). “And they laid their hands on him, and took him (Mark 14:46). “And some began to spit on him, and to cover his face, and to buffet him, and to say unto him, Prophecy: and the servants did strike him with the palms of their hands” (Mark 14:65). All of the above also takes place *at night*.

28a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. “The whole city was immediately agitated – bells rang out in alarm, people grabbed their weapons, and priests locked up their altars in horror” ([\[196\]](#), Volume 4, pages 155-156). However, there is no direct military conflict. Hildebrand forgives Cencius (likewise Jesus who is supposed to have “forgiven” Judas the betrayal).

■ 28b. *Jesus Christ* (Andronicus). “When they which were about him saw what would follow, they said unto him, Lord, shall we smite with the sword? And one of them smote the servant of the high priest, and cut off his right ear. And Jesus answered and said, Suffer ye this far.” (Luke 22:49-51). There is no armed conflict.

29a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. “Roman” chronicles tell us nothing about either the trial of Hildebrand or his “crucifixion” ([\[196\]](#), Volume 4). Recently, in 2004, we discovered ancient data clearly demonstrating that at the end of Hildebrand’s “biography” one can find vivid Evangelical scenarios pertaining to the Crucifixion of 1185 A.D. We shall relate this in detail in our subsequent publications.

■ 29b. *Jesus Christ* (Andronicus). The Gospels describe the trial and crucifixion

of Jesus (his so-called Passions). The parallelism breaks out of synch here.

30a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. The following is told about the fate of Cencius the betrayer: “In his attempts to catch Gregory unawares, this vengeful Roman kept thinking up new plots until his *sudden death* in Pavia” ([196], Volume 4, page 170).

■ 30b. *Jesus Christ* (Andronicus). The following is said about Judas: “And he cast down the pieces of silver in the temple, and departed, and went and hanged himself” (Matthew 27:5).

31a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. The second most important leader of the reformist (or Evangelical) movement of Hildebrand is the well-known *Peter* Damiani, Hildebrand’s right hand. He was born in 1007 and “had the reputation of an extraordinarily gifted individual” ([196], Volume 4, page 84). As we already understand, this Peter is most probably a reflection of Peter the Apostle, the closest ally of Jesus. Peter Damiani became head of the hermit army in the XI century - these hermits were just about as influential as Peter – their influence “was *a mystery in what concerned the strength of its manifestation* – they weren’t equalled by anyone in this respect, with the possible exception of *the Old Testament prophets*” ([196], Volume 4, pages 84-85).

This mystery is but a side effect of the Scaligerian chronology that transferred the Evangelical boom into the I century A.D. from the XII. F. Gregorovius proceeds to tell us that “Damiani had been the very heart of this church [the church of Hildebrand, that is – A. F.]” ([196], Volume 4, pages 88-89). Damiani’s banner was immediately picked up by Peter the Stylite: “he became a folk hero, a prophet of sorts – someone who received his authority of a crusade leader from Christ himself” ([196], Volume 4). These two Peters are the only well-known characters in the XI century Rome bearing that name. They may have been reflected in the collective evangelical character by the name of “Peter Simon the Apostle”. The names Simon and Damian may have been interchangeable.

■ 31b. *Jesus Christ* (Andronicus). Peter Simon is considered the main figure among the apostles of Christ – he is called the founder of the new Roman church. The Papal throne is still referred to as the Throne of St. Peter. According to the official

formula, Peter had been the keystone of the Catholic Church.

32a. *Hildebrand*. XI century Rome, possibly the XII century Czar-Grad. According to some mediaeval Russian chronicles, Russia was baptized by Andrew the Apostle, an actual disciple of Jesus Christ (Andronicus) ([208], pages 121-122). At the same time, according to the Scaligerian-Romanovian chronology, Russia was baptised in late X – early XI century, that is, allegedly *a thousand years later than Christ had lived*. More details concerning the fact that Andrew the Apostle is really yet another reflection of the XII century Emperor Andronicus can be found in our book entitled *King of the Slavs*.

■ 32b. *Jesus Christ* (Andronicus). One of the apostles of Jesus was called Andrew (Mark 1:16). As well as the other apostles, he had walked the Earth preaching the doctrine of Jesus. The Scaligerian chronology places him in the I century. How could he have baptized Russia in the XI century?

Commentary. The Scaligerian-Romanovian version tells us about Andrew the Apostle and his baptism of Russia in the X-XI century A.D., which contradicts the same Scaligerian dating of Andrew's lifetime (I century A.D.). However, this baptism corresponds to our new chronology and the year 1053 (considering the 1153-year shift) perfectly. Indeed, when we transpose the evangelical events from the phantom I century into the real XII century, everything falls into place. We begin to understand why the “evangelical boom” falls on the XII-XIII century, as well as “the heyday of baptisms”. It becomes perfectly clear that Russia didn't have to wait a whole millennium so that it could “finally” get baptized – the baptism followed the naissance of the new religion in the XII century almost immediately. The legend about Andrew the Apostle baptizing Russia also begins to make sense. By the way, the Scaligerian-Romanovian history shall doubtlessly assure us that the legend of Andrew the Apostle baptizing Russia is a “later addition” to the famous *Povest Vremennyh Let* ([208], page 121). Nevertheless, in the XVI century John IV the Terrible, being unaware of the Scaligerian chronology, which was introduced after his death, “used to point out that the Russians were baptized by Andrew the Apostle himself, and didn't import Christianity from Greece. That was the very same thing that Hieromonk Arseniy Soukhanov, the emissary in Greece... had told the Greeks a century later” ([208], page 121).

Mind that a 720-year chronological shift backwards in time (its value equalling the subtraction residual of the two primary shifts: $720 = 1053 - 333$) superimposes

Hildebrand over a well-known Christian saint – Basil the Great (or “The Great King” in translation). The year 1053 is shifted backwards and transforms into the year 333 A.D., since $1053 - 720 = 333$. *This happens to be precisely the year Basil the Great was born according to the Scaligerian chronology.*

This fact instantly explains the vivid and explicit parallelism between Jesus Christ (Andronicus) and Basil the Great that was already pointed out by N. A. Morozov in [\[544\]](#), Volume 1. Thus, the XII century Jesus (Andronicus) became reflected in history twice – as “Pope Hildebrand” and St. Basil the Great.

As we have already mentioned, the hagiographies of St. Basil the Great devote plenty of attention to his conflict with the Roman emperor Valens “the Unholy” – the double of the Evangelical King Herod. In the alleged IV century A.D. St. Basil the Great “instilled horror into Valens” and broke his spirit in a way. We see another “secular trace” of this scenario in the alleged XI century – the well-known opposition between “Pope Hildebrand” and the Roman Emperor Henry. We are referring to the well-known scene that took place in Canossa in 1077 A.D., when Hildebrand had humiliated Henry.

We have to bear in mind that when the struggle against the secular authorities had reached its apogee in the alleged XI century, “Pope” Gregory had excommunicated Emperor Henry. “The clerical excommunication that Gregory sentenced the most powerful Christian monarch to had left the entire world amazed. Not a single excommunication that preceded it had ever made such a tremendous impact” ([\[196\]](#), Volume 4, page 162). Henry had to beg for absolution on his knees. “The poor king had to stand in front of the inner gate of the castle begging to open it, dressed in the clothes of a repentant sinner” ([\[196\]](#), Volume 4, page 168. “This bloodless victory of the coenobite [Hildebrand – A. F.] is more wonderful than all the victories of Alexander the Great” ([\[196\]](#), Volume 4, page 167). Henry would eventually revenge himself and his humiliation upon Gregory.

On fig. 2.11 we can see a mediaeval picture of “the scene in Canossa” which was painted in the alleged year 1114. Emperor Henry IV kneels before Margravess Matilda ([\[304\]](#), Volume 2, pages 184-185).

Fig. 2.11 A mediaeval picture of Emperor Henry IV genuflecting before Margravess Matilda in Canossa. Taken from the parchment manuscript entitled *The Life History of Matilda* by Doniso the Coenobite written in the monastery of Canossa. The manuscript is dated to 1114 and is kept in the Vatican Library. Taken from [\[304\]](#), Volume 2, pages 184-185.

6.4. The Bethlehem Star of the alleged I century and the famous supernova explosion of circa 1150 (subsequently shifted to 1054 by the chronologists)

Let us turn to some fascinating astronomical data that prove our reconstruction according to which Jesus Christ (Andronicus) had lived in the XII century A.D. In our book entitled *King of the Slavs* we demonstrate that the famous supernova explosion dated to 1054 nowadays really took part a century later, in circa 1150, and became reflected in the Gospels as the Star of Bethlehem.

We shall proceed to cite the list of Scaligerian datings pertaining to the so-called nova and supernova flashes as reflected in “ancient” chronicles. The list was compiled by M. Zamaletdinov according to [\[978\]](#) and [\[703\]](#). Let us emphasize that the list in question is a *complete* collection of all the flashes whose veracity isn’t doubted.

The datings are as follows: the alleged years 2296 B.C., 2241 B.C., 185 A.D., 393, 902, 1006, 1054, 1184 and 1230 A.D. followed by several XVI century flashes, qv in Kepler’s list. We shall point out the flash of 11 November 1572 that was mentioned by

Tycho Brahe – the so-called “Tychonian Supernova” ([\[395\]](#), pages 124-125). This list is usually complemented by the so-called “Christian Supernova”, or the famous Star of Bethlehem as described in the Gospels and allegedly dating to the I century A.D. This flash marked the birth of Jesus Christ (Andronicus). The Oriental Magi were asking: “Where is he that is born King of the Jews? For we have seen his star in the East... Then Herod, when he had privily called the wise men, enquired of them diligently what time the star appeared... and, lo, the star which they saw in the east, went before them... when they saw the star, they rejoiced with exceeding great joy” (Matthew 2:2, 2:7, 2:9-10). In fig. 2.12 we see a mediaeval picture of the Star of Bethlehem from the book by S. Lubienietski ([\[1257\]](#)).

Fig. 2.12 A mediaeval picture of the Evangelical “Star of Bethlehem” from the *Historia universalis omnium Cometarum* by Stanislaw Lubienietski ([\[1257\]](#)). Taken from [\[543\]](#), page 13, ill. 4.

Amongst the scientists who delved into the research of the astronomical environment as it had been in the I century A.D. was, amongst others, the eminent astronomer J. Kepler. The same “Star of the Magi” enjoyed a great deal of attention from the part of the chronologist Ludwig Ideler ([\[426\]](#), pages 128-129).

Let us now try a different approach to the issue. As we are beginning to understand, the list of nova and supernova flashes can (and must) contain duplicates. In other words, the number of flashes observed wasn’t that great – however, they were “multiplied” when some of the chronicles had to “travel backwards in time”. Let us compare the nova flash dates for the Second Roman Empire and the Roman Empire of the X-XIII century (see table below).

The nova flash dates for the Second Roman Empire and the Roman Empire of the X-XIII century

a. Middle Ages (Roman Empire of the X-XIII century A.D.)

■ *b. “Antiquity”* (The Second Roman Empire of the I-III century A.D.)

1*a.* We give a *complete* list of all nova and supernova flashes reflected in the documents of the X-XIII century empire epoch:

1. The flash of 1006 A.D.
2. The famous flash of 1054.
3. The flash of 1184.
4. The flash of 1230.

■ 1*b.* Below find a *complete* list of all nova and supernova flashes reflected in the documents of the Second Empire (the alleged I-III century A.D.):

1. ?
2. The evangelical flash of 1 A.D.
3. ?
4. The famous flash of 185 A.D.

Commentary. As we have already seen, a chronological shift of 1053 years leads to the mutual superimposition of the events that took place in the Second Roman Empire over those of the Holy Roman Empire that existed in the alleged X-XIII century, identifying them as each other’s duplicates. It would be interesting to find out whether a shift of 1053 years should give a superimposition of star flash dates, or phantom reflections of the flashes that were observed in the X-XIII century Roman Empire. The answer happens to be in the positive (see fig. 2.13).

2*a.* The flash of the alleged year 1054 A.D.

■ 2*b.* The flash of the alleged year 1 A.D.

Commentary. The dates of these flashes correlate ideally if we’re to consider the 1053-year shift.

3a. The flash of 1054 was visible “in the eastern sky”, according to mediaeval chronicles. Quoting by [703].

■ 3b. The flash of 1 A.D. was visible “in the East”, according to the Gospels (Matthew 2:2 and 2:9). Concurs well with the data presented on the left.

4a. The flash of 1230.

■ 4b. The flash of 185.

Commentary. These flashes get superimposed over each other if we’re to consider a 1053-year shift, the difference being a mere 8 years.

5a. The flash of 1230 lasted for 6 months ([703]).

■ 5b. The flash of 185 lasted for 7 months ([703] and [978]).

Commentary. Thus, we discover that the entire list of flashes with their characteristics as given for the Second Roman Empire is derived from several flashes observed in the Holy Roman Empire of the X-XIII century shifted 1053 years backwards in time. Thus, half of mediaeval flashes observed in this epoch drifted backwards in time and ended up in the “antiquity” instead of the Middle Ages (see fig. 2.13)

Fig. 2.13 Nova and supernova flash chronology according to the Scaligerian chronology. It is plainly visible that a 1053-year shift shall identify the Evangelical Star of Bethlehem as the famous supernova explosion dated to 1054 A.D., by the modern historians, for instance. The real explosion took place in mid-XII century, around 1152 A.D. It was subsequently misdated to 1053 A.D. by the mediaeval chronologists who were of the opinion that Christ wasn’t born in 1152 A.D., but rather 1052 A.D. (qv in our book entitled *King of the Slavs*. The Nativity date was then shifted by an additional 1000 years, transforming into 1 A.D. Taken from [395], [703] and [978].

6a. The famous supernova flash of 1054 was observed in the Taurus constellation (The Great Soviet Encyclopaedia, 3rd edition, Volume 23, page 53). “A most amazing example of what supernova explosion remnants may look like is the Crab nebula which is located where the Chinese and Japanese chronicles reported a bright supernova explosion in 1054” (GSE).

■ 6b. The famous flash – the Star of Bethlehem that could be observed when Jesus Christ (Andronicus) was born (Matthew 2). Representations of this star can often be found in Christian iconography, as well as mediaeval art and literature in general. Many chronologists tried to date the Nativity with the aid of this outstanding and scarce astronomical phenomenon, but to no avail, since they were looking for the star in the wrong century; as for the XI – there hardly is any point in looking for it here, it is known quite well already. In reality, this flash took place a century later, around 1150, qv above. Mediaeval chronologists have first misdated it to the XI century instead of the XII, and then aggravated the error, dating it to the I century A.D.

We have demonstrated the parallelism between the “biographies” of Jesus Christ (Andronicus) from the XII century and “Pope Gregory Hildebrand” from the XI. Let us reiterate that Italian Rome had apparently not been founded yet, and the events known as “Roman” nowadays really took place in the New Rome on the Bosphorus, or Constantinople. Later on, when Byzantine events migrated westwards (on paper), Jesus Christ (Andronicus), who had preached in the New Rome in the XII century A.D. and suffered there, became reflected in Italian history as “Pope Hildebrand”.

Corollary. Jesus Christ, also known as the Byzantine emperor Andronicus who had lived in the XII century A.D., became reflected in the Scaligerian version of Roman history as “Pope Hildebrand” from the alleged XI century.

6.5. The Crucifixion of Jesus on Mount Beykos, or the evangelical Golgotha, which is located outside Constantinople, near the shore of the Bosphorus

Where did the events described in the Gospels really take place? Let us point out a very interesting and important fact directly related to this issue.

The Turkish historian Jalal Assad in his book entitled *Constantinople* ([\[240\]](#)) tells us

that right outside Constantinople, on the Asian coast of Bosphorus straits, one finds “the tallest hill of the Upper Bosphorus. On top of this hill (180 metres above the sea level) there is *the grave of Joshua son of Nun, or Ioushah*” ([\[240\]](#), page 76).

However, according to our reconstruction, Joshua son of Nun is merely another name of Jesus Christ (Andronicus), qv below; one can thus suggest that this tallest hill of the Upper Bosphorus might really be the famous Golgotha where they crucified Christ.

Since we doubt that all of our readers have heard or read about the “grave of Joshua son of Nun”, we shall tell its story in brief. Jalal Assad, the famous Muslim author of the XIX century tells us that “if one is to follow the Asian coast of the Bosphorus, one comes to a small bunder by the name of Sutluge, which is where the path to the tallest hill of the Upper Bosphorus. On top of this hill (180 metres above the sea level) there is *the grave of Joshua son of Nun, or Ioushah*... There are many different superstitions concerning this *gigantic grave*, which is four metres long and half a metre wide. According to one opinion, this used to be the bed of Heracles; some others deem this to be the grave of Amycus killed by Polydeuces [Polydes, or Pilates? – A. F.]. Muslims believe this to be the grave of Joshua, son of Nun. Many travel there... in hope of curing their ills.

One sees some Byzantine ruins on the top of this hill – possibly the ruins of the Church of St. Pantaleimon, as well as a holy spring... in the Byzantine epoch this place was called the Bed of Heracles... the renowned village of Beykos is located at the foot of this hill; this is where the Argonauts came to replenish their supply of food, and also the place where *king Amycus was killed*” ([\[240\]](#), pages 76-77).

Our reconstruction is as follows. Mount Beykos is most probably the famous Christian Golgotha. The “murder of king Amycus” at the foot of the hill would thus become identified as the crucifixion upon the Golgotha. The church, whose ruins we see on the hill, is none other but the famous Church of Resurrection that had been built on top of the Golgotha, according to the ecclesial tradition. It is well understood why the Argonauts – or, as we already understand, the crusaders – had to stop at this particular location.

This “grave” exists until the present day, and is considered a holy place. Locals call it the grave of saint Jushah, or Ioushah. That may well mean Jesus. What we see here nowadays is a flat 17 by 2 metre field. The graves of his kin are of a regular size and can be found all around this gigantic “sepulchre”. The plan of the “grave of Jesus” in its modern condition can be seen in fig. 2.14; one can also find the legends of St. Ioushah in [\[1181\]](#).

Fig. 2.14 A plan of Jesus' (Ioushah's) grave on top of Mount Beykos just outside Istanbul (modern condition).

However, this account of ours is far from being exhaustive. Near the grave of St. Ioushah, or Jesus, one finds three more gigantic graves about 7 or 8 metres long. One of them is the grave of Kirkklar Sultan, and it is concealed within a mausoleum of sorts, unlike the other two burial grounds, which one finds out in the open – the graves of the holy Uzun Elviya Leblebici Baba and Akbaba Sultan.

Apart from that, as some Beykos locals had told the author in 1995, there are 5 or 6 more of similar gigantic graves of saints on the other (European) side of the Bosporus. Could these “graves” be real or symbolic sepulchres of some of the Apostles of Jesus? We still know nothing of where most of them had been buried, after all.

So, could this “grave of St. Ioushah”, or Joshua, be the place where Jesus was crucified and the place where the Holy Sepulchre stood – the one sought by the crusaders?

It may be for some reason that “the main street of Constantinople led from the Forum of Arcadius and the first wall of the city to the Golden Gate, presently Isa-Kapusu, or the Gate of Jesus” ([240], page 67; see fig. 2.15). Could this be an indication that the evangelical events really took place in the New Rome? See more on the subject in [Chron5](#) and [Chron6](#).

Fig. 2.15 The Golden Gate of Czar-Grad (Constantinople). Taken from [\[240\]](#), inset between pages 128-129.

In [Chron6](#) we analyze the description of Daniel's voyage to the Golgotha in the Middle Ages. As we point out, in Daniel's rendition the place is closer to "the scene of the events" than to a real grave of Jesus. He calls in the "spot of the Crucifixion".

Therefore, what we can find on Mount Beykos is a monument that tells us Jesus was crucified on *this very spot* – possibly rebuilt; its survival is truly a mystery. The exceptional size of the grave is also easily explained by the fact that the fenced area doesn't surround the actual grave, but rather the place where the events took place. In this case, the 17 by 2 metre size is easily understood.

Our conception of evangelical events really taking place in the New Rome = Czar-Grad = Constantinople is confirmed by the established mediaeval tradition of painting the evangelical Jerusalem as a city with Ottoman crescents. In fig. 2.16, for instance, we see a mediaeval painting of Christ entering Jerusalem ([\[745\]](#), Volume 7, page 339 – The Aprakos Gospel, 1693). We see the city of Jerusalem in the background, with a distinct *Ottoman crescent* topping one of the spires, qv in fig. 2.17.

Fig. 2.16 Jesus Christ enters Jerusalem. One can clearly see the Ottoman crescent on the spire at the background.
Taken from [\[745\]](#), Volume 7, page 339. A 1693 Aprakos Evangelium. BAS archive #339, page 568, reverse.

Fig. 2.17 A close-in with the Ottoman crescent upon a spire. Taken from [\[745\]](#), Volume 7, page 339.

In fig. 2.18 we see a mediaeval picture of Pilate's trial of Jesus ([\[745\]](#), Volume 7, page 356 – The Aprakos Gospel, 1693). We see a turban with an Ottoman crescent on Pilate's head.

Fig. 2.18 Pilate's Judgement. Pilate is wearing a crescent-shaped turban. Taken from [\[745\]](#), Volume 7, page 356. A 1693 Aprakos Evangelium. BAS archive # 339, page 646.

We shall keep coming across the fact that a crescent with a star used to be the ancient symbol of Czar-Grad, or Constantinople. It is possible that it symbolized the Moon, which had obscured the Sun in the year of the crucifixion, together with the Star of Bethlehem that had flared up around 1150 and was misdated to 1054 by later chronologists. The crescent could symbolize the moon, or, alternatively, partially obscured solar disc during the eclipse.

Let us mention another fact that is of interest to us. In figs. 2.20 ([\[745\]](#), Volume 7, page 155) and 2.21 ([\[745\]](#), Volume 8, page 326) we see two mediaeval pictures of the evangelical Jerusalem (the Aprakos Gospel, 1693). We see tall chimneys over the rooftops. This implies the existence of furnaces in the evangelical Jerusalem – most probably heaters used to keep houses warm, which doesn't quite concur with the Scaligerian version that tells us Jerusalem was situated on the territory of modern Palestine, which is tropical enough to render heating unnecessary – however, it does occasionally snow in Istanbul, and it can get rather cold. At any case, smoke from chimneys indicates the evangelical Jerusalem to have been situated somewhat further to

the north than the Scaligerian version insists.

Fig. 2.20 A mediaeval illustration with a view of the Evangelical Jerusalem. The city has tall chimneys installed for heating purposes. Taken from [\[745\]](#), Volume 7, page 155. A 1693 Aprakos Evangelium. BAS archive # 339, page 241.

Fig. 2.21 A similar view of Jerusalem with smoking chimneys. Taken from [745], Volume 8, page 326. A 1693 Aprakos Evangelium. BAS archive # 339, page 725, reverse.

Let us conclude with a peculiar detail. Apparently, the true XII century dating of the Crucifixion had been recorded in various literary sources, which were later declared apocryphal and remained such for a considerable amount of time. In particular, the legend of Andrew the Apostle baptizing Russia near the end of the alleged X century (the XII century in reality) could be related to the recent Crucifixion. This tradition was reflected in the famous novel *Master and Margarita* by M. A. Bulgakov, who had

studied various apocryphal tales of Christ, which he had incorporated into his work. The fact that we are about to relate was pointed out to us by our readers, and it fits well into our reconstruction. The last 32nd chapter of Bulgakov's novel entitled "Forgiveness and Eternal Abode" mentions Boland leaving Moscow accompanied by his entourage and paying a visit to the Roman Procurator of Judea Pontius Pilate, who was serving his penance as a hermit perched upon a rock in a desolate land; Margarita expressed her amazement at the long term of this amercement in the following words: "Isn't twelve thousand moons for a single moon a little too much?" The events are supposed to take place in the late 1930's – the novel itself was finished in 1940.

Moons have been well known to stand for the so-called lunar or synodal months, which have passed since a certain event. Such a month equals 29.5 calendar days ([797], page 792). However, in this case we find 12,000 moons counted backwards from 1940 to equal 970.8 years and give us 969 A.D. as the approximate dating of the Crucifixion. If we are to think that a "moon" really equals a stellar lunar month equalling 27.3 calendar days ([797], page 792), this date shall be 1043 A.D. One way or another, the tradition which was voiced by M. A. Bulgakov in a somewhat clandestine manner indicates the Crucifixion to have occurred in either the X or XI century. This mediaeval tradition is some 100-150 years off the mark, since it indicates the phantom XI-century dating instead of the real XII-century one. This circumstance proves nothing per se, but becomes understandable enough if we are to consider some of the facts that are known to us.

7.

Identifying Livy's "ancient imperial Rome" as the Third Roman Empire after a 1053-year shift

In the preceding paragraphs we have given brief descriptions of several dynastic parallelisms that emerge from the "Scaligerian History Textbook", which are really the manifestations of the chronological shifts with values equalling 333, 1230 and 1053 years. We shall carry on with our discussion of the 1053-year shift. We shall relate this method of restoring the correct datings in more detail below – a brief version can be found in Chapter 6 of [Chron1](#).

Let us regard the history of "ancient" and mediaeval Rome. The parallelism that we are about to relate covers 1300 years, no less. It serves to "identify" the mediaeval Rome as its "ancient" double. We learn that one has to move the "ancient" dating of Rome's foundation (around the alleged year 753 A.D.) forwards in time by 1053 years, which transposes it to approximately 300 A.D. This is how the 1053-year shift manifests itself; bear in mind that the hypothesis about Diocletian, who is supposed to have ruled in the alleged years 284-305 A.D., was already suggested by N. A. Morozov in [\[544\]](#). However, this hypothesis had proved erroneous. Our hypothesis shows that this millenarian shift forward in time is far from sufficient. We shall have to move it even closer to our age – by a further 1000-1050 years. Therefore, the true dating of the foundation of Rome in Italy shall fall on the XIV century A.D. See [Chron6](#) for more details. However, we aren't concerned with this shift at the moment – let us just concentrate on the very first step, which is interesting by itself and deserves to be covered separately.

So as not to bind ourselves by any additional hypotheses, we shall be formal enough in the demonstration of the parallelism that we have discovered. We shall simply superimpose Livy's *ab urbe condita* date (counted off the alleged foundation of Rome in Italy) over 300 A.D. (instead of the 753 B.C. dating prevalent in Scaligerian history). We shall then proceed forwards along the chronology of events as reflected in "ancient" and mediaeval sources, comparing them to one another with the aid of the same universal chronological formula that we shall abbreviate to $T = X + 300$. X stands for the *ab urbe condita* dating according to Titus Livy and other "ancient" sources, whereas T represents the Scaligerian A.D. dating. We thus suggest considering the date of

Rome's foundation to be 300 A.D. This "uniform rigid formula" was discovered when we were processing form-codes and compiling the global chronological map.

In other words, the formula that we transcribe as $T = X + 300$ is a somewhat different representation of the same chronological shift of 1053 years.

It is extremely important that the superimposition of the "ancient" Roman history over its mediaeval original as suggested by this formula is confirmed by the discovered parallelism of compared events. That is, "ancient" and mediaeval Roman events that the "Scaligerian textbook" separates by a period of about 1053 years turn out to be extremely similar to each other. A more formal way of putting it would be to say that these events possess extremely similar form-codes; this ongoing parallelism turns out to cover a very long time interval very methodically – an interval of 1300 years, to be precise.

A) According to the $T + X + 300$ formula, all 244 years of Livy's "Ancient Royal Rome" ([\[482\]](#)), or the First Roman Empire in our terminology, become identified as the interval that covers the alleged years 300-552 A.D. – that of the Third Roman Empire in the West.

B) The seven kings described by Titus Livy ([\[482\]](#)) are really a collection of generalized aliases, or terms used for referring to the seven consecutive epochs of the Third Roman Empire. We find out that every such epoch is represented in Livy's work by a biography or two from the imperial history of the Third Empire. As we find out, Livy concentrates on these emperors and hardly mentions any other rulers from the epoch in question, either ignoring or being ignorant of them.

C) We learn that the form-codes of the First and the Third Roman Empire demonstrate a very obvious parallelism.

We shall present the seven epochs (Livy's "kings") below, also providing their "translations" into the terms of the Third Roman Empire, qv in figs. 2.24 and 2.25. See the discussion of dates and reign durations for the emperors of the Third Roman Empire in [Chron2](#), Chapter 1.

Fig. 2.24 The parallelism between the “ancient” First Roman Empire (Regal Rome as described by Titus Livy) and the “ancient” Third Roman Empire.

Fig. 2.25 A superimposition of the “ancient” First Roman Empire and the “ancient” Third Roman Empire with a rigid shift of roughly 1050 years.

1a. *Romulus Quirin*: the alleged years 300-337 A.D. after a shift of 1053 years.

■ 1b. *Constantine I the Great*.

2a. *Numa Pompilius*: the alleged years 380-423 A.D. after a shift of 1053 years.

■ 2b. *St. Basil the Great*, or the Great King (since Basil = Basileus, or simply “King”).

3a. *Tullus Hostilius*: the alleged years 380-423 A.D. after a 1053-year shift.

■ 3b. *Valentinian II + Honorius*. Alternatively, we can take *Theodosius I* – the co-ruler of Valentinian.

4a. *Ancus Marcius*: the alleged years 423-444 A.D. after a 1053-year shift.

■ 4b. *Aetius*.

5a. *Tarquin the Ancient*: the alleged years 444-476 A.D. after a 1053-year shift.

■ 5b. *Valentinian III + Ricimer*.

6a. *Servius Tullius*: the alleged years 476-526 A.D. after a 1053-year shift.

■ 6b. *Odoacer + Theodoric*.

7a. *Tarquin the Proud*: the alleged years 526-552 A.D. after a 1053-year shift.

■ 7b. *The royal Gothic dynasty*: from Amalasuntha to Teia.

The comparison of reign durations with the numbers indicated by Titus Livy ([\[482\]](#), Book 1) shall give us the following: 37-37, 43-43, 32-43, 24-21, 38-32, 44-50 and 25-26. A calculation of proximity coefficients gives us 10–4. Let us compare the general duration of the “Regal Rome” epoch as described by Livy with the length of the Third Empire period that we are considering presently (300-552 A.D.). This duration equals 252 or 246 years if we are to begin counting from the first reign year of the first Emperor – Constantine I the Great. Livy indicates the duration of 244 years. Thus, the two durations – 244 according to Livy and 252 – differ from 246 by a mere 3%.

One cannot fail to notice that the special attention received from the part of Livy by some of the epochs we discovered correlates quite unequivocally with their division into intervals bordering on periods of *great civil unrest*. We have already considered these intervals in our comparison of the Second Empire with the Third. If we are to calculate the amount of years covered by the abovementioned emperors of the Third Empire in the epoch of 300-552, we shall get the duration of 242 years as a result! Titus Livy reckons the period to equal 244 years. The reign duration correlation is virtually ideal. We see that Livy had simply summed up the reign durations of the Third Empire’s rulers that we mention.

Let us now cite a brief table of this biographical parallelism, only pointing out its most important moments. See more details concerning the rulers of the Third Roman Empire as well as the kings of Israel and Judea above – in Chapter 1 of [Chron2](#). We use the letter “a” to denote Livy’s “Regal Rome”, or the First Empire; “b” stands for the Third Roman Empire, and “c” – for the Biblical Israelite reign and the Kingdom of Judea.

1a. *The First Roman Empire*. The epoch of Romulus Quirin according to Livy.

■ 1b. *The Third Roman Empire*. The alleged years 300-337 A.D. The main representative of the epoch is Constantine I the Great: the alleged years 306-337 A.D.

■ ■ 1c. *Israel and Judea*. The epoch of Jeroboam I and Rehoboam.

1.1a. *The First Empire*. Livy tells us that the founder of Rome was called Romulus ([482], Book 1:7, page 11). Eutropius the historian also writes that “having founded Rome, the city that he had named after himself, Romulus proceeded to do the following...” ([269], page 8). Thus, the capital is named after its founder: RM = RML sans vocalizations. Apart from that, Romulus had a brother by the name of Remus, whose name is virtually identical to the word “Rome”. We shall also mark that there were no other capital foundations in the history of the Regal Rome after Remus.

■ 1.1b. *The Third Empire*. Constantine I founds the new capital that he calls New Rome (allegedly moving it to that site from elsewhere). This city is supposed to have been called Constantinople in the Middle Ages. Here we see another case of a capital named after its founder (Constantine). It is very noteworthy that mediaeval chronicles actually mention the parallelism between Constantine the Great and the “ancient” Romulus, calling the Temple of Constantine I in Rome the Temple of Romulus ([196]). See more details above in [Chron1](#), Chapter 7. There were no other capitals founded in the Third Empire (300-552) after Constantine.

■ ■ 1.1c. *Israel-Judea*. Jeroboam I, the double of Constantine I, moves the capital of the state to the town of Sichem and thus becomes the founder of a new capital, qv above, in Chapter 1 of [Chron2](#). No other capitals were founded in the Kingdom of Israel after Jeroboam I.

1.2a. *The First Empire*. Romulus rules jointly with his brother Remus ([482], Book 1:6-7). Romulus kills Remus subsequently ([482], Book 1:6-7, page 11). After the murder of Remus, Romulus remains the single head of state ([482]). Mark that the non-vocalized versions of the names of the two founders, Romulus and Remus, are rather similar: RML and RM.

■ 1.2b. *The Third Empire*. Constantine I rules together with Licinius. Soon Constantine I makes Licinius suffer bitter defeat at Hellespont, and the Licinius is killed during his battle with Constantine the Great. After the death of Licinius

Constantine remains the sole ruler of the state, qv in [Chron2](#), Chapter 1. The names of Constantine and Licinius bear no semblance to each other.

■ ■ 1.2c. *Israel-Judea*. Jeroboam I rules together with Rehoboam. They had been at war basically all the time of their joint rule, qv in [Chron2](#), Chapter 1. Unvocalized names of Jeroboam and Rehoboam, the finders of the kingdoms of the Israelite and Judea are virtually the same: RBM and RBM.

1.3a. *First Empire*. The notorious “rape of the Sabines” happens under Romulus (the Romans were short of wives, and are thus forced to abduct women from a neighbouring tribe). This event occurs in the epoch of Rome’s foundation.

■ 1.3b. *Third Empire*. We find no such event in the Third Empire.

■ ■ 1.3c. *Israel-Judea*. Right before the beginning of the Israelite reign the Bible contains the well-known legend of “the rape of the daughters of Shiloh (Judges 21:21-25). This event is perfectly analogous to the Roman “rape of the Sabine women”. The sons of Benjamin also had a shortage of wives; then this tribe of Israel carried off the women of another tribe. A more detailed comparison of the Biblical description of this event with the Roman shall be given below.

1.4a. *First Empire*. Romulus Quirin was deified alive ([\[482\]](#), Book 1:16). One should remember that “quirin” translates as “divine” ([\[544\]](#)). Quirin was rapt up into heaven when he died. Livy tells us “everybody praises Romulus as a divine entity and a son of a deity [sic! – A. F.], King and Founder of Rome; he is often addressed in prayers” ([\[482\]](#), Book 1:16, page 27). This point of view is manifestly Christian and evangelical – suffice to remember Christ rapt into heaven, qv in the Gospels.

■ 1.4b. *Third Empire*. Constantine the Great was also proclaimed divine while alive (see [Chron2](#), Chapter 1). Christian church ranks him among its saints. Arianism, the Christian analogy of “Jeroboam’s heresy”, flowers in his lifetime, qv above. St. Basil the Great was born around 333 A.D., near the end of Constantine’s life (who is supposed to have died in 337 – see [\[544\]](#), Volume 1. Legends about him are virtually identical to what we know about Jesus Christ ([\[544\]](#), Volume 1). Therefore, the “phantom biographies” of St. Basil the Great and Constantine I cast an evangelical glow over each other.

■ ■ 1.4c. *Israel-Judea*. The Biblical “double entry” system (see [Chron1](#), Annex 6.4) of the kingdoms of Judah and Israel allows us to estimate that the Judaic king Asa, the double of St. Basil the Great, began his reign two years before the rule of

Jeroboam I had ended. In other words, when Jeroboam I, the double of Romulus and Constantine I, was nearing death. Therefore, the Bible also tells us Asa (Jesus?) had lived in the epoch of the first “great king” Jeroboam I.

1.5a. *First Empire*. Sometime after his ascension into heaven, Romulus “comes down to Earth all of a sudden” ([482], Books 1:16 and 26) and appears before a Roman by the name of Proculus Julius. Romulus pronounces a hortation before his disciples, and then returns to heaven. Livy tells us that “he had uttered those words and ascended into the heavens” ([482], Book 1:16, page 27).

■ 1.5b. *Third Empire*. No ascension into heavens is mentioned in St. Basil’s “biography”.

■ ■ 1.5c. *Israel-Judea*. Gospels tell us about Jesus returning to Earth after the Crucifixion. “After these things [the ascension, that is – A. F.] Jesus shewed himself again to the disciples” (John 21:1). Jesus, who has returned to Earth, converses with his disciples, and ascends into heavens again, this time for good. “And it came to pass, while he blessed them, he was parted from them, and carried up into heaven” (Luke 24:51).

Commentary. Thus, we see that the legends placed at the end of the biography of Romulus by Titus Livy are of an evangelical nature, and may contain references to both Jesus and Constantine the Great. Let us now give a more detailed comparison of the two stories: Livy’s, which tells us about the rape of the Sabines, and the Biblical legend of the daughters of Shiloh.

1.6a. *First Empire*. The events take place in the recently founded city of Rome, in the reign of King Romulus, the epoch of Regal Rome’s naissance (according to Livy), or the very beginning of the First Roman Empire in our terminology. There was a shortage of women in Rome, which had made the prospects of progeny and procreation look grim ([482], Volume 1, pages 15-16).

■ ■ 1.6c. *Israel-Judea*. The event precedes the formation of the Israelite Kingdom immediately: “In those days there was no king in Israel” (Judges 21:35). The tribe of Benjamin lost its women in a war, and was thus on the brink on extinction (Judges 21:16-25).

1.7a. *First Empire*. Romulus sends delegations to neighbouring tribes and asks

those to send some of their women to Rome ([\[482\]](#), Book 1). The ambassadors face a hostile reception; none of the nations in the vicinity of Rome concede to provide the Romans with wives ([\[482\]](#), Book 1).

■ ■ 1.7c. *Israel-Judea*. The Bible tells us that all the tribe's elders had gathered together in order to decide what to do about wives for the tribe of Benjamin, having asked other tribes of Israel for help (Judges 21). Their pleas didn't lead anywhere: "Then the elders of the congregation said... we may not give them wives of our daughters: for the children of Israel have sworn, saying, Cursed be he that giveth a wife to Benjamin" (Judges 21:16, 21:18).

1.8a. *First Empire*. The Romans proceeded to organize festivities and invite the inhabitants of nearby settlements together with their wives and children. Livy writes that "the entire Sabine tribe came together with their wives and their offspring" ([\[482\]](#), Volume 1, Book 1:9, page 16). The ulterior motivation behind the feast had been the abduction of women. There may be a proximity pattern between the unvocalized "Sabine" and "Benjamin" – SBN and BNMN without vocalizations, respectively.

■ ■ 1.8c. *Israel-Judea*. According to the Bible, "there is a feast of the Lord in Shiloh yearly... Therefore they commanded the children of Benjamin, saying, Go and lie in wait in the vineyards... and, behold, if the daughters of Shiloh come out to dance in dances... catch you every man his wife of the daughters of Shiloh" (Judges 21:19-21).

1.9a. *First Empire*. In the middle of the celebrations the Romans seize foreign women and abduct them. This is how they obtained wives and secured a legacy, and this is also the beginning of how the Romans began to dwell in their new City ([\[482\]](#), Book 1:9). According to Livy, the Rape of the Sabines took place in Italy ([\[482\]](#), Book 1). Furthermore, Livy is of the opinion that the founders of Rome were the offspring of the Trojans who had initially disembarked at Sicily after having fled Troy, which was destroyed by the Greeks ([\[482\]](#), Book 1:1, pages 3-4). Therefore, the founders of Rome could be referred to as "the sons of Sicily" or "Sicilians". We should also bear in mind that the "ancient" authors Hellanicus and Damastes claimed Rome to have been founded by Odysseus and Aeneas ([\[579\]](#), page 23).

■ ■ 1.9c. *Israel-Judea*. The Bible tells us that "the sons of Benjamin did so, and took them wives, according to their number, of them that danced, whom they caught:

and they went and returned unto their inheritance, and repaired the cities, and dwelt in them” (Judges 21:23). N. A. Morozov suggests that it might be possible to identify the Biblical tribes as the mediaeval European nations in [\[544\]](#); his localization of said tribes differs from the Scaligerian to a large extent. The “sons of Benjamin” thus became identified as the inhabitants of Italy and Sicily; is it therefore possible that the “daughters of Shiloh” were really the “daughters of Sicily”.

2a. *The First Roman Empire*. The epoch of Numa Pompilius according to Livy. It is possible that “Pompilius” conceals the name of Julian or Elias and that Livy is really referring to Julian the Great.

■ 2b. *The Third Roman Empire*. The epoch of the alleged years 337-380 A.D. The absolute protagonist of this epoch is St. Basil the Great, or the Great King (the alleged years 333-378). This happens in the reign of the Roman emperor Julian who allegedly reigned in 361-363. A biographical parallelism between Julian and St. Basil can be found in [\[544\]](#).

■ ■ 2c. *The Bible*. Here we have Asa, king of Judah (Jesus?) As we have already mentioned, he appears to be the double of Basil the Great. See more about the superimposition of the Kingdom of Judah over the Third Roman Empire in the East in [Chron1](#), Chapter 6.

2.1a. *First Empire*. Livy characterizes Numa Pompilius as a just and pious ruler, and tells us that “Numa... was a man most experienced in laws secular as well as ecclesial” ([\[482\]](#), Book 1:18, pages 30-31). Numa became enthroned in Rome as a result of divine intervention from the part of Jupiter ([\[482\]](#), Book 1:18). Titus Livy relates Numa’s affairs of the state at length; all of them appear to be of a conspicuously ecclesiastical character ([\[482\]](#), Book 1).

■ 2.1b. *Third Empire*. St. Basil the Great (or the Great King) is considered to be one of the central figures in Christian hagiography. He is said to have instigated the modern procedure of officiation – the so-called “Liturgy of St. Basil the Great”. As we already pointed out above, Basil is very likely to be a double of Jesus Christ who had lived in the XII century. Legends of Basil the Great usually mention his ecclesiastical activities and their impact on the history of the Third Empire.

■ ■ 2.1c. *Israel-Judea*. Jesus Christ is sent to Earth by the Almighty Father with a mission of ministration. The Gospels are focused on Christ’s religious activities primarily; the tales of “Pope” Gregory VII Hildebrand (one of the XI century

reflections of the XII-century Jesus) are all of a similar nature.

2.2a. *First Empire*. Numa Pompilius manages to implement a major calendar reform. He divides the year into 12 months, having also introduced intermediate months so as to make the calendar conform to climatic changes and the solar year ([482], Book 1:19). What this reform resembles the most is the introduction of the Julian calendar with its leap year system. According to Livy, “it was he who had made the distinction between days when there was service, and those when there was none” ([482], Book 1:19). This may be a reference to the Sundays introduced into the week. “The death of Numa led to an interregnum” ([482], Book 1, page 36). It is peculiar that Livy tells us nothing of Numa’s death. The reason may be that Livy had already assigned these details (including the “ascension into heaven” to the final period of Romulus’ reign.

■ 2.2b. *Third Empire*. Scaligerian history is of the opinion that the Julian calendar was introduced by Julius Caesar in the alleged I century B.C., or at the very dawn of the Second Roman Empire. However, due to the parallelism between the Second Empire and the Third, the introduction of the Julian calendar falls onto the epoch of Constance I Chlorus, the double of Julius Caesar – the alleged years 305-306 A.D. This date is close to the epoch of the alleged years 333-378 – the “reign” of St. Basil the Great. We should also keep in mind the partial superimposition of Julian Caesar (the alleged years 361-363) over Julius Caesar. The death of Basil the Great in the alleged year 378 led to a period of *interregnum* – there was an upheaval that year, qv in [Chron2](#), Chapter 1. What we see is a parallelism between the events contemporary to Numa as described by Livy, and the ones that were happening at the foundation of the Third Empire. We shall emphasize that none of these events could have happened before the XII century A.D., according to the global chronological map as presented in Chapter 6 of [Chron1](#).

3a. *The First Roman Empire*. The epoch of Tullus Hostilius according to Livy.

■ 3b. *The Third Roman Empire*. The epoch of the alleged years 380-423 A.D. Valentinian II (378-392) or Theodosius I (379-395) and Honorius (395-423).

3.1a. *First Empire*. The beginning of Tullus’ reign is marked by a series of wars with the Alvanoi ([482], Book 1:23, page 37). The Alvanoi attack the Roman region with a great number of troops. Tullus launches a campaign against the “perfidious”

Alvanoï ([482], Book 1:23). The Alvanoï are then united by the dictator Mettius Fufetius ([482], Book 1:23, page 37).

■ 3.1*b. Third Empire.* The parallelism between the Third Empire and the Second tells us that the double of Theodosius I in the Second Empire is Emperor Domitian. At the very beginning of his reign, Theodosius (Domitian) enters his first large-scale military conflict with the “Albanians”. We learn that “the Roman provinces of the Balkan peninsula were under threat of invasion” ([327], page 314). The Albanians (or Dacians) rebelled. Under Theodosius I the Albanian Goths did likewise. The Dacian Goths unite under the leadership of Decebel. “Decebel”, or “Dacibel” might be derived from “Dacians” and the word “bellum”, or war.

3.2*a. First Empire.* The “ancient” Alvanoï soon sign a truce with Tullus ([482], Book 1:24-25, page 40). However, they break the pact soon enough, initiating a second war with Rome, which leads to a defeat of the Alvanoï ([482], Book 1:29-30, page 50).

■ 3.2*b. Third Empire.* The Albanians, or the Dacian Goths, negotiate a truce with Theodosius-Domitian (under Valentinian II, qv in [327], page 444). A short while later, the Albanians (Dacians-Goths) denounce the truce, and another war with Rome begins under Honorius. This time the famous Alaric comes from the Balkans ([767], Volume 2, page 793).

3.3*a. First Empire.* Towards the end of Tullus’ reign – under Honorius, if we’re to bear the parallelism in mind, or in the alleged years 395-423 A.D. – “one would often observe *stones hailing from the skies* near the Alvanoï Mount... people were sent to study this miracle... indeed, there were rocks falling from the sky... they heard *a terrifying voice* from the grove that stood on top of the mountain that ordered the Alvanoï to occupy themselves with holy ceremonies... impressed by this miracle, the Romans themselves made sacrifices for nine days in a row” ([482], Book 1:31, pages 52-53). According to the Scaligerian version of the story, the Alvanoï Mountain is in Italy. Apparently, Livy refers to a volcanic eruption that took place somewhere upon that peninsula. There is indeed a volcano here, a single one on the mainland – the Vesuvius.

■ 3.3*b. Third Empire.* One of the famous eruptions of the Vesuvius took place in the alleged year 79 A.D. The parallelism between the Second Empire and the Third places this eruption into the epoch of Honorius (395-423), making it cover the

interval between the alleged years 409 and 420 A.D. – most probably in 412 A.D. Vesuvius is the famous volcano in Italy that is located near Rome. This powerful eruption had led the town of Pompeii to an untimely demise. If we're to count 79 years forwards starting from 333 A.D., or the “date of birth” of Basil the Great, the double of Jesus Christ (also known as the beginning of the “new era”), we shall come up with the year 412, or the very end of the epoch of king Tullus, according to Titus Livy. It is however necessary to state it explicitly that the eruptions of the alleged years 79 or 412 are really phantom reflections of a *later* eruption of Vesuvius. It is possible that the archetypal eruption had been the one that occurred in 1138-1139 A.D. The chronological shift here equals exactly 1053 years. However, the real prototype of the “Pompeian eruption” must have been the more recent eruption of the Vesuvius dating to either 1500 or even 1631, qv below.

4a. *The First Roman Empire*. The epoch of “Ancus Marcius” (according to Livy).

■ 4b. *The Third Roman Empire*. The epoch of the alleged years 423-444 A.D. Aetius.

4.1a. *First Empire*. After King Tullus, the Roman throne is succeeded by Ancus Marcius ([482]). However, a short while later a certain Lucumon appears in Rome, who soon changes his name to L. Tarquin the Ancient, alias Tarquin Priscus ([269], page 9). He is reckoned to have been of “an Etruscan origin” ([269], page 319). Also see Livy, Book 1:34 Tarquin began to gather great influence in Rome ([482], Book 1:34, pages 58-59). One has to point out that the name of Ancus Marcius might be close to the name Aetius.

■ 4.1b. *Third Empire*. Aetius becomes the de facto ruler in the West of the Third empire between the years of 423 and 444, qv in [Chron2](#), Chapter 1. However, the balance of powers in Rome slowly but steadily shifts in favour of the young Valentinian III, who had been in custody of Aetius ([767], Volume 2; also [64]).

4.2a. *First Empire*. L. Tarquin the Ancient subsequently becomes king of the “ancient” Rome and succeeds Ancus Marcius on the throne, having successfully shifted the power balance in his own favour ([482], Book 1). We see two characters here: the Roman Ancus Marcius, and L. Tarquin the Ancient – an alien or a “barbarian”, since he came from another country far away ([482], Book 1:34).

■ 4.2b. *Third Empire*. Valentinian III subsequently becomes the Emperor of Rome

and seizes power. He eventually pushes his custodian Aetius away from the throne. What we see here is another pair of political leaders whose destinies are twined: the first one is Aetius, a “barbarian by birth” ([64], pages 33 and 40). He came to Rome from a distant land. The other character is the Roman Valentinian III. When we compare this with Livy’s description, we notice that in this particular manifestation of the parallelism the terms “Roman” and “barbarian” are obviously swapped.

4.3a. *First Empire*. L. Tarquin the Ancient had been accompanied by his wife Tanaquil, “a patrician by birth” ([482], Book 1:34, page 59). She had a great influence on L. Tarquin the Ancient. Tanaquil was very eager to seize power in Rome, and kept impelling her husband to engage in this activity. Livy tells us that “his pride was constantly fuelled by his wife Tanaquil... who would not allow the position of her husband to be any lower than that of her own family” ([482], Book 1:34, page 59).

■ 4.3b. *Third Empire*. We observe the same thing to happen in the Third Empire. Next to Valentinian III we see his mother and official custodian Placidia, who had herself been under the influence of Aetius. Placidia is the Emperor’s mother, her family is therefore aristocratic by definition, as Livy duly notes when he describes her as “Tanaquil”.

4.4a. *First Empire*. According to Livy, “he [L. Tarquin the Ancient – A. F.] soon transformed his acquaintance with the king into a strong friendship... being his advisor at meetings social as well as private, civil as well as military” ([482], Book 1:34, page 60). Also: “Tried and tested in every which way, he [L. Tarquin the Ancient – A. F.] even became... the custodian of the King’s children” ([482], Book 1:34, page 60).

■ 4.4b. *Third Empire*. It is natural that the relationship between the young Valentinian III and his custodian Aetius had initially been very much like a family bond; Livy is correct to call him the custodian of the royal offspring since Valentinian III is the son of Placidia. Historians tell us that “until Valentinian III had reached the age of 27 years (in 444), no one ever doubted the right of Aetius to rule the state” ([64], page 35). If we are to compare this version with Livy’s, we shall see that the custodian and the child in custody have swapped places.

4.5a. *First Empire*. The very fact of such “custody” is unique for the history of the

“Regal Rome”. No other ruler of the First Roman Empire is characterized in this manner (according to Livy). Ancus Marcius had ruled for 24 years ([\[482\]](#)). This concurs perfectly with the Biblical information about his double, qv below.

■ 4.5b. *Third Empire*. The custody in question as described above is a unique occurrence in the history of the Third Roman Empire. No other emperor of the Third Empire is described in this manner – that is, no one had ever been in custody of his mother and her powerful ally. Aetius had reigned for 21 years, qv in [Chron2](#), Chapter 1. However, the Bible actually reports a 24-year interregnum that falls on this epoch, qv in [Chron2](#), Chapter 1, and the “double entry” system as related in Annex 6.4 to [Chron1](#). In other words, the lengths of this period according to the Bible and Titus Livy coincide! We are beginning to understand that Titus Livy had been more familiar with the Biblical version of Rome’s history than its secular variety, and shall soon encounter more evidence to prove this.

4.6a. *First Empire*. Livy tells us that “at home as well as on the battlefield he [L. Tarquin the Ancient – A. F.] was accompanied by an experienced mentor, the king Ancus himself... and so he had studied Roman law and... had been emulous of everyone... including the king [sic! – A. F.]” ([\[482\]](#), Book 1:35, page 61).

■ 4.6b. *Third Empire*. Valentinian III continues to push Aetius aside, formally remaining in his custody. As Valentinian III grows older, the influence of Aetius diminishes.

4.7a. *First Empire*. L. Tarquin the Ancient finally seizes power in Rome. He addresses the Romans with a request [?] to elect him king instead of Ancus Marcius. Livy tells us that “the people voted in favour of vesting him with royal authority. This man... was pursued by the very same ambition when he came to the throne as had led him in his contest for the kingdom” ([\[482\]](#), Book 1:35, page 61).

■ 4.7b. *Third Empire*. Valentinian III finally seizes full power. In the alleged year 444 Aetius loses the last shreds of his influence after a series of military defeats. Valentinian III casts away the burden of custody ([\[64\]](#)). All of this happens while Aetius, or the “experienced mentor” (according to Livy) is still alive.

4.8a. *First Empire*. Titus Livy tells us nothing of how Ancus Marcius had lost his regal power. According to Livy, L. Tarquin the Ancient becomes emperor in a peaceful manner, with the consent of the people. For some reason, Livy tells us

nothing about the death of Ancus Marcius ([\[482\]](#)). Eutropius the historian tells us that Ancus Marcius had “expired of a disease on the 24th year of his rule” ([\[269\]](#), page 8).

■ 4.8b. *Third Empire*. Valentinian III gets full power after a very peaceful procedure. There was no coup in 444, the year when the power of Aetius the custodian was no more. Having seized power, Valentinian III soon kills Aetius in Ravenna with his own hands ([\[579\]](#)). As we can see, Livy remained silent about this for some reason.

Commentary. It is supposed that Livy localizes all these events in Italy. On the other hand, when we begin to compare them to the ones that took place in the Third Roman Empire, we begin to find out that other chronicles reckon some of these events at least to have happened in the New Rome on the Bosphorus, moving them to the East. This may be the aftermath of some confusion, or a deliberate distortion of history, when a lot of occurrences had migrated from Constantinople to Rome in Italy on paper.

5a. *The First Roman Empire*. The epoch of “Tarquin the Ancient” according to Livy.

■ 5b. *The Third Roman Empire*. The epoch of the alleged years 444-476 A.D. Valentinian III (444-455) and Recimer (456-472).

■ ■ 5c. *The Bible*. Menahem + Pekahiah = Pekah, acting as a double of Recimer here, qv in [Chron2](#), Chapter 1.

5.1a. *First Empire*. Tarquin the Ancient fights just one war with the Sabines, but it's a hard and bloody one. The war progresses unevenly and ends in a truce ([\[482\]](#), Book 1).

■ 5.1b. *Third Empire*. Valentinian III fights a single war with the notorious Attila the Hun, which proves a long and hard one. Success favours both parties erratically; finally, Rome signs a pact of peace with Attila, paying him a large tribute, qv in [Chron2](#), Chapter 1.

■ ■ 5.1c. *Israel-Judea*. The Biblical double of Valentinian III, Menahem, has just one war to fight with the king Phul or Thul, but this war is long and violent. Peace comes when Menahem pays tribute to Phul or Thul – as we have already pointed out, this barbaric king is most probably a double of Attila the Hun.

5.2a. *First Empire*. The end of the epoch of “Tarquin the Ancient” is abundant in political turmoil, as Livy tells us. Power struggle flares up in Rome; Tarquin the Ancient is assassinated in a conspiracy ([\[482\]](#), Book 1:40, pages 67-68).

■ 5.2b. *Third Empire*. In the Third Empire the end of this epoch (the alleged years 444-476) coincides with the reign of Recimer (456-472). This is one of the largest upheavals in the Third Empire. We see more power struggle, a series of temporary emperors on the throne shuffled by Recimer. After the death of Recimer (the alleged years 472-475), the Empire is shaken by a civil war, qv in [Chron2](#), Chapter 1.

■ ■ 5.2c. *Israel-Judea*. According to the Bible, this epoch ends with Pekah. “And Hoshea the son of Elah made a conspiracy against Pekah the son of Remaliah, and smote him, and slew him” (II Kings 15:30). Once again we see Livy’s version to be closer to the Biblical version than to secular Roman history.

6a. *The First Roman Empire*. The epoch of “Servius Tullius” according to Livy.

■ 6b. *The Third Roman Empire*. The epoch of the alleged years 476-526 A.D. Odoacer (476-493) + Theodoric (493-526 or 497-526).

6.1a. *First Empire*. Mark the name of this ancient king, which is “Servius”. It obviously resembles the name Severus, which we are about to encounter in the history of the Third Empire. Livy describes Servius Tullius as a very level-headed, intelligent and steadfast politician ([\[482\]](#)).

■ 6.1b. *Third Empire*. The name of Odoacer’s double in the Second Empire is Septimus Severus, whose name is somewhat similar to that of Servius. Both Odoacer and Theodoric are known to have been prudent rulers, unlike the emperors of the preceding anarchical period. A propos, Severus (Servius?) had a co-ruler by the name of Geta in the Second Empire (209-212). In the Third Empire king Theodoric is a Goth. Geta and Goth sound very similar.

7a. *The First Roman Empire*. The epoch of “Tarquin the Great” according to Livy.

■ 7b. *The Third Roman Empire*. The epoch of the alleged years 526-552 A.D. Gothic dynasty.

The parallelism between these two last epochs that we have discovered is an extremely vivid and obvious one, and it is of great enough importance for our analysis of the consensual global chronology to make us allocate a separate section for its discussion, qv below.

For the meantime, let us answer a question that one cannot evade under these circumstances. Which part of Livy's book describes events with parallels in the Third Roman Empire? In other words, how much of the information related by Livy remains unperturbed by all of the superimpositions listed above? In terms of form-codes, this question can be formulated as follows: what is the volume of section AK-34? See [Chron1](#), Chapter 5.

Let us point out that Livy's texts consist primarily of isolated short stories. Each of those relates a single episode. Livy hardly ever returns to past episodes; ergo, the value of $X = A/B$ is relatively easy to calculate, A being the volume (in pages, for instance) of the stories that contain parallelisms with the Third Empire, and B – the general volume of the fragment of Livy's *History* that we have been comparing to the Third Empire. We calculated the X value, which turned out to equal 67 per cent. In other words, *67% of Livy's text that describes the Regal Rome happens to be isomorphic with the history of the Third Empire*. It is possible that we have failed to discover all of the parallels. Apart from that, it is possible that the events related in the remaining 33% of Livy's text weren't reflected in any other mediaeval chronicles that our conception of the Third Roman Empire relies upon.

On fig 2.26 one sees a page from Livy's *Ab urbe condita* allegedly dating from the XV century ([\[1229\]](#), page 29). The illustrations look distinctly mediaeval, as well as the book in general. In the top left corner we see a battle between the "ancient" Romans, or the characters described by Titus Livy. All of them look like typical mediaeval knights in heavy armour and helmets with visors. Several mediaeval Christian coats of arms can be seen nearby, qv on the right and at the bottom. Historians are trying to convince us that mediaeval painters included these coats of arms into books with the sole objective of pandering to the tastes of their clients. However, these mediaeval coats of arms most probably reflect mediaeval reality – just like the pictures of mediaeval Roman knights found in the books of the mediaeval author Titus Livy.

Fig. 2.26 A page from an edition of Titus Livy's *Ab urbe condita* dating to the alleged XV century. "Ancient" Romans are portrayed as mediaeval knights; the pages of the book are all covered with mediaeval coats of arms – possibly belonging to the participants of the events described by Livy or their contemporaries. Vatican, Biblioteca Apostolica Vaticana, Arch. Cap. S. Pietro, page 132, fol. 65v. Taken from [\[1229\]](#), page 29.

Bibliography

1.

Identifying the Tarquinian War of the alleged VI century B.C. as the Gothic War of the alleged VI century A.D. with a 1053-year shift

The parallelism defined by the chronological formula $T = X + 300$ that we have already been following over a span of 200 years continues well into the VI century A.D. Remember that a comparison of dates with the aid of this formula is equivalent to a rigid chronological shift forward in time by about 1053 years. In fig. 2.27 we see a rough scheme of the new parallelism that we are about to relate herein.

Fig. 2.27 The parallelism between the Gothic War of the alleged VI century A.D. and the Tarquinian War of the alleged VI century B.C. A chronological shift of 1053 years.

1a. *The Tarquinian War.* King *Servius Tullius* (according to Livy).

■ 1b. *The Gothic War.* King *Theodoric the Goth*.

1.1a. *The Tarquinian War.* Servius Tullius is the *last* king who died when the Regal Rome had still existed ([482]). According to Livy, “he had involved himself in

affairs of peace... created the canon law, and there is a rumour amongst his offspring calling Servius the founder of the system of social estates and degrees... he had also founded the census, an institution that is most beneficial for the state” ([482], Book 1:42). Also: “even his kind and modest successor had found it hard to compete with his glory... which was also amplified by the fact that *the reigns based on law and order had ended with him*” ([482], Book 1:48).

■ 1.1b. *The Gothic War*. Theodoric had been the *last* emperor of the Third Empire in the West. His death in the alleged year 526 marks the beginning of a period of anarchy in Italy. Theodoric’s policy in domestic affairs, as we have already mentioned in Chapter 1 of [Chron2](#), was famous for its flexibility. He was the founder of the Ostrogothic kingdom, patronized arts and sciences, gave foreigners and Romans equal rights and instigated some great migrations ([579] and [196]). Caracalla, his double in the Second Empire, performs similar feats, qv in [Chron2](#), Chapter 1.

1.2a. *The Tarquinian War*. A shift forwards by 1053 years (following the formula $T = X + 300$), the death of Servius Tullius falls on the year 518 A.D. ([482]). We shall replace all of Livy’s *ab urbe condita* datings with the “new era” T-datings by the formula $T = X + 300$.

■ 1.2b. *The Gothic War*. Theodoric dies in the alleged year 526 A.D. If we compare this date with 518 A.D. for Servius Tullius, we shall see that the difference only equals 8 years. By the way, this is precisely the difference between the general time span covered by the Regal Rome and the Third Empire. What we thus see is a very good correlation of dates with the 1053-year shift taken into account.

2a. *The Tarquinian War*. Events that follow the death of Servius Tullius. The Tarquins come to power. The tale of Tullia and Lucretia according to Livy.

■ 2b. *The Gothic War*. Events that follow the death of Theodoric the Goth. The Ostrogothic dynasty of the Amalings coming to power. The tale of Amalasuntha and Matasuntha.

2.1a. *The Tarquinian War*. After the death of Servius Tullius, the power is inherited by his *daughter* Tullia and her consort Lucius Tarquin the Proud ([482], Book 1, pages 80-81; also [269], page 9. Many Tarquins group themselves around Tullia, Lucius Tarquin the Proud being one of them – their leader, after a manner

([\[482\]](#), Book 1). Let us point out the similarity between the names Tullia and Julia which we are about to study as a pair.

■ 2.1b. *The Gothic War*. After the death of Theodoric, the empire falls into the hands of his daughter Amalasuntha and the Amaling dynasty of the Ostrogoths. This dynasty is the double of Livy's Tarquinian clan. A large group of the Ostrogoths forms a party of avid supporters around Amalasuntha ([695]). The Ostrogoths constitute a clan impenetrable for the outsiders, likewise the Tarquins. Due to the parallelism between the Second Empire and the Third, Amalasuntha's double in the Second Empire is Julia Maesa, qv in [Chron2](#), Chapter 1. Her name (Julia) is similar to the one used by Titus Livy – *Tullia*. We must also emphasize that the name *Amalasuntha* can be a derivative of “*Amala-Santa*”, or *St. Amal* (or *Alan*, if we are to consider the flexion of N and M).

2.2a. *The Tarquinian War*. The reign of the Tarquins (between the death of Servius Tullius until the fall of Lucius Tarquin the Proud) equals 25 years. Tarquin the Ancient, the stranger who came to Regal Rome, may be an ancestor of Tarquin the Proud. According to [\[482\]](#), he is a foreigner. The name *Tarquin* is possibly a derivative from Terra Aquilonius, or “the northern land” ([237], page 88). Also, if we are to read the name *Tarquin* backwards – in the Hebraic or Arabic fashion – we shall get “*Neukrat*” (spelt phonetically); this may be a variation of “*Nov-Grad*”, or “*Novgorod*” (*the New City*). In this case, the name Tarquin may apply to someone from the New City. A propos, the Latin dictionary ([237]) fails to provide a translation for the name *Tarquin* for some reason. One also has to note that Tarquin the Proud fights a war with either a city or a state by the name of *Ardea* ([269], page 9). It might be a reflection of later mediaeval events – the war between Italy and the *Horde*, *Ardea* being a possible variation of the latter's name.

■ 2.2b. *The Gothic War*. The period when the Ostrogoths had been in power, begins with the death of Theodoric and ends with their final rout in the alleged year 552, thus equalling 26 years. We see a substantial propinquity between the values 25 and 26. One also has to mention that the Ostrogoths came to the Third Empire as a *foreign* nation, unrelated to the Italians. This is, what the famous mediaeval author Procopius tells us, at least. His book (*The Gothic War* – [237]) is a source that we shall be making numerous references to hereinafter. Now, the Goths presumably came to Italy *from the North* – “a northern land”. This indication concurs well with our suggestion that the name *Tarquin* really stood for “stranger *from the North*”. What

we get in this case is that the last king of the First Empire (according to Livy), L. Tarquin the Proud, is a collective personality that fills the entire “northern” dynasty reigning in the alleged years 526-552 A.D. All these events are most likely to reflect what happened much later, in the Middle Ages – qv in [Chron6](#).

2.3a. *The Tarquinian War*. The Tarquins are soon to be banished from Rome, qv below. Their name without vocalizations is transcribed as TRQN. One should bear in mind that there is a similar name Torquatus, translating as “Laurelled for Battlefield Valiance” ([237]). The name of the ruler preceding the Tarquins had been Servius. Thus, we have a pair of “key names” for this epoch – “*Servius*” (or *Severus*), and TRQN (without vocalizations).

■ 2.3b. *The Gothic War*. Shortly before the death of Theodoric, there were reports of repressive sanctions against Boetius and Symmachus, cf. with the prompt ousting of the Tarquins, qv above. The full name of Boetius turns out to contain the family names *Torquatus Severus* ([64], pages 45-46). Therefore, we learn of the existence of two powerful clans in the epoch of Theodoric and before him, in the alleged VI century A.D., by the names of Severus and Torquatus (or TRQN?). Also, the word *Severus* may be related to the Russian “*Sever*”, or “North” and mean “Stranger *from the North*”.

2.4a. *The Tarquinian War*. The clan of the Tarquins as described by Livy may be referred to by the unvocalized root TRQN (see discussion above).

■ 2.4b. *The Gothic War*. The *Franks* take part in the Gothic war of the alleged VI century as the allies of the *Goths*. Considering the flexion of F and T, the word “Frank” (FRNK, or TRNK without vocalizations) may be related to the unvocalized root of the name Tarquin, or TRQN. One should also remember a similar unvocalized version of the word Pharaoh (or “*Faraon*” in Russian) – TRN, which can also be found in the Bible as related to this epoch. Ergo, we can be relatively certain of the following: *in both wars*, Tarquinian as well as Gothic, the enemy of Rome was known by the name of TRQN or TRNK – therefore, Tarquins = Goths = Franks = People from the North (People from the New City). We shall also learn that there is also a superimposition of the mediaeval Franks over the “ancient” *Persians* (PRS unvocalized) to be taken into account. *France* still reads FRNC (or TRNK) unvocalized, whereas the name of its capital is *Paris*, or PRS without vocalizations, likewise the words *Persia* and *Prussia*. Unvocalized PRS could also be used for

referring to P-Russians, or White Russians (cf. with modern Byelorussians).

2.5a. *The Tarquinian War*. According to Livy, *Tullia hands the state over to Tarquin* ([482]). This reign is *still considered to belong with the dynastic sequence of Regal Rome*, Tarquin being the last ruler of the First Empire. However, *the Tarquins shall soon be dethroned and banished* ([482]).

■ 2.5b. *The Gothic War*. Amalasuntha (and her double in the second empire – *Julia Maesa*) *hands power over to her son, Amalaric the Goth*. This reign also *belongs to the sequence of the Third Empire*, since Constantinople recognized Amalasuntha (and Amalaric) as rightful rulers in the West of the Empire ([196], Volume 1). However, *the Goths were soon chased away from Italy*.

2.6a. *The Tarquinian War*. We see *Lucretia* next to *Tullia*. Both women are married into the Tarquinian clan, the former being the wife of Tarquin Collatine, and the latter espoused to Tarquin the Proud. Both women are of noble (royal) birth ([482]). They actively get involved in all proceedings concerning the throne of Rome. Livy tells us nothing about any other women from this epoch ([482]).

■ 2.6b. *The Gothic War*. We see *Amalasuntha* accompanied by her sister *Matasuntha*. We see a similar pair of “reflections” in the Second Empire – *Julia Maesa* and her daughter *Mamea*. All these pairs of women belong to royal families, and are extremely eager to take part in ruling the Empire. We know nothing about any other prominent Italian women of that epoch ([695]). Thus, “a pair of politically active women” happens to be a unique detail characterizing both wars – Gothic and Tarquinian. We shall observe a similar situation in other duplicates of the XIII century war (Gothic = Tarquinian). We shall use the term “*Legend of a Woman*” for referring to this scenario in brief.

2.7a. *The Tarquinian War*. *Lucretia commits suicide*. *Tullia is banished*; we know nothing of her further fate ([482], Book 1:58, pages 93-94).

■ 2.7b. *The Gothic War*. In the alleged year 535 Amalasuntha is *assassinated*, likewise her Second Empire double – *Julia Maesa*, whose daughter Mamea was murdered as well. Matasuntha, or Mamea’s double, is also reported killed ([196] and [695]). We see that if we’re to compare the First Empire to the Third, Lucretia and Tullia swap their respective places as related to the pair or their duplicates – Amalasuntha (or Julia Maesa), and Matasuntha (Mamea). However, the fact of

murder is represented in both duplicate Empires. In fig. 2.28 we can see what is presumably an ancient portrait of the Gothic queen Amalasuntha.

Fig. 2.28 “Presumably, the portrait of Queen Amalasuntha” ([196], Volume 1, page 310, ill. 60).

2.8a. *The Tarquinian war*. Tarquin Sextus (Tarquin Junior from the clan of the Tarquins, or TRQN) is reported to have brought Lucretia to ruination ([269], page 9). He is supposed to have raped her, qv in [482], pages 1:58-59). Lucretia stabbed herself to death afterwards, unable to survive the dishonour (*ibid*). We shall encounter this story of “a woman brought to ruination” in many other duplicates, or reflections of this notorious mediaeval war.

■ 2.8b. *The Gothic War*. In the alleged year 534 Amalasuntha gives Theodahad the Goth a royal title, however “kept all the actual power in her hands... Theodahad had been a sworn foe of Amalasuntha... as soon as he had had it [the crown – A. F.] in his hands, he didn’t have to wait too long with his *revenge upon the princess*” ([196], Volume 1, page 318). Theodahad *banishes* Amalasuntha to an island, where she is *murdered* – allegedly at his orders.

2.9a. *The Tarquinian War*. The death of Lucretia sparked the fuse of the well-known Tarquinian war of the alleged VI century B.C., which resulted in the *exile of the Tarquins from Rome* ([482]).

■ 2.9b. *The Gothic War*. The casus belli of the Gothic war in the alleged VI century A.D., a very well-known event, had been none other but that of Amalasuntha’s death. The *exile of the Goths from Italy* can be regarded as the main result of the war ([196] and [695]). This subject of a *well-known war following the ruination and dishonour of a well-known woman* shall recur in many more phantom reflections of this war as encountered in the “Scaligerian history textbook”. This is what this “legend of a woman” is based upon in the first place.

3.a. *The Tarquinian War*. The beginning of the Tarquinian war in the alleged VI century B.C. The exile of the Tarquins from Rome (according to Livy).

■ 3b. *The Gothic War*. The beginning of the Gothic war in the alleged VI century A.D. The exile of the Goths from Rome (according to Procopius).

3.1a. *The Tarquinian War*. When the news of *Lucretia's death* spreads all over Rome, animosity towards the entire clan of the Tarquins flares up instantly. Junius Brutus assembles a large crowd at a Roman forum; according to Livy, "Brutus had made the infuriated crowd strip the king [L. Tarquin the Proud – A. F.] of all power and banish him together with his wife and children" ([482], Book 1:59). *The Tarquinian war commences*.

■ 3.1b. *The Gothic War*. When the news of *Amalasuntha's murder* reaches Emperor Justinian I, who rules in the East of the Empire, he gives orders for Roman and Byzantine troops to invade Italy in order to banish the Ostrogoths ([196], Volume 1, page 319). The land forces of the Roman troops led by Mundus attack the Ostrogoths together with the fleet of the famous warlord Belisarius that moves towards Sicily (*ibid*); said events mark *the outbreak of the Gothic war*.

3.2a. *The Tarquinian War*. A short while later, Tarquin Sextus, the offender of Lucretia and the main instigator of the Tarquinian war, *gets killed* ([482], Book 1:60, page 97). It happens in the following manner: Tarquin Sextus *flees*, and on his way into exile some *personal enemy* murders him in what is said to be an "old vendetta" ([482], Book 1).

■ 3.2b. *The Gothic War*. After the passage of a year since the *murder of Amalasuntha*, Theodahad, the de-facto initiator of the Gothic war, *is killed* ([196], Volume 1, page 327). After the exile of the Goths, "Theodahad *flees*... to Ravenna. Some Ostrogoth... a *personal foe* of Theodahad, had ambushed the latter while he was underway and strangled him" ([196], Volume 1, page 327).

3.3a. *The Tarquinian War*. A great part in the ousting of the Tarquin kings was played by the eminent Roman Lucius Junius, some of Marcus and also a Brutus ([482], Book 1:60, page 97; also [72], page 206). He had led this Roman uprising, which resulted in a coup. "His was the glory... of the one who had banished King Tarquin the Proud" ([482], Book 1, page 98). The roots of his full name without vocalizations are transcribed as N MRK BRN LC – the "consonant skeleton" of the names Junius, Marcus, Brutus and Lucius.

■ 3.3b. *The Gothic War*. We learn of the activities of an eminent Roman that take place around the same time as the Ostrogoths fled from Rome – in the alleged years 533-538. It was none other but Pope (Pontifex) John II Mercury son of Projectus from the Hill [?] of Celius” ([196], Volume 1, pages 315, 325, and 335). This pope had been head of the Roman church in 532-535, and so he must have played an important part in the events of this epoch. However, we haven’t managed to find out about any details of his “biography”. His unvocalized name transcribes as follows: N, MRCR, PRCT, CL for John, Mercury, Projectus and Celius. If we are to look towards Livy’s text for a comparison, we shall see that what we have is most probably the same name written in two different ways. Really, *Junius* = *John*, *Marcus* = *Mercury*, *Brutus* = *Projectus*, and *Lucius* = *Celius*. This is a perfect example of the mediaeval chronicle duplication mechanism. Two mediaeval chroniclers – Titus Livy and Procopius in our case – were deciphering the meagre remnants of the ancient documents that they’d had at their disposal, trying to reconstruct the past. One of the documents contained a rather lengthy unvocalized name. Titus Livy and Procopius vocalized it in two different ways, and so the same mediaeval character became duplicated in the two well-known tractates – one by the “ancient” Livy, the other by the “mediaeval” Procopius; the names used by the two authors, albeit differently, possess an obvious similarity.

3.4a. *The Tarquinian War*. Lucius Junius Brutus, son of Marcus, is *one of the most famous* Romans in the entire history of the “ancient” Rome. Memories of this historical personality can be found in Roman literature up until the foundation of the Second Roman Empire, qv in the books of Plutarch, for instance ([660]).

■ 3.4b. *The Gothic War*. John Mercury, the son of Projectus from the Hill of Celius, is *one of the most famous* Roman pontiffs. Some of his monuments remain in Rome to this day; one has to clarify here that only a limited number of Popes can boast having their names recorded in one way or another on the monuments that have survived until our age. However, one finds all sorts of references to John II (532-535) everywhere in mediaeval Roman history ([196], Volume 1, page 335).

3.5a. *The Tarquinian War*. Livy calls Lucretia, the woman whose death had led to the Tarquinian war, a *Roman* woman ([482], Book 1). He emphasizes her inflexible Roman will of iron. She is supposed to have addressed all those who surrounded her with a patriotic speech right before her death (*ibid*). What we have here is the

portrait of a “true Roman woman” painted by Livy – one that subsequently became a canonical role model.

■ 3.5b. *The Gothic War*. History considers Amalasuntha, the double of Lucretia, to have belonged to the *Amaling* dynasty of the Ostrogoths. The Amaling clan had allegedly been extremely partial to *Roman culture* and traditions, unlike other Gothic kings who had reigned after Amalasuntha ([196], Volume 1, page 327). Therefore, one of the chroniclers (Titus Livy, for instance) could have easily called this royal woman *Roman*. Vittigis becomes King of the Ostrogoths after the death of Amalasuntha, and “*tramples* the hereditary rights of the Amaling clan” ([196], Volume 1, page 327).

3.6a. *The Tarquinian war*. Junius Brutus and Publius Valerius lead an uprising aimed at overthrowing the rule of the Tarquins in Rome. The Tarquinian king is declared *deposed*. Livy tells us that “the liberator [Brutus – A. F.] had received a *warm welcome in the camp*, whilst the children of the king were *cast out*” ([482], Book 1:60, page 97).

■ 3.6b. *The Gothic War*. The Byzantine and Roman troops enter Italy. Pope *John Projectus II*, the double of the “ancient” *Junius Brutus*, happens to be in Rome at this time, whilst the approaching Roman troops are led by *Belisarius*, the double of the “ancient” *Valerius*. His troops entered Rome right after Vittigis, King of the Goths, had fled the city. “Romans were overjoyed to see the Greeks, and *welcomed them as liberators*... Belisarius entered Rome on 9 December 536” ([196], Volume 1, page 329).

3.7a. *The Tarquinian War*. Livy tells us that “when the tidings [of his exile – A. F.] had reached the camp [of king Tarquin – A. F.], the king *headed towards Rome* in order to suppress the uprising, somewhat confused by the spontaneity of it all ([482], Book 1:60, pages 96-97).

■ 3.7b. *The Gothic War*. Having received the news of Belisarius invading Rome, the king of the Ostrogoths (Vittigis) sent his troops towards the capital of Italy. “In early March of 537 Vittigis *approached the walls of Rome* with so many Goths near him that they could barely fit into one’s eyesight” ([196], Volume 1, page 339).

3.8a. *The Tarquinian War*. Livy tells us that “the gates were shut before Tarquin, and he was declared an exile” ([482], Book 1:60, page 97). One would think that a

battle at the walls of Rome would ensue, since King Tarquin, who had arrived in order to stifle the revolt, qv above, would hardly turn back confused at the news of his being deposed. However, Livy tells us nothing of King Tarquin's reaction to the loss of throne for some reason ([482]). He just tells us that Tarquin heads away from Rome. This is the so-called "*Exile of the Kings*" which marks the end of the Tarquinian rule in the "ancient" Rome. Furthermore, Scaligerian history considers this to have been the end of all royal power in Rome – until the foundation of the Second Roman Empire, at least.

■ 3.8b. *The Gothic War*. The gates of Rome are shut in front of Vittigis, King of the Ostrogoths. The Goths try to storm the walls of Rome, but fail and begin a siege ([196], Volume 1, pages 348-363). This siege of Rome is supposed to have been a breakpoint in the history of mediaeval Italy, since the Goths *did not succeed*, and Vittigis was forced to retreat from Rome in 538. Ferdinand Gregorovius tells us the following: "This *siege of Rome that became immortalized* in history lasted a whole year and nine months; over this time the Ostrogoths took part in 59 battles and were finally forced to *turn away from Rome*" ([196], Volume 1, page 363). Scaligerian history considers this moment to mark *the end of Gothic rule* in Rome ([196]).

3.9a. *The Tarquinian War*. According to Livy, a certain Roman by the name of *Publius Valerius* (Lucius Valerius Publicola – see [269], page 10) actively participates in the ousting of the Tarquinian kings from Rome. He is one of the most famous historical figures in the "ancient" Rome, qv in [482], book 2:1, page 101. Valerius is a prominent Roman military leader who had led Roman troops when they had fought the Tarquins. There are many legends concerning his life; he is a national hero. After the death of Brutus, he became the primary figure in the epoch of the Tarquinian war ([482]).

■ 3.9b. *The Gothic War*. A Romean (Roman) by the name of Belisarius plays a major part in chasing the Goths away from Rome. He is a famous military leader of the Middle Ages ([196], Volume 1). By the alleged year 535 "Belisarius had already succeeded in dethroning the Vandals in Africa... and was free... to conquer Italy... Justinian decided to unite the Eastern and the Western part of the empire once again... fate had given him *one of the greatest warlords in history* to make this plan a reality" ([196], Volume 1, page 319).

3.10a. *The Tarquinian War*. The full name of *Valerius* is as follows: Lucius

Publicola Valerius, son of *Valusius* ([482], page 206; also [269], page 10. The unvocalized skeletons of the names Valerius and Valusius are, respectively, VLR and VLS. This could stand for *Valerius* + *Lusius* (Lucius). We see his full name to be formed by the consonants VLSR. The term “son” may have been introduced later, when various scribes vocalized the consonant bases of names they found in ancient documents.

■ 3.10b. *The Gothic War*. Unvocalized name of Belisarius (Velisarius) is BLSR (or VLSR, if we’re to bear in mind the flexion of “B” and “V”). It coincides with the “skeleton” of consonants for the names Valerius and Valusius from Livy’s book. It goes without saying that all such phonetic analogies mean little per se; however, they become more important when they appear “in all the right places” of our step-by-step comparison involving the “ancient” history and its mediaeval original superimposed over each other in the manner described by the rigid formula $T = X + 300$. Thus, Belisarius (Velisarius) = VLSR, likewise Valerius-Valusius = VLSR. A propos, the name of Belisarius sounds similar to the Slavic “*Velikiy Tsar*”, or “The Great King”.

4a. *The Tarquinian War*. The war between the Tarquins and Rome in the alleged VI century B.C., or the Tarquinian war, according to Livy.

■ 4b. *The Gothic War*. The war between the Goths and the Romans, or the Gothic war of the alleged VI century A.D., according to Procopius (see fig. 2.27).

4.1a. *The Tarquinian War*. Junius Brutus is one of the key characters who had taken part in the ousting of the Tarquinian kings from Rome. We have already identified him as Pope *John Projectus* from the alleged VI century A.D. The two military leaders – Valerius and Brutus – lead the Roman troops into battle against the Tarquins. *Junius* Brutus commands the Roman *cavalry* and gets killed in a battle ([482]). His name is very similar to John.

■ 4.1b. *The Gothic War*. We see the famous general *John* beside Belisarius, a leader of the Roman (Romean) troops. He was known under the alias of “The Cruel General” ([196], Volume 1, page 358). He leads the Roman *cavalry* as well as Livy’s “ancient” *Junius* Brutus. General John was made legendary by taking Vittigis, king of the Goths, captive. Therefore, General *John* appears to be a chronological continuation of Pope John in a way, playing his part in the history of the Gothic war. General *John* was *killed* in one of the battles with the Goths ([695], page 273). However, Procopius mentions several Johns here, obviously confused by their

respective identities. These “multiple Johns” may have transformed into a single unified image of the “ancient” *Junius* Brutus as described by Titus Livy.

4.2a. *The Tarquinian War*. All the Taquins act as a single united clan in this war, forming a dynasty of sorts: Lucius Tarquin the Proud, Tarquin Sextus (Junior), Lucius Tarquin Collatine etc.

■ 4.2b. *The Gothic War*. The Goths also form a union and act as a single dynasty in the war. Their kings had been elected from this closely-bound group for a rather brief but intense period – Vittigis, Uriah, Ildibald, Totila and Teia ([196], Volume 1).

4.3a. *The Tarquinian War*. According to Livy, after the exile of the kings from Rome, the institution of *consulate* came to existence. More specifically, Romans had adopted the custom of electing consuls for the period of a year. This is a well-known institution that had existed in Rome for several centuries up until the middle of the alleged VI century A.D. ([72] and [482], Book 2:11, pages 98-99).

■ 4.3b. *The Gothic War*. In the middle of the alleged VI century A.D. the Italian consulate *ceases* to exist ([196], Volume 1), see fig. 2.27. Immediately after this, the very same “consulate” appears in Livy’s “ancient” Rome, right before 544 A.D. = year 244 *ab urbe condita* + 300 years. The year 245 *ab urbe condita* is considered to be the first year of the “ancient” Roman Republic and the consulate ([72]).

Commentary. Gregorovius reports the following when he tells us about the alleged VI century A.D.: “Decius Theodore Pauline was *the last consul of Rome* in 534... he is famous for nothing else but being last in the long line of Roman consuls” ([196], Volume 1, pages 319-320). Thus we see that after a shift of 1053 years according to the formula $T = X + 300$, Livy’s “ancient” consulate begins *where* it is supposed to have stopped existing in the Western Third Empire, according to the Scaligerian chronology. At the same time, Scaligerian history of the mediaeval Rome keeps showing us “traces of the consulate”, as Scaligerite historians coyly name them, starting with the exact same VI century A.D. – see [196], Vol. 1. In spite of the efforts made by certain historians to “bury the mediaeval consulate” in post-VI century Rome, they have to admit every now and then that certain *mediaeval consuls* “did in fact exist in Rome”. However, no complete list of them has reached our day for some reason, notwithstanding the fact that the lists of the “ancient” consuls from the Republican and Imperial “ancient” Rome have miraculously survived ([72]). According to our reconstruction, these documents are the

“mysteriously missing” mediaeval lists of the Roman consuls from the Middle Ages, which have been arbitrarily displaced into “deep antiquity” by learned historians. As a result, mediaeval history of the XI-XIV century has become a lot poorer, obscured by artificial darkness.

4.4a. *The Tarquinian War*. According to Livy, in the year 245 *ab urbe condita* (or 545 A.D. considering the 1053-year shift) the “ancient” P. Valerius, the double of the mediaeval Belisarius, was made *consul*. Valerius and Brutus are *the first consuls* in a *long line* of their “ancient” colleagues, whose lists have survived for the most part ([482], Book 2:1, page 101; also [72], page 206).

■ 4.4b. *The Gothic War*. After the first stage of the war with the Goths had been over, Belisarius was called away from Italy to fight the Persians. He returned to Italy around the end of 543 – beginning of 544 ([196], Volume 1, page 319). We see that the date given by Livy virtually *coincides* with the mediaeval date after a 1053-year shift. Belisarius is the first consul in mediaeval Rome after the exile of the Goths, or one of the first in the long line of mediaeval Roman consuls whose lists “*haven’t survived*” ([196], Volume 1).

4.5a. *The Tarquinian War*. According to Livy, Valerius, the “son” of Valusius, was consul for three consecutive years in 245, 246 and 247 *ab urbe condita*. He was then suspended from consulate ([482], Volume 2:15, page 120; also [72], page 206. A 1053-year shift of the dates forward in time shall give us the years 545, 546 and 547 A.D.

■ 4.5b. *The Gothic War*. Belisarius returns to Italy for another 3 or 4 years in 544-548 A.D. In the alleged year 548 Belisarius leaves Italy when Emperor Justinian I calls him back ([196], Volume 1, pages 401-402). When we compare this information to what Titus Livy tells us, we see that the two time intervals in question coincide in length as well as their positions on the absolute axis of time after a 1053-year shift of the “ancient” datings forward.

4.6a. *The Tarquinian War*. According to Livy, Valerius, the leader of troops, had remained alive for some time after his suspension from the consulate in 248 *ab urbe condita* (or 548 A.D. after the application of the 1053-year shift). He died in 251 *ab urbe condita*, or 551 A.D. if we’re to shift the dates forward ([482], Book 2:16, page 122).

■ 4.6b. *The Gothic War*. After his withdrawal from Italy in the alleged year 548 A.D., the eminent warlord Belisarius had remained alive for some time. He died around the alleged year 561 A.D. – however, this information is rather vague ([64], page 84). If we’re to compare it to Livy’s, we shall see that the date of his death, the alleged year 561, is separated from the year Valerius died (551 A.D.) by a mere 10 years, which really isn’t all that much considering the size of the 1053-year chronological shift. Apart from that, we are to bear in mind that all the previous chronological landmarks of their “biographies” concur with each other perfectly after the application of the abovementioned rigid shift according to the formula $T = X + 300$.

4.7a. *The Tarquinian War*. According to Livy, despite the suspension of his consulate in 248 *ab urbe condita* (548 A.D. with the shift forward equalling 1053 years) and his inability to partake in the affairs of the state, Valerius-Valusius had nevertheless *served as consul for yet another year*, shortly before his death in 251 (551 A.D. considering the shift), qv in [482], Book 2:16. This “restoration of rights” occurs immediately before the death of Valerius ([482]).

■ 4.7b. *The Gothic War*. Despite his withdrawal from Italy in the alleged year 548 A.D. and accusations of treason, qv below, Belisarius manages to “restore his good name; he had soon been released, with his ranks restored and part of his estate given back to him” ([64], page 84). All of this is very similar to what Livy tells us about Valerius, or Valusius. This “restoration of rights” happens a short while before the death of Belisarius. “He had received some of his estate back; however, putting it to any use was already beyond his power, since Belisarius had died shortly” ([64], page 84). A rather obvious parallel with Livy’s description.

4.8a. *The Tarquinian War*. According to Livy, Valerius died in great glory. “P. Valerius had died; everyone had deemed him the first of men in times of war and peace alike, and his glory was truly great” ([482], Book 2:16, page 122).

■ 4.8b. *The Gothic War*. Belisarius dies laurelled with the glory of a national hero. “Having performed a multitude of feats that put him amongst the heroes of ancient times, the great warlord died” ([196], Volume 1, page 402). This characteristic is unique amongst the characters of the Gothic War epoch (the alleged VI century A.D. – see [196]).

4.9a. *The Tarquinian War*. It is amazing that Valerius (Valusius), the only truly great military leader of the epoch, should *die in poverty*. Livy tells us that “P. Valerius had died... his glory was great, but his means were so meagre that there was nothing left for his burial, which was financed by the treasury” ([482], Book 2:16, page 122).

■ 4.9b. *The Gothic War*. Virtually the same is told of Belisarius. The only famous warlord from the epoch of the Gothic war also *dies in poverty* – he couldn’t make any use of the estate that was returned to him, either – he dies “in such disfavour and obscurity that proverb made him symbolize the vanity and impermanence of human felicity” ([196], Volume 1, page 402). All of Belisarius’ possessions were confiscated after his arrest ([64], page 84).

4.10a. *The Tarquinian War*. Livy tells us that “Valerius, who had been in favour, didn’t just provoke envy [after the victory over the Tarquins – A. F.], but also fell under suspicion twined with a horrendous accusation... Rumour had it, he aimed for the throne... and had been building a dwelling on top of the Vellius, allegedly an impenetrable fortress... These rumours as well as the fact that the folk trusted them infuriated the very spirit of the consul [Valerius – A. F.]... Having called the citizens together, he ascended the dais” ([482], Book 2:7, page 108). Valerius proceeded to utter an inspired speech, refuting the accusation of willing to seize power. Livy quotes his following tirade: “Will no valiancy suffice... to make you respect it without ever considering making it tarnished by suspicion? Need I, a sworn enemy of kings, be in fear of being accused that I want regal power?” ([482], Book 2:7, page 109). This characteristic is unique; we have found no other consul in Livy’s work who was accused of anything like that over all the time of the “ancient” republic’s existence up until the alleged I century B.C.

■ 4.10b. *The Gothic War*. In the course of the Gothic War, Belisarius also becomes accused of treason. The Goths had supposedly offered him the crown of Italy so as to separate Belisarius from Justinian I and secure the support of his mighty army. Vittigis, King of the Ostrogoths, was defeated by Belisarius in the alleged year 539, which is supposed to have been the time when the Goths offered him the royal crown ([196], Volume 1, page 372). Towards the end of the alleged year 539, before Belisarius’ departure from Italy, Ildibald, the new king of the Goths, “sends emissaries... to tell Belisarius that he, Ildibald, shall himself come and lay his royal robes at the feet of Belisarius, if the latter keeps his promise [sic! – A. F.] to become

crowned as king of Italy” ([196], Volume 1, page 373). However, “Belisarius deceives the Goths and hands the crown over to the Emperor [Justinian – A. F.]” ([196], Volume 1, page 372). After that, “reluctant to rise against the emperor, he travels to Byzantium calmly with his laurels of a hero” ([196], Volume 1, page 373). However, the very circumstance that Belisarius allegedly promised the Ostrogoths to be crowned king of Italy had led to his arrest and the confiscation of his property ([64], page 84).

Let us thus highlight the key points of the events related in order to make the parallelism even more obvious.

*1a) The great warlord Valerius is accused of treason (intent to seize royal power).

■ *1b) The great warlord Belisarius is accused of treason (intent to become crowned King of Italy).

*2a) The charge against Valerius may have been based on some real fact.

■ *2b) The accusation of Belisarius was based on a real fact, namely, his acquiescence to take the crown of Italy in his negotiations with the Goths.

*3a) Valerius becomes withdrawn from his consulate; Livy’s description suggests that he had fallen into disfavour.

■ *3b) Belisarius is called away from Italy as a result of a treason charge. His arrest follows; he falls from grace with the Emperor.

*4a) Valerius tries to refute the accusation in a speech given before the Roman public.

■ *4b) Belisarius may have tried to refute the accusation upon his arrival to the New Rome; however, we know nothing of the process, if there was one.

*5a) During the “trial of Valerius” a bill about “withdrawing the one who attempts to seize regal power from the protection of law, and confiscating all of his property” becomes ratified ([482], Book 2:8, page 109). This may be the reason why his estate was sequestered, likewise his “death in poverty”.

■ *5b) The property of Belisarius had been confiscated, and he had died in

poverty.

*6a) According to Livy, “the consul [Valerius – A. F.] had suggested a number of bills that didn’t just free him from accusations of plotting to seize royal power, but also... changed the direction of the process drastically, having made him a popular favourite instantly” ([482], Book 2:8, page 109). Valerius was made consul once again.

■ *6b) Belisarius was pardoned, with his former ranks returned and his former glory untarnished once again.

*7a) All of these events take place in 245-256 *ab urbe condita*, or 545-546 A.D. (considering the 1053-year shift of datings forward).

■ *7b) The events in question took place in the alleged years 544-548 A.D. Belisarius was called away from Italy due to a treason charge in 548; we see a perfect concurrence with the “ancient” dates after shifting them forward by 1053 years.

4.11a. *The Tarquinian War*. The Tarquinian War continues. The Tarquins are located at some distance from Rome, and keep raiding it from time to time. In the years 243-244 *ab urbe condita* (or 543-544 A.D., if we’re to consider the 1053 year shift) Tarquin the Proud, king of the Tarquins, sends a missive to Rome addressed to the Roman Senate ([482], Book 2:3, page 102).

■ 4.11b. *The Gothic War*. The Gothic War rages on. The Goths are located at a distance from Rome, and raid the capital periodically. In the alleged year 543 A.D. Totila, the new king of the Goths, sends a “missive to the Roman Senate” from Naples ([196], Volume 1, page 476. We see a very good concurrence with Livy’s “ancient dates”.

4.12a. *The Tarquinian War*. According to Livy, the Senate was visited by the “royal envoys [of king Tarquin – A. F.] whose demands included the requisition of property – *not a single word was uttered about the return of the kings*. When these claims were heard by the Senate, their discussion took several days” ([482], Book 2:3, page 102). The senators obviously took their time. Livy explains that “they were afraid that the refusal to pay tribute might serve as *casus belli*, whereas their conceding to the terms would aid the Tarquins greatly, providing them with the means

necessary for military actions” ([482], Book 2:3, page 102).

■ 4.12b. *The Gothic War*. Totila the Goth accuses Romans of being ungrateful to the Goths in his message to the Roman senate. However, he doesn’t say a single word about their intention to return to Rome as rulers. Totila’s epistle contains no military claims. The full text of this mediaeval document is cited in [196], Volume 1, pages 376-377. In particular, Totila does not demand the exile of the Roman Greeks from Rome. The Goths delivered their letter via captive Romans ([196], Volume 1. General John forbade to reply to Totila’s missive. Then Totila addressed Romans with several more missives, which were of just as peaceful a nature ([196], Volume 1, page 377; also [695]).

4.13a. *The Tarquinian War*. Tarquin’s envoys addressed the young people of Rome asking them for support. Livy tells us that “they *secretly plotted a coup* in order to restore the royal rule... negotiating for the royal family to be admitted into the city under the cover of night” ([482], Book 2:3-4, page 102). As a result, *a conspiracy emerges* in Rome, one that involves many distinguished Romans. However, the conspiracy becomes uncovered, and the conspirators arrested, tried and executed ([482], Book 2:5, pages 104-105).

■ 4.13b. *The Gothic War*. The same is happening during the Gothic War. “The public read these proclamations, which could be encountered in virtually every part of the city, in great agitation. The Greek rulers *suspected collusion between the Arian priests and the Goths*” ([196], Volume 1, page 377). It is supposed that the organization of this conspiracy could be aided by Cethegus, Head of the Senate (*ibid*). However, the conspiracy was discovered, and the conspirators banished from Rome (*ibid*).

4.14a. *The Tarquinian War*. Livy tells us the following: “Having received the news [of the unsuccessful conspiracy and the execution of the plotters – A. F.] Tarquin... decided to prepare for *open warfare*” ([482], Book 2:6, page 106). Livy refers to this leader as to “Tarquin” and not L. Tarquin the Proud almost everywhere he mentions this war, thus collecting all of the Tarquins under a single name.

■ 4.14b. *The Gothic War*. The unsuccessful conspiracy and the exile of the cabal are followed by a military campaign launched against Rome by Totila the Goth in the alleged years 543-544 A.D. ([196], Volume 1, page 377). Let us emphasize that the Goths were a very close-knit group as seen in the course of the war, and their leaders

are warlords rather than kings bound to a permanent place of residence ([695]). The clan of the Goths is the double of the Tarquinian clan.

4.15a. *The Tarquinian War*. According to Livy, “Tarquin begins to perambulate the towns and cities of Etruria” ([482], Book 2:6, page 106). He is alleged to have begged the Etruscans to help him conquer the Roman throne back. This is most probably a reference to the movement of Tarquin’s troops occupying Etruria. Livy also tells us that “these negotiations proved successful”; thus, Tarquin heads forth accompanied by his allies, who “followed Tarquin to support his claims for the throne and wage war upon the Romans” ([482], Book 2:6, pages 106-107).

■ 4.15b. *The Gothic War*. In the Gothic War Totila decided to “seize several cities of *Etruria*, Picenum and Emilia first” ([196], Volume 1, page 378). One has to point out that Procopius may relate more details of the events in question than Livy. Totila doesn’t just “perambulate Etruria” with pleas for help – he takes over it and recruits soldiers for his troops ([196], Volume 1).

4.16a. *The Tarquinian War*. In the years 244-245 *ab urbe condita* (or 544-545 A.D. with a shift of 1053 years), the troops of Tarquin and his allies approach Rome ([482], Book 2:6). The battle of Rome begins. Livy writes that “the Tarquinians... chased away the Romans who came out against them” ([482], Book 2:6, page 107). However, the Romans, in turn, defeated the allies of the Tarquinians.

■ 4.16b. *The Gothic War*. We learn that “in the summer of 545 Totila fixes his camp at the walls of Rome” ([196], Volume 1, page 378). We see ideal concurrence between the dates of Procopius and those given by Livy (see the account of 544-545 A.D. as cited above). The battle of Rome ensues. Belisarius turns back, and the Goths enter Rome “in full calm” ([196], Volume 1, page 385). This retreat of Belisarius had saved the Roman troops.

4.17a. *The Tarquinian War*. For some reason, the Tarquins have not used the opportunity given to them by this victory over the Romans. The Tarquins withdrew from Rome all of a sudden. Livy claims this to have been a miracle. Allegedly, a loud voice was heard in the night, one that claimed victory to favour Romans ([482], Book 2:7, pages 107-108). The Tarquins “scattered in terror” as soon as they had learnt of this.

■ 4.17b. *The Gothic War*. The Goths also fail to take advantage of their victory

and leave Rome in the most bizarre fashion. According to Gregorovius, “the most peculiar thing is that Totila hadn’t gathered all of his resources in order to capture Porto, so as to get the war over and done with” ([196], Volume 1, page 391). The matter is that Belisarius and his troops were in Porto at the time.

4.18a. *The Tarquinian War*. Livy tells us that after the sudden retreat of the Tarquins “following the dawn which brought no sight of enemy, the consul P. Valerius had gathered his armour and returned to Rome triumphant” ([482], Book 2:7, pages 107-108). This happened in 245 *ab urbe condita*, or 545 A.D. considering the shift of 1053 years.

■ 4.18b. *The Gothic War*. In the course of the Gothic war, shortly after the sudden retreat of the Goths, “Belisarius... accompanied by the rest of his troops, enters the city [Rome – A. F.]... As soon as the great warlord had entered the land that brought him glory, his genius and his fortune returned to him, their power doubled” ([196], Volume 1, page 396). Although the Goths had tried to return, they were thrown back immediately ([196], Volume 1, page 397). “This happened in the spring of the year 547” ([196], Volume 1, page 396). The battle of Rome had lasted from 545 to 547 A.D. Yet again we see a perfect concurrence of Livy’s dating (545 A.D.) with that of Procopius (545-547 A.D.).

4.19a. *The Tarquinian War*. As we have already mentioned, Livy ascribed the victory of Valerius over the Tarquins to a miracle – namely, the voice of the god Sylvan from the Forest of Arsia, which presumably made the enemies of Rome flee in terror ([482], Book 2:7, page 108).

■ 4.19b. *The Gothic War*. Gregorovius draws our attention to a similar scenario in his rendition of the Gothic war according to Procopius: “Everyone was deeply amazed by the defeat of the Goths in Rome that had been half open, as well as the success of Belisarius’ resistance, even the inhabitants of faraway towns and villages” ([196], Volume 1, page 398).

4.20a. *The Tarquinian War*. After the first unsuccessful battle of Rome (the first battle after the exile of the Tarquins from Rome), the Tarquins ask king Porsenna for assistance ([482], Book 2:9, page 111). The unvocalized name of Porsenna transcribes as PRSNN. One has to remember that TRQN (the Tarquins) and PRSNN (Porsenna) are *allies* in this war. We must point out that Porsenna might be a

derivative of P-Rasena or P-Rusena. Let us remind the reader that Raseni had been the name used by the Etruscans to refer to themselves, qv in our discussion of this topic as seen in [Chron5](#). This concurs perfectly with the references to Porsenna as the “king of the Etruscans” made by the “ancient” historians of Rome ([269], page 186).

■ 4.20b. *The Gothic War*. After the first unsuccessful battle for Rome (the first one fought after the exile of the Goths from Rome), Totila, king of the Goths, seeks the assistance of Theudebert I, a Frank ([196], Volume 1, page 398). We already mentioned the fact that the unvocalized root of “Frank”, or TRNK, is similar to TRQN as referred to by Livy. Also, the parallelisms that we have discovered often identify the Franks as the Persians, or PRS unvocalized. Remember that Paris = PRS; therefore, the Parisians could well be the Evangelical Pharisees. PRS could also have stood for “Prussians” or P-Russians (White Russians). Bear in mind that in the Gothic war the Goths (doubles of TRQN – Tarquins) and the Franks (doubles of PRSNN – Porsenna) also act as allies. It also has to be mentioned that the unvocalized name TRNK as used for referring to the Franks (the Goths) could also have been synonymic with “Turks”, or “Tartars”. This may be a reflection of the events dating to the epoch of the Ottoman Empire.

4.21a. *The Tarquinian War*. According to Livy, king Larth Porsenna decided to aid the Tarquins and joined them on their conquest of Rome. This is the second campaign against Rome ([\[482\]](#), Book 2:9, page 111). The united troops of Porsenna and the Tarquins soon approach Rome. The Roman Senate is frightened that “the common Romans might be frightened into letting the Kings enter the City and accepting peace” (*ibid*). It is possible that Livy is really referring to a campaign launched against Rome by the joined forces of TRQN-TRNK (the Turks?) and PRSNN-PRSN – P-Raseni, or P-Russians (the White Russians). The name of King Porsenna, which is Larth or L-Art may refer to the “Mongolian” Horde, or Arta.

■ 4.21b. *The Gothic War*. In his description of the Gothic War Procopius tells us nothing of whether the Franks had taken part in Totila’s second Roman campaign. Furthermore, Theudebert is supposed to have given the basket to Totila, who had tried to marry his daughter ([695]; also [196], Volume 1). However, a few years earlier, the Frankish troops led by Theudebert did take part in the war, fighting alongside the Goths. Theudebert I of the Franks had aided the Gothic king Vitigis when the latter was waging war against the Romans and invaded Italy. However, Vitigis retreated upon hearing the threats made by Belisarius ([196], Volume 1).

4.22a. *The Tarquinian War*. Livy dates the second Roman expedition of the Tarquins to the year 246 *ab urbe condita*, or 546 A.D. considering the 1053-year shift forwards. Valerius is the leader of the Roman troops and he fights Larth Porsenna (L-Horde PRS) – see [\[482\]](#), Book 2:9, page 111.

■ 4.22b. *The Gothic War*. The second Roman campaign of the Goths is dated to the alleged years 548-549 A.D. In 540-544 Belisarius is called away from Italy to lead Roman troops against the Persians (or PRS) – see [196], Volume 1, pages 401-402. Firstly, we observe a good concurrence between the datings offered by Livy and Procopius: 546 and 548-549 A.D. Secondly, we encounter yet another superimposition of the “ancient” L-Horde PRSN (Larth Porsenna) over the mediaeval PRS (Persians).

4.23a. *The Tarquinian War*. According to Livy, Larth Porsenna and the Tarquins besiege Rome, but fail to capture it ([\[482\]](#), Book 2:10, page 112). A certain Horace Cocles became distinguished as a heroic defender of Rome ([\[482\]](#), Book 2:10, page 112). His name is transcribed as CCLS without vocalizations.

■ 4.23b. *The Gothic War*. In the course of the Gothic War, Totila had captured a part of Rome, but could not seize the castle of Hadrian where the Roman garrison was located ([196], Volume 1, pages 403-404). “A gallant warlord named Paul of Cilicia” becomes distinguished for his bravery during the defence of Rome against the Goths and the battle for Adrian’s castle in particular ([196], Volume 1, page 403). Apparently, this native of Cilicia can be identified as Livy’s Cocles (compare CLC for Cilicia with CCLS for Cocles). What we see is most probably the same name or alias transcribed in two different versions.

4.24a. *The Tarquinian War*. Livy informs us that Larth Porsenna “withdraws from Rome”, having failed to conquer it ([\[482\]](#), Book 2:13, page 118). This is the last battle of Rome in the “ancient” Tarquinian war ([\[482\]](#)).

■ 4.24b. *The Gothic War*. In the alleged year 549 A.D. the Gothic king Totila leaves Rome ([196], Volume 1, page 404). This marks the end of the second battle of Rome, which is also last in the course of the mediaeval Gothic war ([196], Volume 1).

5a. *The Tarquinian War*. The end of the Tarquinian War according to Livy.

■ 5b. *The Gothic War*. The end of the Gothic War according to Procopius.

5.1a. *The Tarquinian War*. According to Livy, in the year 250 *ab urbe condita* (or 550 A.D. considering the 1053-year shift forwards), Valerius is elected consul one last time. In the next year (251 *ab urbe condita*, or 551 A.D. with the 1053-year shift), his involvement in the Tarquinian war finally ceases. He dies the same year ([482], page 122).

■ 5.1b. *The Gothic War*. Belisarius is called back from Italy in the course of the Gothic War (allegedly towards the end of 548 – beginning of 549 A.D.). He withdraws from military action permanently, and the Gothic war ends without his participation ([196], Volume 1, page 402). Let us point out the perfect concurrence between the dates offered by the “ancient” Livy (550) and the mediaeval Procopius (548-549), emphasizing the fact that we are observing this almost perfect correspondence cover the span of *two hundred and fifty years*.

5.2a. *The Tarquinian War*. In 253 *ab urbe condita* (553 A.D. with the 1053-year shift forwards) T. Larcius becomes leader of the Roman troops in Italy instead of Valerius ([482], Book 2:18, page 123). Larcius transcribes as LRC without vocalizations (or NRC, since N and L were occasionally subject to flexion).

■ 5.2b. *The Gothic War*. In the alleged year 551 A.D. Justinian I appoints another commander-in-chief of the Roman army in Italy to replace Belisarius – a certain Narses. This is the second eminent Roman warlord of the epoch, albeit not quite as renowned as Belisarius – a “#2” military leader of sorts. He brings the Gothic War to its conclusion. His name without vocalisations transcribes as NRS, which is similar to LRC or NRC (Larcus) as mentioned by Titus Livy.

5.3a. *The Tarquinian War*. Livy singles out Larcius as the *first dictator* of the “ancient” Rome. The latter is described as vested with exclusive powers ([482], Book 2:18, page 123).

■ 5.3b. *The Gothic War*. Narses gathers powers of unprecedented scale in the course of the Gothic war. He becomes the autocratic *dictator* of the entire Italy ([196], Volume 1, page 121).

5.4a. *The Tarquinian War*. According to Livy, in the year 259 *ab urbe condita* (or 559 A.D. with the 1053-year shift forwards) the Tarquins faced the Roman forces for

one last battle – however, this time at a certain distance from Rome. This is the last battle of the Tarquinian war (we have listed every battle in this war that Livy mentions in his work explicitly and with no omissions). The battle was an exceptionally furious one, and it ended with a complete defeat of the Tarquins ([482]).

■ 5.4b. *The Gothic War*. In the alleged year 552 A.D. the Gothic troops led by king Totila faced the troops of the Roman Greeks for the last time – well away from Rome. This is the final battle in the course of the Gothic war ([196], Volume 1, pages 407-408). We have listed all the major battles of the period as related by the mediaeval sources. The battle was an arduous and bloody one. The Romans prevailed, albeit with heavy losses, and the Goths were defeated ([695]; also [196], Volume 1).

5.5a. *The Tarquinian War*. According to Livy, Lucius Tarquin the Proud, king of the Tarquins, “was wounded in the side and carried off to a safe place by the warriors that gathered around him” ([482], Book 2:19, page 125). He died in Cuma a short while later ([482], Book 2:21). Apart from that, L. Tarquin the Proud was accompanied by his son, the young Tarquin, in this last battle of the Tarquins with the Romans. Unfortunately, Titus Livy fails to mention the son’s name ([482], Book 2:19, page 125). It may have been the king’s young heir.

■ 5.5b. *The Gothic War*. Totila, king of the Goths, was seriously wounded during his escape from the battlefield, and died a short while later ([196], Volume 1, pages 407-408). In the last battle between the Goths and the Romans the young Teia or Teias becomes king of the Goths for a short period of time just after the death of Totila. However, in the alleged year 553 A.D. – that is, immediately after the defeat of Totila, young Teia gets killed ([196], Volume 1, pages 408-411). Most probably, both Livy and Procopius are referring to the same event here.

5.6a. *The Tarquinian War*. After this rout, the Tarquins disappear from the political arena of the “ancient” Italy as well as the history of the “ancient” Republican Rome in general. At least, Livy ceases to mention them after informing us of the total defeat that they had suffered in this war. We know nothing of the remaining Tarquins or their subsequent location. Livy doesn’t utter a word on the subject.

■ 5.6b. *The Gothic War*. After the defeat, the Goths disappear from the pages of

this epoch's historical chronicles. They are supposed to have left Italy. Gregorovius tells us that "we know nothing of... where the Goths headed after they had left the battlefield, and their exile from this beautiful land that their fathers had conquered [under Odoacer and Theodoric – A. F.] – a land that still bears numerous marks of their glorious deeds in many places, *is covered in utter obscurity*" ([196], Volume 1, pages 412-413).

Thus, in the overwhelming majority of cases we have witnessed an almost complete correspondence of Livy's "ancient" datings shifted forwards by 1053 years with the mediaeval datings of respective parallel events. The numeric coefficient $X = A/B$ (qv above) equals 74% for the part of Livy's text that refers to the Tarquinian War. In other words, 74% of this text by Livy is covered by the parallels with mediaeval events that we have discovered, which provides even the most "ancient" events described by Livy with mediaeval duplicates dating to a much more recent epoch.

2.

The parallelism between the Gothic War of the alleged VI century and the Nika rebellion that took place in the same century. No date shift here

In Chapter 6 of [Chron1](#) we already mentioned the Gothic War of the alleged VI century A.D. as one of the brightest duplicates of the Eurasian war that we deem to have taken place in the XIII century A.D., qv in the global chronological map in [Chron1](#), Chapter 6, and the corresponding table. This war was reflected in the chronicles of many nations. Above we give our analysis of the texts referring to the events that allegedly took place in and around Italian Rome. However, we have already told the reader that the most probable dating of the Italian Rome's foundation pertains to the epoch of the late XIV century A.D. It wasn't until much later that a part of the Byzantine history, as well as that of the New Rome on the Bosphorus, became transferred to these parts (on paper, naturally). Hence one finds it hard to imagine that the Eurasian war of the XIII century A.D. wasn't reflected in the Byzantine chronicles that describe the reign of Justinian I, one of the key figures of the Gothic War and its "principal monarch", in a way. Our expectation proves correct.

We learn that the Eurasian war of the XIII century A.D. had indeed left a phantom trace in the "purely Byzantine" part of history known to us as the Nika Rebellion which took place in the alleged year 532 A.D. ([\[486\]](#)). This coincides with the beginning of the Gothic war – the alleged years 534-535 A.D.

If we are to consider the documents describing Justinian's reign in the New Rome, the ones that stand out the most are the books of Procopius of Caesarea. Some of them portray Justinian benevolently, praising him in his royal magnitude; in others, such as the *Arcane History* by the same author, Justinian is represented in an altogether different manner. Scaligerian history went so far as to invent the theory of a "two-tongued Procopius" who would eulogize Justinian in the daytime, and fill the pages of the *Arcane History* with accounts of his atrocities after dusk. However, we aren't concerned with the authorship of the collection of texts written by "Procopius" at the moment, since it doesn't affect anything of substance, inasmuch as our research is concerned.

A brief rendition of the events that later became known as the *Nika rebellion* is as

follows (according to [468]). It was an uprising that shook the entire Third Roman Empire in the alleged year 532 A.D. A great revolt flared up in Rome with neither any leader striving for royal power to head it, nor any clear reason behind it. This makes the Scaligerian version of the rebellion rather odd. The revolt is supposed to have been a short one, but characterized by its *dramatic scale* of actions. Military conflicts involve great forces, regular imperial troops as well as mercenaries. Indeed, this seems to resemble an all-out civil war rather than a mere rebellion. The New Rome burns, and the arsonists are active in several locations simultaneously. The main powers behind the revolt are the two Byzantine political factions – the *venetes* and the *pracines*, united against Justinian. His military commander-in-chief by the name of Belisarius (!), the leader of the imperial troops, receives orders from Justinian to crush the uprising. Belisarius deploys the powerful *Gothic* garrison led by Mundus to aid the Romean-Roman army. Terrified by the sheer scale of the revolt, Justinian doesn't take part in military actions against the rebels himself, finding shelter in his castle instead, unlike Belisarius. It is peculiar that the rebels didn't attempt to storm the castle, although, according to Procopius, there were no special fortifications to protect it. Eventually, Belisarius managed to use his brilliant cunning and entrap a large mob of rebels in a *hippodrome* = circus, slaughtering a great many of their number as a result.

a. *The Gothic War* of the alleged VI century A.D.

■ b. *The Nika Rebellion* of the alleged VI century A.D.

1a. *The Gothic War*. Procopius of Caesarea is the most famous author to have related the events of the Gothic war. His *Gothic War* has been the principal work used for shaping the entire modern academic concept of this event (see [695] and [696]).

■ 1b. *The Nika Rebellion*. This rebellion is also described by a famous author – the very same Procopius of Caesarea. His text is basically the only original source with a description of these events hailing from the New Rome.

2a. *The Gothic War*. This war broke out around the middle of the alleged VI century – the years 535-553 A.D. It is considered to have been one of the bloodiest wars in the whole history of Rome and Romea. It had claimed a great number of lives and resulted in the destruction of the entire Italy.

■ 2b. *The Nika Rebellion*. This event also dates from the middle of the alleged VI

century – the alleged year 532 A.D. ([468])). It serves as a classical example of a large-scale civil war, and a very brutal one at that. Virtually the entire New Rome lay in ruins as a result.

3a. *The Gothic War*. The primary royal figure here is Justinian the Great, the Byzantine emperor who is supposed to have masterminded the military actions in Italy remotely. He doesn't take part in the Gothic war personally, controlling the course of events from New Rome (Constantinople, see fig. 2.29).

■ 3b. *The Nika Rebellion*. The principal royalty here is also Justinian, who commands the punitive forces. As above, he doesn't take part in any of the actual battles and gives orders from the Palatium. He doesn't appear before his troops once, whereas the rebels never approach the Palatium with so much as a single attempt to storm it (see fig. 2.29).

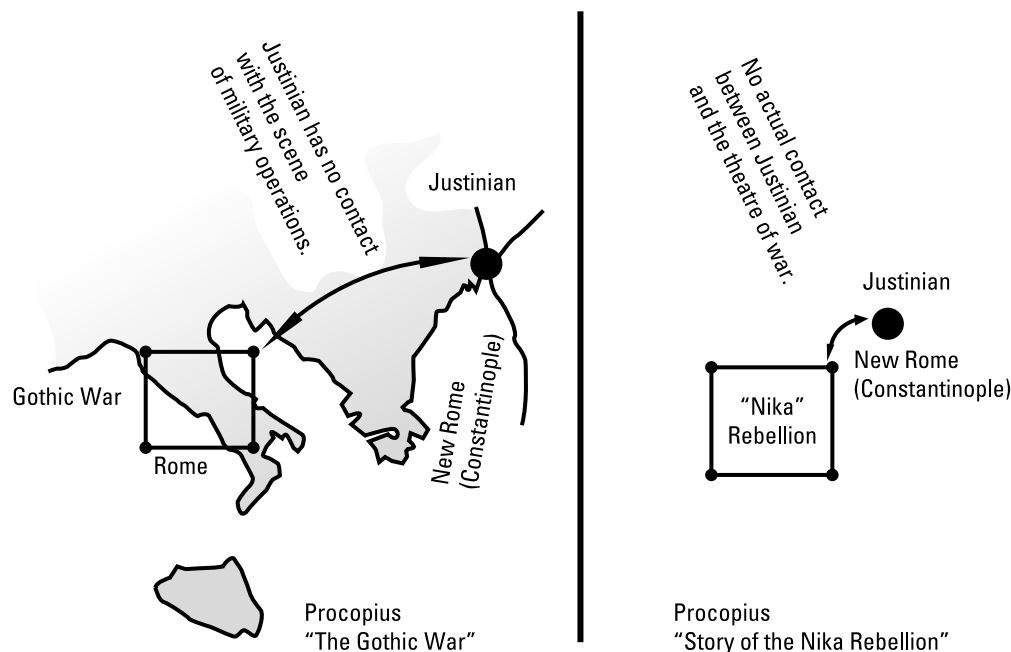

Fig. 2.29 Parallelism between the Gothic War and the Nika Rebellion.

4a. *The Gothic War*. Justinian's main opponents in the Gothic war of the alleged VI century are as follows:

- the Goths (aka the Trojans, qv in Chapter 6 of [Chron1](#) and the next section);
- the Franks and the Persians = PRS (Porsenna and Paris in the Trojan war, qv in Chapter 6 of [Chron1](#) and below. TRQN and PRS are the two main forces gathered against Justinian.

■ *4b. The Nika Rebellion.* Justinian's principal enemies are the venetes and the pracines. The former can be identified as the Goths and the Tarquinians, and the latter (PRSN) – as the Persians and Porsenna's Etruscans (or P-Racines/P-Russians – PRS). The two factions are supposed to have been "circus parties" in the New Rome, whatever that means. Most probably, the two factions had been of a religious nature, and united to oppose the emperor.

5a. The Gothic War. As we shall demonstrate below, in our study of the parallelism between the Gothic War and the Trojan War, the Goths (Trojans) who had fled from Troy after the city fell prey to the enemy (or, possibly, the victors who were pursuing them), founded Venice and thus can be regarded as its first inhabitants. They may have called themselves the Venetes. The Venetes (or the Vendians) are well-known late mediaeval nations. The second power that stood against Justinian in the Gothic was referred to as "PRS" – P-Russians, or Franks (Turks) – see fig. 2.30.

■ *5b. The Nika Rebellion.* The Venetes had been one of the primary forces fighting against Justinian in the Nika rebellion. They may therefore have been the duplicate of the Goths (or the Trojans), the heroes of the Gothic=Trojan war of the XIII century A.D., qv in the global chronological map in Chapter 6 of [Chron1](#). P-Racines = PRSN = the rebels, who apparently become superimposed over the Persians in the Gothic War (PRS). Also bear in mind the fact that, according to Titus Livy, the P-Russians (or Larth Porsenna – L-Horde P-Racens) took part in the Tarquinian war. P-Racines are the second key force in the Nika rebellion (see fig. 2.30).

Fig. 2.30 The parallelism between the Gothic War and the Nika Rebellion.

6a. *The Gothic War*. This is a war fought by the Goths. As we shall see below, they are identified as the Trojans in the Trojan War. The Goths oppose Justinian during the Gothic war; however, prior to that they had been the Empire's allies, qv in Chapter 1 of [Chron2](#). Justinian is the victor in this war, and his involvement is rather of a "behind-the-scenes" nature.

■ 6b. *The Nika Rebellion*. The suppression of the rebellion is aided by the Goths, who fight on the side of Justinian as allies of Rome and Romea. However, the Goths burn and loot the temple of Hagia Sophia and murder a Romean priest as they tried to hold back the rebels, actually acting against Justinian's clergy ([468], page 60). Justinian crushes the rebellion and also enjoys the triumph, albeit without personal participation in military action. Thus, in both versions Justinian and the Goths are represented as allies initially and enemies afterwards. Both schemes are shown in fig. 2.30. It is clearly visible that they're almost identical.

7a. *The Gothic War*. The troops of the Romean Greeks are led by the great military commander Belisarius. Beside him we see the famed warlord Mundus, who actively participates in crushing the forces of the Goths = Trojans and the Franks = PRS and TRNK ([695]).

■ 7b. *The Nika Rebellion*. A complete reflection of the scenario related above – the suppression of the rebellion is headed by the same military leader – Belisarius

([468], pages 60-61), who crushes the venetes and the P-Racines (PRSN) aided by the very same Mundus (*ibid*).

8a. *The Gothic War*. As we shall demonstrate in the next section, the only way Belisarius could seize Naples = The New City (or the double of the ancient Troy, qv below) was due to exceptional cunning – getting into the city via an aqueduct. Thus, the entire plan was based on the use of an aqueduct – the “Trojan horse”, the “aquatic or equine duct” ([237]). See details below.

■ 8b. *The Nika Rebellion*. The situation is quite similar: the only means of suppressing the rebellion successfully had been guile. It is said that Belisarius had managed to entrap the rebels in a large hippodrome (circus). There is a legend that the proclamation of Hypatius (Justinian’s nephew) as the new emperor was a trick played by none other than Justinian himself, with the aid of Belisarius. It had allegedly served to fool the crowd and lure them into the hippodrome or circus, where nearly all of the rebels got killed. “More than 30 thousand people died in this carnage” ([468], page 61). We see a hippodrome to be the centre of the entire subterfuge (*ibid*). Thus, the tale of the Nika Rebellion also includes an “equine duct” of sorts – cf. the Gothic war.

Commentary. One shouldn’t think that the Nika Rebellion took place in the VI century A.D. As we shall see below, it is most likely to have occurred in the XV century and gained formidable extra age on the pages of the Scaligerian history textbooks. For the time being, let us merely point out the following parallel, whose existence is admitted by the very same historians who inform us of the Nika rebellion: “The first insurgency flared up... under Justinian, in the year 532. The emperor had been on the verge of losing his throne; however, Belisarius, his commander-in-chief, had slaughtered 40.000 insurrectionists at the Hippodrome. The *second rebellion* took place under Sultan Mehmet II, who had ordered to execute 30.000 mutinous janissaries on the very same spot” ([1464], page 47). Apparently, we see two accounts of one and the same uprising in the Ottoman Empire.

Thus, some of the mediaeval chroniclers would gaze at the abris of the past, which had perhaps not been all that distant, but rather traced out quite sparsely, and, confused by the old documents full of unvocalized words, would tell us of an aqueduct; others descanted about a hippodrome, or a *horseracing* arena – all of this owing to the fact that the Latin words for “horse” and “water” (*equa* and *aqua*) are very similar indeed

([237]). What we encounter here appears to be two different reflections of one and the same real event that multiplied itself throughout various chronicles.

Summary. It is most likely that the “Nika Rebellion” is yet another echo of the Gothic War that later chroniclers placed in the same century – allegedly IV A.D. The *bellum internecinum* would thus transform into a simple mutiny, albeit a violent one, and the scribes crammed it into the confines of the imperial capital – the New Rome, having also subjected events to temporal compression (several weeks instead of several years). However, the backbone of key facts remained intact, and they become more or less recognizable as soon as one gets an indication of which dates should be compared.

We shall proceed to analyze a number of parallelisms generated by the 1780-1800-year chronological shift, which we shall be referring to as the Graeco-Biblical shift. It provides us with a superimposition of the “ancient” Greece over the mediaeval Greece and Italy of the XI-XVI century A.D. In particular, the great “ancient” Greek colonization of the alleged VIII-VI century B.C. becomes a mere phantom reflection of the crusade epoch of the alleged XI-XIII century A.D., as well as wars of the XIV-XV century. The “ancient” wars between the Greeks and the Persians transform into a reflection of the early XIV century wars in Greece. The “ancient” Marathon battle is most likely to have the 1316 battle of Greece as its original. The list goes on; see the subsequent chapters for more details.

An important and representative example of how this shift manifests is the parallelism between the “ancient” Trojan war of the alleged XIII century B.C. and the Gothic war of the alleged VI century A.D. We shall then add thereto the parallelism with the European war that took place in the middle of the XIII century A.D., and is likely to have served as the original of all these “phantom” wars. The parallelism between the Trojan War and the Gothic War can be found at the very beginning of the 1780-1800-year shift, qv on the global chronological map in Chapter 6 of [*Chron1*](#).

3.

The Trojan War of the alleged XIII century B.C. superimposed over the Gothic War of the alleged VI century A.D. after an 1800-year temporal shift forwards

As we already pointed out above, Ramon Muntaner, a mediaeval historian and a contemporary of Dante, tells us the following: “One of the Trojan outposts was located on Cape Atraki in Asia Minor, near Isle Tenedos... the Romanian aristocracy would often go there... to worship the divine effigy. And so one day *Helen, the wife of the Duke of Athens, had made a pilgrimage there, accompanied by a hundred knights. Paris, the son of the Trojan king, noticed her, murdered all the knights and abducted the beautiful duchess*” ([195], page 188(6)).

In fig. 2.31 you can see an ancient miniature from the French “Global Chronicle” (*Chronique de la Bouquechardière* by Jean de Courcy published in Rouen in the alleged year 1470) – see [\[1485\]](#), page 164, and ill. 202. What we see here is the arrival of Paris and Helen (on the left) in Troy. They are met by Priam, the Trojan king, at the walls of the city (qv in the right of the miniature). Unfortunately, the size of the illustration is rather small, and so one must study the colour version in order to see all the details. It is clearly obvious that the author of the miniature didn’t for a second doubt the fact that the Trojan War had been a mediaeval event. A similar mediaeval representation of the Trojan war can be seen in fig. 2.32, which is yet another ancient miniature.

Fig. 2.31 Ancient miniature entitled “King Priam meets his son Paris and the abducted Helen at the gates of Troy” from the *Chronique de la Bouquechardière* by Jean de Courcy (dating to the alleged year 1470). The setting, people’s clothes and the whole city of Troy are presented as very distinctly mediaeval in nature. Taken from [1485], ill. 202.

Fig. 2.32 A miniature from *Le Roman de la guerre de Troie* by Benoît de Sainte-Maure dating to the alleged XIV century. We see a battle scene of the Trojan War with Greeks fighting the Trojans. The warriors are wearing heavy

armour and helmets, some of which have closed visors. We see warriors of the Middle Ages wearing characteristically mediaeval armour. Taken from [\[1485\]](#), ill. 320.

According to modern historians, the ignorant Ramon Muntaner had been unfamiliar with the Scaligerian chronology (which is hardly surprising, considering that it was introduced two centuries after his death). Therefore, his presumed errancy had made him believe the Trojan War to have taken place in the Middle Ages. The fact that it involved dukes, duchesses, knights etc apparently didn't baffle him at all. The authors of the illustration to the famous Russian almanac known as the *Litseyoy Svod* (The State Museum of History, Article #358), fig. 2.33. The illustration is called "The Trojan Army Preparing for Battle" ([\[851\]](#), page 33). Once again, we see warriors who look typically mediaeval.

Fig. 2.33 Mediaeval miniature named "The Trojan Army Riding into Battle" from the Russian *Litseyoy Svod* almanac (State Museum of History, Museum collection No. 358). The "ancient" Trojans are portrayed as mediaeval warriors. Taken from [\[851\]](#), page 33.

3.1. The first accounts of the Trojan War: their presumed

authorship, as well as geographical and temporal origins

3.1.1. The general conception of chronological shifts

In this section we shall give an account of the phenomenal parallelism between the following events:

1. The famous Trojan War of the alleged XII century B.C.,
2. The famous Gothic War of the alleged VI century A.D.,
3. The well-known wars of the crusade epoch – the alleged XI-XIII century A.D.

In other words, *the Trojan War and the Gothic War are most likely to be phantom reflections of real wars that took place during the crusade epoch. The Trojan War is a real event; however, it took place in the XIII century A.D. and not in deep antiquity. Homer's epic poem of the Trojan War is therefore an intricate compound myth telling us about the crusades of the Middle Ages.*

Our hypothesis is as follows: the fall of Troy is the fall of the New Rome = Constantinople = Jerusalem as a result of the crusader invasion of the XIII century A.D. The myth of the Trojan War consists of several episodes relating the events of major crusades. The crusaders were avenging the Crucifixion of Christ that took place in Czar-Grad in 1185.

The Trojan war of the XIII century A.D. had been one of the most important events in the history of Europe and Asia. It became reflected in multiple written sources, the authors of which hailed from different countries and wrote in a number of languages. When the epoch of “streamlined history” came, the chronologists of the XVI-XVII century started to sort through the old documents that were available to them at the time, and have made many serious mistakes in their reconstruction of the ancient history. As a result, a large number of authentic documents slid into deep antiquity, and served to create a phantom reflection of the mediaeval reality. In other words, many of the events that took place in the XI-XVII century A.D. became doubled, tripled and quadrupled. The original would most often remain in its due place, with its duplicates taking a voyage that was not just temporal, but also geographical – events would drift from Rome to Greece and vice versa. Numerous misdatings led to several chronological shifts, qv in [Chron1](#), Chapter 6. The key ones are as follows:

1. The Graeco-Roman shift of 330-360 years;
2. The Roman shift of 1053 years;
3. The Graeco-Biblical shift of 1780-1800 years.

The shift values are rather approximate since they vary from document to document. The names that we offer are explained very easily:

1. *The Roman-Byzantine shift* had elongated the history of Rome and Byzantium and moved it into the past.
2. *The Roman shift* had resulted in the elongation of Roman history, with artificial “extra age” added thereto.
3. *The Graeco-Biblical shift* had made Greek and Biblical history longer and “more ancient”.

Thus, numerous copies of the real mediaeval war that took place in the XIII century A.D. have come into existence. Some of them time-travelled into the past and got baptized anew. One of the phantom duplicates that wound up in the XIII century B.C. became the “Trojan War”. Another was dated to the VI century A.D. and dubbed the “Gothic War”. Et cetera, et cetera.

However, since both wars are but phantom reflections of *one and the same real mediaeval war*, they must resemble each other. This proves to be the case. Due to the fact that these two famous wars are of paramount importance to Scaligerian history, it shall be expedient to discuss the parallelism that we have discovered in more detail, *qv* below.

The reader is familiar with various accounts of the Trojan War from childhood. It was described in great detail by the blind poet Homer in his two immortal epic poems – the Iliad and the Odyssey. With great inspiration he tells us about the gods and the heroes facing each other in the Battle of Troy, the passionate love between Helen and Paris (*casus belli*), the legendary Trojan horse, the fall of Troy, the smoke from the fires, the escape of the Trojans and the voyage of Ulysses.

The Gothic war is somewhat less popular. Many readers don’t know anything about it at all. Mediaeval history is less vogue than that of the “antiquity”, after all. At the same time, historians who study the Middle Ages are well aware of the Gothic War to have been one of the most important breakpoints in the history of the Roman Empire ([196], Volume 1). According to the Scaligerian version, the Gothic war ends the development of Regal Rome. This is supposed to have been followed by the decline of the Roman Empire, barbaric invasions, and the transformation of the splendid Imperial Rome into the murky mediaeval Papal Rome, heralded the beginning of the “Dark Ages” in Europe.

3.1.2. The strange fate of Homer’s epic poems

1. Who told Homer about the Trojan War that is supposed to have taken place five centuries before his birth?

Let us begin with the actual legend of the Trojan War and its history. *Who was the first to have told this tale? Where and how did it happen?* The Scaligerian version tells us the following about the origins of the Iliad and the Odyssey. It is presumed nowadays that the fall of Troy (at the end of the Trojan War, which had lasted for several years) took place in 1225 B.C. ([72], page 243). Homer was the author whose text had allegedly been the first to reach us (see figs. 2.34 and 2.35). However, a closer acquaintance with the Scaligerian version of how Homer's poems came into being leaves one somewhat confused.

Fig. 2.34. An “ancient” bust that is supposed to represent Homer. Kept in the Capitol Museum. Taken from [304], Volume 1, page 81.

Fig. 2.35 The “ancient” Aphrodian and Homer on the northern gates of the Blagoveshchenskiy Cathedral of the Kremlin in Moscow ([331], Volume 1, page 182). Their famous dicta, which are very much in the vein of early Christian patriarchs, can be seen nearby, signed “Aphrotian and Omiros”. Thus, the “ancient” Aphrodian and Homer were considered to be in direct relation to the Christian church – it is hard to imagine a reason we should find them in a Christian cathedral otherwise, and accompanied by quotations at that. Taken from [331], Volume 1, page 182.

See for yourselves: the Trojan War took place around the alleged year 1225 B.C. We know *nothing* of when Homer had really lived. The Concise Columbia Encyclopaedia ([1447]), for instance, gingerly informs us that the poems were “written by the poet for the aristocratic public in Asia Minor at some point before 700 B.C.”, qv in the article entitled “Homer” (*ibid*). At any case, we are told that *Homer had lived in an epoch separated from that of the Trojan war by several centuries* – possibly as late as the alleged VIII century B.C. Thus, he must have “written his poems” *a few hundred years* after the war.

Actually, there’s nothing too suspicious about it so far. However, we must remind the reader that, according to the Scaligerian point of view, Homer had been *blind* ([1447]). Therefore, he couldn’t have written anything on his own – at best, he could have *dictated* something. The version used to prove his “authorship” of the poems is as follows.

It is admitted that Homer was blind, but he is said to have been a genius. He wrote two gigantic poems. They occupy seven hundred pages of the modern 1967 edition ([180]), no less, the font being rather small. The poet is supposed to have memorized both of them, and started singing the poems to his audience. He must have been at it *for many years*, since the poems *had not been recorded* anywhere in his lifetime! We are surprised to learn that “both the *Iliad* and the *Odyssey* had *first been written down* [a few centuries after Homer’s death – A. F.] by a special commission created for this purpose by Pisistratus, the tyrant of Athens who had reigned in 560-527 B.C.” ([180], page 711).

Thus, both of these titanesque poems, adding up to 700 pages of a contemporary book, are supposed to have been *recorded for the first time 670 years after* the Trojan War. This takes place more than half a millennium later, and also several centuries after Homer’s death. All of the above spawns confusion galore. How could the words sung by a blind poet with such great inspiration have reached the commission of Pisistratus through many centuries in order to get written down for the first time? We’re talking about two immense epic poems. Chanting them aloud by heart must take many hours. One should also take good care not to make any mistakes. The allegedly veracious picture of the events that we’re fed can be outlined as follows.

2. How does one memorize seven hundred pages of Homer’s poems for a lifetime?

The blind poet chanted his two poems before all kinds of audience many a time. The

listeners eventually managed to *memorize* them. Then the poet died; however, his compatriots remained, and they had learnt the entire volume of these 700 pages by heart and verbatim. These people had carried on with the oral tradition, telling the poems to a new audience. They eventually perished as well, yet their “oral tradition”, as historians are so very keen to call it, continued and became inherited by their children. This is supposed to have lasted for several hundred years. Towns fell and empires collapsed; still the descendants of Homer’s first listeners would keep on chanting two gigantic poems by heart.

Just try to memorize as little as the first hundred pages of the *Iliad* merely by listening to them chanted so as to keep them in memory for about two decades. Failing that, try to learn them by heart reading the actual text of the book – something Homer’s descendants didn’t have. You aren’t likely to succeed. Bear in mind that there are seven times more than a hundred pages in the book. We shall be told that “the ancients had a better memory”, which is highly unlikely – the contrary is more probable, since there weren’t any libraries at the time, nor anything resembling a unified educational system.

Let us return to the Scaligerian version of history for the meantime. Pisistratus the tyrant finally hears the magnificent chant which was apparently crooned by the court singer for several days on end and gives orders to get the poems recorded in writing for the very first time. This must have taken several singers, since one finds it hard to imagine that “oral tradition” had only reached one singer in the epoch of Pisistratus. In this case, their versions of Homer’s poems must have differed from each other considerably. Or are we being coerced into thinking that all the singers had known the same version of the text?

This is what Scaligerian history tells us about the fate of Homer’s poems – all of this with a straight face. We deem it to be extremely unlikely.

3. Where are Homer’s poems supposed to have been kept for two thousand years?

Let us trace the further fate of “Homer’s poems recorded in writing”. They are presumed to have been widely known as late as the III century B.C. ([\[180\]](#), page 711). Still, there are no copies of either the *Iliad* or the *Odyssey* that could be dated to this period. His poems had allegedly remained lost for many centuries up until the Renaissance. And yet Homer had been popular enough for his poems to be chanted aloud in many towns and villages of Greece for many centuries before they got recorded. However, no texts of Homer are seen, let alone read, by anyone in the Middle

Ages. Homer's songs have ceased to ring; the location of the unique and priceless copy of his poems remains unknown.

This is what historians tell us: "In mediaeval Europe Homer's texts were only known from the quotations and references given by Aristotle and a number of Latin authors; the poetic glory of Homer had been completely outshone by Virgil. It wasn't until the late XIV – early XV century that... the Italian humanists had made a closer acquaintance of Homer. In the XV century many of them occupied themselves with translating Homer into Latin... in 1448 the first printed Greek copy of Homer was published in Florence. Many partial Italian translations of Homer's texts were made in the XVI century. However, the first complete translation of the *Iliad* came out as late as 1723 and is credited to the poet Antonio Maria Salvini" ([180], pages 711-712).

Where could Homer's dusty text have been stored for nearly two thousand years? If we are to cast aside the highly implausible theories of oral/vocal/choral tradition that had allegedly kept Homer's poems alive for many centuries, it has to be admitted that *in reality both of Homer's poems had only surfaced as late as the end of the XIV century A.D.* ([881], Volume 2, pages 97-98. There are *no veracious accounts* of their existence dating back earlier than the XIV century. Therefore, we can put forth the hypothesis that *they were written around that epoch*, possibly in the XIII-XIV century of the new era. The myth about blind Homer singing them by a fire in the Copper Age Greece of the VIII or even XIII century B.C. is nothing but a fancy of Scaligerite historians that originated in the XVI-XVII century A.D.

3.1.3. Dares and Dictis – the “alleged participants” of the Trojan War

Scaligerian history tells us that “in the reign of the Roman emperor Claudius the sepulchre of a certain Dictis was uncovered, which contained an “account of the Trojan war” in a tin ark”. Towards the IV century A.D. we witness a *wide propagation* of the “notes” of Dictis and Dares (Dares of Phrygia), the *alleged participants* of the Trojan war, in Latin translation. The new interpretation of events and characters offered by these two authors was *deemed true in mediaeval Europe*; Homer is accused of “inveracious embellishments” and being “a touch *too partial* wherein the Greeks were concerned” ([851], page 5).

It is perfectly clear why Dares and Dictis became immediately pigeonholed as “alleged participants”, or impostors of sorts. Indeed, according to the Scaligerian chronology, Homer's poems had been chanted by the “ancient” *Greeks* for many centuries before they finally got recorded. And what do we see in this case? An instant

discovery of *Latin* (and not Greek) original “*notes written by the participants of the war*”! We also learn that “the *Greek* texts of Dares and Dictis *disappeared* without a trace” ([335], page 85).

Let us enquire about the Scaligerian dating of the first surviving account of the Trojan War. After all, other authors besides Homer have written about it. The answer is that the first surviving description of the Trojan War is a Latin text from the alleged VI century A.D. We proceed to find out that “some ignorant scribbler who had probably lived in the VI century compiled the facts related to the siege in a dry and monotonous manner; *he used to be very popular in the Middle Ages*” ([335], pages 85-86).

We should be aware of why this “first description” of the war became dated to the alleged VI century A.D. In the present section we shall provide the facts indicating that the Trojan War can be identified as the Gothic war of the alleged VI century A.D. The chronological shift, or the difference between the respective Scaligerian datings of the Trojan and the Gothic War, shall equal about 1800 years in this case. The Trojan War is considered the most important event in the history of the “ancient” Greece, whereas the Gothic War is the key event in the mediaeval Graeco-Roman history. It is little wonder, then, that the “first surviving account of the Trojan War” became dated to the VI century – erroneously so, as we are beginning to realize.

It goes without saying that historians treat the texts of Dares and Dictis sceptically or even with outright hostility. They tell us the following, for instance: “the two freshly-manufactured accounts of ‘real eyewitnesses’ were valued higher [in the Middle Ages – A. F.] than Homer’s ‘far-fetched poem’” ([171], page 45). Also, Homer’s poem had only been known in “short extracts” (*ibid*). Further on we find out that “Thucydides had been of the opinion that the narrative of the *Iliad* [by Homer – A. F.] wasn’t to be trusted” (*ibid*).

In general, the chronicles of Dares and Dictis served as a real apple of discord for the scientific community. “Many XIX century scientists denied the existence of a Greek manuscript [of Dictis – A. F.], naming Lucius Septimius as the author of *this famous forgery*... However, in 1907 an excerpt from *the diary of Dictis* was found among the Egyptian papyri” ([171], page 45).

Could Dares and Dictis really have been impostors, then? Homer himself provides us with indications that the contrary is more likely to be true. The matter is that Homer, the author of the two classical epic poems, mentions Dares *directly* at the very beginning of Book V. Furthermore, Homer refers to the Cretan king Idomeneus, who was accompanied by Dictis during the Trojan campaign ([171], page 45). Finally, Dares is

also mentioned in Virgil's *Aeneid*.

The language of the Latin text by Dares the Phrygian “sets the classical philologists ablaze with indignation... the Greek original... did not survive” ([175], page 45). Had there actually been a *Greek* original? If the Trojan War wasn't merely an event from Greek history, but rather Graeco-Roman or even pan-European, why can't the “diary of an eyewitness and a participant” be written *in Latin*, even if it had been written rather late? These “dry and monotonous” eyewitness diaries – especially the text from the alleged VI century A.D. – had instigated the creation of a great many *œuvres* inspired by the Trojan war; their entire collection is usually referred to as “The Trojan Cycle” nowadays.

A propos, we find it necessary to mention that in the alleged years VIII-IX A.D. the famous poet Angilbert had lived and worked at the court of Charlemagne, or simply “The Great King” in translation, and his first name had been *Homer*! ([122], Volume 5, page 391). Could *his* name been used in the future Greek account of the “ancient” Trojan War?

I. N. Golenishchev-Kutuzov wrote that “for a *whole millennium* (up to the very XVII century) the glory of Dares and Dictis *had been greater than that of Homer*. Isador of Sevilla considered Dares the first historian after Moses, the precursor of Herodotus. In the XII century Dares the Phrygian became the most widely-known writer of the antiquity” ([171], page 47). In the Middle Ages “the epoch of Homer had been referred to in the same terms as the age of Moses and Solomon – however, neither the devotees nor the vituperators had been familiar with any of his texts [Homer's; bear in mind that the text in question had first surfaced in the XIV century A.D. – A. F.]; the only known part of the *Iliad* had been a short excerpt ascribed to Pindarus for some reason... However, the *œuvres* that occupied a higher hierarchical position than the passage in question were the ones whose authorship allegedly belonged to Dares of Phrygia and Dictis the Cretan” ([335], pages 85-86). As late as in the XII century Joseph of Exeter concocts a recital of the Trojan war according to Dares and Dictis, claiming to describe “real events, *since Dares and Dictis were eyewitnesses*”. Quote given by [171], pages 47-48.

The historians invented the “forgery” theory as late as in the XVII-XIX century, after the creation of the Scaligerian chronology which, as we shall proceed to demonstrate, is very obviously at odds with the diaries of Dares and Dictis. Confronted with the necessity to choose between the two versions in question, the historians decided to accuse Dares and Dictis of “ignorance” in order to preserve the integrity of the

Scaliger-Petavius chronology. After that they declared Homer the Greek original, whereas the writings of Dares and Dictis became “forgeries” (in Latin).

One might think the case was closed and all the t’s crossed. However, the new critical research of the Scaligerian chronology has made the problem resurface. This is where we learn of the apparent error made by the historians. The diaries of Dares and Dictis with their dry and monotonous narrative are most probable *earlier originals*, whereas Homer’s *Iliad*, which is much more elegant and *grandiloquent*, happens to be a more recent work of art that couldn’t have been created before the Renaissance; it is the *poetic epitome* of the entire “Trojan Cycle”, which precedes “Homer’s *Iliad*” chronologically.

In fig. 2.36 we present our graph, which provides one with an ostensive representation of how the datings of the surviving oeuvres from the Trojan Cycle are distributed in time. The resulting graph proved a most edifying one, since its first peak falls on the VI century A.D., where we find the first original text that has reached our age. Then we see the visible absolute maximum of the graph to fall on the alleged XII-XIII century, which is the time *when a particularly large number of Trojan legends had come to existence*. This alone indicates that the actual war apparently took place in the XII-XIII century, since this is when most of its renditions had appeared.

Fig. 2.36 A chronology of literary works referring to the Trojan War.

A Trojan chronicle surfacing in the alleged VI century is most probably explained by the quirks of the Scaligerian chronology, which had transferred the real chronicle of the mediaeval wars (the ones that took place in the XII-XIII century A.D.) into distant past.

In fig. 2.37 one sees an ancient miniature dating to the alleged XIV century portraying Dictis the Cretan (upper left), Dares of Phrygia (upper right), and Benoit de Saint-Maure (below) – see [\[1229\]](#), page 21.

Fig. 2.37 A miniature of the alleged XIV century with the portraits of Dictis the Cretan (top left), Dares the Phrygian (top right), and Benoit de Sainte-Maure (below). Taken from [\[1229\]](#), page 21.

3.1.4. *The mediaeval troubadours and the Franks telling us about the Trojan War*

According to historians, “In the late XII – early XIII century, the eternally glorious names of Ilion, Hector and Alexander have started to reach wide audiences via the medium of *French* poetry... The troubadours of this cycle began with the Trojan war, since *it had almost been a national legend for them*. In the VII century Fredegarius Scholasticus calls *Francion, son of Priam* [Priam the king of Troy – A. F.] *the first duke of the Franks*” ([\[335\]](#), pages 85-86). The claim made by this mediaeval author (and many others besides him) moves the Trojan War forwards in time and places it in the epoch of the “first Franks”. However, the “first Franks” *have appeared in the Middle Ages*, which is confirmed by historians themselves ([196]). In this case, the Trojan war is automatically lifted into the Middle Ages.

Here are some of the most famous late mediaeval œuvres of the Trojan cycle ([\[851\]](#), page 6):

- “Roman de Troie” by Benoit de Saint-Maure, the alleged XII century, France;
- “The Song of Troy” by Herbert von Fritzlar, the alleged XIII century, Germany;
- “The Trojan War” by Conrad of Würzburg, the alleged XIII century, Germany;
- “The Tale of Troy’s Destruction” by Guido de Columna (Colonna), the alleged XIII century, Sicily.

The book of Guido de Columna was translated (from Latin!) into Italian, German, English, Russian, Hungarian and a number of Southern Slavic languages in the alleged XIV-XV century ([\[171\]](#), pages 47-48). We shall omit the list of other authors and their “Trojan œuvres”, and only point out the rather odd detail: there are *no Greek authors* listed, likewise the books of the Trojan cycle: they are written in many European languages *apart from Greek* for some reason. The *Greek Homer* shall appear much later, as a luminous and splendid crown of the entire Trojan cycle. It is bizarre that the mediaeval Greeks wouldn’t pay any attention to this most glorious event of their “ancient” history.

We shall be using one of the most ancient and most famous sources for our analysis of the mediaeval Trojan cycle – the oeuvre of Guido de Columna that dates to the alleged XIII century, in its early XVI-century Russian translation (“The Tale of the Rise and the Fall of Troy”) as well as “The Book of Troy” and the book entitled “The Golden Fleece of the Magical Ram” ([\[851\]](#)). Let us re-emphasize that all these sources contain factual information, which is all but identical to that of Homer’s epical poem – the events they relate are the same. However, these books are characterized by a much drier narrative, which does indeed resemble a diary more than a poem – therefore, they must be of a more *primordial* nature. The works of Homer, on the other hand, are written in a lofty style and very artfully, betraying their author to have been an extraordinary poet brought up on the best literary traditions of the Renaissance, already well-developed by his time. They contain fragments of a moralistic nature, tell us about deities taking part in battles, the magnitude of the passion that engulfed Helen and Paris etc.

3.1.5. The ruins of a small mediaeval fortification that Heinrich Schliemann suggested to refer to as “the remnants of the ancient Troy”

Having “lost” the “ancient Troy in the epoch of the XVI-XVII century, the *XVIII century* historians started to search for it anew. It happened in the following manner. According to the archaeologist Elli Kriesch, the author of *The Treasure of Troy and its History*, “after a certain Frenchman by the name of Choiseul-Gouffier had made several expeditions to the North-Western Anatolia at the request of the French envoy in Constantinople (1785) and published a plan of this terrain, the *discussion* about the exact location of Troy *resumed with new vigour*. The Frenchman’s opinion had been that the city of Priam had been located near Pinarbasi, about 10 kilometres towards mainland from the hill of Hissarlik; the latter was *marked as the ruin site* on Choiseul-Gouffier’s map ([\[443\]](#), page 20). Therefore, the hypothesis that the remains of the

“ancient Troy” could be identified as some ruins near Hissarlik had been voiced a long time before Schliemann by the Frenchman Choiseul-Gouffier.

Apart from that, “as early as 1822 McLaren... claimed that the Hissarlik hill had once been the location of the ancient Troy... which was the reason why the Englishman Frank Culvert, who had also been an American ambassador and lived near the Dardanelles together with his family, tried to cajole Charles Newton, the director of the Graeco-Roman collection of the British Museum in London, into organizing an expedition for the excavation of the ruins on the Hissarlik hill in 1863” ([443], pages 21-22).

Schliemann himself wrote the following: “Upon having inspected the entire location twice, I decided to *agree with Culvert completely* in what concerned the identification of the table-land on top of the Hissarlik hill as the place where the ancient Troy used to be”. Elli Kriesch proceeds to tell us that “Schliemann refers to Frank Culvert directly here, which *contradicts the popular myth* about Schliemann finding Troy armed with nothing but a volume of Homer’s works and basing his research on the text of the Iliad exclusively. It was Culvert and not Schliemann who had made the rather confident presumption that Troy should be searched inside the Hissarlik hill; this presumption stemmed from the fact that the remains of stone walls had been partially visible, even if it cannot be considered an actual discovery. Schliemann’s destiny had been to excavate this hill and to find *crucial evidence* to the reality of the town which had been presumed mythical before him” ([443], page 27).

Let us enquire about the reason why “Homer’s Troy” should be sought in this area at all – most probably, due to the fact that a vague memory of Troy being located somewhere “near the Bosphorus” had still existed back then. However, the XVIII century historians could no longer refer to the New Rome on the Bosphorus (or Constantinople) directly, since the fact that Constantinople and the “ancient Troy” had once been known as the same city was already completely forgotten – moreover, Scaligerian history forbade the very thought that Istanbul might be Homer’s Troy. However, there was plenty of indirect mediaeval evidence that suggested Troy had been located somewhere “near the Bosphorus” that fortunately managed to escape destruction. This is why historians and lay enthusiasts alike began their quest for the “lost Troy” in the vicinity of Istanbul.

There are plenty of mediaeval settlement and fortification ruins all across Turkey; thus, the choice of suitable remains that could be proclaimed “the surviving remnants of Homer’s Troy” hadn’t been a problem at all. As we can see, the ruins on the Hissarlik

hill were regarded as one of the potential candidates. However, both the archaeologists and the historians had been aware that one would have to unearth some kind of “proof” that the ruins in question were in fact “the Troy of Homer”. This “problem” was solved successfully by Heinrich Schliemann (fig. 2.38). He had commenced the excavations on the hill of Hissarlik.

Fig. 2.38. A photograph of Heinrich Schliemann (ca. 1870). Taken from [\[443\]](#), page 34.

The unearthed ruins have shown that there had really been some sort of a settlement here, one that had covered the area of a mere 120×120 metres. The plan of the settlement can be seen on pages 76-77 of [\[443\]](#), for instance. It is natural that nothing one could find here bore any relation to Homer at all. One comes across similar ruins all across Turkey. Apparently, Schliemann had been aware that one needed something quite out of the ordinary so that these meagre remnants would attract the interest of the general public. It is most likely that the ruins in question had belonged to some minor mediaeval Ottoman fortification or settlement. As we have already seen, Frank Culvert was claiming the ancient Troy to have been located here for quite a while without getting any attention, which is well understood, since there are plenty of ruins in Turkey. One would need “indisputable evidence”. And so in May 1873 Schliemann “suddenly finds” a hoard of gold that he hastens to claim the “hoarding of the ancient Priam”. That is to say, “the very same Priam” as the great Homer tells us about ([\[1391\]](#) and [\[1392\]](#)). Nowadays this set of golden artefacts travels all across the world to be presented in museums as “the treasure of the ancient Troy”.

This is what Elli Kriesh has to say about this matter: “Heinrich Schliemann... had found a remarkable treasure cache near the Scaean Gate (as he had *erroneously* thought) in May 1873... one that he had initially deemed to belong to none other but Homer’s king Priam. Schliemann and his work gathered wide popularity instantly. However, there were many sceptics who weren’t too inclined to trust this finding. Even nowadays there are researchers – first and foremost David A. Traill, the American specialist, –

who claim the “treasure cache” story to be a myth, *insisting that Schliemann had either bought most of these items, or collected them over a large period of time*. The mistrust was all the stronger due to the fact that Schliemann didn’t mention the exact date of the finding anywhere” ([443], page 113).

Indeed, for reasons unknown to us, Schliemann had kept the information about the exact location, time, and circumstances of his finding the “ancient hoarding” back ([443], page 120). We find out that “detailed descriptions and reports before *it*. What if these rumours really reflect his negotiations about *forging* the “treasure of Priam” that he had conducted *prior to* the moment when he had “discovered the cache” on the Hissarlik hill, *accompanied by no one*?

Schliemann wrote some very interesting things, such as “the jeweller has to be a good connoisseur of antiquities, and he has to promise me not to put his brand on the copies. One needs to find someone who won’t betray me, and agrees to do the job for an affordable price”. Quoting by [443], page 130. However, Baurain, Schliemann’s agent, “was reluctant to become responsible for this dubious an endeavour... he reckoned that ‘it goes without saying the copies should in no case be presented as originals’” ([443], pages 130-131). However, we learn that Baurain had “recommended Schliemann the Frohmann-Meuris jewellers from Rue St. Honoré [in Paris – A. F.]. He described this family enterprise as one that has enjoyed an outstanding reputation since the XVIII century, employing a large number of artists and fine craftsmen” ([443], page 130). A propos, in the XIX century “it became fashionable to wear antique jewellery in certain social circles. Princess Canino, the spouse of Lucien Bonaparte, would often bedazzle the *beau-monde* with her Etruscan necklace, which made her the indisputable centre of every festivity” ([443], page 134). Therefore, Parisian jewellers must have been well familiar with making replicas of antiques, and capable of making them well.

Elli Kriesh doesn’t dispute the authenticity of “Priam’s treasure”, yet she mentions that one finds it hard to say for certain whether Schliemann had really made any “copies”. At the same time, Kriesh gives us a kempt account of the fact that “since that day, the rumours of copies that Schliemann had allegedly ordered never subsided for a second” ([443], page 131).

Kriesh sums up as follows: “a number of abstrusities and contradictions in various accounts of this event whose true date isn’t given anywhere, have led the sceptics to question the authenticity of the finding... William M. Calder III, the Colorado University Professor of Ancient Philology, called Schliemann an egotistical and impertinent illusionist and a pathological liar” ([443], page 13).

By the way, Schliemann is supposed to have discovered another remarkable “ancient” burial ground – namely, that of Mycenae. He was amazingly lucky in what concerned finding ancient gold, wasn’t he then? In Mycenae he “discovers” a golden burial mask that he immediately declares to belong to “the ancient Agamemnon as berhymed by Homer”. No proof is offered whatsoever. The present day historians are cautious enough to write that “Heinrich Schliemann had been of the opinion that the mask he had found in a sepulchre in Mycenae had been the deathmask of king Agamemnon; however, it was later proven that it had belonged to a different ruler whose name isn’t known to us” ([863], page 14). One would wonder how archaeologists managed to “prove” that the unknown mask had belonged to an anonymous ruler.

We can therefore make the following observation in re Troy. All of the facts listed above combine into a most curious general picture.

1) Schliemann doesn’t indicate either the place, the date or the circumstances of “the discovery of Priam’s treasure” anywhere, making this issue oddly contentious. He never presented any valid evidence of having “excavated the historical location of Homer’s Troy”. Scaligerite historians weren’t too keen on demanding it from him, anyway.

2) One has reasons to suspect Schliemann of having ordered some jeweller the manufacture of certain “ancient golden jewellery”. One has to bear in mind that Schliemann had been a very wealthy man – for instance, “he had financed the construction of the German Institute of Archaeology in Athens” ([443], page 55). According to Kriesh, “his personal fortune made from leasing property in Indianapolis, Indiana, and Paris... had served as the material base for his research, allowing him independence” ([443], page 30).

3) It is possible that Schliemann had subsequently smuggled the jewellery into Turkey and then reported it “discovered” among the ruins on the hill of Hissarlik – the very spot that enthusiasts had indicated as the probable “location of the ancient Troy”. As we can see, Schliemann didn’t even bother with searching for Troy. He merely presented the gold as “proof” of the theory put forward by Choiseul-Gouffier and Frank Culvert. We are of the opinion that if those two had named a different spot, Schliemann would have found his “ancient treasure of king Priam” there with equal speed and ease.

4) Many XIX century sceptics wouldn’t believe a single word Schliemann said. However, the Scaligerites were happy for the most part, gleefully claiming Troy to have been “discovered at last”. Never mind the suspicious circumstances of the discovery – they don’t affect the general value of Schliemann’s great achievement. Now we know

for certain: Priam had lived here, on the Hissarlik hill. Look, this slope of the hill is the very slope where Achilles slew Hector. And this is where the Trojan Horse once stood. It didn't survive, but here's a large modern model. A very, very precise one.

One has to admit that nowadays thousands of gullible tourists reverently hearken to these tales.

5) The "treasure of Priam" was treated by Scaligerite historians in the following manner. It would be rather careless to claim the gold to have once belonged to Homer's Priam, since a statement as bold as that would immediately ensue a demand for proof, which naturally hadn't existed. This was apparently obvious to everyone who had to deal with "Schliemann's Troy" in one way or the other.

A very elegant solution was offered eventually: they admitted the treasure to have nothing in common with Priam – yet it was proclaimed to date back to an epoch even more distant than the one suggested by Schliemann.

Kriesh writes that "it was the research conducted after Schliemann's death that gave final evidence of the fact that the so-called "treasure of Priam" had belonged to an epoch a lot more distant than Schliemann could have imagined – the third millennium B.C. ... a culture of the pre-Greek and pre-Hittite period" ([443], page 172). That is to say, a mind-bogglingly old treasure, boys and girls. Perfectly incredible. No one's even heard of either the Greeks or the Hittites back in those days. Such statements render all further argumentation futile, since there doesn't seem to be anything to prove. However, it would be most edifying to learn how the devotees of this theory managed to date a number of golden articles, when even the exact location on the Hissarlik hill where they are supposed to have been found remains unknown, qv above. And gold itself doesn't provide us with any means of giving it an absolute dating so far.

6) What if Schliemann didn't deceive us and really found some old jewellery during his excavations on the Hissarlik? We shall counter with the following: even if the "golden hoarding" was authentic and hadn't been forged by Parisian jewellers, it would still be perfectly unclear why it should prove the "ancient Troy" to have been located on the Hissarlik hill. There isn't so much as a single letter anywhere on the golden items "found" by Schliemann ([443]), let alone a name. A mere verbal statement that someone had found an ancient cache of gold in an unknown location at some vague point in time doesn't suffice to make a valid claim about "the discovery of Troy".

7) Let us point out a rather interesting psychological undertone of the entire affair. This entire amazing story of "Troy finally discovered" is living proof of the fact that neither the "discoverers", nor their colleagues who were involved in this activity in

some way were really interested in scientific veracity. The Scaligerite majority of the historians and the archaeologists remained deeply convinced that “the lost city of Troy” was located somewhere near the Bosphorus straits at any rate. They must have reasoned along the lines of “well, its real location doesn’t really matter all that much, does it? Schliemann, for instance, suggests that Troy had once proudly crowned the summit of the Hissarlik hill. They even report him to have found a hoarding of gold there. The rumours that suggest there might be something wrong with the finding notwithstanding – are the details really all that important to us? Let’s agree with Schliemann’s localization of Troy. He’s a well-known and well-respected man, and an affluent one at that. The place fits. There are indeed some ancient ruins there. Need one begin to split hairs and demand “proof”? Even if Troy wasn’t located at that exact site, it must have been somewhere nearby.

8) A while later the sceptics had got tired of pointing out obvious inconsistencies in the tale of “the discovery of Troy”, which was when the “calm period of scientific research” could finally begin. The excavations continued, many well-respected and voluminous journals began to publish articles “about Troy” in great abundance. It is quite natural that nothing remotely resembling “Homer’s Troy” has ever been found on the Hissarlik hill. The excavations of what must have been some mediaeval Ottoman fortification carried on without haste. Obviously, a number of assorted shards and mutilated objects became unearthed as a result, including remains of weapons and different utensils. However, multiple reiterations of “this is where Troy had once stood” eventually created the tradition that claims that “Troy had really been here”, which proved sufficient for everyone to convince themselves as well as the gullible masses. The influx of the tourists began, and those were eager to be deceived. Thus, another problem of the Scaligerian history became “successfully solved”.

3.2. The tale of the Trojan kingdom. A rough comparison of the Trojan War to the Gothic War

Above we provide a detailed account of the Gothic War that took place in the alleged VI century A.D., identifying it as the Tarquinian war dating to the alleged VI century B.C. and described by Titus Livy. Therefore, we shall be hypothetically referring to the Tarquinian war as to a mediaeval event that could not have taken place earlier than the VI century A.D. The parallelism table that we present below identifies “ancient” events as their mediaeval doubles. In particular, it gives us all we need for making the first steps in the reconstruction of real history. Mediaeval events are of a primordial nature.

The ones we know as “ancient” nowadays are merely phantom reflections.

We shall be using the letter “a” for referring to the “ancient” Trojan war and what had happened in its course, whereas the paragraphs marked “b” will contain mediaeval events (their datings are also subject to multiple distortions due to the efforts of the mediaeval Scaligerite chronologers). Therefore, we shall be trying to reconstruct the dates that appear more precise to us – the ones that fall into the range between the XI and the XVI century of the new era or prove even more recent. The Gothic War, for instance, is dated to the VI century A.D. nowadays, which is incorrect, qv on the global chronological map in Chapter 6 of [Chron1](#). Some of its fragments should be dated to the XI century A.D. the earliest, whereas others cannot predate the XIII century A.D. The Tarquinian War is dated to the VI century B.C., which is also wrong, since it cannot date from an earlier epoch than the XII-XIII century A.D., being a duplicate of the Gothic War.

1a. *The Trojan War*. This war of the alleged XIII century B.C. is one of the key events in the “classical” history of Greece.

■ 1b. *The Gothic-Tarquinian War*. This war of the alleged VI century A.D. is a very well-known event in the Graeco-Roman (or Graeco-Romean, to be more precise) history of the Middle Ages. We shall be using the Scaligerian dating of the Gothic War (the alleged VI century A.D.) for the time being, despite the fact that this war is a phantom reflection of the real Trojan/Gothic war of the XIII century A.D., qv on the local chronological map in [Chron1](#), Chapter 6.

2a. *The Trojan War*. The Trojan Kingdom is supposed to have its origins deep in times immemorial – before XIII century B.C. ([\[851\]](#), page 70).

■ 2b. *The Gothic-Tarquinian War*. The Roman Kingdom of the VIII-VI century B.C. is nowadays referred to as the “First Roman Empire”, which is described by Titus Livy, for instance, as the reign of seven Roman kings. The same empire became reflected as the Second and the Third Roman Empire, qv in the parallelism described above.

3a. *The Trojan War*. Troy is the capital of the kingdom ([\[851\]](#), page 70).

■ 3b. *The Gothic-Tarquinian War*. Rome or the New City of the alleged VI century A.D. is the capital of the Roman Empire. Other large cities include Naples (translates as “The New City”) and Ravenna.

4a. *The Trojan War*. The Trojan kingdom falls in the alleged XIII century B.C. in the all-out war against the Greek invaders.

■ 4b. *The Gothic-Tarquinian War*. The end of Livy's Roman kingdom and the Roman Empire of the III-VI century A.D. came in the alleged VI century A.D. as a result of a great war against foreign invaders – namely, the *Romean Greeks*, or the troops of the Graeco-Romean emperor Justinian I.

5a. *The Trojan War*. The Trojan kingdom was ruled by a sequence of *seven kings*. The first of them had founded the city, as well as the entire state ([\[851\]](#), page 70). The fall of Troy and the decline of the Trojan kingdom came in the rule of the seventh king; the state has never been revived since. Unfortunately, the legends of the Trojan kingdom tell us nothing of just how long the Trojan royal reigns had been. All we know runs down to the names of the kings ([\[851\]](#), pages 70 and 198; also comment 4).

■ 5b. *The Gothic-Tarquinian War*. Here we have the sequence of *seven Roman kings* who had ruled Livy's Rome in the alleged VIII-VI century B.C. The first king's name is Romulus, he had founded the actual city (allegedly Rome) and also the state. Under the last king of seven, the Roman kingdom ceases to exist, and Rome transforms into a republic. Livy specifies the reign lengths of the first seven Roman kings in [\[482\]](#); see also the comparison as presented in fig. 2.39.

Fig. 2.39 The superimposition of the Trojan kingdom over the Regal Rome of Titus Livy.

6a. *The Trojan War*. The duration of the Trojan War is supposed to equal 10 or 11 years ([851] pages 77 and 136).

■ 6b. *The Gothic-Tarquinian War*. According to Livy, the Gothic-Tarquinian War of the alleged VI century A.D. lasted for 12 years ([482], Book 2:20). The Gothic War of the alleged VI century A.D. lasts 16 years according to Procopius – 534 or 536 to 552 A.D. in Scaligerian chronology. We see that the two “oldest” versions – Livy’s and the Trojan – concur with each other perfectly, stating the respective periods of 10-11 and 12 years.

7a. *The Trojan War*. The second Trojan king is called Ilus or Ilush ([851], page 198, comment 4), which might be a version of the name *Ilya*.

■ 7b. *The Gothic-Tarquinian War*. Livy’s second king of the Regal Rome is called Numa Pompilius aka *Julian* or *Elius*, since we have discovered him to be a double of the emperor Julian as well as the Biblical Elijah. We see the Trojan name *Ilus* to be identical to *Julian-Elius-Elijah*.

8a. *The Trojan War*. Some chronicles tell us that Troy was founded by king Dardan ([\[851\]](#), page 98, comment 4). According to the Greek mythology, the Dardanelles straits were named after king Dardan.

■ 8b. *The Gothic-Tarquinian War*. The history of Livy's Regal Rome begins with the foundation of the city, whereas that of its duplicate – the Third Roman Empire of the alleged III-VI century A.D., is marked by the foundation of its capital on the Bosphorus in the alleged year 330 A.D., known as New Rome or Constantinople. The Dardanelles straits neighbours with the Bosphorus; ancient Troy is supposed to have been located somewhere in its vicinity.

Commentary. All of this leads us to the natural consideration that Homer's Troy and the New Rome or Constantinople can be identified as one and the same city. The latter is also known as the New City or Naples. Another name linked with Troy is that of the *New Ilium*, or New Ilion ([\[443\]](#), page 28). Schliemann writes that "according to the tradition that had been kept alive in the New Ilium (the Roman name for Ilion), ancient Troy never saw its final demolition, nor had it been abandoned by all of its inhabitants (Strabon)" (quoting by [\[443\]](#), page 28). So we see that both Constantinople and Troy were referred to as "*New*".

The name Naples (New City) could have come to the territory of Italy somewhat later, when the Roman and Byzantine history was taken away from Byzantium and imported to Italy. This couldn't have happened earlier than the XIV century A.D., which is when the Italian Rome was founded. Schliemann had no reason whatsoever to try and persuade the public into believing the backwater settlement near the Bosphorus that he had excavated to have been the famous Troy of Homer. As we demonstrate above, he'd had cited no proof of any substance.

One shouldn't go far in one's search for Homer's Troy – it would suffice to point at the gigantic Constantinople = New Rome = Istanbul which exists until the present day. In fig. 2.40 one sees that Schliemann's settlement is located *near the southern exit* from the Dardanelles straits (see also fig. 2.41). Constantinople is located *near the southern exit* from the Bosphorus. Apparently, when the name Troy was taken away from Constantinople, historians had to find it a new location. As we can see, it wasn't moved too far away – the southern exit from the Dardanelles, the neighbouring straits, is where the city moved. This can be regarded as a "tip of a hat" to the memory of the real Troy being located at the southern end of the Bosphorus. Then Schliemann managed to find the

remnants of some small mediaeval settlement nearby, and hastened to proclaim it “the very same Troy as described by Homer” (fig. 2.42; also [\[1259\]](#), page 33). Let us reiterate that similar ruins without any distinctive characteristics can be found all across Turkey.

Fig. 2.40 Schliemann’s Troy is really a nondescript site near the southern entrance to the Dardanelles straits. Mark the name “Troia” on the map. Taken from [\[1259\]](#), page 158.

Fig. 2.41 A close-in of the map of Turkey indicating the alleged location of “Homer’s Troy”. Taken from [\[1259\]](#), page 158.

Fig. 2.42 Rather ordinary-looking ruins of a small mediaeval coastal fortification that received the ipse dixit reputation of having once been “the very Troy of Homer” by H. Schliemann. Taken from [\[1259\]](#), page 33.

The hypothesis that Homer’s Troy is really *Constantinople*, and not any other city, finds unexpected support in Scaligerian history. We learn that when the Roman emperor Constantine the Great was laying the foundations of the New Rome – Constantinople-to-be – he went along with the wish of his compatriots and had “initially chosen *the site of the ancient Ilion, the fatherland of the first founders of Rome*” ([\[240\]](#), page 25). This is what the Turkish historian Jalal Assad tells us. And Scaligerian history knows Ilion to be another name of *Troy*.

Historians inform us that Constantine had subsequently “changed his mind” and founded the New Rome in the town of *Byzantium* on the Bosphorus. This “change of

opinion” has been part of the historical discourse from the XVII century and not any earlier, since the epoch marks a break point when “ancient Troy” and “Constantinople” were subject to arbitrary *separation*. Apparently, some memory of the “ancient Troy” being located near Istanbul at the southern exit from “some large straits” had survived until the XVI-XVII century; however, since the Scaligerian history already “forbade” to point at Constantinople in this “search”, later historians would be coaxing the archaeologists into searching for the city somewhere in those parts. Then came Schliemann with his suggestion to consider some nondescript settlement near Hissarlik at the southern end of the Dardanelles the remains of Troy (in 1870 – see [\[1259\]](#), page 32).

Thus, historians would occasionally come across rather obvious evidence in support of the fact that *Constantinople* used to be identified as *Troy* in the Middle Ages.

9a. *The Trojan War*. Some of the chronicles name the founder of the Trojan Kingdom and the City of Troy king Dardan; others call him king Pridesh ([\[851\]](#), pages 70 and 198). Thus, we see confusion between the two founders (of the two capitals?). Let us point out that the name Pridesh may well be a derivative from the Slavic “*priydesh*” (“thou shalt arrive”) or “*prihodit*” (to arrive). This is pretty self-explanatory – some king would arrive and found a city. He would therefore receive the alias Pridesh.

■ 9b. *The Gothic-Tarquinian War*. As we already pointed out, Titus Livy also mentions the founders of the two capital cities - Romulus and Remus, calling them brothers, each of whom is supposed to have founded a capital city of his own ([\[482\]](#), Book 1). However, Romulus had killed Remus and destroyed his capital, and so Rome remained the only capital city. What we see in Roman history is also confusion between the two founders of the two capitals.

10a. *The Trojan War*. The new kingdom and the City bore the name of their founder, king Pridesh (as some chronicles tell us). “The king liked this place, and so he had decided to found a city here and name it after himself” ([\[851\]](#), page 70). Mind that the name of the city hadn’t been “Troy” at that point, but rather “Kingdom of Dardan” or “Kingdom of Pridesh”! The name “Trojan Kingdom” wouldn’t appear until much later; therefore, precision dictates the necessity of calling it “the second kingdom”.

■ 10b. *The Gothic-Tarquinian War*. The Roman Kingdom of Titus Livy, or the

First Roman Empire, was named after the founder of both the City and the state – king Romulus. Unlike the Trojan kingdom, this one didn't change its name.

11a. *The Trojan War*. The history of the Trojan kingdom reports Troy destroyed twice – we know of the last and final destruction, which we shall be referring to as “second”, as well as the so-called “first destruction” which is presumed to have taken place under Laomedontes, the father of king Priam ([851], page 89). These two destructions are the only ones reflected in the history of the Trojan kingdom.

■ 11b. *The Gothic-Tarquinian War*. The history of Livy's Roman Kingdom, as well as that of his double, or the Third Roman Empire, also contains two accounts of the city's destruction. The first one took place under Romulus Augustulus; this had marked the end of the Classical Imperial Rome, when Italy was seized by Odoacer. The second and final destruction happened during the Gothic War of the alleged VI century (in 535-552). These two destructions are also the only ones in the entire history of the Third Roman Empire.

12a. *The Trojan War*. The first war wiped out the first kingdom of Dardan or Pridesh. Shortly afterwards, about a generation or two later, the second kingdom was founded, already bearing the name of the Trojan Kingdom. This occurred in the reign of the last Trojan king Priam ([851], page 89). By the way, the name Priam could simply translate as “the first”.

■ 12b. *The Gothic-Tarquinian War*. The first destruction of the Roman Empire – namely, Italy falling into the hands of Odoacer the German – marks the end of the “purely Roman” empire in the West. Odoacer is an alien governor, likewise his successor, Emperor Theodoric. Immediately after the first destruction (in the alleged years 476-526), the second kingdom is founded – the Germanic-Gothic or the Ostrogothic kingdom in Italy governed by Theodoric and his daughter Amalasuntha.

13a. *The Trojan War*. The end of the first Trojan kingdom is marked by the advent of Jason and Hercules, the two strangers that destroy the first Trojan (Dardan's or Pridesh's) kingdom, come from the West. “Strangers from the West... have seized the town” ([851], page 89). Both are foreigners in Troy.

■ 13b. *The Gothic-Tarquinian War*. The two foreigners Odoacer and Theodoric – the ones who destroy the “purely Roman” empire, which is the double of the first Trojan kingdom, invade Italy from the North-West. They are strangers here – that is to

say, they weren't born in Rome.

14a. *The Trojan War*. The kingdom of Dardan (or Prideshe) changes its name after the first destruction. It is succeeded by the Trojan kingdom. The name Trojan is virtually identical to the word “Franks” - both transcribe as “TRN” without vocalizations.

■ 14b. *The Gothic-Tarquinian War*. The Third Empire in the West changes its name as well as its status under Odoacer; this takes place after the first destruction, transforming the empire into Ostrogothic kingdom in Italy. This is where its double, or Livy's Regal Rome, has its ruling dynasty changed to that of the Tarquins. Their name transcribes as TRQN unvocalized, which is similar to TRN, as well as “Franks” and “Pharaoh”. We are beginning to understand that the Franks had a good reason to trace their ancestry back to the kingdom of Troy, since it belonged to more or less the same epoch as they had lived in – the Middle Ages. Modern historians have no right to exercise their irony at the expense of these “silly fancies” of the Franks.

15a. *The Trojan War*. The unvocalized root TRN, or Trojan, is derived from the name of the new king Troilus, who had “built more of the city than anybody else and thus called it after himself – Troy” ([\[851\]](#), page 70. From that moment on, the inhabitants of the kingdom started to call themselves Trojans, and the city Troy.

■ 15b. *The Gothic-Tarquinian War*. We encounter the unvocalized root of TRQN (Tarquin) in Roman history as the name of the new Tarquinian king. We have demonstrated above that in the superimposition of Livy's Regal Rome over the Third Roman Empire king Tarquin the Ancient would become identified as the emperors Valentinian III and Recimer (acting as their “sum”, in a way). Furthermore, Tarquin the Proud is the collective name used to refer to the entire dynasty of the Gothic rulers that had reigned in Rome in the alleged VI century A.D.

16a. *The Trojan War*. King Troilus (or Laomedon, according to several other versions) is sixth in the sequence of Trojan kings. He had been the founder of the kingdom with the new name – one called the Trojan Kingdom. The kingdom is invaded for the first time at the time of his reign (see fig. 2.43).

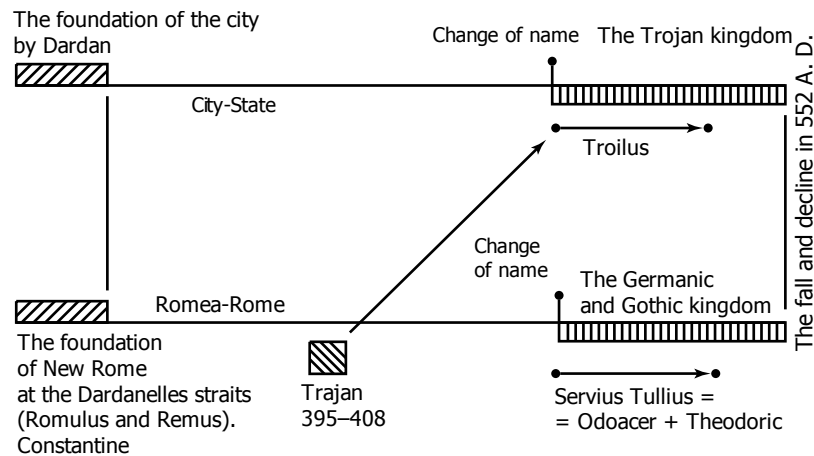

Fig. 2.43 The parallelism between the “ancient” kingdom of Troy and the “ancient” Regal Rome of Titus Livy, or the Third Roman Empire.

■ **16b. *The Gothic-Tarquinian War.*** The sixth king of Regal Rome as described by Livy is Servius Tullius – the duplicate of Odoacer and Theodoric from the Third Roman Empire. Odoacer and Theodoric are the founders of the new German-Gothic kingdom in Italy that had existed between the alleged years 476 and 552 A.D. Odoacer (and Theodoric) were the ones to head the first invasion into the Third Empire that brought an end to the “purely Roman” rule in Italy.

17a. *The Trojan War.* As we have already mentioned, a new term is coined at some point in time closer to the end of the Dardan-Pridesh kingdom: Trojan (Troy).

■ **17b. *The Gothic-Tarquinian War.*** History tells us of a new name introduced at the end of the Second Roman Empire (the double of Livy’s Regal Rome and the Third Roman Empire) – Emperor Trajan, the alleged years 98-117 A.D. His name is virtually identical to the word “Trojan”.

Commentary. Let us remind the reader that all three Roman Empires – the Regal Rome of Titus Livy, or the First Empire of the alleged VIII-VI century B.C. = the Second Empire of the alleged I-III century A.D. = the Third Empire of the alleged III-VI century A.D. are very close to each other statistically, being phantom reflections of one and the same Holy Roman Empire of the alleged X-XIII century A.D., which is partially real and partially a phantom, as well as the Habsburg (Nov-Gorod?) empire of the alleged XIV-XVII century. It is remarkable that the following extremely similar names – Trajan, Tarquin and Trojan – become identified as one and the same name. Among other things, this indicates a possible identification of the Trojans as the Tarquins or the

inhabitants of Nov-Gorod (see more about the meaning of the name as transcribed in reverse above). It would be expedient to point out that the root TRQN remains traceable in the names of many parts of Rome – the havens, the harbour and the canal, which were built by the Roman emperor Trajan, as well as the famous Italian city of Troy, which exists until the present day, etc ([196], Volume 1). Trajan had also been the name of the bodyguard of the military leader Belisarius ([695], I(V), 27 and 4; II (VI), 4, 6 and 14; 5, 4, 9, 10, 21 and 24).

18a. *The Trojan War*. In fig. 2.44 one sees the chronological disposition of the Trojan period in the history of the Trojan kingdom.

Fig. 2.44 The superimposition of the final periods of the Trojan Kingdom and the First = the Third Roman Empire.

■ 18b. *The Gothic-Tarquinian War*. The same fig. 2.44 shows us the period in the history of Regal Rome that is usually referred to as Tarquinian – allegedly located and dated to Italy of the VI century B.C. Both periods concur with each other well due to a mutual superimposition of the Trojan Kingdom and the First = Third Roman Empire. This concurrence shall become ideal if we are to assume that the name Tarquin the Ancient (Trajan in the Second Empire) really applied to Odoacer and Theodoric (in the alleged V-VI century), rather than their predecessors Valentinian III and Recimer. Titus Livy may have confused the names of two neighbouring rulers for each other.

19a. *The Trojan War*. One spells the Latin words for Troy and Trojan (adjective and noun) as follows: Troia, Troja, Troius (Troy), Troicus, Trojanus, Trojus (Trojan

– noun and adjective) – see [237], page 1034. The Greek spellings are similar; in Latin transliteration they look as “Troianos”, “Troakos”, and “Troieus”. One also has to bear in mind that in the Middle Ages the letters V and U would frequently swap positions and be used instead of each other, as one can plainly see in many mediaeval manuscripts. The letters U and V look very similar, which might be one of the reasons for this. Thus, if we are to collect the unvocalized versions of the words “Troy”, “Trojan” etc. – TRN, TRK, TRQV, TRV – we shall get TRQN as the sum of the above, which is the unvocalized root of the name of the Roman Tarquins (Nov-Gorodsmen).

■ 19b. *The Gothic-Tarquinian War*. As we have already pointed out, the mediaeval Franks claimed to have been the descendants of the Trojans. Scaligerian chronology renders this impossible. Nowadays it is considered that in the times of the Trojan War of the alleged XIII century B.C. the predecessors of the European Franks had still remained cavemen. However, it would be expedient to revise the approach to such mediaeval evidence. The facts that we cite demonstrate the mediaeval Franks and the Trojans to have quite possibly been contemporaries. That said, one cannot fail to notice that the Trojan origins of the Franks are reflected in their very name – TRNK without vocalizations (bearing in mind the frequent flexion of F, Ph and T). Apparently, such well-known names from Scaligerian history as “Trojans”, “Franks”, “Turks” and “Tarquins” refer to similar, if not identical, groups of people.

20a. *The Trojan War*. The Trojans (TRQN) had lost the Trojan war and were forced to go into exile. In fig. 2.32 one sees an ancient miniature from the *Roman de Troie* by Benoit de Saint-Maure entitled “The Battle of Agamemnon and Menelaus with Troilus and Diomedes” ([1485], page 246). We see both parts to be typical mediaeval knights in heavy plate armour. Some of them have full helmets with closed visors; there are stars painted on one of the shields.

■ 20b. *The Gothic-Tarquinian War*. The Tarquins (TRQN) suffer bitter defeat in the war and are exiled from Rome. Both wars – the Trojan and the Gothic – are described as incredibly violent, with many battles and large numbers of casualties. These two wars are considered major events in the history of the Trojan and the Tarquinian-Roman kingdom.

Commentary. Apparently, what we see here is a reflection of the events that date to the crusade epoch. The Franks – Turks (Tartars?) - Goths – Trojans – Tarquins (Nov-

Gorodsmen) – TRQN – the crusaders of the alleged XII-XIII century. The New Rome (Constantinople) was probably founded at the beginning of this epoch. The same city can be identified as the original Evangelical Jerusalem and the original Troy of Homer, qv in Chapter 6 of [Chron1](#). The siege of Constantinople by the crusaders in the alleged year 1204 and the war of the XIII century can be identified as the siege of Jerusalem. Other mediaeval documents might have referred to this event as to the fall of Troy, or the Gothic=Tarquinian War. The wars and the movement of troops would aid to the propagation of geographical names across larger areas. One cannot fail to notice the presence of the name TRQN in Crimea, for instance, where the Tmutarakan principality was located. The very name “Tmutarakan” (Tma-Tarakan, or “abundance of the Tarquins”) also indicates the presence of the “Trojan terminology” on this territory in the Middle Ages. Let us remind the reader that the Slavic word “tma” means “abundance”, or “a large quantity”. We shall also provide information concerning the fact that Tmutarakan used to be another name of Astrakhan. A propos, the term “Tmutarakan” is also present in the *Tale of Igor’s Campaign* as “Trayan”, qv in more detail in Suleimenov’s *Az and Ya* ([\[823\]](#), pages 118-122). This observation provides yet another link between the concepts of “Trojan” and “Tmutarakanian”.

21a. *The Trojan War*. The second and final destruction is wreaked upon the Trojan kingdom by the Greek invaders at the end of the Trojan = TRQN period in the history of the kingdom as a result of the famous Trojan War.

■ 21b. *The Gothic-Tarquinian War*. The second and allegedly final destruction of the First=Third Roman Empire in the West in the alleged VI century is also inflicted upon Rome by foreign invaders – the Roman Greeks. The Graeco-Roman emperor Justinian I gives orders to destroy the kingdom of the Ostrogoths, and those are promptly implemented. The famous Roman military commander Belisarius crushes the Gothic troops. The Goths are forced to withdraw from Italy, qv above.

22a. *The Trojan War*. Trojan chronicles tell us about a large fleet of invading Greeks that came to storm the Gothic kingdom. We even learn the number of ships, qv in [\[851\]](#), page 95 and on. The fleet is supposed to have come *from Greece*.

■ 22b. *The Gothic-Tarquinian War*. Roman chronicles, in particular those of Procopius (the author of *The Gothic War* – [695] and [696]) inform us that the Roman Greeks invaded Italy in the alleged year 535 A.D. with a large fleet that came *from Greece* and Byzantium ([196], Volume 1, page 319).

Commentary. In fig. 2.45 we see an ancient miniature from a book that unites two œuvres – *De Bello Troiano* by Dictis the Cretan, and Livy’s *Ab urbe condita* of the alleged XIV century. The first miniature most probably depicts the invasion into Troy ([1229], page 17). It opens an entire series of miniatures representing the Trojan War that one finds in the section of [1229] that deals with *The Trojan War* by Dictis the Cretan. It is most noteworthy that the banner one sees hoisted over the army bears the initials SPQR. These banners accompanied mediaeval, and therefore also “ancient” Roman troops into battle. The modern commentator tells us that “the initials SPQR on the Roman banner identifies the soldiers as Romans fighting under the name of Senatus Populusque Romanus” ([1229], page 17). All of this notwithstanding the fact that, according to the Scaligerian chronology, Rome was founded five centuries after the Trojan War.

Fig. 2.45 The first miniature from the Trojan cycle that one can see in [1229]. What we see is either the Greek army assaulting Troy, or evidence of the artist having linked the very same event to the Roman wars as described by Titus Livy. We can clearly see the initials SPQR (Senatus Populusque Romanus) on the banner, which are considered a sine qua non attribute of the mediaeval (and hence also the “ancient”) Romans. Dictis the Cretan, *De bello Troiano* and Livy’s *Ab urbe condita*. Paris, Bibliothèque Nationale, Ms. lat. 5690, fol. 201v. Taken from [1229], page 17.

In fig. 2.47 we see another miniature from *The Trojan War* by Dictis the Cretan ([1229], pages 18-19) with a scene of battle between the Greeks and the Trojans.

According to the inscriptions on the miniature, amongst the participants of the battle are the kings Agamemnon, Aeneas, Achilles, Hector and Troilus. All of them are represented as mediaeval knights in plate armour and helmets with closed visors.

Fig. 2.47 A battle between the “ancient” Greeks and the Romans. All the warriors are portrayed as mediaeval knights. Dictis the Cretan, *De bello Troiano*. Paris, Bibliothèque Nationale, Reg. lat. 1505, fol. 85r. Taken from [\[1229\]](#), pages 18-19.

The parallelism between the Gothic and the Trojan War that we discovered provides perfect explanation for the existence of these old pictures that virtually identify the “ancient Greeks and Trojans” as the mediaeval knights.

In fig. 2.48 we see an ancient miniature from a copy of Homer’s *Iliad* allegedly dating to the XV century that depicts the “ancient” Greek fleet. However, the vessels we see are typically mediaeval. Modern commentators couldn’t have failed to notice this, hence their cautious remark: “the ship in front looks like a Venetian vessel” ([\[1229\]](#), page 54). We shall discover the participation of Venice in the Trojan War below and from a different source.

Fig. 2.48 A miniature from an edition of Homer’s *Iliad* allegedly dating to the XV century. The Greek fleet is pictured as typically mediaeval; we see a large mediaeval vessel in front (which is also marked by the modern commentator, see [\[1229\]](#), page 54). Vatican, Biblioteca Apostolica Vaticana, Vat. gr. 1626, fol. 30r. Taken from [\[1229\]](#), page 54.

23a. *The Trojan War*. Troy is a seaside town located “in a valley by the sea” ([851], page 70). We also learn that there had been a river “running through Troy” ([851], page 90). In fig. 2.49 we see a miniature entitled “A View of Troy” from the mediaeval *Litseyoy Svod* almanac which is kept in the National History Museum of Moscow ([851], page 17). We see a typically mediaeval town (fig. 2.50). On the left side of the river (straits) we see the “ancient Trojans” occupying themselves with such crafts as shipwork, metallurgy etc. The detail that is of the utmost interest to us is the fact that they apparently cast very large bells, qv in fig. 2.50.

Fig. 2.49. A mediaeval miniature of Troy from the *Litseyoy Svod*. State Museum of History, Museum collection, No 358. The miniature is entitled “A view of Troy” ([851], page 17). We see a typically mediaeval city as well as quotidian activities of its inhabitants – the “ancient” Trojans. Among other things, they occupy themselves with moulding large bells – in order to mount them atop a belfry in a *Christian church*, qv in the upper left corner of the

Fig. 2.50 A close-in of the miniature showing bells cast in the “ancient” Troy. Bells did not appear until the Middle Ages; moreover, they were an attribute of Christian churches. Who could have erred here – the artist or the Scaligerian historians? We shall most probably be told of the artist’s presumed ignorance; however, the opposite is apparently true. In this case, as well as in a great many others, the mediaeval artist was correct, unlike the Scaligerites.

It seems as though the mediaeval artist of the XVI-XVII century had kept the memory of true history, or some vague shreds thereof at the very least, and tried to provide us with a bona fide representation of the mediaeval Troy and its quotidian realities – which included the casting of bells to be placed *upon Christian temples, no less*. It wasn’t until somewhat later, when Troy had already migrated into distant past courtesy of Scaligerian history, that the notion of bells cast in the “ancient Troy” became a hideous anachronism. Scaligerian history started to claim that there were no bells upon the “ancient” Greek and Roman temples. From the XVII century and on, Scaligerite historians have been declaring all examples of mediaeval art that contradicted Scaligerian history “wild fancies”.

There is another noteworthy detail concerning this miniature. As we have already pointed out, the academic edition ([\[851\]](#)) gives the name of the miniature as “A View of Troy”, whereas another modern edition ([\[550\]](#)) contains the same miniature, but without any name this time. The equivocatory comment runs as follows: “A mediaeval town. Miniature from a XVI century chronicle” ([\[550\]](#), page 81). Why would the publishers of [\[550\]](#) refrain from mentioning the name of the miniature? The answer is apparent. The view of Troy as presented on the picture is so blatantly mediaeval, complete with Christian belltowers, that the historians in charge of the publication ([\[550\]](#)) decided to refrain from shocking the reader with such an obvious dissonance between the Scaligerian history and some of the ancient pictures that have survived until our day. Therefore, the reference Troy had to be kept secret, and was therefore replaced by a

mere “mediaeval town” – which is actually correct; what needed to be added was that it also happens to be a view of the “ancient” Troy.

■ 23b. *The Gothic-Tarquinian War*. It is presumed that most of the events in the course of the Gothic War took place in Rome and Naples. Naples is a seaside town. The New Rome, or Constantinople, is also located by the seaside. Furthermore, Istanbul (Constantinople) is situated on the two banks of a long and narrow straits (the Bosphorus), which may well have been referred to as “a river” (fig. 2.51). Apart from that, there is a river that runs through Rome, the capital of the Roman Empire and the kingdom of the Ostrogoths – the famous Tiber.

The Bosphorus and the Princes Islands

Fig. 2.51 A map of the Bosphorus and the city of Istanbul located on both banks of the southern exit of the Bosphorus into the Marmara Sea. Taken from [1464], page 107.

24a. *The Trojan War*. For some reason, Trojan chronicles mention a large number of watermills on the river that ran through Troy ([851], page 90).

■ 24b. *The Gothic-Tarquinian War*. Mediaeval historians (Procopius in particular) make many references to the watermills standing on the river Tiber that runs through Rome in their accounts of the Gothic War ([196], Volume 1, pages 355-

356. They have really played an important role in the Gothic War of the alleged VI century. These watermills have often stood at the centre of the battlefield where the Goths fought the Romeans/Romans/Greeks. Procopius pays a great deal of attention to the “watermill battles” ([695]). No watermills are mentioned in any other accounts of the Third Roman Empire’s military campaigns. We didn’t find any independent evidence to attest to the popularity of watermills in the Italian Rome; au contraire, we have managed to find out that Czar-Grad (or Constantinople) was famous for its watermills, which had stood right on the banks of the Bosphorus – the so-called “Great River” (see the rare mediaeval XV century engraving in fig. 2.52, which belongs to the cycle known as *Peregrination in Terram Sanctam*, or “The Pilgrimage to the Holy Land”, dating to 1486). This engraving depicts a ship approaching Czar-Grad (Constantinople on the Bosphorus). We immediately recognize the city as Czar-Grad, since we can see the Golden Horn bay and the famous *chain* that used to guard its entrance. The engraving shows us the two ends of this heavy chain that hung between the two towers located on each side of the bay. This “chain guard” played an important part in the history of Czar-Grad, as a matter of fact ([695]), and is mentioned by many authors. We see a great many watermills on the engraving, they nearly fill the entire peninsula where the centre of Czar-Grad is located. Therefore the “numerous ancient Trojan windmills” are most probably of a mediaeval origin, and belong in the Constantinople of the Middle Ages – as we can see, they had still existed by the end of the XV century. Therefore, Procopius of Caesaria must have been referring to the New Rome on the Bosphorus in his account of the Gothic War.

Fig. 2.52 An ancient engraving dating from 1486 entitled “A Pilgrimage to the Holy Land that shows Constantinople

(or Czar-Grad) on the Bosphorus, the Golden Horn bay and the famous chain that was locking the entrance to the bay. There are lots of windmills on the coast – possibly the very “windmill multitude” that the old chronicles refer to. Taken from [1189], page 31, ill. 10. Bernhard von Breydenbach. Holzschnitt in: *Reise ins heilige Land*. Weimar, Zentralbibliothek der deutschen Klassik.

Commentary. As a matter of fact, the very same engraving provides us with more proof of the theory that the Evangelical Jerusalem and Czar-Grad on the Bosphorus are the same city. Indeed, Scaligerian history tells us that the mediaeval “pilgrimages to the Holy Land” would always have Jerusalem as the final point of their itinerary. What Holy Land do we see in the 1486 engraving that is supposed to represent one of such pilgrimages? As one sees in fig. 2.52, the city in question is Constantinople, or Czar-Grad. Thus, the Holy Land had been a term associated with Constantinople, or Czar-Grad on the Bosphorus, as recently as in the XV century.

We observe the same phenomenon in another mediaeval engraving of the XV century – *Ritter Grünembergs Pilgerfahrt ins Heilige Land* (“Knight Grünemberg’s Pilgrimage into the Holy Land”), qv in fig. 2.53. We see a ship full of pilgrims that approaches a seaside town and a good view of the bay behind the corner tower. Both engravings are on the same page of the album ([1189]) since they belong to the same “Pilgrimage” cycle. We are most likely to be seeing Constantinople with its Golden Horn bay once again, hence another reason to identify the Evangelical Jerusalem as Czar-Grad.

Fig. 2.53 An ancient engraving of the XV century entitled “The Pilgrimage of Knight Grünemberg into the Holy Land”. The pilgrim ship is approaching a coastal town; one can distinctly see a bay – most probably the Golden Horn, which would identify the city as Czar-Grad on the Bosphorus. Therefore, the Evangelical Jerusalem (the Holy Land) was identified as Czar-Grad, or Constantinople, as recently as the XV century. Taken from [1189], page 31, ill. 11b. Konrad Grünemberg, 1486. Gotha, Forschungsbibliothek.

25a. *The Trojan War*. King Priam is known to have built “a great and splendid palace upon a hill” in the middle of Troy ([851], page 90).

■ 25b. *The Gothic-Tarquinian War*. According to Jalal Assad, the Byzantine palace complex of Constantinople is considered to have been one of “the most fantastic and magnificent phenomena known to history” ([240], page 137). The main one had been the Great Imperial Palace that would “cover... a gigantic area of 400.000 square metres near the Temple of Hagia Sophia” ([240], page 138). This palace had been destroyed in the crusade epoch. Chronicles name it among the wonders of the world – a gigantic edifice where a great deal of the Byzantine Empire’s wealth was stored. One can get some idea of just how magnificent the Great Imperial Palace had been by the grandiose Hagia Sophia, which has reached our days. The Capitol Hill in the middle of Rome also used to be crowned by a palace complex – the Capitol, dating back to the times of the Third Roman Empire; however, it couldn’t have been built earlier than the XIV-XV century A.D. - already after the fall of Byzantium and the “migration of the Roman statehood” from Constantinople to Italy.

26a. *The Trojan War*. Phrygia in Asia Minor. The kingdom of Troy could have been located in Phrygia, comprising a minor part of or it could have been a neighbour of Phrygia. Trojan sources tell us that before the first invasion into Troy, Jason and Hercules had “landed at the coast of the Trojan kingdom in Phrygia” ([851], page 79). Modern commentators tell us that the kingdom of Troy had been adjacent to the land of Phrygia ([851], page 209). We find more references to the fact that the Trojan kingdom was either located in Phrygia or a neighbour thereof in the famous book about Troy written by Dares the Phrygian, whose very name reflects his origins. Many mediaeval authors knew Phrygia as “the land where the Trojan kingdom was located” ([851], page 214, comment 71).

■ 26b. *The Gothic-Tarquinian War*. The mediaeval German Friesia. Nowadays historians locate the “ancient” Phrygia in Asia Minor. However, mediaeval authors are of a different opinion. They identify Phrygia with Friesia, a part of Germany. Modern commentators point this out as well: “apparently, the more correct reading of Guido’s copy suggests Friesia [instead of Phrygia – A. F.]. The north-west of Germany has been inhabited by a tribe known as the Friesians ever since the beginning of the new era” ([851], page 216, comment 99). In this case, the “ancient” Trojan kingdom automatically relocates to either Europe or Byzantium, becoming

identified as either the Romean kingdom (Byzantium), or the early Ottoman (Ataman) Empire. In the latter case the word “Phrygia” may be a slightly distorted version of Turkey (Turkiye). Bear in mind that “Ph” and “T” would often take each other’s place.

Commentary. Apparently, along with the toponymic migrations from the West to the East, the reverse process also took place. The European conquests of the “Mongols” and the Turks, who had moved westwards from the East, certain Oriental names would make their way into Europe.

27a. *The Trojan War*. “Phrygians were allies of the Trojans” ([\[851\]](#), page 216, comment 99). They took part in the Trojan = TRQN War. By the way, Homer calls Dares a priest from Troy = Ilion, see Book 5, 9-11. This also implies that Dares the Phrygian had fought alongside the Trojans.

■ 27b. *The Gothic-Tarquinian War*. In the Gothic War of the alleged VI century the Greeks/ Romeans/Romans were forced to fight against the Goths, who had invaded Italy led by king Theodoric, as well as the German tribes that had come to Italy somewhat earlier with Odoacer as their leader. We recognize the “ancient” alliance between the Friesians/ Germans and the Trojans/TRQN. Another thing that we have to bear in mind is the superimposition of the Goths over the P-Russians and the P-Racenes, as well as the Et-Ruscans. Livy tells us that the Tarquinian clan was often characterized as a tribe of northerners, qv above. Tarquin the Proud, the double of several Gothic rulers, is known to have been a foreigner, and not a Roman native.

Commentary. The peak of the toponymic migration between the East and the West must fall on the crusade epoch of the XIV-XV century, when the Europeans had invaded Asia, shortly before the armies of the “mongols” and the Ottoman Turk swarmed Europe. Since Dares, the author of the first Trojan War chronicle, is known to have been Phrygian, common logic tells us that the first legends of the fall of Troy must have been written by the Goths who took part in the Gothic War. Amongst many other things, this implies both Dares and Dictis to have been completely innocent of “forgery” - their mediaeval chronicles are most probably authentic firsthand evidence of the war set in writing by the eyewitnesses amongst the crusaders.

The Goths taking part in the Trojan war of the alleged XIII century A.D. are perfect nonsense from the point of view of the Scaligerian chronology, which considers these

nations to have been wallowing deep in the Stone Age back in those days, whereas the participants of the Trojan War are hailed by the gold-mouthed Homer in such passages as “the mightiest of mortals, glorious sons of the earth”, or “Mighty Hector with his helmet ablaze”. Therefore, modern historians try to convince us that “it is obvious that the Friesians could not have fought in the Trojan War” ([\[851\]](#), page 216, comment 99). We recommend the reader to compare the material from this chapter with the data provided in [Chron5](#) and [Chron6](#) where we consider the issue of the Goths identified as the Mongols and the Tartars, or the Russian “Mongolian” = Great Empire of the XIII-XVI century.

28a. *The Trojan War*. Some well-known mountain is known to have been located near the “ancient” Troy – Mount Ida, or the Idean mountain ([\[851\]](#), page 198, comment 3), which sounds virtually identical to “Judean Mountain”.

■ 28b. *The Gothic-Tarquian War*. Naples is located at the foothills of the famous European volcano Vesuvius. Rome isn’t too far away, either. The abovementioned dynastic parallelisms suggest that Vesuvius can be identified as the Judean Mountain, or the mountain of the Theocrats – a holy place of worship. What we see at the outskirts of Constantinople (Istanbul) is the famous Mount Beykos with its famous gigantic grave of St. Iusha (Jesus), also a holy place of worship. See [Chron5](#) for more details.

29a. *The Trojan War*. Trojan chronicles – Homer, in particular, often refer to “the Idean heights”, “Zeus the Idean”, “the Forest of Ida” and so on. It is noteworthy that India Minor is located near Mount Ida ([\[851\]](#), pages 93 and 212, comment 50; also [\[180\]](#), page 264). One instantly recollects the fact that in the Middle Ages “India” would often be used to refer to “Judea”; their respective names used to be written similarly, with Judea spelt as “Iudia”. Mount Ida is also supposed to have been a halidom and a religious centre ([\[851\]](#)), just like Mount Beykos on the outskirts of the New Rome (Istanbul), or the Italian Vesuvius described in the Bible as the famous Mount Sinai, or Horeb, where God had given Moses the Law. Trojan chronicles tell us that the famous Judgement of Paris took place in the Forest of Ida (the Judean Forest?). Let us remind the reader that Paris, the son of the Trojan king, solves the “beauty dispute” between the three ancient goddesses, handing the prize over to Aphrodite, the goddess of love ([\[851\]](#), page 93). One has to point out that the Bible often refers to various religions as to “wives” ([\[544\]](#), Volume 1); therefore, the

“judgement of Paris” may really have referred to the choice of the “ancient” Bacchic religion made by the Trojans. They chose one of the three “wives”, or religions – Aphrodite’s religion of love (TRDT or TRTT – Tartars). This may have been the original Judaic (Theocratic) cult. Let us remind the reader that the mediaeval Western European Christian religion could possibly have been superimposed over the ancient Bacchic cult, qv above. On the other hand, one cannot fail to recollect the famous mediaeval “choice of confession” made by Prince Vladimir in his baptism of Old Russia. He had also chosen Christianity from several religions that he had been offered. Could the “ancient Paris” have been a mere reflection of the P-Russian (White Russian) Vladimir (the name translates as “the Master of the World”)? In fig. 2.54 we see a painting by Lucas Cranach (1472-1553) entitled “The Judgement of Paris”. What we see is a typically mediaeval scene – Paris is portrayed as a knight in heavy armour; his servant is also wearing armour and a mediaeval attire.

Fig. 2.54 “The Judgement of Paris” by Lucas Cranach the Elder (1472-1553). The “ancient” scene is represented in a typically mediaeval setting, Paris himself being a knight in plate armour. Taken from [\[1258\]](#), page 45. Also see fig. 4.11 below.

■ 29b. *The Gothic-Tarquinian War*. As we have already mentioned, the Third Roman

Empire became reflected in the Bible as the history of the Judean and Israelite kingdoms, whose original is the Holy Roman Empire of the alleged X-XIII century A.D., and the Habsburg (Nov-Gorod?) Empire of the XIV-XVII century. Therefore, the Trojan names containing the word “Idean”, or Judean – the Judean Heights, Judean Zeus, and the Judean Forest have their origins in the XI-XVI century epoch. At that time, Israel and Judea were the ecclesiastical names for large regions of Europe and Asia. Relics of the vast mediaeval Judea and Israel can be found all over Europe – the town of Ravenna in modern Italy, for instance, which clearly is a derivative of the word “Rabbi”, or “The Town of the Rabbis”. Let us return to the Trojan chronicles. After the fall of Troy, the Trojan Angenor “follows the setting sun” and founds a city by the name of Venicea ([\[851\]](#), page 147). This is apparently an account of how the mediaeval Italian Venice was founded. Let us also remind the reader that in the Middle Ages Southern Italy used to be called Greater Greece ([\[196\]](#)).

30a. *The Trojan War*. The fall of Troy, Hattusas (Hatusa) and Babylon. According to the Scaligerian chronology, Troy fell in the year 1225 B.C. ([\[72\]](#)). It is also presumed that Hattusas, the capital of the Hittite kingdom was destroyed around the same time, likewise Babylon ([\[72\]](#) and fig. 2.55).

Fig. 2.55 Scaligerian datings of the dates when certain ancient cities fell – namely, Troy, Babylon and Hattusha.

■ 30b. *The Gothic-Tarquinian War*. Hittites as another name of the Goths. As we have already mentioned in [ChronI](#), Chapter 1, the “ancient” Hittite kingdom is most probably a phantom reflection of the mediaeval Gothic state. Moreover, some of the chronicles (see Chapter 1 of [ChronI](#)) use the name “Babylon” when they refer to Rome. Therefore Scaligerian chronology is correct in its assumption that Troy, Rome/Babylon, and the Hittite/Gothic kingdom fell all but simultaneously. The only error of the Scaligerite chronologers is that they have misdated this event. It did not happen in the XIII century B.C., but rather the XIII century A.D. In the present case, the XVII century historians merely “reversed the temporal value” of the dating.

31a. *The Trojan War*. Helen of Troy. The casus belli for the Trojan War is known to have been the so-called “humiliation of Helen”, the wife of Menelaius. She is supposed to have been abducted and taken away from her husband.

■ 31b. *The Gothic-Tarquinian War*. Lucretia/ Amalasuntha/Julia Maesa. The Tarquinian War of the First = Third Roman Empire had also been caused by the death of Lucretia/ Amalasuntha. Lucretia had been raped and committed suicide; Amalasuntha was murdered, qv above.

32a. *The Trojan War*. Trojan chronicles tell us of eleven large-scale battles that took place in the course of the Trojan War, which, in turn, fall apart into a multitude of minor battles. The war results in the fall of Troy, which is burned and plundered completely. We learn of the unspeakable atrocities from the part of the Greek victors, and that there was “no stone left unturned in the city” ([851], pages 133-134). The Trojan kingdom ceases to exist; surviving Trojans flee to distant lands. It has to be said that mediaeval artists would paint the Trojan War in a mediaeval manner. For example, in fig. 2.56 we see an old miniature from the *Roman de Troie* by Benoit de Saint-Maure, dating from the first quarter of the XIV century ([1485], page 20). We see the Greeks storming Troy; they are armed with crossbows (fig. 2.57). Crossbows had been a weapon used in the Middle Ages – and late Middle Ages, at that.

Fig. 2.56 A miniature from *Le Roman de la guerre de Troie* by Benoit de Sainte-Maure dating to the first quarter of the alleged XIV century. The warriors storming the walls of Troy are wearing mediaeval clothing and using mediaeval weapons – crossbows, for example. Taken from [1485], page 20.

Fig. 2.57 A close-in with the fragment of “Greeks Storming Troy” where we can very clearly see a mediaeval crossbow. Taken from [\[1485\]](#), page 20.

■ **32b. *The Gothic-Tarquinian War.*** Procopius eloquently and meticulously the Gothic War of the alleged VI century, counting several dozen battles. We also learn of a great number of battles that can be grouped into two large episodes from Livy’s description of the Tarquinian War. The Gothic Rome had led to the pillaging and devastation of Rome, Naples and the entire Italy ([695], [696] and [196], Volume 1). The following is told about Naples, for instance: “The city was ransacked [by Belisarius, Justinian’s military commander – A. F.], and its inhabitants massacred ruthlessly” ([196], Volume 1, page 326). The Roman Greeks had been the party most commonly associated with the atrocities. The Gothic War had often been referred to as the Greek War ([196], Volume 1, pages 426-427). “The city [Rome – A. F.] was besieged by the Greeks and fell prey to their wickedness... the entire Italy from the Alps to Tarent was covered in ruins and dead bodies; famine and plague that followed the war turned the land into a desert... at least one third of the population had died... the horrendous Gothic War has brought an end to many an ancient tradition in Rome as well as across the entire Italy... a dark night of barbarity had covered the destroyed Latin world in darkness” ([196], Volume 1, pages 426-427). In his rendition of Procopius, the XIX century German historian Ferdinand Gregorovius is de facto telling us of the legendary Trojan War as seen by the Latins, which we couldn’t have worked out until today.

3.3. The legend of a woman and the casus belli of the Trojan War

33a. *The Trojan War.* The protagonist of the Trojan version is Helen, the beautiful wife

of Menelaius. Three “ancient” goddesses have a dispute about which one of them is the most beautiful and ergo the best. Each goddess claims to be the one, which should hardly surprise us ([851], page 71). This seemingly innocent dispute results in the extremely brutal and violent Trojan War. Could the dispute in question really have been between several religions allegorically referred to as goddesses? The Bible, for instance, occasionally refers to religions as to female entities ([544]). In this case, ancient chronicles must be telling us about the choice of a single religion from three. The “ancient” Paris – most probably, an allegorical personification of the mediaeval Franks, chooses the most “appealing” goddess, or religion – Aphrodite. One has to remember about the erotic cult of the mediaeval Bacchic Christianity that flourished in the XII-XV century – in France, among other places, qv above. This worship of the “Christian Aphrodite” became reflected in numerous erotic sculptures and murals decorating Christian temples in mediaeval France ([1064]). As we already mentioned, something similar to the “religious choice of Paris” is known to us from the history of Old Russia. Prince Vladimir, the initiator of the baptism of Russia, had also listened to representatives of several creeds and chosen Orthodox Christianity as the official religion of the Russian State. Could this choice of Vladimir become reflected in the ancient myth of Paris, or P-Russ? Aphrodite (PhRDT or TRDT unvocalized) may be a derivative of the word Tartar.

■ 33b. *The Gothic-Tarquinian War*. In the Roman-Gothic version we have Lucretia as the protagonist according to Titus Livy. She is also known as Tullia, Julia Maesa and Amalasuntha in the Second = Third Empire. All of them duplicate Helen. Amalasuntha is one of the main characters in the Gothic War, qv above. The most vivid account of this story is given by Titus Livy. Several husbands had entered a heated dispute about the virtues of their wives; “each one had argued his own to be the best one” ([482], Book 1:57). This discussion had soon led to the Tarquinian War, also known to us as the Gothic War.

34a. *The Trojan War*. The key figure in the dispute between the “goddesses” is Paris the Trojan, or TRQN ([851], page 71). He had to choose the best of the three goddesses.

■ 34b. *The Gothic-Tarquinian War*. Tarquin Sextus. According to Livy, Tarquin Sextus is the judge in this dispute – TRQN as well ([482], 1:57).

35a. *The Trojan War*. A special contest of the goddesses is held to end the dispute.

Victory goes to Venus = Aphrodite, the goddess of love. Paris the Trojan declares her to be the winner, acting as the judge in the contest ([\[851\]](#), page 71).

■ 35b. *The Gothic-Tarquinian War*. The Roman debaters hold a contest between their wives. Livy tells us that “Lucretia had won the contest” ([\[482\]](#), 1:57). Sextus Tarquin is obsessed with his desire for Lucretia.

36a. *The Trojan War*. Paris the Trojan is possessed with a passion for Helen. Aphrodite, or Venus, the goddess of love, promises him “queen Helen for a wife” as a token of gratitude for her victory in the contest ([\[851\]](#), page 71). Helen is the wife of king Menelaus. In fig. 2.58 we see an ancient miniature dating to the alleged XIV century depicting “Paris departing on his search for Helen and finding her” ([\[1485\]](#), pages 249 and 250). One has to notice the large Christian cross over the palace of Menelaus, the Greek king. The XIV century artist had no doubts about the Trojan War taking place in the Christian epoch.

Fig. 2.58 A miniature from *Le Roman de la guerre de Troie* by Benoît de Sainte-Maure dating from the alleged XIV century ([\[1485\]](#), page 245, ill. 322). One sees Paris undertaking a foray (the one that resulted in the abduction of Helen) into the palace of Menelaus, the Greek king. We see a Christian cross over the palace. Taken from [\[1485\]](#), ill. 322.

■ 36b. *The Gothic-Tarquinian War*. Tarquin Sextus falls in love with Lucretia. Livy tells us that “he had been possessed by a flagitious passion to bring shame upon Lucretia, and also greatly attracted by her beauty” ([\[482\]](#), 1:57). Lucretia is the wife of Collatine.

37a. *The Trojan War*. The arrival of Paris the Trojan. Paris arrives to the house of Menelaus, who is unaware of the visit, and receives a friendly reception, since no one suspects him of any malicious intentions ([851], pages 71-72).

■ 37b. *The Gothic-Tarquinian War*. Livy tells us that “Sextus Tarquin went to see Collatius... Collatine knew nothing of his arrival. He was received cordially, since his intention wasn’t known to anyone” ([482], 1:57).

38a. *The Trojan War*. Paris abducts Helen by force. This happens during the night. Trojan chronicles anything but unanimous in their account of Helen’s abduction. One version tells us that she had gone with Paris voluntarily; another – that she had tried to resist the violent abduction ([851], page 72). A chronicle tells us that “Paris delivered Helen to his ship personally... and left her there with a host of bodyguards” ([851], page 96). The current “ancient” version tells us of Helen’s “complete innocence” - she is supposed to have remained true to Menelaus, and Paris left with nothing but her ghost ([851], page 207).

■ 38b. *The Gothic-Tarquinian War*. According to Livy, Tarquin Sextus takes Lucretia by force and rapes her, breaking into her chambers when she’s asleep ([482], 1:58). Here we also see an attempt of Lucretia’s exculpation – in Livy’s rendition, she utters a passionate speech to set an example for the women of Rome prior to stabbing herself to death in order to cleanse the disgrace. Amalasuntha, Lucretia’s double in the Gothic War, is also taken to the island by force, where she is kept “inside a strong fortress” ([196], Volume 1, pages 318-319; Procopius 1(5):14-15). Thus, a violent scenario involving a woman is the *casus belli* in every phantom reflection of Helen’s abduction – a real mediaeval event.

Commentary. The Trojan War, likewise its Gothic reflection, is considered to have been instigated “to avenge the honour of a woman”; see also Livy ([482], 1:60 and 2:1-2). This can actually be regarded as the official slogan of the Trojan = Tarquinian = Gothic War. How could a war as brutal and violent have broken out because of just one woman, albeit a beautiful and dignified one? This doesn’t ring too plausible, after all. There is a rather simple consideration that makes many things clear. Various religions were referred to as “wives” (women) in the Middle Ages; therefore, the Trojan = Tarquinian = Gothic War could have been caused by a religious dispute about the vices and the virtues of several creeds (“wives”). The insult of some religion may have resulted in a war. This interpretation of the source data is in perfect correspondence

with the very spirit of the crusade epoch. Now, the crusades were ecclesiastical events (officially, at least), whose intended purpose was the revenge of the grief caused to Our Lady – the execution of her son Jesus Christ. The Trojan myth receives a natural explanation of being the description of a great war fought by the crusaders in the Middle Ages.

39a. *The Trojan War*. According to some Trojan chronicles, Helen had been killed. She died already after the fall of Troy: “And he had ordered to behead both Helen and *Farizh* [*Parizh*, or Paris, that is – A. F.]” ([851], page 76). Nowadays it is presumed that the mediaeval tale of Helen and Paris executed at the order of Menelaus is at odds with the “ancient” version of Homer ([851], page 207). Mark the typical flexion between F and P – Paris – Parizh – Farizh. In the mediaeval rendition Paris might have really referred to “a Parisian”, which should hardly surprise us since the Franks played a major role in the Gothic War; some of them may well have been from Paris. The Scaligerian XIII century B.C. dating of the Trojan War renders this impossible, since Paris is supposed to have been nonexistent in that age; however, in the XII-XIV century A.D. it must have already been about. Paris can also mean “P-Russ”, or the mediaeval White Russians/Byelorussians/Prussians.

■ 39b. *The Gothic-Tarquinian War*. In the Gothic version Amalasuntha, the double of Helen, is also killed; it is her death that serves as the *casus belli* for the Gothic War, qv above and in [851], Volume 1.

40a. *The Trojan War*. Paris-Parizh (P-Russ), the offender of Helen, was killed ([851], pages 76 and 129).

■ 40b. *The Gothic-Tarquinian War*. Let us remind the reader that Tarquin Sextus, the offender of Lucretia, had also died a violent death ([482], 1:60). In the Gothic version allegedly dating from the VI century A.D. Theodahad, who had raped Amalasuntha, was murdered shortly afterwards ([196], Volume 1, and above).

3.4. The beginning of the war

41a. *The Trojan War*. Greeks begin negotiations with the Trojans in order to determine the fate of the abducted Helen. The Trojans refuse to hand her back; the Greeks declare war on Troy ([851]).

■ 41b. *The Gothic-Tarquinian War*. In the Gothic version the Roman Greeks enter negotiations with the Goths/TRQN, the duplicates of the “ancient” Trojans,

about the fate of the abducted Queen Amalasuntha, who has been taken to an island by force. However, the Goths kill Amalasuntha. Then Romea/Byzantium declares war on the kingdom of the Ostrogoths in Italy ([196], Volume 1; also [695]).

42a. *The Trojan War*. A very large Greek fleet appears at the coast of the Trojan kingdom led by Achilles ([851], page 72). Out of many Greek heroes, the sources pay special attention to Achilles – the most famous military leader of the Greeks and the “numero uno” hero. “The Greeks had revered him [Achilles – A. F.] as a hero” ([851]).

■ 42b. *The Gothic-Tarquinian War*. A powerful fleet of Roman Greeks arrives at the Italian coast with a landing party led by Belisarius in the end of the alleged year 535 A.D. “Fortune gave Justinian one of the greatest military leaders of all time for the implementation of this plan [exile of the Goths from Italy – A. F.]” ([196], Volume 1, page 319). Belisarius is doubtlessly the “number one hero” of the Gothic War.

43a. *The Trojan War*. Achilles is accompanied by the two “most important royal figures in Greece” on his Trojan campaign, namely, Agamemnon and Menelaus, the husband of Helen. “And the kings made Achilles leader of the entire army” ([851], page 72). Their own participation in the war is minute compared to that of Achilles.

■ 43b. *The Gothic-Tarquinian War*. Belisarius is made commander-in-chief by emperor Justinian – the “primary royal figure” of the Gothic war to represent the Roman Greeks. However, Justinian doesn’t become involved in military action personally, since he remains in the New Rome, well away from Italy (qv in fig. 2.29). At the same time, Justinian, as well as his “ancient” double Agamemnon, did actually take part in the war, since it was he who had suppressed the large-scale “Nika Rebellion”, which took place within the walls of New Rome. As we already mentioned, this rebellion is merely a duplicate of the same Gothic War that became reflected in Justinian’s biography in a slightly distorted version. Furthermore, this is an indication that the Gothic (or the Trojan) War is most likely to have taken place in New Rome (Constantinople) and around it – nothing to do with Italy whatsoever.

44a. *The Trojan War*. The Greek fleet led by Achilles seizes Isle Tenedos upon arrival to the shores of the Trojan kingdom, which had once been under Trojan/TRQN rule ([851], page 100). The occupation of Tenedos marks the

beginning of the Greek invasion into the Trojan kingdom.

■ 44b. *The Gothic-Tarquinian War*. The Graeco-Romean fleet of Belisarius arrives at the coast of Italy and immediately seizes Sicily, which had been under the Gothic/TRQN rule at the time ([196], Volume 1, page 319). This is how the Byzantine invasion into the Italian kingdom of the Ostrogoths began.

45a. *The Trojan War*. The “ancient” Greeks remain on Tenedos, the island they captured, for several months. Over this period they exchange envoys with Troy and send some of their troops into a neighbouring country to find provisions, which they procure after a battle ([851], pages 101-103).

■ 45b. *The Gothic-Tarquinian War*. In the Gothic War, the Graeco-Romean troops remain on Sicily for several months – between the end of the alleged year 535 and the summer of the year to follow ([196], Volume 1, page 319).

46a. *The Trojan War*. The “ancient” Greeks proceed to leave the island, move to mainland, invade into the Trojan kingdom and besiege Troy. One of the chapters of a mediaeval Trojan chronicle is called “How the Greeks had Left Isle Tenedos and the Siege of Troy Began”, for instance ([851], pages 103-104).

■ 46b. *The Gothic-Tarquinian War*. Finally, the Romean Greeks leave Sicily and disembark in Italy. “The land troops of Belisarius... accompanied by the fleet” started to move up the coast. “However, they were stopped by the heroic defenders of Naples” ([196], Volume 1, page 326). See fig. 2.59. Nowadays the Gothic War is presumed to have taken place in Italy. However, it is most likely that the fall of Constantinople = New Rome on the Bosphorus in the XIII century A.D. provided for the main source of legends about the fall of the “ancient” Troy. This also gives us a new perspective on the possible meaning of the word Naples (Nea-Polis) as used in the Trojan chronicles – it must have stood for “New City” and referred to the New Rome, or Constantinople.

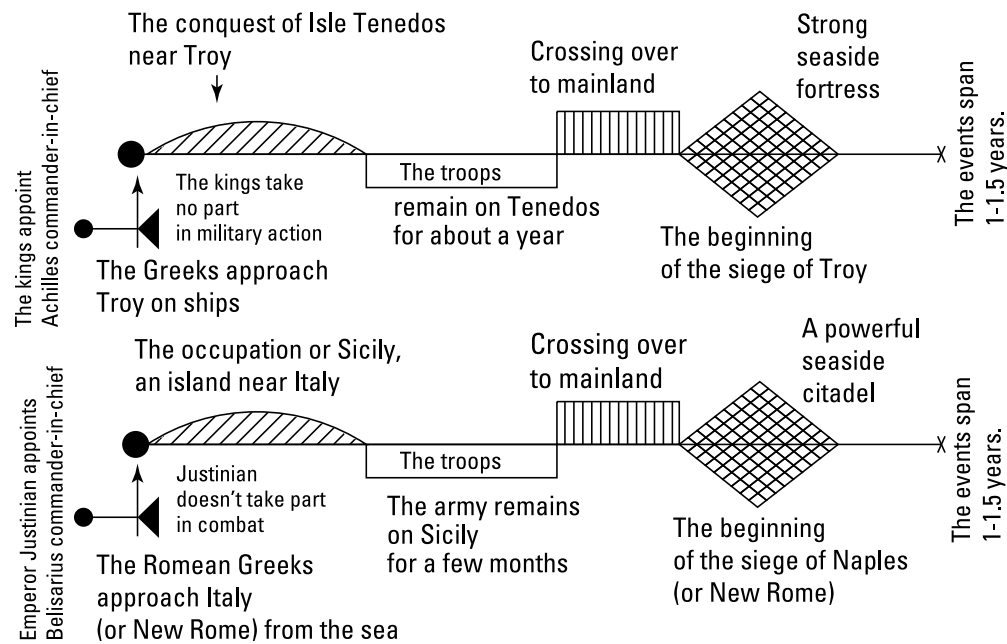

Fig. 2.59 The parallelism between the "ancient" Trojan War and the early mediaeval Gothic War. The beginning of the war.

47a. *The Trojan War*. The long and hard siege of Troy begins. Chronicles describe Troy as a powerful fortress by the seaside. Troy is all the more invincible that the gods themselves protect the city from enemies; this fact is emphasized. "And he gave orders to surround the city with high walls, two hundred cubits in height" ([851], page 90). In fig. 2.60 one sees an ancient miniature entitled "The Third Battle between the Greeks and the Trojans" from *The Tale of Troy's Destruction*, the book by Guido de Colonna (see [1485], ill. 120). Once again we see mediaeval knights wearing heavy armour and chain mails. One of them is holding a trumpet of a rather sophisticated shape.

Fig. 2.60. An ancient miniature from *Historia Destructionis Troiae*, a book by Guido de Columna (delle Colonne) dating from the early XV century. We see the third battle between the Greeks and the Trojans in the Trojan war; once again the weapons used are typically mediaeval. Taken from [\[1485\]](#), ill. 120.

■ 47b. *The Gothic-Tarquinian War*. The Roman Greeks are forced to begin the siege of Naples = New City (New Rome?). The Italian Naples was supposed to have been an unassailable fortress. It is said that the gods themselves have chosen this site with a rocky foundation that excluded the very possibility of the city being undermined ([196], Volume 1, page 326. Just like Naples, Constantinople = New Rome is located by the seaside and may have been the strongest and most famous fortress of both Europe and Asia. The legend of Constantinople's foundation on the Bosphorus around the alleged year 330 tells that the emperor Constantine had "initially chosen the site [for the foundation of his new capital – A. F.] where the ancient Ilion [or Troy! – A. F.] had once stood, the motherland of the first founders of Rome" ([\[240\]](#), page 25). He is supposed to have chosen a different site later on ([\[240\]](#)). In any case we see that the very story of the New Rome's foundation on the Bosphorus tells us quite unequivocally that its location used to coincide with that of Troy initially. The gigantic walls of the New Rome and its beneficial geographical disposition proved to protect it well against many an invasion. We can still see the most impressive ruins of these walls in Istanbul today, qv in figs. 2.61 and 2.62.

Fig. 2.61. Ruins of Constantinople walls. Photograph taken by T. N. Fomenko in 1995.

Fig. 2.62 Ruins of Constantinople walls. Photograph taken by the author in 1995.

48a. *The Gothic War*. We have listed all of the major events pertaining to the beginning of the Trojan war. What follows is the siege of Troy and its fall, see fig. 2.63.

Fig. 2.63. The parallelism between the “ancient” Trojan War and the “early mediaeval” Gothic War. The siege and the fall of the capital.

■ 48b. *The Gothic-Tarquinian War*. We have also listed all of the basic events that preceded the siege of Naples; they were followed by the actual siege and the destruction of the city.

Commentary. Let us point out the rather noteworthy difference between the Trojan version and the Gothic one. In the legend of the “ancient” Troy the city is destroyed at the very end of the war, whereas in the Gothic version Naples falls shortly after the beginning of military action, see fig. 2.63. However, the Roman Greeks are to seize Rome after this victory. Apparently, in the Trojan version these two sieges – of Naples and Rome, or Rome and the New Rome, possibly just the New Rome = Constantinople, have merged into one siege – that of the “ancient” Troy. The fall of Naples = New City moved towards the end of the war chronologically implies a 9-10-year fluctuation in the dating, which doesn’t affect the general picture of this remarkable parallelism.

3.5. The fall of Naples (the “New City”) = the fall of Troy.

The mediaeval aqueduct and the “ancient” Trojan Horse

49a. *The Trojan War*. The fall of Troy was preceded by a long and unsuccessful siege. Several attempts of storming the city resulted in failure. The Greek army led by Achilles falls into despondence ([\[851\]](#), page 70 and on).

■ 49b. *The Gothic-Tarquinian War*. The New City (Naples, or Nea-Polis) resists the siege for a long time; some of the attempts to storm it result in a complete fiasco. The Graeco-Roman army led by Belisarius is demoralized; the Greeks even

consider retreating from the walls of the New City ([196], Volume 1, page 326 and on).

50a. *The Trojan War*. A conspiracy emerges in Troy during the siege. The objective pursued is handing Troy over to the Greeks; the leaders are the Trojans Aeneas and Anthenor ([851], page 131).

■ 50b. *The Gothic-Tarquinian War*. During the siege of Naples (or the New City = Rome), a conspiracy formed in the city. It was led by Stefanos; the plotters sought to deliver Troy into the hands of the Roman Greeks ([196], Volume 1). According to Procopius, the siege of Rome that ensued had followed the same conspiracy scenario, qv above.

51a. *The Trojan War*. The Trojan plotters lead the group of Trojan envoys and begin negotiations with the Greeks. One of the Trojan chronicles contains a chapter entitled “Negotiations and Treason in Troy”. The Greeks promise the Trojan recreants that the houses of the latter shall be spared after the fall of Troy; however, the Greeks ended up capturing Troy in an altogether different way, without the aid of the conspirators ([851], pages 131-132).

■ 51b. *The Gothic-Tarquinian War*. The information offered by the Gothic version is more vague on the subject of a conspiracy in Naples. However, a similar Roman plot is described in great detail ([196], Volume 1). In Naples Stefanos had negotiated with the Roman Greeks for a long time, and apparently to no avail. The Byzantine army captured Naples (New City) unassisted by any plotters. Also, both “ancient” Troy and Naples in the alleged VI century A.D. are supposed to have fallen into the hands of the enemy after the demonstration of exceptional cunning from the part of the latter, as we shall discuss below. This phenomenon is unique in the comparative history of both kingdoms; the parallelism discovered here is remarkable enough for us to relate it in detail. It shall lead us to the understanding of what the famous Trojan Horse, which symbolizes the Trojan War after a manner, had really been.

52a. *The Trojan War*. We learn that the Greeks had used “something that resembled a grey horse” in order to conquer Troy ([851], page 76). Let us emphasize that the chronicle doesn’t mention a horse, but rather something that resembles one, grey in colour. The difference appears marginal at first; however, we shall find out

that the chronicler was perfectly correct to mention a simulacrum of some sort and not a real horse.

Let us open the Trojan chronicles and study their actual contents. “The seers have announced that Troy could not be taken in battle, and that the only way to capture it was guile. Then the Greeks made a gigantic wooden horse [? – A. F.] that concealed brave warriors... the Trojans decided to pull the horse into the city [? – A. F.] ... When they have pulled it in, they started indulging themselves in feasting and merrymaking... and then fell asleep... The warriors that had remained hidden in the horse came out without making any noise, and proceeded to torch the houses of the Trojans... the enormous Greek army rushed in... through the gate that was opened by the Greeks who had been inside the city already. Thus did the mighty-towered Troy fall. Other books tell us that an effigy of a grey horse was forged of glass [? – A. F.], copper [? – A. F.] and wax [which is all a fantasy of later chroniclers who failed to understand the real meaning of what they were describing – A. F.]; three hundred armed knights hid inside” ([851], page 76).

An effigy of a horse – not an actual horse, that is. What could it possibly be? A different chronicle gives us another version: “a gigantic horse had been made of copper; it could hold up to a thousand soldiers inside. There was a hidden door in the side of the horse” ([851], pages 132-133). In fig. 2.64 one sees a mediaeval miniature from the *Litseyoy Svod* almanac (No. 358 in the National Museum of History) that shows us how the XVI-XVII century authors imagined the “Trojan Horse”. The mediaeval artist must have already been confused by old descriptions; his knowledge of the past had been rather poor, and so what we see is a horse with a door in its left side.

Fig. 2.64 A mediaeval miniature entitled “The Forging of a Wooden Horse” taken from the *Litseyoy Svod*, State Museum of History, Museum collection No 358. Taken from [851], page 128.

Another late mediaeval artist who must have also forgotten the exact nature of the matter drew the picture of a huge wooden horse on wheels so that it would be easier to roll it along an uneven stony road (see fig. 2.65).

Fig. 2.65 A miniature from *Le Roman de la guerre de Troie* by Benoit de Sainte-Maure dating to the alleged XIV century ([1485], pages 251 and 252, ill. 328. The artist was already only vaguely aware of the real issue, and thus he painted a wooden Trojan horse on wheels. Taken from [1485], ill. 328.

Nowadays one can see a very impressive wooden model of the Trojan horse near “Schliemann’s site” in Turkey that serves as a tourist attraction. This one has no wheels. Should someone want to climb inside, they are welcome to it for a more direct communion with the history of “ancient Troy”. This is how Scaligerian history gets taught today.

Let us stop and reflect for a moment. Historians suggest the mention of a horse to have been an “ancient” myth or a fairy tale, one where everything was possible. It is, however, clearly visible that the mediaeval text that we quote doesn’t look like a fairy tale. It is dry and sober. The chroniclers clearly referred to some real event, although they hadn’t understood its exact nature very well anymore. However, let us treat them with respect and suppose they had wanted to give us a bona fide account of something interesting and very real. They hadn’t lived in the epoch of the war, and so they had been unable to understand everything that was written in the old documents and honestly

tried to relate whatever they thought had happened in Troy.

Mere common sense suggests that one should hardly believe that the “ancient” Greeks could really have made a gigantic hollow statue of a horse that could hold a thousand warriors in the XIII century B.C., as well as the tale of silly gullible Trojans taking troubles to pull this statue into the city. The nursery tale about a gigantic hollow equine statue is just as preposterous as the Scaligerian tale of Homer’s seven hundred pages melodiously sung aloud by the “ancient” Greek shepherds for five hundred years before they could be written down, five hundred years after the fall of Troy.

Let’s sum up.

- The Greeks had used *some grey object resembling a horse* to conquer Troy.
- We are told about the gigantic size of this “horse look-alike”.
- The “horse” had huge legs.
- Some of the chroniclers say it was made of wood, others name copper, glass and wax. We see a variety of contradictory opinions here.
- The horse is supposed to have made its way into the city somehow.

Let us now turn to the Gothic version.

■ 52b. *The Gothic-Tarquinian War*. The VI century chroniclers give a sober and realistic answer to the abovementioned question about the Trojan Horse and its identity. Naturally, there is *no talk of a horse there*. What we’re told is that Belisarius had used his cunning to take advantage of a certain circumstance ([196], Volume 1; also [695]). Apparently, there was an old dilapidated *aqueduct* going through the sturdy walls of mediaeval Naples. A large pipe made of stone – a *pipe*, not a dale. The aqueduct began *outside* the city limits and used to supply water for the New City (Naples) at some point. There was a stone stopper with a small hole for the water at wall level. The aqueduct didn’t function and had remained abandoned for a long time ([196], Volume 1).

Fig. 2.66 A modern wooden model of the “Trojan Horse” built for the tourists on Schliemann’s site by the Turkish authorities. Taken from [\[1259\]](#), page 33.

A special brigade of some 400 armed Roman Greeks secretly entered the opening in the aqueduct that lay well outside city limits (another version tells us of 300 cavalry soldiers and a hundred infantrymen). At any rate, “Operation Aqueduct” is often mentioned together with cavalry by the chroniclers who tell us of the Gothic War. This entire operation had been kept secret from everyone else in the Graeco-Roman army, let alone the besieged. The Greeks reached the vallum, broke the plug with the utmost caution, signalled to the main body of the troops situated outside and opened the gates to the army of Belisarius that rushed into the city. The defenders of Naples barely had the time to wake and call to arms. This is how the New City (Nea-Polis) fell.

The Gothic War historians describe the aqueduct as an enormous pipe supported by massive propugnacula, wide enough for a human to stand in. One can still see the ruins of an enormous aqueduct in Istanbul (qv in fig. 2.67 and [\[1464\]](#), page 72). Nowadays it is called the Aqueduct of Valens – it is possible that this is the very same conduit that the crusaders had used in the time of the Gothic War, or the storm of the New Rome = Constantinople = Troy. Ancient authors could also have easily compared the aqueduct to a gigantic animal (a horse?) with stanchions for legs that delivered water into the city. Another thing that comes to mind in this respect is the fact that the same word is used to refer to an icebreaker (pier) and an ox – “*byk*”. The decrepit conduit could have been called a “great beast” poetically, see fig. 2.68. We are therefore of the opinion that the famous Trojan Horse is a metaphor used for the water conduit or aqueduct that the Greeks had used in their siege of the New City with such success. Let us trace this

parallel further.

Fig. 2.67 Ruins of the Valens Aqueduct in modern Istanbul. Taken from [\[1464\]](#), page 72.

Fig. 2.68 A schematic representation of the decrepit aqueduct that “entered the city”.

53a. *The Trojan War*. The Latin for “horse”. The Latin word for “horse” or “mare” is “*equa*” (“*equae*”). See [237], pages 350-351.

■ 53b. *The Gothic-Tarquinian War*. The Latin for “water”. The Latin word for “water” is “*aqua*” (“*aquae*”). See [237], page 374. We see a great similarity between the two words. A reference to the Latin language is quite in order here, since most of the Trojan chronicles that reached our age were written in Latin. Apart from that, we should consider Byzantium (Romea) and the New Rome and also possibly a part of Italy as the arena of war.

Commentary. We must point out that the Latin for “aqueduct” or “water conduit” is “*aquae-ductio*”, which is virtually identical with “*equae-ductio*” (or “*equae-ductor*” – see [237]). All the letters but one coincide in both words. “Aqueduct keeper” and “groom” (or “stableman”) are also very similar, as well as “*aqualiculus*”, which

translates as “stomach”, “abdomen”, “belly” etc. This leads us to a recollection of Greek warriors concealed within the abdomen of a horse. The “classical” version by Homer, which didn’t surface until the XIV century A.D., must have been more recent than the Gothic/Roman version of Procopius. Therefore, the aqueduct (water duct) transformed into a horse in the perception of later foreign authors, who had confused one vowel for another. Hence the numerous legends about “a gigantic grey object resembling a horse” a. k. a. the Trojan horse. Even its grey colour may be explained by the real colour of a dusty aqueduct.

One shouldn’t regard such verbal metamorphoses as something out of the ordinary. The “Literaturnaya Gazeta” newspaper (1982, 20 October and 8 December issues) gives several superb examples of how *modern names become disfigured in foreign translation*. This is a phenomenon observed in our age of university education and readily available dictionaries. Ancient scribes would forever be confused by unfamiliar and semi-familiar names, some of them unvocalized. Some of the XIV-XVI century chroniclers must have honestly tried to decipher the names scattered across the pages of whatever old manuscripts reached their epoch; however, they had to study them through the distorting prisms of their own linguistic paradigms. Among these manuscripts one could find the original diaries whose authors took part in the Trojan War of the XIII century A.D.

54a. *The Trojan War*. The idea to use “the likeness of a horse” in the siege of Troy belonged to the Greek named Ulysses or Ulixes, also known as Odysseus. He may have been a double of Achilles, and the phonetic proximity of their names does indeed suggest it – Ulysses/Ulixes/ Achilles. As we already know, a special brigade of 300-1000 men was hidden inside “a grey object resembling a horse”; this had been kept secret from the Trojans. The location where the warriors had entered this “horse” lay beyond the city walls.

■ 54b. *The Gothic-Tarquinian War*. In the Gothic war the idea of using the old aqueduct had belonged to the Roman Greek Belisarius. The parallelisms discovered previously imply Belisarius and Achilles to be phantom reflections of one and the same mediaeval personality. We shall discuss it in more detail below. This “special brigade” had remained hidden in the aqueduct, which was kept secret from everyone, even the rest of the troops. The warriors had entered the aqueduct through an opening that was located outside the walls of the city.

55a. *The Trojan War*. The leader of the Greek stormtroopers was called Sinon or Zeno. He was “given the keys and told to open the secret exit from the equine abdomen by the Greeks” ([851], pages 132-133). As we shall see below, this figure is also prominent in the history of the Gothic War.

■ 55b. *The Gothic-Tarquinian War*. The “special brigade” of the Roman Greeks may well have been led by Zeno – the cavalry leader in the army of Belisarius ([196], Volume 1). However, the names of the actual leaders of this brigade are given as Magnus (or simply “The Great”) and Ennes ([196], Volume 1; also [695]). Sinon (Zeno in these sources) is one of the major characters of the Gothic War, and also the cavalry leader in the army of Belisarius (together with Magnus – see [196], Volume 1; also [695], 2(5); 5, 2; 6 and 13. Thus, Sinon/Zeno definitely took part in the storm of Naples.

56a. *The Trojan War*. We learn that the vallum that guarded Troy had been destroyed for the “grey object of a vaguely equine shape” to be brought into the city. All the Trojan chronicles tell us about some destruction of the city wall that took place at the moment this object had entered the confines of Troy. The versions of this event offered by various authors are at odds with each other. Some tell us of “gates taken apart” ([851], page 76). Some say that “a part of the wall had to be destroyed, which gave the Greeks who came back to the walls of Troy an opportunity to storm into the city” ([851], pages 206-207, comment 53. Yet another version claims that this “pseudo-horse” lost an ear [?]. The most bizarre version informs us that “the stone that crowned the city gates had to be taken down” ([851]). The only consensual trend we can see in this multitude of versions is that they all clearly state that some part of the fortifications that protected Troy were destroyed when the special brigade of the Roman Greeks had infiltrated the city.

■ 56b. *The Gothic-Tarquinian War*. The reference is perfectly clear in the context of this war. As we have already mentioned, a part of the vallum that surrounded Naples (or the New City) was partially destroyed so that the troopers could get out of the aqueduct and enter the city. The soldiers of Belisarius have smashed the stone plug that was blocking the tunnel to bits and widened the opening so that humans could get through.

57a. *The Trojan War*. The Greek party gets out of the “horse” through a secret exit. The Greeks open the city gates from the inside, and the battle of Troy that results in

the fall of the city begins in the small hours of the morning ([\[851\]](#), pages 132-133).

■ **57b. *The Gothic-Tarquinian War*.** The special brigade of Roman Greeks infiltrates the New City (Naples) through the aqueduct late at night, and, discovering the gap in the conduit that was invisible from ground level (secret exit!), uses it for infiltrating the city. Early in the morning they open the gates and give orders to begin the attack. The Byzantine army breaks into the city; the New City falls. It is possible that the image of the Trojan Horse was also affected by the wooden mediaeval siege towers with wheels that were rolled towards the walls of the besieged Troy. The Trojan Horse would often be pictured *as a wheeled wooden construction*, after all, since the siege towers had been mobile and made of wood. See more details in our book entitled *The Dawn of the Horde Russia*.

3.6. The “ancient” Achilles = the “ancient” Valerius. The “ancient” Patroclus = the “ancient” Brutus

58a. *The Trojan War*. Achilles is the leader of the Greek army. He is one of the most famous heroes to be found in the entire “ancient” Greek epos. His name contains the sounds LS.

■ **58b. *The Gothic-Tarquinian War*.** Belisarius is a famous warlord; he is the leader of the Graeco-Roman troops in the Gothic War. Procopius calls him a prominent statesperson of the Roman Empire. His name contains the same sounds LS; “Belisarius” is possibly derived from the Russian “*Velikiy Tsar*” (The Great Czar) or a similar phrase in one of the Slavic languages.

Commentary. A curious fact is that the very manner in which Procopius describes the Gothic War bears great resemblance to how Homer relates the events of the Trojan War. This isn’t even our observation – it was made by Ferdinand Gregorovius, a prominent historian and a specialist in Roman history. He didn’t even suspect how close to the truth he had been: “This siege [of Rome – A. F.] is one of the most important ones in history, and one cannot help noticing strong allusions to heroic epos in the way it is described... by Procopius, who borrows his colours from the Iliad [sic! - A. F.] He tells us how Belisarius... rushed towards the enemy in front of his troops, much like Homer’s heroic character [Achilles – A. F.] ... the Romans observed this battle in deep amazement, since it had been worthy of their ancestors” ([196], Volume 1, pages 339-340).

59a. *The Trojan War*. Achilles, albeit a hero, isn't the "principal monarch" of the "ancient" Greeks, but rather made leader of the troops by two great kings – Agamemnon and Menelaus, the instigators of the Trojan War.

■ 59b. *The Gothic-Tarquinian War*. Belisarius is the military commander-in-chief, not an emperor. He was put in charge of the army by Justinian, the Byzantine Emperor. Thus, Justinian appears to be the mediaeval double of the "ancient" Agamemnon and the "principal royalty".

60a. *The Trojan War*. The closest friend and comrade-in-arms that Achilles had was called Patroclus, whose name transcribes as PTRCL without vocalizations. Another version of his name that we encounter in the Trojan chronicles is Partasis ([851], page 143), which transcribes as PRTS or BRTS unvocalized. However, this consonant skeleton may well assume the form of "Brutus", which is very similar to the Russian word for "brother", which is "*brat*". Thus, the "ancient" Achilles had a friend called Patroclus-Partasis-Brutus-Brat (Brother).

■ 60b. *The Gothic-Tarquinian War*. Let us remind the reader that the Tarquinian War is the duplicate of the Trojan War, and it is described by Titus Livy in his *Ab urbe condita*. We recognize Belisarius as Valerius, qv above. During the Tarquinian War, Valerius is also the commander of the Roman troops and has a close friend by the name of Brutus or Projectus, or BRT-PRCT ([482]). We thus witness yet another duplication of events: the Trojan Partasis (BRT, or "brother"?) becomes identified as Brutus/Projectus/BRT, the hero of the Gothic-Tarquinian War.

61a. *The Trojan War*. In the Trojan War, Patroclus (or BRT/brother) gets killed before Achilles dies. During the first phase of the war, Patroclus/BRT acts as the "number two hero" in the Greek Army, second only to Achilles ([851], pages 108-111).

■ 61b. *The Gothic-Tarquinian War*. Brutus/Projectus/BRT also dies before Valerius/Belisarius. Brutus ("brother"?) is the most important Roman warlord in the Gothic-Tarquinian War after Valerius.

62a. *The Trojan War*. The "ancient" Patroclus/BRT dies in a battle fought by the cavalry – he falls off a horse struck by a sword ([851], page 108). "The episode that describes the duel of Patroclus [and his death – A. F.] ... is one of the focal points of Homer's epic poem (Iliad XVI)" – see [851], page 108.

■ 62b. *The Gothic-Tarquinian War*. Brutus/Projectus/BRT also dies falling off a horse – hit by a spear, according to [482], 2:6. Titus Livy considers the death of Brutus/Projectus to have been one of the key events in the entire course of the Tarquinian War.

63a. *The Trojan War*. The “ancient” Patroclus/BRT breaks the shield of his foe, a young prince from the Trojan camp, with a spear ([851], page 108).

■ 63b. *The Gothic-Tarquinian War*. Brutus/Projectus/BRT uses his spear to break the shield of a young prince from the camp of the Tarquins/TRQN ([482], 2:6).

64a. *The Trojan War*. Patroclus/BRT is killed by Hector, son of the “most important Trojan royalty”, King Priam ([851], pages 73 and 108). Hector also dies a short time after Patroclus/ BRT ([851], page 119). *He dies in a duel, falling off his horse run through by a spear.*

■ 64b. *The Gothic-Tarquinian War*. The killer of Brutus/Projectus/BRT was the son of the “principal Tarquinian royalty”, Tarquin the Proud, by the name of Arruntius Tarquin ([482], 2:6), who had soon been killed as well – just like the “ancient” Hector, although in the Gothic scenario Brutus, or Projectus, gets killed in the same battle as Arruntius – they die by each other’s hand; the latter *is known to have been hit by a spear in a duel and fallen off his horse.*

65a. *The Trojan War*. A luxuriant mourning ceremony is held to lament and glorify the “ancient” Patroclus. Achilles is in deep dejection; the entire Greek army is overcome by melancholy. The body of Patroclus (BRT) is buried by Achilles personally ([851], pages 111-112).

■ 65b. *The Gothic-Tarquinian War*. Brutus (Brat/ brother?) is buried in great sumptuousness, everyone in Rome is mourning him, all the Romans are saddened; the troops are also in despondence ([482], 2:6-7). The body of Brutus is buried by Valerius (or Belisarius in the Gothic version) personally.

66a. *The Trojan War*. The duel of Patroclus and Hector takes place before the all-out battle with the participation of cavalry ([851], page 108).

■ 66b. *The Gothic-Tarquinian War*. According to Titus Livy, the duel between Brutus and Arruntius Tarquin also preceded the actual cavalry battle ([482], 2:6).

67a. *The Trojan War*. Homer regards the “ancient” Patroclus (BRT) as the avenger of Helen’s honour after her abduction.

■ 67b. *The Gothic-Tarquinian War*. In the Tarquinian War Brutus (BRT) also happens to be the avenger of the raped Lucretia ([482], 1:58-60). Valerius buries his comrade Brutus “with as much solemnity as the time allowed; yet a much greater honour had been the public mourning, all the more remarkable that the matrons had mourned him as a fatherly figure for an entire year since he had been such a vehement avenger of chastity dishonoured” ([482], 2:7).

3.7. The “ancient” Achilles = the mediaeval Belisarius. The “ancient” Hector = the mediaeval Gothic king Vittigis

68a. *The Trojan War*. The first phase of the Trojan War is characterized by great hostility existing between the main two opposing warlords – Achilles the Greek and Hector the Trojan (TRQN).

■ 68b. *The Gothic-Tarquinian War*. The beginning of the Gothic War is also marked by an opposition between the two main heroes of the period – Belisarius, the Graeco-Romean commander-in-chief (Valerius in the Tarquinian version), and Vittigis the Goth (Arruntius Tarquin according to Livy).

69a. *The Trojan War*. Trojan sources often transcribe the name of the “ancient” Hector as “Victor”, or VCTR without vocalizations. Hector = Victor is a king and a son of king Priam ([851], pages 11 and 74; also 204, commentary 38, and page 73). Formally, Priam had been the most important king of Troy, however “ancient sources tell us nothing about Priam, a rather frail elder, taking part... in actual military action” ([851], page 217, comment 112). It is possible that Priam had been a collective figure whose unvocalized name PRM could have contained a reference to his relation to the city of Rome (P-Rome). Possibly, “Public Rome”, if we are to consider “P” an abbreviation of Publius. Such an interpretation of Priam’s name concurs with the parallelism between the history of Troy and Rome-Romea that we have discovered. Priam can also be a version of “*Pershiy*” – a Slavic word for “The First”.

■ 69b. *The Gothic-Tarquinian War*. In the Gothic version, the double of Victor = Hector is Vittigis the Goth. His unvocalized name – VTGS – may be related to the name VCTR (Victor) in some way. Vittigis is a royal figure – king of the Goths and a son of a king ([196], Volume 1).

70a. *The Trojan War*. The “ancient” Victor/Hector is the commander-in-chief of the Trojan army (TRQN) in the first phase of war and until his death. He is the number one hero of the Trojans, “the master and the warlord of the entire Trojan army” ([851], page 107 and on). He would appoint and depose military leaders in the Trojan army. Hector/Victor is a Trojan, or TRQN.

■ 70b. *The Gothic-Tarquinian War*. Vittigis had been king of the Goths and the commander-in-chief of the Gothic army in the beginning of the Gothic War, up until his demise ([196], Volume 1). He obviously acts as the key figure in the Gothic kingdom, and is personally responsible for appointing military commanders in the Gothic army. Vittigis is a Goth, whereas his duplicate Arruntius Tarquin is a TRQN.

71a. *The Trojan War*. The “ancient” Hector/Victor dies before his main adversary Achilles and by the hand of the latter ([851]).

■ 71b. *The Gothic-Tarquinian War*. Vittigis the Goth is captured by Belisarius and then killed; thus, the death of the former precedes that of the latter ([196], Volume 1).

72a. *The Trojan War*. The “ancient” Victor/Hector kills Patroclus (BRT) and is in turn killed by Achilles, who runs a spear through his chest and wounds him mortally in a duel ([851], page 119).

■ 72b. *The Gothic-Tarquinian War*. Arruntius Tarquin (the double of Vittigis the Goth) kills Brutus/Projectus/BRT. His own death results from a duel in a battle; he is hit in the chest by a spear and falls off a horse ([482], 2:6). The Gothic version is rather vague on how Vittigis (the double of Arruntius) had died; we know that Belisarius had taken him captive and killed him. The killer of Arruntius (Vittigis) died in the same battle.

73a. *The Trojan War*. The Trojan version pays a lot of attention to the famous “opposition of Hector and Achilles”. It’s a very popular subject in the “ancient” literature. After the death of Hector/Victor the Greeks get hold of his body, which they only give back to the Trojans after lengthy negotiations.

■ 73b. *The Gothic-Tarquinian War*. The Tarquinian version (according to Titus Livy) dedicates a whole half of Chapter 6 in Book 2 to the account of how Arruntius (the duplicate of the ancient Hector) was killed. The Gothic version describes this

event in a very special pagan legend of “the battle between Vittigis and Belisarius”. Procopius tells us a rather bizarre story of how two shepherds (?) were wrestling with each other in the time of the Gothic War. One of them was supposed to impersonate Vittigis, and the other – Belisarius (?). The latter shepherd won the contest, and the former one was sentenced to a histrionic death by hanging; however, the impersonation ended rather tragically, resulting in the death of the shepherd who had played the part of Vittigis. The “shepherds” allegedly interpreted the tragic outcome of the wrestling match as an omen of victory for Belisarius ([196], Volume 1, page 349). The Gothic version tells us about Vittigis taken captive and killed shortly afterwards.

74a. *The Trojan War*. The demise chronology of the key heroic figures in the Trojan War is as follows: Patroclus dies followed by Victor/Hector and then Achilles.

■ 74b. *The Gothic-Tarquinian War*. The dying sequence of the protagonists of the Gothic-Tarquinian War is as follows: Brutus dies first, then Vittigis, and, finally, Belisarius. A comparison of these sequences proves them to be identical.

3.8. The “treason” of the “ancient” Achilles = the “treason” of the mediaeval Belisarius

75a. *The Trojan War*. The “ancient” Achilles slays Victor/Hector. The episode with the so-called “treason of Achilles” takes place right after the battle.

■ 75b. *The Gothic-Tarquinian War*. Belisarius defeats Vittigis the Goth. Immediately after his victory over Vittigis, the “Treason of Belisarius” scenario unfurls. Let us remind the reader that Belisarius was accused of treason in the course of the Gothic War. The Goths offered to crown him king of Italy so as to “separate” the military leader from Justinian and secure military support for themselves ([196], Volume 1). Belisarius pretends to agree; then he deceives the Goths and hands the crown over to Justinian, thus remaining loyal to the Empire. Nevertheless, this episode served as basis for the accusation; Belisarius got arrested, and his property confiscated. He was released eventually – however, the great Byzantine warlord died in poverty and oblivion ([196], Volume 1).

76a. *The Trojan War*. After the victory of the Greeks over Victor/Hector the Trojan, there is a ceasefire. The Trojan king offers Achilles his daughter to marry so

that the war could end ([\[851\]](#), pages 120-122). *Achilles agrees to this*. According to the Trojan chronicles, “King Priam [P + Rome? – A. F.] said unto Achilles, If thou givest an oath to wage no war upon us... thou shalt have my daughter Polyxena as thy wedded wife. And King Priam was the first to give his oath... and then Achilles bowed down to give his promise” ([\[851\]](#), page 75). “Achilles... was ready... to conclude a treaty with the Trojans” ([\[851\]](#), page 205, comment 44). “The ceasefire still held when... Achilles had sent his secret envoy to queen Hecuba... he would make the entire Greek army leave the Trojan land and return to whence they came” ([\[851\]](#), pages 120-121).

■ 76b. *The Gothic-Tarquinian War*. After the victory of the Roman Greeks over Vittigis the Goth, there is a ceasefire. The Gothic king offers Belisarius the Italian crown wishing to bring the war to an end. Belisarius concedes to this ([196], Volume 1).

77a. *The Trojan War*. “The treason of Achilles” plays an important role in the history of the Trojan War. In particular, it leads to the death of Achilles. As a result of the “treason”, Achilles quarrels with Agamemnon, the principal Greek royalty, and stays confined to his ship, being “under house arrest” in a way ([\[851\]](#), pages 122 and 217, comment 119).

■ 77b. *The Gothic-Tarquinian War*. “The treason of Belisarius” is a very important event in the course of the Gothic War, one that results in the withdrawal of Belisarius from military command. He leaves the arena of war, quarrels with Justinian (the “main king” of the Gothic War), gets arrested and incarcerated. Belisarius dies in disfavour shortly after the war ([196], Volume 1).

78a. *The Trojan War*. In spite of his initial assent to betray the Greeks, Achilles refuses to fulfil his promise to withdraw the Greek troops. Nevertheless, Achilles also avoids active participation in the war. He had “commanded his Myrmidonians to refrain from battling the Trojans and aiding the Greeks” ([\[851\]](#), page 122).

■ 78b. *The Gothic-Tarquinian War*. His initial consent to betray Justinian and accept the Italian crown notwithstanding, Belisarius does not fulfil his promise to become the king of Italy and end the war (according to the Goths, at least). However, Justinian calls Belisarius away from Italy under the pretext of the necessity to fight the Persians, sending him to a different scene of operations. As a result, Belisarius spends several years away from Italy.

79a. *The Trojan War*. The ceasefire ends, and the Trojan War breaks out again, with new zeal. The Greeks suffer a series of crushing defeats in the absence of Achilles: “The Trojans have burnt more than 500 Greek ships” ([851], pages 122-123). The Trojans even manage to lay their hands on some Greek treasure which drowns in the sea later when the Greeks try to fight it back: “a great many Greek ships sank, and all the loot got drowned in the sea” ([851], page 134). All of this happens already after the fall of Troy.

■ 79b. *The Gothic-Tarquinian War*. The truce ends, and the Gothic = Tarquinian war flares up again. The Graeco-Roman troops are put to countless routs in the alleged years of 540-544 A.D. The Goths reclaim large parts of Italy that they had initially lost ([196], Volume 1, pages 373-374). The Goths seize the Roman treasure – the so-called “treasure of Theodoric”. The fate of the loot is virtually identical to that of the Greek hoard – the defeated Goths drown it in a lake at the very end of the Gothic war when they are forced to retreat in haste ([196], Volume 1).

3.9. The “ancient” Troilus = the mediaeval Gothic king Totila. The “ancient” Paris = the “ancient” Etruscan Larth Porsenna

80a. *The Trojan War*. After the death of Victor/Hector, king Troilus becomes the most important royal military commander - “number one hero”, if you please. The Trojan chronicles tell us of the king’s “young years” ([851], page 218, comment 124). Also mark the name Troilus.

■ 80b. *The Gothic-Tarquinian War*. After the defeat of Vittigis the Goth and his falling captive to the Roman Greeks, the Goths elect Totila as their new king. He is remarkably brave, and it doesn’t take him too long to become distinguished as a valiant Gothic hero. The Gothic version tells us quite explicitly that Totila had been *very young*, a juvenile royalty ([196], Volume 1, pages 373-374). There is an obvious similarity between his name and that of his “ancient” Trojan counterpart.

81a. *The Trojan War*. The “ancient” Troilus happens to be a relation of king Priam, the principal Trojan royalty – namely, a son of the latter ([851], page 123).

■ 81b. *The Gothic-Tarquinian War*. Totila the Ostrogoth is a relative of the previous Gothic king Hildibad ([196], Volume 1, pages 373-374).

82a. *The Trojan War*. Trojan chronicles describe the bravery of Troilus with

particular magniloquence. He is characterized in a unique manner. One of the chronicle chapters is called “The Amazing Strength of Troilus” ([851], page 123). Troilus leads the Trojans into several glorious victories. “Countless Greeks died at the swords of the Trojans [led by Troilus – A. F.] today” ([851], pages 123-124). However, Achilles the Greek doesn’t take part in the war while Troilus enjoys his triumph.

■ 82b. *The Gothic-Tarquinian War*. The Gothic version is most verbose insofar as the bravery of Totila the Goth is concerned. The Roman Greeks were “terrified by the advent of the new Gothic hero... this militant nation [the Ostrogoths – A. F.] was aflame with enthusiasm yet again, and everything changed as if by magic” ([196], Volume 1, pages 373-374). The Ostrogoths manage to change the course of war under the guidance of Totila. “A year had sufficed for many towns and cities to be conquered by Totila... and for the latter to infest all parts of the land with terror... his advent would be preceded by horrifying rumours” (*ibid*). However, the period of Totila’s glory coincides with the absence of Belisarius, who isn’t to be found anywhere in Italy at the time.

83a. *The Trojan War*. The well-known Trojan king Paris (PRS without vocalizations) fights alongside Troilus. Although Paris had been a veteran of the war, Troilus and Paris only became singled out as a spectacular pair of Trojan heroes in the reign of Troilus ([851], page 124).

■ 83b. *The Gothic-Tarquinian War*. According to the Gothic version, the Persians (PRS) attacked the Roman Empire simultaneously with Totila the Goth, and Belisarius was summoned to resist this onslaught. Although the Romans have been harried by the Persians for quite a while, the role of the latter becomes crucial in the reign of Totila. The two main enemies that Romea and Italy have to oppose in this period are the Persians and Totila. One finds it hard to chase away the thought that the mediaeval Persians and the “ancient” Paris (PRS) reflect one and the same entity in Gothic and Trojan chronicles, wherein the Persians correspond to Paris and the Prussians, or P-Russians.

Titus Livy relates the events in the following manner. As we already know, the Goths are referred to as the Tarquins in his version. It turns out that this is precisely the moment when the Tarquins (or the Goths) are joined by their ally in the war against Rome – the famous king Larth Porsenna (L-Horde of P-Rasenes), or, as one plainly sees, the same PRS or PRSN as before. Thus, the Trojan version refers to Troilus and

Paris as the heroic pair, whereas the Gothic version couples the Goths with the Persians. Titus Livy tells us of yet another pair – Tarquin and Porsenna. We see that all three chronographic traditions correspond to each other well, and must be referring to the same mediaeval war. These three groups of texts were written in different epochs and countries by different scribes, yet they all bear some sort of semblance to each other in their contents. All it takes to be noticed is for one to free one's perception from the yoke of the Scaligerian chronology and study these texts in an unbiased manner.

84a. *The Trojan War*. Paris gets killed ([\[851\]](#), page 129). Bear in mind that many Trojan chronicles use the name “*Parizh*” or “*Farizh*” for referring to Paris, which might also be the name used for the capital city of France. Thus, Paris/Parizh may have been a collective image of the Franks, one of the main forces behind the XIII century crusades. It is also quite clear why Paris is called a Trojan. The reason remains the same – the Trojans (TRQN) can be identified as the Franks (TRNK).

■ 84b. *The Gothic-Tarquinian War*. Titus Livy reports a very serious attempt to assassinate Larth Porsenna, the Etruscan king. The Roman Mucius Scaevola had tried to *assassinate* Porsenna the Etruscan, but to no avail. Above we already pointed out the parallelism that identifies Livy's Porsenna as the *Franks* of the Gothic War. This concurs perfectly with the Trojan version where we see Paris/Parizh the Trojan. We shall therefore reiterate that the mediaeval Franks must have been correct to claim Trojan ancestry.

85a. *The Trojan War*. After the triumph of king Troilus, Achilles returns to the scene of military action unexpectedly. Success immediately begins to favour the Greeks. The troops of Troilus are defeated, and he is killed in a large battle ([\[851\]](#), pages 126-127). In fig. 2.69 we see an ancient miniature that demonstrates the typical pastime of the “ancient” Achilles withdrawn from military action ([\[1485\]](#), ill. 325). We observe him indulge in a game of chess, no less. Achilles is approached by three knights calling him to arms.

Fig. 2.69 A miniature from *Le Roman de la guerre de Troie* by Benoit de Sainte-Maure dating to the alleged XIV century ([1485], page 245). Modern commentary runs as follows: “three mounted Greek envoys appear before Achilles, who takes repose in a game of chess, and summon him to take part in the battle” ([1485], page 250). Taken from [1485], ill. 325.

■ 85b. *The Gothic-Tarquinian War*. As Totila enjoys one battlefield success after another, Belisarius finally returns to Italy. The Roman Greeks under his command immediately prove brilliantly victorious several times in a row. In the alleged year 544 fortune forsakes the Goths permanently ([196], Volume 1, page 377). The Ostrogothic troops led by Totila and Teia (Teias) suffer bitter defeat. The balance shifts in favour of the Roman Empire. The violent and bloody Gothic war approaches its end ([196], Volume 1, page 398 and on). Totila perishes in the grandiose final battle, and the last Trojan king Teia dies a few months later ([196], Volume 1, pages 407-408).

3.10. The end of the war

86a. *The Trojan War*. Troilus the Trojan dies under the following circumstances: 1) surrounded by the Greeks in a battle; 2) killed by a spear; 3) his head is severed by the Greeks ([851], page 127). The decapitation episode is the only such account in the entire history of the Trojan War.

■ 86b. *The Gothic-Tarquinian War*. The legendary Gothic king Teia (Teias) dies as described below. A propos, the last two kings of the Ostrogoths (Totila and Teia) practically merge into one and the same figure due to the brevity of Teia’s reign – a mere few months after the death of Totila. 1) In the last battle between the Roman Greeks and the Goths, the former manage to surround Teia; 2) Teia is killed with a spear; 3) His head is cut off by the Roman Greeks. This decapitation episode is also unique in the history of the Gothic War ([196], Volume 1, pages 411-412). Comparison demonstrates the two scenarios to be identical.

87a. *The Trojan War*. The defeat of Troilus marks a breakpoint in the history of the Trojan War. The Trojans cannot find any worthy heroes to fight for their cause, and the city falls shortly afterwards. Thus ends the “ancient” history of Troy. The last battle of Troilus, likewise his death, takes place at the walls of the perishing Troy ([\[851\]](#)).

■ 87b. *The Gothic-Tarquinian War*. “The history of the Goths... ends with the famous battle... at the foot of the Vesuvius – the battle fought by the last of the Goths. The valiant nation faced extinction here” ([196], Volume 1, pages 411-412). Teia’s last battle is fought at the walls of the New City (Naples, or the New Rome?); this is where he dies.

88a. *The Trojan War*. The demise of Achilles follows shortly afterwards as a consequence of his “treason”. Since he had promised to marry Polyxena, queen Hecuba suggests that Achilles come to Troy for negotiations. He is careless enough to follow the suggestion, and gets killed insidiously from behind ([\[851\]](#), pages 75 and 128). Mark the fact that Achilles doesn’t die in a battle, but rather during negotiations. He is supposed to have been stabbed in the “heel”, or in the back.

■ 88b. *The Gothic-Tarquinian War*. Belisarius, the double of the “ancient” Achilles, dies after the defeat of the Ostrogoths under unclear circumstances. Let us remember that the withdrawal from the war, disfavour, arrest and property confiscation resulted from his “treason”, when he had allegedly promised the Goths to stop the war in exchange for the crown ([196], Volume 1). Belisarius doesn’t die in a battle – he passes away in a peaceful manner soon after his release from arrest; however, we possess no information about whether or not he had been murdered.

89a. *The Trojan War*. King Thoas. We see that some of the tales about Totila/Teia (Teias) became reflected in the Trojan chronicles as the legend of Troilus, King of Troy; we find out that the Trojan myth also kept some information about the mediaeval Ostrogoth Teias – his name remains all but unaltered. Thus, Teis (Teias) appears in the Trojan chronicles as two characters. See for yourselves – the famous king Thoas takes part in the Trojan War ([\[851\]](#), pages 113, 125 and 218, comment 126. King Thoas fights together with the Greeks, but falls captive to the Trojans several times, and is finally taken away to Troy.

■ 89b. *The Gothic-Tarquinian War*. King Teias. The “ancient” name Thoas is

almost completely identical to that of the last Gothic king Teias (Teia). See [196], Volume 1.

3.11. Other legends of the Trojan War

We have listed all of the main legends that comprise the history of the Gothic War. However, there are quite a few smaller episodes that also turn out to be phantom reflections of mediaeval events.

90a. *The Trojan War*. The fall of the Trojan kingdom ends with the “exile of the Trojans”. The surviving Trojans run away from the country and scatter. Centaurs, or semi-equine humans, are reported to take part in the Trojan War. It is possible that “centaur” (CNTR unvocalized) is yet another version of TRQN – the same old name of the Trojans ([\[851\]](#), pages 103 and 214-215, comment 78).

■ 90b. *The Gothic-Tarquinian War*. After the decline of the Ostrogothic kingdom, the Goths and their doubles – the Tarquins, or TRQN – leave Italy and Romea. This exile of the mediaeval TRQN is completely analogous to the exodus of the “ancient” Trojans (TRQN). The ancient “centaurs” are probably yet another phantom reflection of the TRQN/Tarquins/ Franks.

91a. *The Trojan War*. A certain King Remus fights the Greeks aided by the Trojans. Now, Romulus and Remus are the alleged founders of Rome. Could this “Trojan Remus” be a doppelgänger of Remus the founder of Rome? See [\[851\]](#), pages 109, 229 and 216, comment 96. Troy resists while Remus remains “in command of the horses”.

■ 91b. *The Gothic-Tarquinian War*. The city of Rome, or Constantinople (New Rome) takes part in the Gothic-Tarquinian War. We see the ruins of the “equine” aqueducts, which have sealed the fate of the Roman kingdom, in both Constantinople and Rome. The New City had stood stalwart until the Roman Greeks managed to capture the aqueduct.

92a. *The Trojan War*. Ulysses (Odysseus) is a possible double of Achilles, qv above. He is supposed to have stolen the horses of king Remus; this results in the fall of Troy ([\[851\]](#), page 216, comment 96). Some of the Trojan sources claim that “if the horses of Roesus [Remus, that is – see [\[851\]](#), page 216, comment 96; another possible meaning is “Ross” (Russian) – A. F.] drank some water from the Scamander

[the river Troy stood upon – A. F.], Troy wouldn't have fallen" ([\[851\]](#), page 216, comment 96).

■ 92b. *The Gothic-Tarquinian War*. The “equine aqueduct” of the New City. Apparently, this is a reference to a real event that took place in the course of the Gothic War. If the “horse” (the aqueduct) remained in order, or “drank water properly”, providing it to the New City, one couldn't have used it for entering the city; thus, the capital would have resisted the assault.

93a. *The Trojan War*. It is possible that king Remus counts among the casualties of the Trojan War. He had “fallen to the ground from his horse” hit by a spear ([\[851\]](#), page 109). We also encounter king Remus at the beginning of the Trojan War, where he appears in the episode with the famous amazons, who fight for the Trojans ([\[851\]](#), page 74, also pages 129-131). The words “amazon” and “Amalasuntha” resemble each other a great deal; one may well be a derivative of the other. The queen of the amazons was killed in the Trojan War. Her name was Penthesilea (Anthesilea?), and she was killed by the Greeks ([\[851\]](#)).

■ 93b. *The Gothic-Tarquinian War*. King Remus, the founder of Rome, is killed in battle by Romulus ([\[482\]](#)). This happens at the very dawn of Roman history, right after the foundation of the city – in yet another phantom reflection of the Gothic-Tarquinian War. Amalasuntha is queen of the Goths at the beginning of the Gothic-Tarquinian War, which means that she belongs to the TRQN clan. This clan is at odds with Romea. It is possible that another version of Amalasuntha's name was “Anthesilea the amazon”. She gets killed soon after the breakout of the Gothic War, allegedly with the consent of the Roman Greeks ([196], Volume 1).

94a. *The Trojan War*. At the beginning of the Trojan War, the Trojans have the military support of king Theutras, who engages in combat against the Greeks when the latter attack his kingdom ([\[851\]](#), page 102). Theutras was killed in the Trojan War. He had been the ruler of Phrygia, or Friesia (see more on the superimposition of Friesia over either Germany, the Italian kingdom of the Germans/Goths in the alleged VI century A.D., or the Ottoman Turkey, above).

■ 94b. *The Gothic-Tarquinian War*. At the beginning of the Gothic War Theodahad fights the Roman Greeks who invade his kingdom. Theodahad gets killed in the Gothic War ([196], Volume 1). He had been the ruler of the German/Gothic kingdom. The names “Theodahad” and “Theutras” are very similar to each other.

95a. *The Trojan War*. The cunning of Ulysses (Achilles?) leads to the fall of Troy. This involves “a horse”. Ulysses replaces Achilles towards the end of the Trojan War, and concludes the war as the “successor of Achilles” ([851]).

■ 95b. *The Gothic-Tarquinian War*. In the Gothic War, Naples (New City/New Rome) falls prey to the cunning of Belisarius, the double of the “ancient” Achilles. An aqueduct is used for this purpose. Belisarius was then relieved by Narses, who concluded the war as his successor.

96a. *The Trojan War*. Ulysses replaces Achilles for a relatively short term (as compared to the entire duration of the Trojan War, see fig. 2.70). The “ancient” legend of the wanderings and the poverty of Ulysses/Odysseus after the Trojan War is known rather widely: “Ulysses had been in utter destitution when he reached the land of Idomeneus” ([851], page 136). The poverty of the famous “ancient” Greek hero is a unique occurrence in the course of the Trojan War.

■ 96b. *The Gothic-Tarquinian War*. Narses as the successor of Belisarius. Narses acts as the successor of Belisarius for a relatively short time at the very end of the Gothic War, qv in fig. 2.70. The legend of the poverty that befell the great hero (Velisarius/Valerius, qv above) is the only such legend in the entire history of the Gothic (Trojan) War ([196], Volume 1; also [482]). It is mentioned by both Procopius of Caesarea and the "ancient" Titus Livy, qv above.

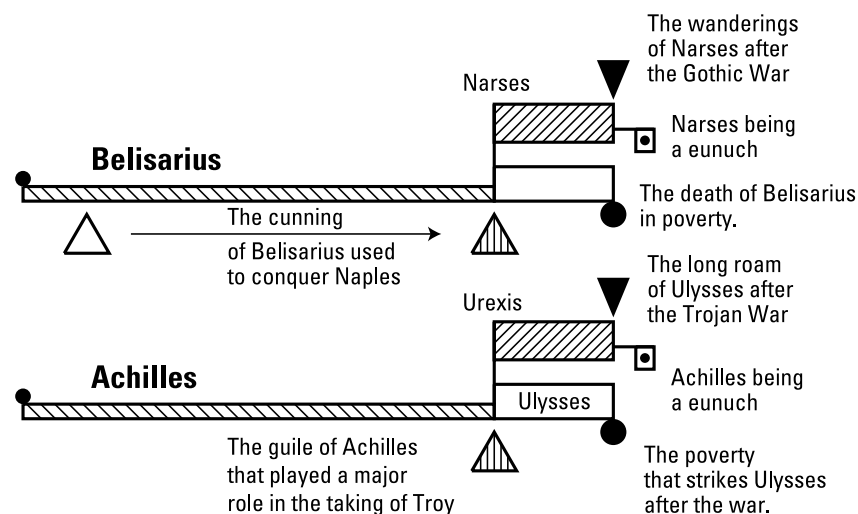

Fig. 2.70 The parallelism between the respective biographies of Belisarius and the “ancient” Achilles.

97a. *The Trojan War*. These are the various names of Ulysses/Odysseus as used in the Trojan chronicles: Odysseus, Urekshish, Urexix, Diseves, Nicyotenines, Ulyces,

Ulyxes, Ulisan and Ulysses ([\[851\]](#), pages 201 and 202, commentaries 21 and 33. Let us point out that the name Ulyxes or Ulysses is most probably a version of the name Achilles. Let us sum up. The end of the Trojan War is marked by the deeds of the two heroes Achilles and Ulysses, where the “short-term character” Ulysses carries on with the deeds of Achilles, the “main hero”. Their names are similar: ChLLS-LSS/LLS. The ordeals of Ulysses after the Trojan War are related by Homer in the *Odyssey*, in particular.

■ 97b. *The Gothic-Tarquinian War*. Narses “carries the flag” of Belisarius in the Gothic War. The variations of his name include Narses, Narces and Narcus. We are most likely confronted with the variations of the name Ulysses: Ulyxes, Ulyces, Urexis etc. Thus, we see that the end of the Gothic war is also marked by the appearance of a pair of military leaders – Belisarius and Narses. Narses is a “short-term hero” and fights for the same cause as Belisarius. There may be a similarity between their names: BLSR and NRSS. The ordeals of the unfortunate Narses after the Gothic War are described in [196], Volume 1. It is possible that the very same “ordeal of Narses” became reflected in Livy’s Tarquinian version of the war as the wanderings of the “ancient” Roman Coriolanus ([\[482\]](#)).

98a. *The Trojan War*. Let us point out an astonishing “ancient” story about Achilles as a “eunuch”. It is reported that he had been a servant in a gynaeceum. This famous event is reflected on numerous “ancient” vases and paintings. Achilles is supposed to have “served as a eunuch” before the Trojan War. After that he had *pretended to be a woman* for a certain period of time for some reason, wearing a woman’s clothing [?!] and apparently forced to take care of a woman’s chores by some queen or king. “And so it came to pass that Haran made him [Achilles – A. F.] dress in a maiden’s attire, and sent him away to *serve king Lycomedes as a maid* [that is to say, he was taken into the service of some king as if he were female: a maid – A. F.] *And he had lived there together with the maidens* ([\[851\]](#), page 142). Nothing of the kind has ever been told about any other hero of the Trojan War. This bizarre and unique fact – a distinguished warrior running the chores of a serving girl, instantly draws one’s attention. It has to be said that the “ancient” sources don’t offer any explanation; one gets the feeling that the “ancient” authors of the XVI-XVII century had already been unable to understand the matter at hand. We had a reason to call Achilles a “eunuch”. Below we shall see that our reconstruction of this “gynaeceum episode” involving Achilles had been correct; however, none of the

“ancient” authors use the word “eunuch” - either owing to having forgotten the true story, or in order to obfuscate the mediaeval nature of all the events in question.

■ 98b. *The Gothic-Tarquinian War*. The chroniclers of the Gothic War *report the famous Narses to have been a eunuch!* It is said that he had served in a Constantinople gynaeceum before the Gothic War ([196], Volume 1). The following is told about his post-war fate: “He didn’t dare to return to Constantinople... having learnt that Empress Sophia promised to make the *eunuch* spin linen in the gynaeceum together with her women [sic! - A. F.]. Legend has it, the *castrate* answered that he would spin a thread that shall take the Sophia’s entire life to straighten out” ([196], Volume 1, Book 2, pages 213-213; Savin’s translation).

99a. *The Trojan War*. As we pointed out, Achilles (= Ulysses?) is the only hero of the Trojan War to have “served as a maid”; this legend is most bizarre indeed. Achilles the “eunuch” had served at the court of *a king*. However, as the Trojan War breaks out, Achilles ceases his “eunuch service” to become distinguished as a heroic military commander ([851], page 142). He leaves to storm the walls of Troy: “When Achilles had learnt of this, he cast the maiden’s attire away and hastened to Troy” ([851], page 142). He gathers great fame as a hero, and, as we now understand, ends the Trojan War crushing the Trojan forces completely.

■ 99b. *The Gothic-Tarquinian War*. Narses is the only well-known character of the Gothic War to have served as a eunuch. This legend is unique. Let us point out that Narses the eunuch had served at the emperor’s court in New Rome. As the Gothic War begins, Narses ends his gynaeceum service and hastens to ride into battle against the Goths. He becomes a famous military commander and a successor of Belisarius, ending the Gothic War with a complete defeat of the Goths and their kingdom ([196], Volume 1). Nowadays it is perfectly obvious to us why “the ancient Achilles” had spent a part of his life “in the gynaeceum”. The famous Byzantine military leader Narses (Achilles) had been a eunuch. Bear in mind that nothing of the kind is told about any other hero of the Gothic War. There were no other eunuch warlords in this epoch.

100a. *The Trojan War*. Chronicles tell us of a “terrifying pestilence”, or a great epidemic that had raged in the time of the Trojan War. This is the single report of such nature over the entire course of the Trojan War ([851], page 73).

■ 100b. *The Gothic-Tarquinian War*. An epidemic bursts out during the Gothic

War. This is also the only such mention in the course of the war ([695]; also [196], Volume 1, pages 357-358).

101a. *The Trojan War*. Troy is reported to have been surrounded by “a Roman territory” ([851], pages 210 and 212).

■ 101b. *The Gothic-Tarquinian War*. The New City = Naples, or the New Rome had really been the centre of a “Roman domain”. Naples is located in Roman Italy, whereas the New Rome is the capital of Romea, or Byzantium.

See figs. 2.71 and 2.72 for a brief summary of this section.

The Trojan version	The Gothic version
■ Centaurs take part in the Gothic War fighting against the Greeks on the side of the Trojans. CNTR without vocalizations.	■ The Goths, or the Tarquins (according to Livy) fight against the Romean Greeks in the Gothic-Tarquinian War. TRQN without vocalizations.
■■■■ King Remus (the founder of Rome?) fights against the Greeks in the Trojan War.	■■■■ The city of Rome (or New Rome?), founded by Remus, fights against the Romean Greeks in the Gothic War.
□□ King Remus owns the “horses” that decide the fate of Troy.	■ The New City (New Rome?) does indeed “own” the aqueduct that had sealed the fate of the city.
■ Ulysses abducts the “horses of Remus”.	□□ Belisarius (Ulysses/Achilles) captures the aqueduct of the New City.
□□ The abduction of the horses leads to the fall of Troy.	■■■ The captured aqueduct is the cause of the city’s fall.
■■■ King Remus was apparently killed in the Trojan War.	King Remus (the founder of Rome) is killed by Romulus in a battle.
Amazons fight on the side of the Trojans.	■■■ Amalasuntha (queen of the Goths) is killed immediately before the beginning of the Gothic War.
■■■ The queen of the amazons is killed in the Trojan War.	■ Theodahad, king of the Goths, appearing at the beginning of the Gothic War.
■ The legend of king Theutrates at the beginning of the Trojan War.	
■ King Theutrates is a sworn enemy of the Greeks and fights against them.	■ King Theodahad opposes the Romean Greeks and fights against those.

Fig. 2.71 A brief scheme of the parallelism in secondary plots that emerge in the course of the Trojan and the Gothic-Tarquinian War.

The Trojan version	The Gothic version
■ ■ ■ Theutrates is killed.	■ ■ ■ Theodahad is killed.
□ □ □ □ Theutrates was the ruler of Phrygia (Friesland).	□ □ □ □ Theodahad had been the ruler of the Germanic/Gothic kingdom.
□ □ □ The cunning of Ulysses (Achilles?) leads to the fall of Troy.	□ □ □ Belisarius captures the New City by sheer ingenuity.
■ ■ The Trojan War is brought to an end by Ulysses/Odysseus.	■ ■ The Gothic War is ended by Narses.
□ □ □ The poverty and the ordeals of Ulysses/Odysseus after the Trojan War.	□ □ □ Poverty, exile and other ordeals of Narses after the Gothic War.
■ ■ Ulysses as the "sequel to Achilles".	■ ■ Narses is the successor of Belisarius.
□ □ □ The legend of Achilles serving in a gynaeceum as a eunuch.	□ □ □ Narses is a eunuch and has served at the gynaeceum of the Constantinople court for some time.
□ □ □ Achilles ceases his "eunuch service" and goes off to the Trojan War.	□ □ □ Narses quits his "eunuch job" and goes to fight in the Gothic War.
■ ■ ■ Achilles is a renowned military leader of the Greeks.	■ ■ ■ Narses is an eminent military commander of the Roman/Greek.
■ ■ A horrendous pestilence – an epidemic during the Trojan War.	■ ■ Fever and plague in the empire during the Gothic War.
■ ■ Troy is surrounded by "Roman territories".	■ ■ Rome and the New City (Naples or the New Rome) are situated on the territory of the Roman/Roman Empire.

Fig. 2.72 A brief scheme of the parallelism in secondary plots that emerge in the course of the Trojan and the Gothic-Tarquinian War.

3.12. What is it about the Trojan chronicles that surprises the present day historians the most?

Let us conclude with mentioning the style and the tone of all the modern comments to these mediaeval documents of the Trojan cycle. Modern historians never cease to wonder about the ignorance of the mediaeval scribes who have de facto "transferred" the Trojan War into the Middle Ages. A standard accusation of the chroniclers is as follows: they follow an erroneous chronology and thus *shift the antiquity into the Middle Ages*. Let us demonstrate some examples of these "mediaeval anachronisms".

According to modern commentators, "the claim that Sparta had been part of the

Romanian (Roman) kingdom in the times of the Trojan War is an obvious anachronism from the part of the mediaeval author” ([851], page 210, comment 28). It goes without saying that, according to the Scaligerian version of history, there could have been no mediaeval Romania (Romea/Byzantium) in the XIII century B.C. There were wild woods where “ancient” Rome would initially be founded – according to Scaliger-Petavius, the foundation of Rome took place 500 years after the fall of Troy, no less. One cannot help but wonder which version is correct. The data we possess imply that the Trojan scribes must have been right, and that their chronicles were apparently written in the XIV-XVI century.

Another comment of the modern historians runs as follows: “the reference to Cyclad isles being under *Roman* jurisdiction is an *anachronism*, since they only became Roman in the II century B.C.” ([851], page 212, comment 55). We see nothing original here, so we shall refrain from reiterating our considerations.

According to a modern historian, “they [the Trojan chroniclers – A. F.] often *misidentify* Thessalia as Thessaloniki... a city that had been founded a great deal later and became... one of the most important centres of the mediaeval Byzantium” ([851], page 208, comment 2). What we are being demonstrated is a chronological discrepancy of *fifteen hundred years* between the indications of the mediaeval scribe and the Scaligerian chronology. We deem the mediaeval authors correct, and the consensual chronology erroneous.

We proceed to learn that modern commentators consider the descriptions of the weapons used in the Trojan War *typically mediaeval* and therefore “*doubtlessly erroneous*” ([851], page 210, comment 31; also page 214, comment 73, and page 202, comment 28).

Aeneas the Trojan is supposed to have arrived in Italy on a ship after the fall of Troy. The “ancient” legend proceeds to tell us that Rome had been founded by his grandson Romulus. This is the version the “ancient” authors Hellanicus and Damastus insist upon, for instance ([579], page 23). This indication irritates the modern commentators, since it moves the Trojan War into *the immediate chronological vicinity of the “urbe condita” date*. This results in a *500-year discrepancy* with the Scaligerian chronology. Historians prefer to keep silent about this fact, as if it were nonexistent.

We also find out that, apparently, “Procopius had been flabbergasted at the sight... of the legendary ship of Aeneas that was still kept in the arsenal of a bank on the Tiber... one thing he had witnessed in particular is that the famous vessel had looked as though it were freshly-made, with no signs of rot whatsoever ([196], Volume 1, page 406). To

quote Procopius verbatim, “none of the wooden parts were rotten or looked unsound – each and every piece of the ship had looked as though they were freshly-made and stood strong, miraculous even for someone like myself” ([696], page 89).

We believe this to be perfectly natural. Procopius is most probably a crusade chronicler of the XV-XVII century epoch (erroneously placed in the alleged VI century A.D. by later historians), who had observed the real ship of the real *crusader* Aeneas built a short while before Procopius – possibly in the XIII-XV century A.D.

Unlike the commentators in question, we shall refrain from accusing the Trojan chroniclers of terrible ignorance. On the contrary – as we are beginning to realize, *these chroniclers were correct for the most part*. Generally speaking, such “anachronisms” occupy a large part of the Trojan chronicles if one is to study them through the distorting prism of the Scaligerian chronology. According to the consensual history, all these “anachronisms” imply that a large number of mediaeval scribes had lacked necessary competence. To us, they *prove the authenticity of the chronicles*.

3.13. How similar are the respective descriptions of the Trojan and the Gothic War?

We shall proceed to discuss a very important issue – the estimation of just how many heroes of the Trojan War are isomorphic with those of the Gothic = Tarquinian War? For the sake of simplicity, let us merely consider characters mentioned on 20 pages of the text at least ([\[851\]](#)). In other words, the personalities that interest us at the moment are really important and turn up often. A simple calculation provides us with the following list:

Priam is mentioned on 51 pages; this number equals 39 for Achilles, 35 for Agamemnon, 34 for Menelaus, 33 for Hector, 32 for Paris, 23 for Ajax and 22 for Troilus. As one can plainly see, Ajax is the only hero who remains outside the parallelism. Therefore, 87 per cent of the “ancient” Trojan War protagonists also spawned doppelgängers in the mediaeval chronicles relating the events of the Gothic-Tarquinian War.

Our reconstruction is as follows: the Trojan War had been a famous mediaeval event, possibly dating from the XIII century A.D., also known as: 1) the Gothic War; 2) the Tarquinian War; 3) the destruction of Constantinople (or the New Rome) by the crusaders in 1204 A.D.; 4) the Judean war of Joseph Flavius. The city of Troy is most likely to be identified as the New Rome = Constantinople. The tales of Troy besieged and fallen may have absorbed some real events of the XIII century war in Italy. This is

where the city of Naples is located (the New Town), as well as the mediaeval town of Troy that still exists ([196]).

3.14. Other erroneous datings of the Trojan War

3.14.1. *Phantom reflection of the Trojan War in the alleged III century A.D.*

Above we demonstrate the Second Roman Empire of the alleged I-III century A.D. to be a statistical double of the Third Roman Empire (the alleged III-VI century A.D.). Both of them are phantom reflections of the Holy Roman Empire of the alleged X-XIII century as well as the Habsburg (Nov-Gorod?) Empire of the XIV-XVII century.

Among other things, the end of the Second Roman Empire (the epoch of the alleged years 234-270 A.D.) must have become superimposed over the end of the Third Roman Empire – that is, the period of the alleged years 536-552 or 536-553 A.D. In other words, the Gothic = Tarquinian = Trojan War must “re-surface” as a phantom somewhere in the III century A.D. This hypothesis finds excellent proof. For the sake of brevity, we shall merely point out the central focal points of the parallelism in question; should anyone wish to reconstruct the entire picture in detail, it can be done easily.

1a. *The Gothic War* of the alleged III century. The end of the Second Roman Empire falls on the alleged year 217 A.D. After that, the anarchy of the alleged years 217-235 begins. A woman by the name of Julia Maesa comes to power, and the emperors Heliogabalus and Alexander Severus are her creatures, qv in [Chron2](#), Chapter 1.

■ 1b. *The Gothic War* of the alleged VI century. The Third Roman Empire ceases to exist in the alleged year 526 A.D. after the death of Theodoric, the last official emperor of Rome, albeit not a Roman. Then Amalasuntha and two of her minions (Amalaric and Athalaric) come to power and reign between the alleged years 526 and 536. A partial parallelism between Julia Maesa and Amalasuntha is studied in [Chron2](#), Chapter 1.

2a. *The Gothic War* of the alleged III century. Here we have the civil war of the alleged years 234-251. It is however more than just a civil war, but rather the famous *Gothic* war. The term “Gothic War” is used officially for referring to the period of the alleged years 238-251 A.D. nowadays ([579], pages 439-440).

■ *2b. The Gothic War* of the alleged VI century. This is the famous Gothic War of the alleged years 536-552 A.D. All available sources also call it “Gothic”. As we point out above, this very war is also described by Titus Livy as the Tarquinian War.

3a. The Gothic War of the alleged III century. Let us list the names of several Roman emperors, who had reigned in the epoch of the anarchy and the Gothic War of the alleged III century. The first name we encounter is *Severus* (222-235).

■ *3b. The Gothic-Tarquinian War* of the alleged VI century. The Tarquinian clan comes from a northern land, as discussed above. The Goths also invade Italy from the North. The name Severus might be a derivative of the Slavic “*Sever*” (North) – as in “one who comes from the North” or “Northerner”.

4a. The Gothic War of the alleged III century. The Gordian dynasty: Gordian I (238), Gordian II (238), Gordian III (238-244). Let us point out the similarity of the name Gordian and the Slavic word “*gordiy*” (proud), which, in turn, is apparently a derivative of the word “horde”. Therefore, there may be a link between the Horde and the Gordians (of which there were three).

■ *4b. The Gothic-Tarquinian War* of the alleged VI century. As we already know, Titus Livy described the Gothic War as the Tarquinian War, while the entire clan of the Goths received the collective name of “Tarquin the Proud”. It is very likely that the Slavic “*gordiy*” (proud) and the name Gordian are two different derivatives of “horde”. Bear in mind that Livy tells us of three Tarquins: Tarquin Collatine, Tarquin Sextus and Tarquin the Proud.

5a. The Gothic War of the alleged III century. Valerian and Balbinus. a) Emperor Valerian, 253-260 A.D.; b) Emperor Balbinus, 238 A.D.

■ *5b. The Gothic-Tarquinian War* of the alleged VI century. Valerius/Belisarius and Baduila. a) The eminent Romean warlord Belisarius described as Valerius by Livy. The name Valerius also resembles Valerian to a great extent; b) The famous military leader of the Goths named Baduila, also known as Totila ([196], Volume 1). Balbinus might be another version of Baduila.

6a. The Gothic War of the alleged III century. The wife of Gordian III is called Furia Tranquillina ([579], page 438).

■ *6b. The Gothic-Tarquinian War* of the alleged VI century. The wife of Tarquin

the Proud (the famous Tullia, according to Livy) is said to have been a real fury – a malicious, power-hungry woman, in other words ([\[482\]](#)). We observe a pattern here: Gordian = proud (“*gordiy*”), Tranquillina = Tarquins, Furia = “fury” (as a characteristic of a woman according to Livy).

7a. The Gothic War of the alleged III century. The Gothic War that broke out in the middle of the alleged III century A.D. is supposed to have shaken Europe for either 13 or 16 years: 238-251 or 235-251. The official temporal framework of the Gothic War is supposed to fit into the period between 238 and 251 ([\[579\]](#), pages 439-440). Severus, the creature of Julia Maesa, had died in 235; his demise was followed by a period of anarchy.

■ *7b. The Gothic-Tarquinian War* of the alleged VI century. The Gothic War of the alleged VI century is supposed to have lasted for either 16 or 18 years: 536-552 or 535-553. Titus Livy described it as the Tarquinian War, reporting its duration to equal 12 years ([\[482\]](#)). Thus, the 13/16 years from the previous paragraph concur well with the duration of the war given as 12, 16 or 18 years.

3.14.2. The Christian dating of the Trojan War

The Bible describes the kingdoms of Judea and Israel that had appeared under Jeroboam I. His immediate predecessors are named by the Bible as the “famous triad” of rulers – Saul, David and Solomon. The Scaligerian datings of their reigns are as follows:

- the alleged years 1020-965 or 1004 B.C. for Saul,
- the alleged years 1004-965 B.C. for David,
- and the alleged years 965-928 B.C. for Solomon ([\[72\]](#), page 192).

Thus, David had reigned in the alleged X century B.C. How does one make it concur with the Trojan chronicles indicating that the Trojan War took place in the reign of King David? For instance, one of the Trojan chronicles is called “The Tale of Troy’s Foundation and Captivity, as well as its Last Destruction that Took Place under David, King of Judea” ([\[851\]](#)). Another name is “Thus Fell Troy in the Reign of David king of Israel in Jerusalem” ([\[851\]](#), page 147). However, the Trojan War took place in the alleged XIII century B.C. (1225 B.C. according to [\[72\]](#)), whereas David had lived in the alleged X century. Scaligerian chronology demonstrates a discrepancy of roughly 250 years.

The New Chronology eliminates this discrepancy. The results of our research as described in Chapter 6 of [Chron1](#) demonstrate that the history of the Israelite and the Judean kingdoms happens to be the ecclesiastically-hued rendition of the events that took place in the Holy Roman Empire of the alleged X-XIII century, as well as the Habsburg (Nov-Gorod?) Empire of the alleged XIV-XVII century. Thus, the “great royal trio” consisting of Saul, David and Solomon can most probably be identified as a group of XIII-XV century characters, qv on our global chronological map in [Chron1](#), Chapter 6. This corresponds well with our re-dating of the Trojan War to the XIII century A.D.

3.14.3. The datings of the Trojan War as offered by Hellanicus and Damastus

The “ancient” authors Hellanicus and Damastus claim (in [579], page 23) that the Trojan War was only separated from the foundation of Rome by the lifetime of a generation or two. According to [Chron1](#), Chapter 6, the foundation of the Italian Rome is most likely to have taken place in the XIV century A.D. If we are to count two generations backwards from this date – roughly 50 years, that is – we shall end up with the XIII – early XIV century of the new era, which is when the Trojan/Gothic/Tarquinian War had taken place according to our reconstruction. Various scribes may have considered some of the war’s numerous reflections in the “Scaligerian history textbook” to have been authentic. Let us point out that there are at least 13 such reflections, no less! They are marked by black triangles on the global chronological map in [Chron1](#), Chapter 6.

3.14.4. The Judean dating of the Trojan War

The mediaeval “Tale of Troy’s Foundation and Captivity as well as its Last Destruction that Took Place under David, King of Judea” tells us that “Troy was taken in the year 4016” ([\[851\]](#), page 136). Which chronology is this date in, and what did the chronicler refer to exactly? Scaligerian history considers such “great datings” of several millennia to have Genesis as the beginning of the scale, and one is to remember that there are several datings of the Genesis itself.

Apparently, the phenomena we encounter here owe their existence to the late mediaeval “scientific activity” of the XVI-XVII century chronologists who tried to order and date ancient events. Having put them into a wrong sequence and extended it arbitrarily, “experts” such as Matthew Vlastar and Joseph Scaliger would measure the

intervals between various events in years and write the resulting erroneous figures into ancient chronicles and other old documents. Veracious sources would thus become corrupt with erroneous datings, and the motivations for this activity may even have been noble.

Let us return to 4016 as the dating of the fall of Troy. What “Genesis” does it refer to? Since the name of the book refers to David, King of Judea, it would be only natural to assume the chronicler to use the Judaic dating of the Genesis – the alleged year 3761 B.C. in Scaligerian chronology ([\[72\]](#), page 68). In that case, we shall obviously get the year 255 A.D. if we are to count 4016 years forwards. This dating falls well into the 235-251 A.D. interval where chronologists erroneously placed a phantom reflection of the XIII century war (Gothic = Trojan), or the decline of the Second Roman Empire. 255 A.D. is in close propinquity with 251 A.D. that marks the end of the Gothic War (the alleged III century A.D. reflection), qv in fig. 2.73.

Fig. 2.73 One of the erroneous datings of the Trojan War.

Thus, if some chronologist of the XVI-XVII century had fallaciously used a phantom duplicate for the dating of the Trojan War – the one that wound up in the III century A.D. – he was by all means entitled to include the words “Troy fell in 4016” into his chronicle, which we indeed witness to be the case.

3.14.5. *The Scaligerian dating of the Trojan War*

The identification of the Trojan War dating to the alleged 1225 year B.C. as the Gothic War of the alleged VI century A.D. that ended in the alleged year 553 A.D. is one of the most obvious consequences of the rigid chronological shift of 1800 or 1780 years ($1225 + 552 = 1777$, or roughly 1780 years). Thus, the Graeco-Biblical chronological shift had transposed a duplicate of the Gothic War, which had wound up in the VI century A.D. by mistake (the correct dating being the XIII century A.D.), into an epoch even

more ancient – the XIII century B.C. This is a perfect example of how the phantom duplicates of real mediaeval events would “multiply” due to false datings.

As one sees from the global chronological map in [Chron1](#), Chapter 6, the most recent reflection of the Trojan = Tarquinian = Gothic War is located in the XIII century A.D. (on the far right). This is the very epoch when the creation of the greater bulk of the Trojan cycle begins, qv in fig. 2.36. Therefore, the rare “Trojan texts” that modern historians consider to predate the XIII century A.D. need to have their datings revised.

3.15. The table of heroes who had fought in the XIII century war (Trojan = Tarquinian = Gothic) and their phantom doubles

Let us consider the entire collection of the phantom doubles that we have discovered. They all reflect the protagonists of the Trojan War of the XIII century A.D. We shall also consider all of the parallelisms related in the following chapters. We come up with the table below, which is most edifying. For the sake of simplicity, we shall limit ourselves to just four heroes, namely:

1) *Achilles*; 2) *Agamemnon*; 3) *Odysseus/Ulysses* – the “sequential Achilles”; 4) *Patroclus*. Let us keep their respective index numbers in order to refer to their duplicates in other phantom reflections of the Trojan War as listed in the table.

I. *The Trojan War* of the alleged XIII century B.C.

- 1) Achilles,
- 2) Agamemnon,
- ■ 3) Odysseus – Ulysses - “sequential Achilles”
- ■ ■ 4) Patroclus.

II. *The Tarquinian War* of the alleged VI century B.C.

- 1) Valerius,
- 2) Tarquin the Proud,
- ■ 3) Larcus + Marcius Coriolanus,
- ■ ■ 4) Junius, the son of Marcus, Brutus (Brother?)

III. *Civil war in Rome* (the alleged I century B.C.)

- 1) Julius Caesar,
- 2) Gnaeus Pompey Magnus,

- ■ 3) Sulla and Cicero (NRSS, qv below),
- ■ ■ 4) Marcus Brutus (Brother?).

IV. *Civil war in Rome* (the alleged III century A.D.)

- 1) Constantius Chlorus,
- 2) Diocletian the Great,
- ■ 3) Lucius Aurelian,
- ■ ■ 4) ?

V. *Gothic War* of the alleged VI century A.D.

- 1) Belisarius,
- 2) Justinian (and Theodora),
- ■ 3) Narses/Narcus,
- ■ ■ 4) John II.

VI. *Civil war in Rome* (the alleged years 901-924 A.D.)

- 1) Alberic,
- 2) Theophylactus (and Theodora I),
- ■ 3) Alberic I (?) and Marozia (?),
- ■ ■ 4) John X.

VII. *Civil war in Rome* (the alleged years 931-954 A.D.)

- 1) Alberic II,
- 2) Hugo (and Theodora II),
- ■ 3) ?
- ■ ■ 4) John XI.

VIII. *War in the early days of the Holy Roman Empire* of the alleged X-XIII century A.D.

- 1) Alberic II,
- 2) Otto III,
- ■ 3) Otto I, Otto II, Octavian Augustus,
- ■ ■ 4) ?

IX. *The XIII century A.D. wars in Italy and Byzantium. The fall of*

Constantinople/New Rome in 1204 and 1261. The fall of the mediaeval Troy and the New City (Naples) in Italy. All of these reflect fragments of the original Trojan War.

1) Charles of Anjou,

■ 2) Innocent IV,

■ ■ 3) Charles of Anjou (NRSS, qv below),

■ ■ ■ 4) John XXI.

Let us reiterate that the Scaligerian location of the Gothic War of the alleged VI century A.D. in Italy is highly arguable. We have already demonstrated the famous Nika rebellion in the Byzantine New Rome to be a duplicate of the Gothic War. This is yet another fact to indicate that the original Trojan battlefield had been in Byzantium, and that Constantinople = New Rome = New City = Troy = Jerusalem. These events drifted towards Italy (in documents, naturally) as recently as the XIV-XV century A.D., when the Byzantine refugees had founded Rome here. The “ancient” Aeneas – a partial representation of Charles of Anjou, was their leader. The founders of Rome from the XIV century A.D. have then entered Livy’s “History” as Romulus and Remus.

See more about the escape of King Aeneas from the burning Troy and the foundation of Rome and the Roman Empire by his offspring in our book entitled *The Dawn of the Horde Russia*.

One needn’t be of the opinion that the four characters of the XIII century A.D. listed in the table are the “true prototypes” of the Trojan War heroes. Their real biographies have doubtlessly served as a foundation of some sort – however, a large amount of data was introduced into their biographies by later written sources. It shall thus require a great deal of work to separate the “reality skeleton” from the “fantasy flesh” grown thereupon due to the efforts of the mediaeval chroniclers. We have already seen them transform a real mediaeval aqueduct (or a wheeled mediaeval siege tower) into a phantom Trojan Horse by a quick flick of the quill, after all – it would be naïve to expect any less “transformation layers” to peel from the great mediaeval Achilles - an “ancient” Greek.

4.

The Great Triad of Kings in Roman history: Sulla, Pompey and Caesar. The parallelism with the Trojan = Tarquinian = Gothic War

It is hard to find characters in “ancient history” whose popularity could compare to that of Julius Caesar, Pompey, Brutus and Sulla. We are familiar with numerous works of art, historical novels, films and the like, all of which tell of, or are inspired by, the events of this great epoch’s legendary history. As we shall see, the “skeleton” of the “ancient” Roman events of the alleged I century B.C. happens to be yet another carbon copy of substantially more recent events, which took place in the XII-XIII century A.D. The mediaeval original has travelled backwards in time and landed in the I century B.C. due to the same primary chronological shifts of 333 and 1053 years, respectively. In Chapter 6 of [Chron1](#) we demonstrated the “framework” of the Roman events from the alleged I century B.C. to mimic the events of the alleged X-XI and XIII century A.D. The resulting shift thus approximates 1053 or 1400 years. This parallelism is of a primary nature and stems from the already well-familiar Roman shift of 1053 years, or the equivalent formula $T = X + 300$ where T stands for years Anno Domini, while X corresponds to the *Ab urbe condita* dating as used by Titus Livy, for instance.

As we indicated in [Chron1](#), Chapter 6, the following epochs duplicate the war of the XIII century A.D.: the Trojan War of the alleged XIII century B.C., the Tarquinian War of the alleged VI century B.C., the Gothic War of the alleged VI century A.D., likewise the epoch of Sulla, Pompey and Caesar of the alleged I century B.C.

Being duplicates of one and the same original, the respective four groups of documents must be related to each other to a greater or a lesser extent. In [Chron2](#), Chapter 1, we relate the parallelism between the following two “great triads” of kings:

1. Sulla, Pompey and Caesar – the alleged years 82-45 B.C., early days of the Second Roman Empire;
2. Aurelian, Diocletian and Constantius I Chlorus – the alleged years 270-306 A.D., the beginning of the Third Roman Empire.

We shall proceed with a brief outline of the remarkable parallelism between the epoch of the Sulla/ Pompey/Caesar triad and the Gothic war of the alleged VI century A.D. A

rough scheme of the parallelism is as follows:

- Pompey = Justinian,
- Julius Caesar = Belisarius,
- Sulla (and Cicero) = Narses (and Belisarius).

Let us point it out once again that the equal sign here must not be interpreted literally. It merely points out a manifest parallelism and proximity of form-codes, but not a complete similarity of descriptions. The authors of the texts differ, and belong to different epochs besides that – therefore, there are bound to be significant variations in many details.

a. The Gothic War of the alleged VI century A.D. See Procopius ([695]) and F. Gregorovius ([196], Volume 1).

■ *b. The epoch of Sulla, Pompey and Caesar* – the alleged I century B.C. See Plutarch ([660]).

■ ■ *c. The Trojan War* of the alleged XIII century B.C. See the *Trojan Tales* ([851]) and Homer ([180]).

■ ■ ■ *d. The Tarquinian War* of the alleged VI century B.C. See Titus Livy ([482]).

1*a. The Gothic War.* Belisarius is a prominent Byzantine (Graeco-Romean) military leader. He is the “number one warlord” in the Gothic War of the alleged VI century A.D. ([695] and [196]). His unvocalized name root transcribes as BLSR.

■ 1*b. Sulla, Pompey and Caesar.* Julius Caesar is a famous Roman military commander and an emperor from the early years of the Second Empire. He is also the main military commander in the civil war and the external war of the alleged I century B.C. ([660]). His unvocalized name transcribes as LCSR. In fig. 2.74 one sees an old portrait of Caesar’s from Lucan’s work dating back to the alleged XIV century entitled *De bello civili*. “The miniature by Niccolo da Bologna shows Caesar after his victory over Pompey” ([1229], page 33). Julius Caesar is portrayed as a typical mediaeval knight in armour; the setting is also distinctly mediaeval.

Fig. 2.74. A miniature of the alleged XIV century from *De bello civili* by Lucan that portrays Julius Caesar after the victory over Pompey; the setting is typically mediaeval. Milan, Biblioteca Trivulziana, Ms. 691, fol. 86v. Taken from [\[1229\]](#), page 33.

■ ■ 1c. *The Trojan War*. Achilles is a famous Greek hero and a military commander in the “ancient” Greece, who also ranks first among the heroes of the Trojan War of the alleged XIII century B.C. His unvocalized name is ChLSS, or LSS (since Ulysses/Odysseus happens to be his “successor” in this war – see [\[851\]](#)).

■ ■ ■ 1d. *The Tarquinian War*. Valerius is an eminent military commander from the epoch of Regal Rome’s decline and the dawn of the Roman republic. He is the “number one warlord” in the Tarquinian war of the alleged VI century B.C. His unvocalized name transcribes as VLR (Valerius) + VLS (son of Valusius, qv above and in [\[482\]](#)). Thus, the complete name without vocalizations will be VLSR; one sees that all four unvocalized names resemble each other to some extent.

Commentary. We observe a distinct phonetic parallelism: Belisarius – Julius Caesar. We have already witnessed the superimposition of Valerius over Valusius to produce Belisarius. The name Achilles also contains the unvocalized root LS. Let us pay more attention to the names of Julius Caesar and Belisarius. The font that many Latin inscriptions are set in uses the same letter for U and V (qv on page 32 of [\[873\]](#), for

example). Thus, the name of Julius Caesar may well have sounded as *Velicaesar* (or *Belicaesar*, considering the frequent flexion of V and B). Also, the words Caesar and Czar are related and possess the same unvocalized root CR. Thus, the name *Velicaesar* may have sounded as *Veliczar*, which is also similar to Belisarius. The name Belisarius may be a distorted version of the Slavic “Velikiy Tsar”, or “The Great King”. These considerations aren’t aimed at proving anything whatsoever, but may turn out useful for the understanding of the capacity of ancient names to become distorted after their migration from one language group to another.

2a. *The Gothic War*. Belisarius and Narses are the two military leaders of the Gothic War that “merge into one”, in a way. Let us remind the reader that it is Narses who brings the Gothic War to completion, having taken over the army after Belisarius, and crushes the Goths ([695] and [196]). We see is the pair Belisarius-Narses. The name Narses transcribes as NRSS (or NRCC) unvocalized.

■ 2b. *Sulla, Pompey, and Caesar*. Julius Caesar, Cicero and Sulla are all important figures of the civil war in Rome of the alleged I century B.C. (not to be confused with the “great triad” of Caesar, Sulla and Pompey). We are thus considering the triad of Caesar, Cicero and Sulla. Cicero’s name transcribes as CCRN (in its *Tsitseron* or *Ciceron* form), which is the same as the name of Narses in reverse. We know the reason for such transformations well enough – bear in mind that the Arabs and the Jews read from the right to the left, which may well transform Narses into Cicero.

■ ■ 2c. *The Trojan War*. Achilles and Ulysses are the two heroes of the Trojan War of the alleged XIII century B.C. They also constitute a single military commander after a manner, since Ulysses takes over from Achilles and brings his cause to victory, defeating the Trojans. We see the pair of Achilles and Ulysses as main figures ([851]). The other name of Odysseus/ Ulysses is Urexis (*ibid*). The unvocalized Ulysses-Urexis shall transcribe as LSRXS, or LSSRCSS.

■ ■ ■ 2d. *The Tarquinian War*. P. Valerius and T. Larcus are the two primary military commanders of the Tarquinian War (in the alleged VI century B.C.). They have already been identified as the pair of Belisarius and Narses. Livy pays special attention to a triad of heroes here, namely, Valerius, Larcus and Marcus Coriolanus ([482]). The name Larcus (or Marcus) is obviously analogous to the name Narses (or Narcus).

3a. *The Gothic War*. The primary royal figure here is Justinian I, the Byzantine Emperor and the ruler of Greece and Romea ([695] and [196], Volume 1).

■ 3b. *Sulla, Pompey and Caesar*. The “principal royalty” in the Roman war of the alleged I century B.C. is Pompey Magnus (Pompey the Great), the Roman emperor ([660], Volume 2, page 338). Pompey Magnus is *older* than Julius Caesar ([660], Volume 2, pages 539 and 543).

■ ■ 3c. *The Trojan War*. The “principal royalty” is Agamemnon, the Greek ruler ([851] and [180]). His name may be related to that of Pompey Magnus. Agamemnon is also older than Achilles, the latter being the double of Julius Caesar, qv above.

■ ■ ■ 3d. *The Tarquinian War*. The key royal figure here is Tarquin the Proud, King of Rome. Livy’s account ([482]) suggests Tarquin the Proud to have been *older* than the Roman military leader Valerius, the double of Caesar.

4a. *The Gothic War*. Belisarius had obeyed emperor Justinian in the beginning of the Gothic war, but is supposed to have plotted for the Italian throne at some point towards its end (see above for details; also [695] and [196], Volume 1). The relationship between Belisarius and Justinian had been an amicable one initially, but turned hostile later on. The quarrel with Justinian and the order for the arrest of Belisarius are soon to follow; Belisarius falls into disfavour.

■ 4b. *Sulla, Pompey and Caesar*. Julius Caesar started his career with Pompey Magnus as his superior, since the latter had held all the key military ranks. However, Julius Caesar had gradually edged Pompey out, crushing his troops and seizing power in Rome ([660]). What we see is a deteriorating relationship between Pompey and Caesar – one that had led from initial amicability to a military conflict ([660]).

■ ■ 4c. *The Trojan War*. Achilles obeys Agamemnon at the beginning of the war. However, he subsequently plots for seizing royal power and ending the war with Troy (see details above and in [851]). Once again we see friendship transform into hostility leading to a quarrel, a severed relationship and even the “house arrest” of Achilles – a reflection of a similar event from the biography of Belisarius, qv above.

■ ■ ■ 4d. *The Tarquinian War*. Valerius had initially been subordinate to Tarquin the Proud; however, mutual animosity had eventually developed between the two; Valerius struggles against Tarquin and deposes the latter. We see yet another neutral relationship turn hostile over the course of time and result in a violent military conflict between Tarquin the Proud and Valerius ([482]).

5a. *The Gothic War*. The “second greatest” military leader in this war is Narses the eunuch ([695] and [196], Volume 1). Thus, we see a triumvirate of important figures in this war – Justinian, Belisarius and Narses.

■ 5b. *Sulla, Pompey and Caesar*. Pompey and Julius Caesar are accompanied by the Roman Crassus. This triad forms the group that we have dubbed the “first triumvirate” above (see [Chron2](#), Chapter 1). The initial leader of the triumvirate was Pompey Magnus, likewise Agamemnon, his Trojan War double. Julius Caesar had been the main military commander in the war of the alleged I century B.C., just like Achilles, his double. Crassus had been a lay warrior and a wealthy citizen of Rome. He played a secondary role in regard to the first two military leaders, likewise his Trojan War double Menelaus. As we shall shortly witness, this power disposition in the “first triumvirate” is very similar to the situations arising in all other duplicates of this epoch.

■ ■ 5c. *The Trojan War*. The second most important royalty here is king Menelaus, the husband of Helen ([\[851\]](#) and [\[180\]](#)). We see yet another “triumvirate” here – Agamemnon/Menelaus/Achilles.

■ ■ ■ 5d. *The Tarquinian War*. The second most important king in this war is Tarquin Collatine. There is no formal triumvirate here; however, one distinctly sees the most prominent figures of the epoch to equal three in their number: Tarquin the Proud, Tarquin Collatine and Publius Valerius ([\[482\]](#)).

We have already made numerous references to the “legend of a woman” that one encounters in all known versions of the Trojan = Tarquinian = Gothic War. It is most noteworthy that this very legend surfaces in Roman history of the alleged I century B.C. that we are considering presently.

6a. *The Gothic War*. The protagonist of this legend in the alleged VI century A.D. is Amalasuntha ([695]). Her double in the Second Empire is Julia Maesa.

■ 6b. *Sulla, Pompey and Caesar*. The protagonist in the alleged I century B.C. is Pompey’s woman who is in close proximity with Julia ([\[660\]](#)). See details below.

■ ■ 6c. *The Trojan War*. The woman from the legend who had lived in the alleged XIII century B.C. is the famous Helen of Troy ([\[851\]](#) and [\[180\]](#)).

■ ■ ■ 6d. *The Tarquinian War* of the alleged VI century A.D. We see Lucretia as the legendary character in this version, accompanied by Tullia ([\[482\]](#)).

Commentary to 6d. Back in the day when the relationship between Julius Caesar, Pompey and Crassus had still retained the exterior of amicability, “an unpleasant incident took place in Caesar’s home. There had been some man from a distinguished old gens who was renowned for his wealth . . . but his impudence and debauchery equalled him with any famous lecher. He had fallen in love with Pompeia, the wife of Caesar, enjoying her reciprocity... Aurelia, Caesar’s mother, would watch her daughter-in-law closely, making every rendezvous of the lovers hard and dangerous” ([660], Volume 2, page 455, “Caesar” IX).

Every year the Romans celebrated the mysteries of Bona Dea, “the Good Goddess”; the celebration could only be attended by the women. All of the men had vacated the house of Caesar, and the feast commenced. Clodius, Pompeia’s lover, had sneaked into the house hoping to meet Pompeia; however, one of Aurelia’s serving women discovered him, and he was chased out in great disgrace ([660], Volume 2, pages 455-456, “Caesar” IX-X). The next day the entire city of Rome was buzzing with the rumour of the sacrilege committed by Clodius – apart from the dishonour that he had inflicted upon the people involved, he was also guilty before the people and the gods. One of the tribunes accused Clodius publicly of ignominy, and some of the most influential senators spoke out against him” ([660], Volume 2, page 456, “Caesar” X). Caesar divorced Pompeia; Clodius got killed shortly afterwards, in the alleged year 52 B.C. during a skirmish on the Appian Way ([948], page 157). Let us now make a brief analysis.

7a. *The Gothic War*. Disgrace inflicted upon a woman served as a casus belli (Amalasuntha’s arrest and her incarceration on a distant island – see [695] and [196], Volume 1; also above). Let us point out that Amalasuntha had been queen of the Goths. Her double in the Second Empire is Julia Maesa. Mark the name Julia.

■ 7b. *Sulla, Pompey and Caesar*. The Roman war of the alleged I century B.C. is preceded by an “affront of a woman”: the attempt of Clodius to arrange a date with Pompeia, the wife of Caesar, during a holy feast of the women. The gender aspect is clearly emphasized ([660]). Pompeia is a relation of the “most important emperor” Pompey Magnus ([660], Volume 2, page 543, comment 12). See also [660], Volume 2, “Caesar” V. By her side we see Julia – the daughter of Caesar, and also the wife of Pompey Magnus ([660], Volume 2, page 465). We thus see a pair of women here – Pompeia and Julia, the respective wives of the “number one king” and the “number one warlord”. Notice that the name Julia surfaces here as well as in the Gothic War.

■ ■ 7c. *The Trojan War*. The casus belli in this case is perfectly similar to the

above cases. Helen is abducted by force (there are actually several contradictory versions here, qv above) and taken away to Troy ([\[851\]](#)). The gender aspect of this abduction is also emphasized. Helen is the wife of Menelaius, one of the two “main kings”; afterwards, she becomes the wife of Paris the Trojan, or a member of the TRQN clan; Paris = PRS or P-Russ. The names Helen and Julia may have been identical.

■ ■ ■ 7d. *The Tarquinian War*. Once again, the casus belli is a dishonourable act against a woman – the rape of Lucretia by one of the Tarquins ([\[482\]](#)). We see that the sexual aspect is also emphasized by Titus Livy. Lucretia is the wife of Tarquin Collatine, or the second most important royal figure. By his side we see Tullia (Julia?), the wife of Tarquin the Proud, the “primary royalty”. The events unfold around the clan of the Tarquins (TRQN). The name Tullia obviously resembles Julia, qv above.

8a. –

■ 8b. *Sulla, Pompey and Caesar*. Rome of the alleged I century B.C. Aurelia is the mother of Julius Caesar; she plays an important part in the “insult of Pompeia”, Caesar’s wife, qv above.

■ ■ 8c. *Trojan War*. –

■ ■ ■ 8d. *The Tarquinian War*. In this war Valerius acts as the double of Julius Caesar and is in the epicentre of events concerning the “rape of Lucretia”. Let us point out the obvious similarity between the names of the two protagonists: Aurelia the woman and Valerius the man. The fact that certain mediaeval scribes would occasionally confuse male and female names for each other should not surprise us, and we are to see more examples of such errors below.

9a. *The Gothic War*. One of the most important events here is the death of Amalasuntha. Its analogue from the Second Empire is the death of Julia Maesa. Both of the women were murdered, qv above. The Gothic War begins immediately after the death of the queen, and it had been her demise that served as reason for the war to break out in the first place. The affronter of Amalasuntha (= Julia Maesa) is Theodahad the Goth who dies a violent death himself shortly afterwards ([196], Volume 1).

■ 9b. *Sulla, Pompey and Caesar*. The death of Julia takes place in the alleged I century B.C. in Rome. It happens rather suddenly, yet there is no report of a murder

([\[660\]](#)). The civil war in Rome begins after the death of Julia. Plutarch, for one, regards this death as the cause of the war. He tells us that “both Pompey and Caesar were cast into deep dejection [after the death of Julia; compare to Livy’s version – A. F.]; their friends were in confusion since the bond of blood that still helped to maintain peace and accordance in the country torn apart by embroilment had been severed... the public took the body of Julia to Campus Martius, despite the objections voiced by the tribunes of the people” ([\[660\]](#), Volume 2, page 465, “Caesar” XXIII). After the demise of Julia, the relationship between Pompey and Caesar rapidly deteriorates, and they “rise against one another” ([\[660\]](#), Volume 2, page 465, “Caesar” XXIII). Claudius, the Roman “offender” of Pompeia, is soon killed in the civil war ([\[660\]](#)).

■ ■ 9c. *The Trojan War*. It breaks out because of Helen, who was killed subsequently ([\[851\]](#)). However, in this version she dies already after the Trojan War, which does not stop her death from being paid particular attention as an important event. The “miscreant” Paris, who had abducted Helen, also dies a short while later, at the end of the Trojan War ([\[851\]](#)).

■ ■ ■ 9d. *The Tarquinian War*. What we see here is the death of Lucretia. She stabs herself to death after having been raped ([\[482\]](#)). It is her death that causes the war in Rome ([\[482\]](#)). The “offender” of Lucretia, Tarquin Sextus who had raped her, is soon killed in the Tarquinian War ([\[482\]](#)).

10a. *The Gothic War*. The war begins with the exile of the Goths from Rome. The principal initiator of this exile is Belisarius, the Graeco-Roman military commander. He leads the troops against the Goths aided by General John (the double of the “ancient” Brutus described by Livy, qv above and in [\[196\]](#), Volume 1).

■ 10b. *Sulla, Pompey and Caesar*. When the war of the alleged I century B.C. began, Pompey Magnus was banished from Rome. The military leader Valerius masterminded his exile. Together with Brutus, yet another warlord, they conducted the campaign against Pompey Magnus ([\[660\]](#)).

■ ■ 10c. *The Trojan War*. Achilles leads the troops to fight the Trojans accompanied by Patroclus (= BRT, qv above). See [\[851\]](#) and [\[180\]](#). Patroclus is the double of Brutus from the Tarquinian War and his namesake who had fought in the Roman war of the alleged I century B.C.

■ ■ ■ 10d. *The Tarquinian War*. The war begins when the royal clan of the Tarquins gets deported from Rome. The exile is a brainchild of the military

commander Valerius, who also leads the Roman revolt against the Tarquins with Brutus as his ally ([\[482\]](#)).

11a. *The Gothic War*. When the war begins, Belisarius is outside Rome, whereas the Goths led by king Theodahad are located in the city. Belisarius begins a military campaign against the Romans and soon chases the Goths out ([\[695\]](#) and [\[196\]](#), Volume 1).

■ 11b. *Sulla, Pompey and Caesar*. At the beginning of the civil war that broke out in the alleged I century B.C., Julius Caesar is initially located outside Rome, unlike Pompey Magnus ([\[660\]](#)). Then Caesar launches his Roman campaign, crosses the Rubicon (a famous “ancient” scene), and banishes Pompey and his allies from Rome. This event may well be called the “Exile of the Kings” (see more details in the commentary below).

■ ■ 11c. *The Trojan War*. When the war begins, Achilles the Greek has his camp outside the besieged Troy, the fortress of the TRQN = Trojans, qv above ([\[851\]](#)). As a result of the war, the Greeks banish the Trojans from Troy ([\[851\]](#) and [\[180\]](#)).

■ ■ ■ 11d. *The Tarquinian War*. We see a reversal of the scenario in this particular case. Tarquin the Proud is outside Rome whilst Valerius is inside ([\[482\]](#)). Then the Tarquins are chased away from Rome by Valerius and Brutus, which is Livy’s famous “Exile of the Kings” from Regal Rome. The Tarquins counter with a campaign against Rome.

Commentary to 11b. According to Plutarch, “Caesar decided to depose Pompey a long time ago” ([\[660\]](#), Volume 2, page 467, “Caesar” XXIX). A civil war breaks out. Caesar’s troops march towards Rome, cross the Rubicon and seize Ariminum. “After the fall of Ariminum, the gates of war open wide in all the lands and on all the seas; all Roman laws were wiped out together with the border of the province (which is the same as Titus Livy tells us – A. F.); it seemed as though it hadn’t just been the men and the women roaming all across Italy in terror, but the very towns and cities themselves left their sites and fled... as for Rome herself... authorities failed to maintain order with either orders or persuasion... conflicting passions and violent turmoil reigned throughout the land” ([\[660\]](#), Volume 2, page 471, “Caesar” XXXIII). A great embroilment flares up in Rome, resulting in the exile of Pompey Magnus.

This takes place in the following manner. In his belief that “the war had engulfed the entire country, he [Pompey – A. F.] had made a public declaration that the city was in

turmoil and anarchy and left the city, ordering the senators and everyone who preferred fatherland and freedom to tyranny to follow his example... the consuls fled without even making the usual sacrifices before their departure; most of the senators also fled in great haste... the terrified people had lost their ability to think and allowed the current of this stampede carry them away for no reason whatsoever... before the great storm.

Regardless of how much this mass emigration had hurt them, the Romans trusted the land of the exile to become their new fatherland in their love for Pompey and so they were leaving Rome” ([660], Volume 2, pages 471-472, “Caesar” XXXIII-XXXIV). Plutarch (Petrarch?) is most likely to be giving us a de facto account of the exile of the Tarquins from Rome (according to Livy, they were driven out by Publius Valerius), or the exile of the Goths by Belisarius in the Gothic version. The Trojan version places this “Exile of the Kings” at the end of the war, when Troy had already fallen.

By the way, in fig. 2.75 one can see a XV century miniature by Jean Fouquet painted around 1420-1477/81 depicting the troops of Caesar crossing the Rubicon ([1237]). Pay attention to the fact that we see the imperial bicephalous eagles on the flags of the “ancient” Roman legions, as well as the caparison of Caesar’s horse. Nowadays it is considered that they were on the official coat of arms of the “ancient” imperial Rome. At the same time, we know these symbols quite well from mediaeval history, qv in [Chron7](#).

Fig. 2.75 A mediaeval miniature of the XV century that depicts the “ancient” Julius Caesar crossing the Rubicon (Jean Fouquet, circa 1420-1477/81). We see the imperial bicephalous eagle on the “ancient” banners – one we know very well from the history of the XIV-XVII century A.D. Taken from [\[1237\]](#).

12a. *The Gothic War*. Rome is abandoned by the Goths, and Belisarius enters the city with triumph. Romans greet him as their liberator. Let us remind the reader that Belisarius had been the main military leader of Roman Greece.

■ 12b. *Sulla, Pompey and Caesar*. Julius Caesar enters Rome abandoned by Pompey and his followers. Caesar is made dictator and vested with emergency powers for the course of the war ([\[660\]](#), Volume 2, page 473, “Caesar” XXXVII).

■ ■ 12c. *The Trojan War*. Achilles is the commander-in-chief of the Greek troops that hold Troy under siege ([\[851\]](#) and [\[180\]](#)).

■ ■ ■ 12d. *The Tarquinian War*. Titus Livy tells us the following about Brutus, the ally of Valerius: “the city’s liberator was given a warm welcome in the camp, and the children of the king banished” ([\[482\]](#), 1:60, page 97).

Commentary to 12b. “Ancient” authors point out obvious similarities between the legends of Pompey Magnus and Agamemnon without any prompts from our part. This

superimposition had already manifested in the parallelism that we are referring to. Plutarch, for instance, tells us that “everyone was accusing Pompey of cowardice, mockingly calling him Agamemnon, king of kings [the Trojan version does in fact refer to Agamemnon as the “king of kings” since he is the leader of the royal Greek heroes – A. F.]: his reluctance to let go of undivided power was allegedly making him proud of so many warlords having to come to his tent for orders” ([\[660\]](#), Volume 2, page 475, “Caesar”).

13a. *The Gothic War*. One of the heroes who liberate Italy from the Goths is called John MRC, the son of PRCT (Celius). The Roman pontifex John is also active in this epoch, while Belisarius is accompanied by General John, the double of the “ancient” Brutus ([\[695\]](#) and [\[196\]](#), Volume 1). See above.

■ 13b. *Sulla, Pompey and Caesar*. In the alleged I century B.C., Marcus Junius Brutus earns great fame as the liberator of the Roman people from tyranny. Also see the references to Decimus Junius Brutus Albinus below ([\[660\]](#)).

■ ■ 13c. *The Trojan War*. Here we see Patroclus/BRT who liberates Helen and fights for her honour ([\[851\]](#) and [\[180\]](#)).

■ ■ ■ 13d. *The Tarquinian War*. Junius Brutus, the son of Marcus, liberates the people of Rome from the Tarquinian tyranny ([\[482\]](#)).

Commentary to 13b. We have to linger here for a short while in order to discuss such a famous “ancient” hero as Marcus Junius Brutus (Brother?) from the alleged I century B.C. Plutarch refers to yet another Brutus (Brother?) who is active in this epoch, namely, Decimus Junius Brutus Albinus. A careful study of Plutarch’s works ([\[660\]](#)) leaves one with the impression that he confuses one of them for the other, possibly due to the fact that they’re different reflections of one and the same mediaeval character. Indeed:

*1) The name of the first Brutus is Marcus Junius Brutus ([\[660\]](#), Volume 2, page 312).

*1) The name of the second Brutus is Decimus Junius Brutus Albinus ([\[660\]](#), Volume 2, page 545).

*2) Marcus Junius Brutus had initially been a comrade of Julius Caesar, maintaining a close relationship with the latter. He had probably also been his comrade-in-arms.

*2) Decimus Junius Brutus Albinus serves under Caesar in Gaul ([\[660\]](#), Volume 2, page 545, comment 95, “Caesar” LXIV, page 488).

*3) Marcus Junius Brutus conspires against Julius Caesar ([\[660\]](#), Volumes 2 and 3).

*3) Decimus Junius Brutus Albinus also takes part in the plot against Julius Caesar ([\[660\]](#), Volume 2, page 319).

Let us now return to the comparison of the war that took place in the alleged I century B.C. with the Tarquinian War.

■ 14b. *Sulla, Pompey and Caesar*. In the war of the alleged I century B.C., Decimus Junius Brutus Albinus + Marcus Junius Brutus (Brother?) act as the famed hero who saves Rome from Caesar the tyrant according to Plutarch, killing Caesar together with other plotters. Let us point out a possible etymological connection between the name Brutus and the word Brother.

■ ■ ■ 14d. *The Tarquinian War*. Lucius Junius Brutus, son of Marcus, is a famous hero of the Tarquinian war – the one who had liberated Rome from the tyranny of the kings. His name is very similar to that of the “double Brutus” from the previous section: Lucius may be the same as Decius, Junius = Junius, Brutus = Brutus and Marcus = Marcus. We consider it necessary to remind the reader that, according to Titus Livy, Lucius Junius Brutus, son of Marcus, went down in Roman history (together with Publius Valerius) as the hero who had chased the Tarquins away from Rome and killed the king’s son, Tarquin Arruntius, the enemy of Rome (qv above and in [\[482\]](#)).

■ 15b. *Sulla, Pompey and Caesar*. Marcus Junius Brutus was killed afterwards. His father (also a Brutus, by the way), died by the hand of Pompey ([\[660\]](#), Volume 2, “Pompey”, LXIV, page 379; also “Pompey” XVI, page 344. Pompey Magnus is the “main royalty” when the war begins; he is superimposed over Livy’s Tarquins.

■ ■ ■ 15d. *The Tarquinian War*. Lucius, the son of Marcus Junius, was killed while fighting the Tarquins (he and Tarquin Arruntius had killed each other, qv in [\[482\]](#)).

Commentary to 15. Once again we witness the ancient authors to indicate direct analogies between Marcus Junius Brutus from the alleged I century B.C. and Lucius

Junius Brutus, son of Marcus – a hero of the Tarquinian War that took place in the alleged VI century B.C. without any prompting from our part whatsoever and in perfect correlation with the chronological shifts. Furthermore, this “Bruti couple” is the only pair of famous people wearing the name of Brutus in “Classical Rome”. Plutarch tells us that “Junius Brutus [! - the hero of the Tarquinian War – A. F.] is the predecessor of Marcus Brutus [Marcus Junius Brutus, Julius Caesar’s contemporary, qv in [\[660\]](#), Volume 3, page 312, “Brutus” I; the reference in comment 1 – A. F.]; ancient Romans had placed his bronze statue wielding a sword on the Capitol hill among the statues of the kings, since it was to him first and foremost that the Romans owed the fall of the Tarquins ([\[660\]](#), Volume 3, page 312, “Brutus” I).

Also: “Brutus [Marcus Junius Brutus from the alleged I century B.C. – A. F.] had been exhorted to decisive actions [against the tyranny of Julius Caesar – A. F.] for quite a long time... the statue of the ancient Brutus, the one who had deposed the kings [Brutus, the hero of the Tarquinian War – A. F.] was covered in numerous graffiti saying “Oh, if you could only be with us today!” or “Had Brutus been alive!”. One morning, the magisterian hatpate where Brutus officiated as a praetor, had been found covered in tablets saying “Brutus, are you sleeping?” and “You aren’t a real Brutus!”. The ones responsible for this surge of rancour against the dictator [Plutarch refers to Julius Caesar, and Titus Livy – to Tarquin the Proud – A. F.] were his adulators who would keep inventing new honours for him, which the Romans had loathed... in hope that the populace would pronounce Caesar king; however, what really took place was the opposite” ([\[660\]](#), Volume 3, pages 317-318, “Brutus” IX).

All these ruminations, comparisons, parallels and explanations from the part of Plutarch (Petrarch?), possibly a late mediaeval author of the alleged XV-XVI century, who was obviously confused wherein these two “Brutus characters” were concerned, considering them two separate entities, whose deeds would nonetheless constantly get superimposed over each other (under the pressure of the Scaligerian chronology, naturally). This erroneous chronology had bound Plutarch hand and foot, and arbitrarily divided the same Brutus (Brother?) into two duplicates, one of which became shifted into the I century A.D., and the other – into an even earlier epoch, the VI century B.C. This resulted in the existence of two duplicate characters sharing the name Brutus, virtually indistinguishable from one another – Junius Brutus, son of Marcus, the liberator of the Romans from the Tarquinian tyranny, and Junius Brutus Marcus who delivered the Romans from the tyranny of Julius Caesar.

16a. *The Gothic War*. In this war we see General John, a possible “sequel” of John MRC, the son of PRCT, qv above. The Gothic war is both civil and external.

■ 16b. *Sulla, Pompey and Caesar*. We observe Marcus Junius Brutus die in the war of the alleged I century B.C. and his great posthumous glory ([\[660\]](#)). This war is also both civil and external.

■ ■ 16c. *The Trojan War*. What we see here is the death of Patroclus (BRT) in a battle at the walls of Troy and his fame of a Trojan War hero ([\[851\]](#) and [\[180\]](#)). The Trojan War is of an external nature.

■ ■ ■ 16d. *The Tarquinian War*. Here we witness the death of Brutus, son of Marcus, in a battle against the Tarquins, and his Roman laurels ([\[482\]](#)). This war is also civil as well as external.

17a. *The Gothic War*. The Goths and the PRS (= Franks, or TRNK), or PRS = Persians, are the two primary opponents here, both defeated by the army of Romea, or Byzantium. We also see the siege of the New City (allegedly Naples in Italy, a famous fortress).

■ 17b. *Sulla, Pompey and Caesar*. In the war of the alleged I century B.C., the Pompeians had been the primary foe; the secondary enemy was PRS = the Gauls (Gaul/Galicia/France) as well as PRS = the Persians. Both enemies were defeated. We see a siege of the famous fortress Alesia in the course of this war. In the Gaulish (Galician?) war, Julius Caesar’s main opponents are the Gauls [possibly the Slavic tribe of Galichi?]: “The lands of the Arverni (Arventi) and the Carnutes were the hotbed of rebellion” ([\[660\]](#), Volume 2, “Caesar”, XXV-XXVI, page 466. It is possible that these RVNT and CRNT are distorted versions of the clan name TRQN.

■ ■ 17c. *The Trojan War*. The Trojans are the main opponent here; the other one is PRS, or Paris. They’re both defeated. We see the siege of Troy, a famous “ancient” citadel. The enemies of Achilles, the double of Julius Caesar, are the Trojans = TRQN, qv above.

■ ■ ■ 17d. *The Tarquinian War*. The Tarquinians are the number one enemy here, they have an ally by the name of PRS = Porsenna. Both are defeated. Rome is under siege. The Tarquins (TRQN) are also the enemies of Valerius.

Commentary to 17b. According to Plutarch, Caesar’s Gaulish (Galician?) war was “the greatest and the most violent [war – A. F.] ... ever to rage in Gaul” ([\[660\]](#), Volume 2, page 466, “Caesar” XXV. Its description occupies an important place in Caesar’s

“biography” according to Plutarch (Petrarch?). The war culminates in the siege of Alesia, a fortress of the utmost strength. “Most of the barbarians who had survived the battle [with Caesar – A. F.] concealed themselves in the town of Alesia. Caesar inflicted a great danger upon himself in the siege of this town that had seemed unassailable due to high walls and large numbers of the besieged, since the elite forces of all the Gaulish tribes... arrived to Alesia, whereas the number of the Gauls under siege had equalled a hundred and seventy thousand at least” ([660], Volume 2, page 467, “Caesar” XXVI. Plutarch proceeds to tell us that “the battle for Alesia was a most glorious one; no other war would give us an example of such brave and artful deeds” ([660], Volume 2, page 467, “Caesar” XXVII.

The name Alesia might be a corruption of “Achilles” – the double of Caesar = Belisarius. The siege and the fall of Alesia made their way into every military history textbook as examples of the art of war as practised by the “ancients” – see [172], Volume 1, for instance.

18a. *The Gothic War*. According to Procopius, the war rages in Italy ([695] and [196], Volume 1). Vitigis had been the king of the Goths shortly before the siege of the New City (Naples) began.

■ 18b. *Sulla, Pompey and Caesar*. The fortress of Alesia is located in Italy, according to Plutarch ([660]). The defence of Alesia is led by King Vercingetorix who presided over the tribes of the Arverni (Arventi, or RVNT) and the Carnutes (CRNT). See [660].

■ ■ 18c. *The Trojan War*. Military action takes place in the vicinity of Friesia or Phrygia. The famous Trojan hero Hector is a royal figure leading the defence of Troy – the leader of the TRQN, in other words. One sees an obvious parallelism: the long name Vercingetorix is most probably a collation of two shorter names: Vitigis and Hector.

■ ■ ■ 18d. *The Tarquinian War*. According to Livy, the war takes place in Italy. The double of the Trojan Hector here is most probably Tarquin Arruntius ([482]).

19a. *The Gothic War*. The captivity of Vitigis ([695] and [196], Volume 1). The victor is commander-in-chief Belisarius.

■ 19b. *Sulla, Pompey and Caesar*. In the alleged I century B.C. we see the demise of Vercingetorix after his capitulation. The victor’s name is Julius Caesar, and he is a double of Belisarius. The account of the event given by Plutarch is as follows:

“Vercingetorix, the leader of the entire army... rode out of the gates. He jumped off his horse, removed all of his armour and sat down at the feet of Caesar, remaining there until he was taken away to be kept under guard until the triumph” ([660], Volume 2, page 467, “Caesar” XXVII. Also: “Caesar’s triumph could only be celebrated six years hence. All the while Vercingetorix had remained captive; he was killed immediately after the triumph” ([660], Volume 2, page 544, comment 49).

■ ■ 19c. *The Trojan War*. The demise of Hector, whose body is taken “captive” by the victor Achilles ([851] and [180]).

■ ■ ■ 19d. *The Tarquinian War*. What we see here is the death of Tarquin Arruntius in a battle ([482]).

20a. *The Gothic War*. The siege of the New City (Naples) resulted in the fall of the latter. Belisarius had to resort to cunning for the city to be taken. His troops secretly infiltrated the city through a gigantic old aqueduct that was constructed near the walls of the New City ([695] and [196], Volume 1).

■ 20b. *Sulla, Pompey and Caesar*. In the alleged year I B.C., the siege of Alesia finally results in the fall of the city. Caesar also wins by ingenuity, ordering to erect a gigantic construction – namely, a double wall to surround the bastions of Alesia ([660]). See below for more details.

■ ■ 20c. *The Trojan War*. Troy falls after a prolonged siege. The Greek assailants use their guile to infiltrate the city, constructing an enormous “grey effigy of a horse” ([851]) and hiding therein (the famous “Trojan Horse”).

■ ■ ■ 20d. *The Tarquinian War*. No analogue of the “Trojan Horse” here; this is where the parallelism breaks.

Commentary to 20b. Plutarch informs us that “clenched tight between such great forces (the Gauls – PRS and RVNT-CRNT – A. F.), Caesar was forced to erect two walls simultaneously; one to defend himself against the city, and the other to hold back the arriving Gauls, since it had been clear that the unification of his two enemies would mean his defeat... however, the most amazing thing is how Caesar had crushed the large army outside the city walls without letting anyone know [?! – this is a fantasy of the mediaeval author Plutarch who tried to make heads or tails of the sparse data contained in the old documents – A. F.]; not merely the besieged, but even those of the Romans who were guarding the wall that surrounded the city... thus, the vast force had been put to a complete rout, and most of the barbarians died in the battle. Finally, the defenders

of Alesia also surrendered” ([660], Volume 2, page 467, “Caesar” XXVII).

We are of the opinion that the construction of a “double wall” by Caesar is highly unlikely, especially done furtively. We are most likely to be seeing yet another reflection of the same old remarkable ploy of Belisarius, who had used an old aqueduct constructed before the war – not built in several days, as Plutarch (Petrarch?) is trying to convince us. One has to point out that ancient aqueducts would often be built as very large chutes concealed by two vertical walls and held up with a footing, qv in fig. 2.67, for instance. The chute would then be covered with a roof which transformed it into a pipe. The “double wall” of Caesar is possibly a later distortion of the original image – the chute of an aqueduct. It becomes clear why Plutarch emphasizes that the walls were built with neither the besieged, nor the major part of the assailants noticing [?]. In our rendition of the Gothic War we already mentioned the fact that Belisarius kept this infiltration of a special brigade secret even from his own army.

21a. *The Gothic War*. Belisarius battles the kingdom of the Goths or the Germans whose predecessors were Odoacer and Theodoric the Goth. The war had raged for 16 or 18 years – namely, between 535-536 (the advent to Rome) and 552-553 (the defeat of the Goths). See [196], Volume 1. Justinian is the key royal figure in the Gothic War; he does not participate in military action personally.

■ 21b. *Sulla, Pompey and Caesar*. The Gaulish (Galician?) War is a conflict between Julius Caesar and the Germanic tribes, one of which deserves special attention from the part of Plutarch – the Tencteri tribe (TNCTR unvocalized; possibly a duplicate of TRQN – see [660], Volume 2, page 464. The Gaulish (Galician?) war rages for “nearly ten years” ([660], Volume 2, page 459, “Caesar” XV. Pompey Magnus is the “Great King” of the first period; he does not take part in Caesar’s Gaulish War.

■ ■ 21c. *The Trojan War*. Achilles fights against the Trojans (TRQN) and the Friesians/ Phrygians, who are partially identified as the Germans, qv in the analysis above. The duration of the war is nine years and a half, or 9 (10) years according to other versions ([851], also see above). The “main king of the Greeks”, Agamemnon, does not participate in military action actively, which is all the more obvious from observing the activity of Achilles in this war.

■ ■ ■ 21d. *The Tarquinian War*. According to Livy, Publius Valerius fights against the Tarquins (TRQN). The war lasts for 12 years; the primary royal figure (L. Tarquin the Proud) does actually participate in combat ([482]), which is where the

parallelism breaks. However, the war durations in all four instances correlate with each other quite well.

22a. *The Gothic War*. Procopius describes the Gothic war as large-scale and extremely violent ([695]).

■ 22b. *Sulla, Pompey and Caesar*. According to Plutarch, the Gaulish War (the war in Galicia?) has been one of the greatest wars ever fought by humankind. We learn that “he [Caesar – A. F.] had conquered more than eight hundred towns and cities [in the course of the Gaulish or the Galician War – A. F.], and also three hundred nations [sic! – A. F.], with three million people as his enemies, one million of which were destroyed [!? – A. F.] in various battles” ([660], Volume 2, page 459).

■ ■ 22c. *The Trojan War*. Trojan chronicles also emphasize the unusually violent character of the war and numerous battles fought in its course) ([851]).

■ ■ ■ 22d. *The Tarquinian War*. According to Titus Livy, the Tarquinian war is one of the most important events that took place over many centuries of Roman history ([482]).

23a. *The Gothic War*. This war brings the demise of Totila and Teia (Teias), the two last Gothic kings. They die at the very end of the Gothic War ([196], Volume 1). The victors cut off Teia’s head, which is an important symbolic episode in the course of the Gothic War, qv above.

■ 23b. *Sulla, Pompey and Caesar*. In the alleged I century B.C., Pompey Magnus dies trying to flee from the battlefield ([660], Volume 2, pages 477-478). Pompey was *decapitated*, which is one of the war’s central episodes ([660], Volume 2, page 479).

■ ■ 23c. *The Trojan War*. Here we see all the principal Trojan royal figures die after the fall of Troy. Agamemnon, the double of Pompey Magnus, is treacherously killed. Troilus, the double of the Goths Totila and Teia, is beheaded; this event is also amongst the focal points of the Trojan War. Inasmuch as the original sources let us know, the episode with the severed head of a king is *unique* for each of the three wars – the Gothic War, the Trojan War, and the Roman war of the alleged I century B.C.

■ ■ ■ 23d. *The Tarquinian War*. In this war, king Tarquin the Proud dies after his defeat in the battle with the Romans. He flees and dies in Cumas a short while later ([482]). The parallelism is broken here, since we find no decapitation episode.

24a. *The Gothic War*. Theodahad, King of the Goths, takes part in military action and gets killed as a result ([695] and [196], Volume 1; also see above).

■ 24b. *Sulla, Pompey and Caesar*. One of the important participants of the civil war that broke out in Rome in the alleged I century B.C. is called Theodotus ([660], Volume 2, pages 388-390). We see his name to be virtually identical to that of his Gothic counterpart; moreover, his fate is also similar, since he dies a violent death ([660], Volume 2, page 391).

■ ■ 24c. *The Trojan War*. King Teuthrates, the double of Theodahad the Goth, takes part in the war and also dies by violence ([851]). See above.

■ ■ ■ 24d. *The Tarquinian War*. No duplicate found here.

25a. *The Gothic War*. Belisarius kills (executes?) the Gothic king Vittigis. Likewise, the legend of the battle between Belisarius and Vittigis reports the death of the latter ([196], Volume 1; also see above). Belisarius the military leader and his enemies – the Gothic kings Totila and Teia – are active around the same time.

■ 25b. *Sulla, Pompey and Caesar*. Pompey Magnus is killed by a certain Achillas, the leader of the brigade responsible for the death of Pompey the enemy of Julius Caesar ([660], Volume 2, pages 389-390). Achillas acts as the double of Belisarius here; his death follows shortly ([660], Volume 2, page 391).

■ ■ 25c. *The Trojan War*. Achilles kills the Trojan king Troilus ([851]). As we have just witnessed, Troilus is the double of the Gothic kings Totila and Teias. Let us also point out the stunning similarity between the names Achillas and Achilles (who also dies in a short while).

■ ■ ■ 25d. *The Tarquinian War*. We didn't manage to locate a duplicate here.

26a. *The Trojan War*. Belisarius was accused of treason and harbouring intentions to seize royal power in Italy ([196], Volume 1). He had presumably promised the Goths to accept the royal crown from their hands. Belisarius himself had denied the accusation; nevertheless, Emperor Justinian withdrew Belisarius from military action and called him away from Italy.

■ 26b. *Sulla, Pompey and Caesar*. Julius Caesar is accused of plotting to seize royal power in Rome. Many Romans offer to crown him ([660]). See more details below. Julius Caesar is forced to refute the accusation of treason publicly. The events take place in peaceful Rome, there is no war at the time. According to Plutarch,

“Caesar’s aspiration to be vested in royal powers was the thing that provoked the utmost hatred for him and the wish to kill him in the populace, for whom this was Caesar’s main crime... the people who urged Caesar to accept this authority had spread rumours across the nation...” ([660], Volume 2, page 485). All of this leads to the growing unpopularity of Caesar, who claims to have no secret plans and yet appears dangerously close to seizing actual “royal power”. Caesar, likewise his doubles Belisarius and Volusius, does his best to demonstrate the falsity of these accusations, rejecting the royal title that his minions had given him ([660], Volume 2, pages 485-486). However, it does little to calm the Romans down, and the hostility keeps on growing. Plutarch proceeds to tell us about the destruction of Caesar’s house (or the fable thereof, qv in [660], Volume 2, page 488).

■ ■ 26c. *The Trojan War*. The hero Achilles is also accused of treason and plotting to seize absolute royal power ([851]). This results in his withdrawal from combat – either voluntary or forced.

■ ■ ■ 26d. *The Tarquinian War*. After the Tarquins are deposed in Rome, the wish to seize royal power is also incriminated to Publius Valerius, who makes a public refutation. Nevertheless, Valerius is drawn away from both the consulate and military action ([482]). Livy also reports the destruction of the home of Caesar’s double Publius Valerius, and tells us that the accusation of plotting to seize absolute royal power was also supported by the fact that Valerius had been building his house on a hill, turning it into an impregnable fortress. Valerius is said to have craved the cessation of these rumours and ordered for the house to be destroyed, and then re-built in a valley ([482]).

27a. *The Gothic War*. What we witness next is Belisarius falling into disfavour, his arrest and the confiscation of his property, promptly followed by his death in utter poverty ([196], Volume 1).

■ 27b. *Sulla, Pompey and Caesar*. A plot against Caesar hatches up in Rome, resulting in the treacherous murder of Julius Caesar. He is killed by a strike from behind. Plutarch tells us that “it was Cascas who had delivered the first blow, striking him in the hind-head with a sword” ([660], Volume 2, page 490).

■ ■ 27c. *The Trojan War*. Here we also see a plot against Achilles which results in his getting murdered perfidiously – once again, with a blow dealt from behind ([851]).

■ ■ ■ 27d. *The Tarquinian War*. It is possible that Publius Valerius, the double

of Belisarius, also fell into disfavour, since it is reported that he had died in poverty ([482]). We learn nothing of his murder, though.

28a. *The Gothic War*. No duplicate found here.

■ 28b. *Sulla, Pompey and Caesar*. Plutarch claims that Titus Livy had written a biography of Julius Caesar ([660], Volume 2, page 488). Plutarch refers to the part of Livy's *Ab urbe condita*, which had allegedly failed to reach our time ([660], Volume 2, page 545, comment 94).

■ ■ 28c. *The Trojan War*. We find no duplicate here.

■ ■ ■ 28d. *The Tarquinian War*. Apparently, Titus Livy did in fact write Caesar's biography; however, he had known him under a different name, that of Publius Valerius. In this case the respective part of Livy's history must have been preserved and reached our day and age ([482]). As we are beginning to realize, Plutarch (Petrarch?) must have been absolutely right in making this claim.

29a. *The Gothic War*. Apart from fighting the Goths (TRQN), Belisarius also battles the Persians (PRS), qv in [196], Volume 1. We thus see two major foes; apart from that, Belisarius also takes part in the African campaign against the Vandals.

■ 29b. *Sulla, Pompey and Caesar*. Julius Caesar launches the Persian campaign against Farnakh ([660], Volume 2, p. 480). The name is very similar to TRNK due to the frequent flexion of F and T. Moreover, we have already witnessed the identification of TRNK with the Franks; "Farnakh" and "Franks" are all but identical phonetically. Julius Caesar also launches an African campaign ([660], Volume 2, p. 482).

■ ■ 29c. *The Trojan War*. Achilles fights against Paris (PRS) and the Trojans (TRQN). We see the same pair of PRS and TRQN/TRNK.

■ ■ ■ 29d. *The Tarquinian War*. Valerius battles against the Etruscan Larth Porsenna (L-Horde PRSN) and the Tarquins (TRQN). The two groups of foes prove similar yet again.

30a. *The Gothic War*. After the withdrawal of Belisarius from military action, the final defeat of the Goths is carried out by Narses (Narces), qv in [196], Volume 1. He finishes that which was started by Belisarius and acts as his successor. His unvocalized name transcribes as NRSS or NRCS.

■ 30b. *Sulla, Pompey and Caesar*. Cicero also acts as the successor of Julius

Caesar, after a manner, being a legate and a legion commander in Caesar's army ([660], Volume 2, page 544; also see below). The unvocalized transcription of the name Cicero (CCR, or CCRN) would transform into NRCC when read back to front, in the Hebraic or Arabic manner. Let us also point out a certain similarity between the names of Caesar and Cicero (*Tsitseron* in Russian): CSR and CCR (CCRN) unvocalized.

■ ■ 30c. *The Trojan War*. Ulysses (Odysseus) treads in the footsteps of Achilles, bringing the war to a victorious finale. The names of Ulysses and Achilles are similar.

■ ■ ■ 30d. *The Tarquinian War*. Larcius (or Marcius Coriolanus) picks up where Publius Valerius had left off. Larcius defeats the Tarquins and acts as the successor of Valerius, bringing his cause to a victory. The name Larcius is similar to that of Narces or Narses.

Commentary to 30b. In the time of the Gaulish War (the Galician War?) Cicero had been a legate in Caesar's army, according to Plutarch ([660], Volume 2, page 465, "Caesar", XXIV. Historians consider this Cicero to have been a "brother" of Marcus Tullius Cicero, the famous orator. However, Plutarch doesn't mention any "brothers" whatsoever, and refers to this character simply as "Cicero". Nowadays it is presumed that the famous "ancient" Cicero the orator had not been a professional military man, likewise Narses, his double in the Gothic War, who had allegedly been a eunuch at the court of Justinian. However, Cicero the orator had been Caesar's ally, and often took part in military action – for instance, during the occupation of Cilicia, Cicero was commanding an army of 1200 infantrymen and 2600 horsemen ([660], Volume 3, page 180, "Cicero" XXXVI). Plutarch tells us that "he [Cicero – A. F.] also took part in combat... and the soldiers had titled him emperor" ([660], Volume 3, page 185. Cicero had been a consul, and it is known that "he did not participate in the plot against Caesar" ([660], Volume 3, page 185).

After the death of Julius Caesar, a popular movement burgeoned in Rome. It had brought Cicero to the crest of the political current that would make him the successor of Caesar. "Cicero's name would get mentioned often... it held a special charm for the populace, being the symbol of the republic ([948], page 174). Therefore, according to Plutarch (Petrarch?), Cicero acts as Caesar's incomer, in perfect accordance with similar scenarios for Narses/Belisarius and Ulysses/Achilles.

31a. *The Gothic War*. Narses and Belisarius are presumed to have been friends. Narses took no part in the arrest of Belisarius and the repressions against the latter. Narses had been a eunuch (*orbator* in Latin), qv in [237], pages 709-710. The word *orbator* means “infecund” or “childless”; it can also mean “a eunuch” when applied to a man.

■ 31b. *Sulla, Pompey and Caesar*. Cicero and Caesar had also been on friendly terms. Cicero did not participate in the conspiracy against Caesar ([660]). Cicero had been an *orator* ([237]).

■ ■ 31c. *The Trojan War*. Ulysses (Odysseus) was a friend of Achilles. He didn't take part in the Trojan plot against Achilles ([851]). As we already know, certain authors may have referred to Achilles as a eunuch, since he had once “served in the gynaeceum”, qv above. The Latin for “eunuch” is *orbator* ([237]).

■ ■ ■ 31d. *The Tarquinian War*. Titus Livy does not report any animosity between Larcius and Publius Valerius. We learn nothing of either Valerius or Larcius (Marcius) being a eunuch here.

Commentary. The words *orator* and *orbator* are obviously similar; therefore, mediaeval authors could easily confuse them. Some of the chroniclers – Procopius, for instance – would try to decipher the sparse and random data that had reached them and then give us flowery accounts of the alleged infertility of Narses = NRCC, which brought Narses the eunuch into existence. Other authors, such as Plutarch (Petrarch?) would read the word in question as *orator* and glorify Cicero (CCR/CCRN) as a talented speaker. The reference to Latin is quite in place here, since it is Roman history that we're analysing. What we see in action is obviously the same psychological mechanism as in the case of a mediaeval aqueduct transforming into the Trojan horse. A foreign scribe would misinterpret the vaguely familiar word, giving it a new meaning due to similar phonetics, and then use his own considerations to provide the details which were often of a fanciful nature; all of this literary activity would then make its way into history textbooks.

32a. *The Gothic War*. Narses is the only eunuch (*orbator*) mentioned in the case of the Gothic War ([695] and [196], Volume 1).

■ 32b. *Sulla, Pompey and Caesar*. Cicero and Caesar are the only famous orators mentioned by Plutarch in the context of the Roman War that took place in the alleged I century B.C. Caesar is supposed to have been the second best orator after Cicero.

The fact that CCR (CCRN) acts as the successor of Caesar is also manifest in Plutarch referring to the pair as to “gifted orators”. Both Cicero and Caesar have studied elocution in the same school of Apollonius ([\[660\]](#), Volume 2, page 451, “Caesar” III). Plutarch tells us nothing about any other participants of the alleged I century B.C. war being renowned for eloquence.

■ ■ 32c. *The Trojan War*. Achilles is the only “eunuch” mentioned in the course of the Trojan War ([\[851\]](#) and [\[180\]](#)).

■ ■ ■ 32d. *The Tarquinian War*. No duplicate was found here.

33a. *The Gothic War*. The first scenario: after the end of the Gothic War, Narses has to go into exile (we can refer to this episode as “the ordeal of Narses”). The second scenario: Narses soon returns to Rome triumphant ([196], Volume 1). The third scenario: we know nothing about the death of Narses and its circumstances.

■ 33b. *Sulla, Pompey and Caesar*. The first scenario: the exile of Cicero after the Gaulish (Galician?) War – “the ordeal of Cicero” ([948], page 156). Cicero remained in exile for a year and a half (*ibid*). “His house in Rome was destroyed, his villas looted, and a great part of his property became confiscated... giving shelter to the fugitive was forbidden on the pain of death (if he were to appear anywhere within the radius of 500 miles from Rome)” ([948], page 156). The second scenario: despite all of this, Cicero soon returns to Rome triumphant. “Over the time [of Cicero’s exile – A. F.] the political climate in Rome had changed... a council of the people decided to call Cicero back to Rome. In August of the year 57 Cicero lands in Brundisia, and his journey to Rome... becomes a march of triumph. He gives speeches of gratitude to the senate and the people of Rome” ([948], page 156). Third scenario: the tragic demise of Cicero during his escape ([\[660\]](#), Volume 3, page 189).

■ ■ 33c. *The Trojan War*. First scenario: the wanderings of Ulysses (Odysseus) after the Trojan War, qv in Homer’s *Odyssey*, or “the ordeal of Ulysses/Odysseus”. Second scenario: Ulysses returns home triumphant. Third scenario: we know nothing of how Ulysses/ Odysseus had died.

■ ■ ■ 33d. *The Tarquinian War*. First scenario: Marcius (Coriolanus) has to roam for some period after the end of the Tarquinian War, which can be referred to as “the ordeal of Marcius”. Second scenario: Marcius Coriolanus returns to Rome as the leader of troops menacing his home town ([\[482\]](#)). Third scenario: the tragic death of Marcius Coriolanus during his escape ([\[482\]](#)).

We have exhausted all the primary scenarios in each of the four versions under comparison: we see their “skeletons” are identical. Therefore, one has a reason to consider them four different accounts of the same sequence of events that took place at some time in the Middle Ages. Let us now compare the remaining scenarios of minor importance, concentrating our attention on the comparison of the Gothic War with the Roman war of the alleged I century B.C.

34a. *The Gothic War*. Antonine, the wife of the military leader Belisarius, is one of the central figures emerging in this period ([695] and [196], Volume 1). She accompanies Belisarius for the entire duration of the Gothic War and is reported to have been a powerful and intelligent woman with a great influence over her husband.

■ 34b. *Sulla, Pompey and Caesar*. Antonius is the closest comrade-in-arms of Julius Caesar; he is one of the primary characters emerging in the Roman civil war. Antonius accompanies Caesar for the entire duration of his war with Pompey ([660], Volume 2, page 474, “Caesar”). Let us remind the reader that the war in question is a duplicate of the Gothic War; one cannot help but notice the striking similarity between the names of Antonine and Antonius.

Commentary. What we see is obviously a result of confusion that arose somewhere in the mediaeval chronicles. The texts of the Gothic War consider “Antonine” a woman, whilst Plutarch tells us that “Antonius” had been a man. Also, Plutarch keeps comparing the Roman war of the alleged I century B.C. that he describes with the Trojan War, apparently under the influence of the parallelism and without any prompting from our part. He is also forced to compare Antonius the “man” with Helen the “woman”: “Cicero in his *Philippics* tells us that while the Trojan War began because of Helen, the civil war was started by Antonius ([660], Volume 3, page 230). We shall see many more examples of gender confusion in the analysis of “ancient” Greek history; below we shall see that some of the scribes were making references to “the woman” Mathilda, while the others would tell us about “the man” Milthiades.

35a. *The Gothic War*. Antonine had been a famous prostitute. According to Procopius, she had only been second to Empress Theodora, the wife of Justinian and “prostitute number one”, in that respect ([695]). Therefore, Antonine could easily have been called a *hetera*.

■ 35b. *Sulla, Pompey and Caesar*. The history of the civil war of the alleged I

century B.C. calls Antonius an utterly debauched person. Plutarch tells us all sorts of legends about his depravity, qv below.

Commentary to 35b. According to Plutarch, “Antonius had been unbelievably handsome in his youth... Curio had aided him [Antonius – A. F.] to develop a taste for drunkenness, debauchery and wasting money in the most horrendous manner” ([660], Volume 3, page 227, “Antonius” II). Plutarch carries on with the description of Antonius and his favoured pastimes for many pages on end. Respectable civilians were “repulsed by the entire lifestyle of Antonius – his constant inebriation, throwing money left and right, as well as endless wenching” ([660], Volume 3, page 232, “Antonius” IX).

All of these characteristics make Antonius quite unique, since Plutarch doesn’t reveal any details of this sort in his description of any other characters that had lived in the alleged I century B.C. Thus, the automatic superimposition of Plutarch’s “debauched Antonius” over “Antonine the prostitute” serves to confirm the correctness of the parallelism that we observe manifest in Roman history yet again. The chronicles that modern historians date to the VI century A.D. call Antonine a *hetera*. However, one needn’t be of the opinion that the word “*hetera*” only translates as “prostitute”. It turns out that *heterae* had also been a word used for referring to horsemen from elite Roman troops ([660], Volume 2, page 531, comment 7). Therefore, a man from these troops could also become dubbed a “*hetera*”, which means we may have discovered the real reason why Antonius (male) had transformed into Antonine (female). Some mediaeval scribe came across the words “Antonius the hetera” in an ancient text and translated them erroneously as “Antonine the prostitute”, having instantly invented countless piquant details to embellish “her” biography.

36a. *The Gothic War*. Antonine the hetera, who had been the wife of Belisarius, the empire’s commander-in-chief, was obviously a frequent visitor at the court of Emperor Justinian ([695]).

■ 36b. *Sulla, Pompey and Caesar*. Antonius the “hetera” had indeed been the leader of elite cavalry in Julius Caesar’s troops ([660]), qv below.

Commentary to 36b. Antonius the “hetera” was the leader of Roman cavalry ([660], Volume 3, page 228, “Antonius” III) who had personally commanded the troops on the battlefield – in the battle against Octavian Caesar, for instance ([660], Volume 3, page 270). Apart from that, we have to remember that Antonius commanded the cavalry of

Julius Caesar, the double of Belisarius - “the great king” of the Gothic War, as Plutarch tells us; Procopius, on the other hand, tells us of Antonine the *hetera* who was obeying her husband Belisarius. Plutarch emphasizes the fact that “the leader of the cavalry was only second to the dictator” ([660], Volume 3, page 231, “Antonius” VIII. The persons he refers to are, respectively, Antonius and Julius Caesar.

37a. *The Gothic War*. Antonine the *hetera* is the wife of Belisarius ([695]).

■ 37b. *Sulla, Pompey and Caesar*. In the alleged I century B.C., the Roman “*hetera*” Antonius was married to “Julia from the house of the Caesars” ([660], Volume 3, page 227, “Antonius” II). We see an obvious confusion of two similar verbal formulae: 1) Antonine is married to Belisarius (Julius Caesar), and 2) Antonius is married to Julia from the house of the Caesars.

38a. *The Gothic War*. The famous *hetera* Theodora was married to the “main king”, Emperor Justinian I ([695]). According to Procopius, she eventually became the empress of Romea. Her numerous portraits adorn the temples of the New Rome (Constantinople), qv in [196], Volume 1. Theodora had been the most famous empress in Rome. Her name is similar to that of Flora that we are about to introduce into the narrative, and the two names may be related to each other. In fig. 2.78 one sees a golden medallion with a portrait of Justinian; in fig. 2.79 we see an old mosaic portraying Justinian from the church of St. Vitalius in Ravenna, and a similar mosaic with the portrait of his wife Theodora in fig. 2.80.

Fig. 2.78 A portrait of Justinian from a golden medallion that is currently lost. The medallion was kept in the British Museum (London). Taken from [1122], p. 1.

Fig. 2.79 Justinian. An inlay from the Church of St. Vitalius (Ravenna, Italy). Taken from [\[1122\]](#), p. 12. See also [\[328\]](#), p. 94, and [\[196\]](#), Vol. 2, p. 188, ill. 32.

Fig. 2.80 Theodora. An inlay from the Church of St. Vitalius (Ravenna, Italy). Taken from [\[1122\]](#), p. 13. See also [\[196\]](#), Vol. 2, p. 189, ill. 33.

■ 38b. *Sulla, Pompey and Caesar*. In the alleged I century B.C., the famous hetera Flora had been the lover of the “main king” Pompey Magnus, the double of Justinian ([\[660\]](#), Volume 2, pages 334-335, “Pompey” II). According to Plutarch, Flora’s fame had been so great that her portraits would adorn temples (!) and be offered to the gods (!), see [\[660\]](#), Volume 2, page 335, “Pompey” II. This seems an unlikely manner for treating a prostitute; however, the parallelism that we discovered gives us an instant explanation. Flora’s portraits were hung in temples since she is the double of the Romean empress Theodora in Plutarch’s rendition of the events, and not because of her fame as a prostitute, great as it may have been. However, her lifetime is misdated to the VI century A.D. – the correct dating would be a late mediaeval one. We do indeed see portraits of empress Theodora in the holy temples of Romea ([\[196\]](#), Volume 1). Once again we witness how our parallelism helps us understand the true events of the Middle Ages, wiping away confusion and distortions.

We shall proceed with comparing several more scenarios pertinent to the Roman war of the alleged I century B.C. (“b” series) and the Tarquinian War of the alleged VI century B.C. (“d” series).

■ 39b. *Sulla, Pompey and Caesar*. According to Plutarch, in the epoch of the alleged I century B.C. a certain incident occurred, involving Romans called away from Rome “to seek freedom upon a mountain” ([\[660\]](#); also see the details below).

■ ■ ■ 39d. *The Tarquinian War*. According to Titus Livy, the Roman plebs had left Rome to search “freedom upon a mountain” ([\[482\]](#)).

Commentary. In his rendition of the XIII century events from the course of the Trojan = Tarquinian = Gothic War, the mediaeval Plutarch (Petrarch?) informs us of the fact that the proclamation of “freedom upon a mountain” had been rather famous in this epoch; the first and only time it ever sounded in the entire history of Rome up until the alleged I century B.C. had been in the epoch of the war with the Tarquins.

Therefore, Plutarch gives us direct indications of parallels exactly where they are supposed to be as a result of chronological shifts. In this case, he points out the parallelism between the war of the alleged I century B.C. and the Tarquinian War of the alleged VI century B.C., telling us that “Catullus had made a speech with numerous arguments against the law... however, since he hadn’t manage to convince anyone in the Popular Assembly, he addressed the Senate, shouting repeated proclamations from the orator’s dais and telling the senators that they should follow the example of their ancestors [sic! – A. F.] and retreat to some mountain or rock, which had to be found first in order to save freedom from peril” ([\[660\]](#), Volume 2, pages 354-355, “Pompey” XXX). Modern historians comment as follows: “he [Plutarch – A. F.] is referring to the first years of the Roman republic when the plebs, frustrated by the endless and fruitless struggle against the patricians, had left Rome and found retreat on the Holy Mountain” ([\[660\]](#), Volume 2, page 536, comment 41). A propos, Plutarch also mentions Catullus addressing the “popular assembly”, or the plebs.

■ 40b. *Sulla, Pompey and Caesar*. In his description of the Roman war that broke out in the alleged I century B.C., Petrarch makes the sudden reference to an allegedly ancient event – namely, the rape of the Sabine women. The reference is a very timely one, since this is precisely where our parallelism places this scenario.

■ ■ ■ 40d. *The Tarquinian War*. Titus Livy cites the famous legend of the rape

of the Sabines when he tells us about the foundation of the City (allegedly Italian Rome, see [\[482\]](#)).

Commentary. Once again, Plutarch (the mediaeval Petrarch?) doesn't require our prompt to include the legendary rape of the Sabines into his rendition of the war that took place in the alleged I century B.C., emphasizing its "repetition/revival" in the epoch of Julius Caesar. Let us remind the reader that Titus Livy places this legend in the epoch that precedes the foundation of Rome – the alleged VIII century B.C. As we already understand, the "rape of the Sabines" is an integral part of the Trojan = Tarquinian = Gothic War. Plutarch tells us that "Antistius the praetor... had felt sympathy for Pompey and offered the latter to marry his daughter... Pompey agreed to this, and so they signed a secret agreement" ([\[660\]](#), Volume 2, page 336). Bear in mind that, according to Livy, the rape of the Sabines was also plotted in secrecy.

Plutarch proceeds to tell us that "all secrecy notwithstanding... the populace learnt of the deal... as Antistius was voicing the verdict, the people started to shout "Talassia", an ancient wedding exclamation... this custom harks back to the day when the bravest of Romans were abducting the Sabine women..." ([\[660\]](#), Volume 2, page 336, "Pompey" IV). Plutarch proceeds with his rendition of the actual legend. It has to be noted that Plutarch doesn't mention the epoch that this custom belongs to originally; his mere mention of its being "old" does not imply that the legend has to be shifted several centuries backwards.

We shall end our brief overview of the parallelism between the Roman war of the alleged I century B.C. and the Trojan = Tarquinian = Gothic War. A concise graphical scheme of the parallelism is shown in figs. 2.81-2.84. We are using arbitrarily chosen geometrical figures in lieu of numbers; this provides for a more representative graph demonstrating each row to consist of different scenarios unrelated to each other. The parallelism that we have discovered manifests in the quadruple multiplication of one and the same row.

■	Belisarius is a military leader. Justinian is an emperor. The relationship is initially a benevolent one, but ends in a quarrel.	■	Caesar is a military leader. Pompey is a number one public figure. Friends initially, foes eventually.	■	Achilles is a military leader. Agamemnon is the "principal royalty". Friends at first, enemies afterwards.	■	Valerius is a military leader, while Tarquin the Proud is the "main king". Hostile in the beginning; mortal enemies afterwards.

5.

The rebellion of Spartacus as a vague and fragmented reflection of the Trojan = Tarquinian = Gothic War of the XIII century A.D.

Apparently, when the Scaligerites were busy shuffling mediaeval chronicles and their fragments, another partial duplicate of the XIII century war (Trojan = Tarquinian = Gothic) made its way into the epoch of the “Great Triad” – the kings Sulla, Pompey and Caesar, that is. The situation we encounter here is *perfectly similar* to what we observe in the course of the Gothic War of the alleged VI century A.D. – its history contains a brief account of itself disguised as the so-called Nika Rebellion in Constantinople = New Rome, all courtesy of the Scaligerian school in history. The documented history of the Roman civil war that took place in the alleged I century B.C. includes a concise rendition of the very same war – we're referring to the famous rebellion of Spartacus. In both cases we see that these “compressed versions” are referred to as mutinies or rebellions.

As we have already seen, in the war of the alleged I century B.C. the Romans oppose the TRQN as well as the PRS. What we provide below is but a brief outline of a possible parallelism here; enthusiasts are by all means welcome to delve further.

41a. *The Gothic War*. The war of the Romain Greeks and the Romans against the Persians (PRS) and TRQN (the Franks and the Goths). The war is dated to the alleged VI century A.D. It was won by the Romans/Romeans, Italy being the alleged primary battlefield ([695] and [196], Volume 1).

■ 41b. *Sulla, Pompey and Caesar*. In the alleged I century B.C. the Romans have an armed conflict with Spartacus, whose unvocalized name transcribes as SPR-TC. This may be a merged form of PRS and TK, which had once been used for referring to the Franks or the P-Russians, as well as the Turks. The war with Spartacus (SPR-TC) ends with a victory of the Romans ([\[660\]](#)), and supposedly takes place in Italy.

42a. *The Gothic War*. In all three primary duplicates of the XIII century war (Trojan = Tarquinian = Gothic), the enemies of Rome are the TRQN – that is, the Goths = the Trojans = the Franks = the Turks (or the Tartars?), qv above. We shall

re-emphasize the fact that the two primary opponents of Rome that we see here are the PRS and the TRK.

■ 42b. *Sulla, Pompey and Caesar*. Spartacus was Thracian by birth ([660], Volume 2, page 242). He is known to have been a sworn enemy of the “ancient” Rome. *Thracia* may well be *Turkey* (TRC or TRK sans vocalizations). We learn that most of the mutinous “slaves” (gladiators) in the Capuan school have been of *Gaulish* and *Thracian* origins. The actual word “gladiator” may be a derivative of the words “Gaul” and “Tur” (*Gauls* + *Turks* or *Gauls* + *Tartars*). We should also remember the famous mediaeval *Galicia*, which may have been known as *Gaul* at some point in time; apart from that, the name was also used for referring to France. Thus, we see two forces opposing Rome: PRS (Galicia/France, Paris or P-Russians) and TRK (the Franks, the Turks and/or the Tartars).

43a. *The Gothic War*. The Trojan = Tarquinian = Gothic War is considered to have been one of the greatest and bloodiest wars in the history of the empire.

■ 43b. *Sulla, Pompey and Caesar*. The war with Spartacus in the alleged I century B.C. had been an extremely hard and violent one. It had led to the devastation of the entire Italy. Plutarch wrote that “all of Italy was swept over by a wave of looting during the gladiator's rebellion, also known as the Spartacian War... the senate's irritation at the low and ignominious nature of the rebellion [of Spartacus – A. F.] gave place to fear and awareness of peril; therefore, the Senate sent both consuls to suppress the rebellion, as it would in case of an all-out war, brutal and bloody” ([660], Volume 2, pages 242-243).

44a. *The Gothic War*. Commander-in-chief Narses (the double of Julius Caesar and Cicero) finally triumphs over the PRS (Persians, or P-Russians) and the TRK (Franks/Goths) together with his liege, Emperor Justinian I (the double of Pompey Magnus), qv in [695] and [196], Volume 1.

■ 44b. *Sulla, Pompey and Caesar*. In the alleged I century B.C. Crassus and Pompey Magnus defeat Spartacus (SPR-TK), qv in [660], Volume 2, page 246. We have already witnessed the superimposition of Pompey over Justinian; the possible identification of Crassus as Narses is a novelty. The unvocalized name of Crassus transcribes as CRSS, which may be a misinterpretation of NRSS (Narses) resulting from the graphic similarities between the Slavic letters K and H (used for sounds K and N, respectively), as well as the Romanic N.

45a. *The Gothic War*. Bear in mind that during the siege of Alesia (the double of Troy = the New City = Naples) Julius Caesar builds a “double wall” around the besieged. As we have already pointed out, it is a distorted recollection of the aqueduct. Paris (PRS, or P-Rus) got killed in the Trojan War ([\[851\]](#)).

■ 45b. *Sulla, Pompey and Caesar*. We discover that a similar scenario applies to the rebellion of Spartacus. The Romans take the camp of Spartacus by guile: Crassus, the double of Narses and/or Caesar orders for the camp under siege to be surrounded by a wall and a moat “whose size and fortitude had been truly formidable” ([\[660\]](#), Volume 2, page 244). Spartacus (the double of Paris) also dies a violent death ([\[660\]](#), Volume 2, page 246).

Thus, what we see in the Byzantine/Romean history of the alleged VI century A.D. is: primo, a detailed account of the war known as the Gothic War from the alleged XIII century A.D. (subsequently described as the Gothic War of the alleged VI century A.D.); secundo, a *brief* version of the same war under the alias of “the Nika *Rebellion*”. The Roman history of the alleged I century B.C. is virtually the same – an *in-depth* rendition of the same XIII century war presented as the civil war in Rome (Sulla, Pompey and Caesar), and its *shorter* version, the story of Spartacus and his *rebellion*. This alone demonstrates us that both mediaeval Byzantine history of the alleged VI century A.D. and “ancient” Roman history of the alleged I century B.C. are but later copies of the same mediaeval original dating to the XIII century – or, quite possibly, an even more recent epoch.

6.

A general picture of the 1053-year chronological shift

6.1. The identification of the First Roman Empire (Livy's Regal Rome) as the Third Roman Empire of the alleged III-VI century A.D. and the 1053-year shift

We have already made quite a few references to this parallelism above. Therefore, let us simply remind that it happens to mark the beginning of an extremely lengthy parallelism between the “ancient” and mediaeval Roman history; one that covers a span of some 1,500 years.

Let us now consider the next sequence of the parallelism that manifests if we consider the 1053-year shift.

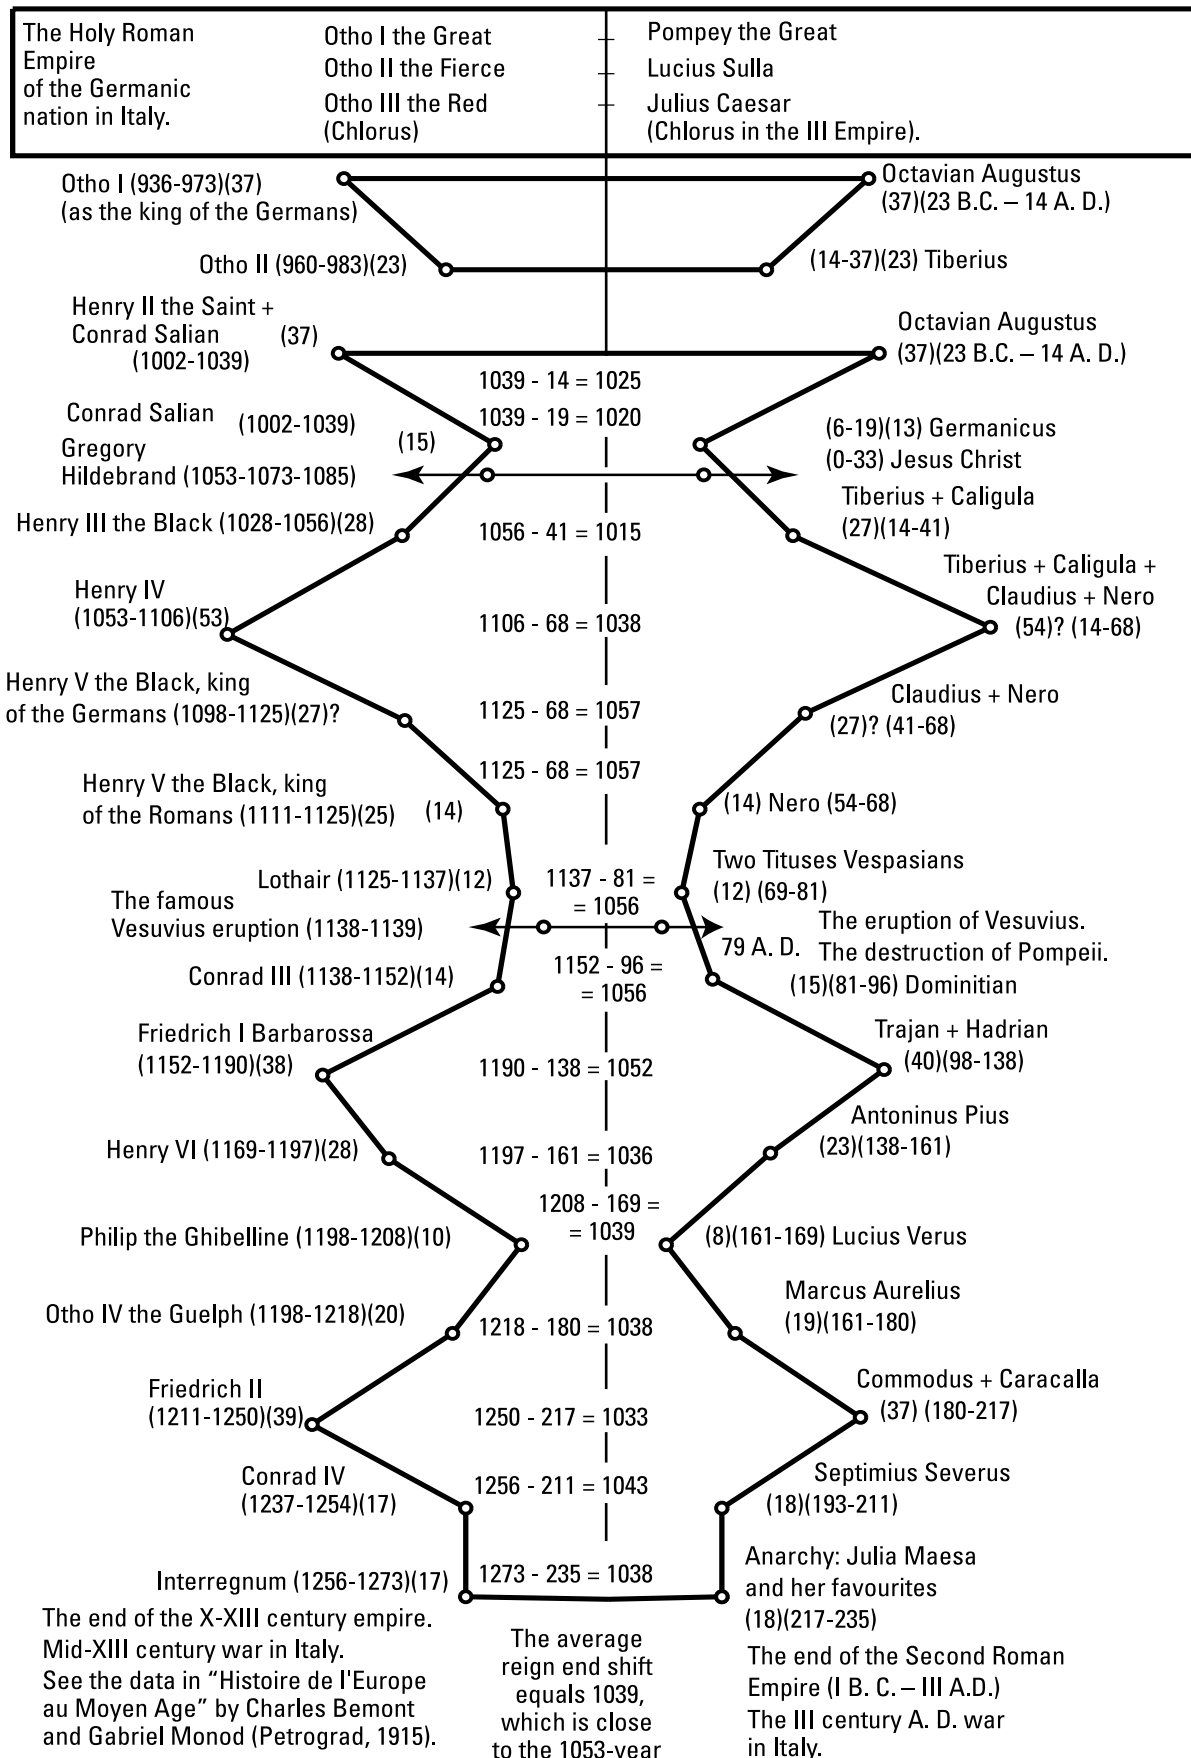

6.2. Identifying the Second Roman Empire as the Holy Roman Empire of the X-XIII century as well as the Habsburg Empire of the XIV-XVII century. Two shifts – of 1053 and 1400 years, respectively

The superimposition of the “ancient” history over that of the Middle Ages (with the chronological shift of 1053 years taken into account) continues into the subsequent epochs. In particular, the Second Roman Empire (of the alleged centuries I B.C. – III A.D.) becomes identified as the Holy Roman Empire of the alleged years 962-1254 A.D. (see fig. 2.85). Bear in mind that the proximity coefficient for both of these dynasties equals 1.3×10^{-12} .

X-XIII century A. D.

A rigid shift of 1053 years

I century B. C. – III century A. D.

The average reign end shift equals 1039, which is close to the 1053-year value of the rigid shift. This is one of the key parallelisms.

Fig. 2.85 The parallelism between the Second Roman Empire of the alleged I century B.C. – III century A.D. and the Holy Roman Empire of the alleged X-XIII century A.D.

It is significant that the Holy Roman Empire of the X-XIII century fits into the parallelism that we discovered perfectly – all the years that had passed between 1002 and 1271. Of all the rulers that the Second Roman Empire ever had, starting with Octavian Augustus and ending with Caracalla, only nine aren't represented in the parallelism, namely, Galba (who had reigned in the alleged years 68-69 A.D.), Vitellius (69 A.D.), Nerva (96-98 A.D.), Pertinax (193 A.D.), Didius Julianus (193 A.D.), Clodius Albinus (reigned as an independent ruler for less than one year in 193; also in 193-197), Pescennius Niger (around a year in 193-194 A.D.) and Geta (around 3 years in 209-212 A.D.), see [\[72\]](#) pages 236-237. They have all been short-term emperors, in other words, and may thus have been excluded from the parallelism as secondary figures.

Thus, insofar as the indicated timeframe is concerned, the parallelism exhausts the entire Holy Roman Empire of the alleged X-XIII century, and almost all of the Second Empire, excepting several short-term rulers. Let us remind the reader that every ruler of the Holy Roman Empire had simultaneously been a German king and an emperor of Rome in that epoch, hence the double inauguration dates and double reign durations (one for Germany, the other for Rome). It is significant that in each case the parallelism in question relates to the German reign durations of the Holy Roman Empire rulers in the X-XIII century ([\[64\]](#), see table on page 250). The parallelism looks like this:

1a. *Henry II the Holy + Conrad* (Horde Khan?) *Salian* – 37 years (1002-1039 A.D.) Both reign durations are German, qv above. The name Henry (Heinrich) can be related to the words “Khan” and “Reich”, or “Rex”. The name Conrad may have meant “Khan of the Horde”.

■ 1b. *Octavian Augustus* – 37 years, or the first version of the reign (23 B.C. to 14 A.D.); see [Chron2](#), Chapter 1.

2a. *Conrad II Salian* – 15 years: 1024-1039 A.D. The second Khan of the Horde?

■ 2b. *Germanicus* – 13 years between 6 and 19 A.D. This pair can be excluded, as a matter of fact, since despite the royal status of Germanicus in the Second Empire, he had been a co-ruler of a more renowned ruler – Tiberius.

3a. *Henry III the Black* – 28 years (1028-1056 A.D.)

■ 3b. *Tiberius + Caligula* – 27 years (14-41 A.D.)

4a. *Henry V* – 53 years between 1053 and 1106. The parallelism is broken here, since there is no similar reign in the Second Empire.

■ 4b. The parallelism is instantly restored if we are to study the full names of the Second Empire rulers. We find out that the four emperors Tiberius, Caligula, Claudius and Nero can be united into a sequence resembling a long reign of a single emperor. The matter is that all four of them had the formula *Tiberius Claudius Nero* as part of their name, which is their unique characteristic in the entire Second Empire ([72], page 236-237). Apparently, the scribes have collated them together, which resulted in a 54-year reign of a single “ruler” – *Tiberius Claudius Nero*. Thus, *Tiberius + Caligula + Claudius + Nero* – 54 years between 14 and 68 A.D.

5a. *Henry V the Black* ([64], page 227); German reign duration – 27 years between 1098 and 1125 A.D.; Roman reign duration – 14 years between 1111 and 1125 A.D.

■ 5b. *Claudius + Nero* – 27 years: 41-68 A.D., or 14 years for Nero alone (54-68 A.D.)

6a. *Lothair* – 12 years: 1125-1137 A.D.

■ 6b. Two kings sharing the name of *Titus Vespasian* – 12 years between 69 and 81 A.D.

7a. *Conrad III Hohenstaufen* – 14 years (1138-1152 A.D.) There is a possible link between Conrad and “Khan of the Horde”.

■ 7b. *Domitian* – 15 years (81-96 A.D.)

8a. *Frederick I Barbarossa* (a barbarian from Russia?) – 38 years between 1152 and 1190 A.D.

■ 8b. *Trajan + Adrian* – 40 years: 98-138 A.D. The unification of these two rulers may result from their sharing the name Trajan as part of their full names, qv in [72], pages 236-237.

- 9a. *Henry VI* – 28 years (1169-1197 A.D.)
9b. *Antoninus Pius* – 23 years (138-161 A.D.)
-

- 10a. *Philip of Swabia* – 10 years (1198-1208 A.D.)
■ 10b. *Lucius Verus* – 9 years (161-169 A.D.)
-

- 11a. *Otho IV of Brunswick* – 20 years (1198-1218 A.D.)
■ 11b. *Marcus Aurelius* – 19 years (161-180 A.D.)
-

12a. *Frederick II* – 39 years (1211-1250 A.D.) 1211 here is the date of the second inauguration in Germany – the final crowning.

■ 12b. *Commodus + Caracalla* – 37 years (180-217 A.D.). The reign of Commodus is calculated from the end of the reign of Marcus Aurelius; this is therefore the second version (see [Chron2](#), Chapter 1, the Second Empire list). We must point out that the merging of these two rulers into one and the same person is most probably explained by the fact that the full names of both Commodus and Caracalla contain the formula Marcus Aurelius Antoninus, which happens to comprise half of each full name in question.

- 13a. *Conrad IV* – 17 years (1237-1254 A.D.). Conrad – Horde Khan?
■ 13b. *Septimius Severus* – 18 years (193-211 A.D.)
-

- 14a. *Interregnum* – 17 years (1256-1273 A.D.)
■ 14b. *Interregnum* (Julia Maesa and her minions, qv in [Chron2](#), Chapter 1) – 18 years (217-235 A.D.)
-

Since our proximity coefficient is defined by the formula 1.3×10^{-12} , both dynasties superimpose over each other quite well, considering the same universal rigid shift of 1053 years. We shall now give a brief outline of the biographical parallelism manifest here (the form-code parallelism).

1a. *The Second Empire*. The total lifetime of the Second Roman Empire equals about 299 years – the total period between the alleged years 82 B.C. and 217 A.D., qv in [Chron2](#), Chapter 1. This empire is considered “purely Roman”, and its parent

state is allegedly Italy.

■ 1b. *Empire of the X-XIII century*. The entire period of the Holy Roman Empire's existence covers the span of roughly 292 years, starting with either 962 or 965 A.D. and ending with 1254 A.D. This state is supposed to have consisted of Italian and German lands, the parent state being Italy. The lengths of the temporal spans covered by both empires are quite similar.

2a. *The Second Empire*. A shift of 1053 years forward shall date the formation of the Second Roman Empire to 971 A.D. (the year 671 *ab urbe condita* + 300 years = 971 A.D.) Sulla, the first emperor of the Second Empire, was titled "Restorer of the City/State/Peace". See [Chron2](#), Chapter 1.

■ 2b. *Empire of the X-XIII century*. This empire came into existence in either 962 A.D., the year Otho was crowned in Rome, or 965 A.D., the year he conquered Italy ([\[64\]](#), page 205). Otho I, the first emperor of the Holy Roman Empire, is said to have "resurrected the Roman Empire" ([\[64\]](#)). Mark the parallelism with Sulla. This deed of Otho's is important enough to make the headings of historical reviews. For instance, Paragraph 14 of [\[64\]](#) is entitled "The Revival of the Western Empire for the Benefit of Otho I (962)" ([\[64\]](#), page 206). Thus, we see the rulers standing at the roots of the two empires under comparison to bear the same title of "Restorer" or "Reviver" of the City (or the State). Let us point out the fact that the dates 962 and 965 all but coincide with the parallel date – 971 (see above).

3a. *The Second Roman Empire*. After a 1053-year shift forward in time, the dissolution of the Second Empire falls on the year 1270 A.D. This is where the end of Caracalla's reign gets relocated (the alleged year 217 A.D.) Caracalla is the last emperor of the Second Empire; what we see after his reign is an 18-year period of wars (the alleged years 217-325 A.D. – the so-called Gothic War of the III century A.D. This is the epoch of Julia Maesa and her minions (see [Chron2](#), Chapter 1).

■ 3b. *Empire of the X-XIII century*. The decline of the Holy Roman Empire is somewhat "marred" by the war and covers the period between either 1252 or 1254 and 1256 ([\[64\]](#)). 1254 is considered the year when the Empire of the X-XIII century ceased to exist officially, according to the Scaligerian chronology ([\[64\]](#), table on page 250). It is significant that the year 1254 is very close to the "parallel date" – 1270 A.D., qv above. Therefore, we witness the datings of the rise and the fall of both empires under comparison to concur very well with each other, if one is to

consider a 1053-year shift. This period (ending in 1256) is followed by 17 years of anarchy and interregnum in Italy and Germany (1256-1273, qv in [\[76\]](#), Table 25. The durations of both “parallel wars” identifying as one and the same war are almost identical – 18 and 17. The parallelism is thus manifest in a very obvious manner.

4a. *Second Empire*. A large amount of “ancient” Roman golden coinage from the epoch of the Second Empire has reached our day (see [\[1070\]](#), [\[1163\]](#) and [\[1164\]](#)). See [Chron1](#), Chapter 1 for more details. For the most part, these coins are of very fine mintage and resemble the golden coins of mediaeval Europe in quality as well as subjects – for instance, the ones minted in the XIV-XV century Italy. It may well be that these coins were made in the Holy Roman Empire of the X-XIII century A.D., but became misdated by chronologists and “time-travelled” into a “distant age”.

■ 4b. *Empire of the X-XIII century*. It is most peculiar that there are hardly any golden coins of the Holy Roman Empire left in existence ([\[1070\]](#), [\[1163\]](#) and [\[1164\]](#)). See [Chron1](#), Chapter 1. This bizarre fact was noticed by numismatists a long time ago, spawning a great many explanatory theories in numismatic literature. These coins are most probably known to us under a different name and erroneously dated to the epoch of the Second Empire, the chronological shift equalling 1053 years.

5a. *Second Empire*. The decline of this empire is roughly dated to the alleged year 217 A.D. It is interesting that in the Third Roman Empire of the alleged III-VI century A.D. the amount of golden coinage is drastically lower than in the Second Empire that is supposed to have preceded it. Our explanation of this effect is a very simple one: most of these coins had remained in their “rightful place”, that is, the XIV-XVII century A.D.

■ 5b. *Empire of the X-XIII century*. In 1252 Italy “begins” to mint full-weight golden coins – quite unexpectedly for Scaligerian history ([\[1070\]](#), pages 20-21). Bear in mind that the end of the Second Roman Empire falls on the alleged years 1263-1270 A.D. after a 1053-year shift forward. This dating is very close to 1252 A.D. Thus, the numismatic data for both of the parallel empires concur well with each other, if we are to consider the 1053-year shift.

6a. *Second Empire*. This state is of a distinct republican/imperial character, and combines elements of a republic with those of an empire.

■ 6b. *Empire of the X-XIII century*. The Holy Roman Empire also has manifest

characteristics of both a republic and an empire; said institutions managed to coexist in some way. The famous mediaeval Roman republic blossoms in the period of 1143-1155.

7a. Second Empire. Some of the emperors here share the formula of Germanicus Caesar Augustus between themselves as a common part of their respective full names – the emperors Germanicus, Caligula, Claudius, Nero and Vitellius, for instance ([72]; see also [Chron2](#), Chapter 1).

■ *7b. Empire of the X-XIII century.* The rulers of the Holy Roman Empire have simultaneously been Roman emperors and German Kaisers Augusti ([64], page 250). Thus, their full names would include the same formula of “Germanicus Caesar Augustus”, Kaiser being a version of Caesar.

8a. Second Empire. A famous eruption of the Vesuvius took place in the alleged year 79; this resulted in the destruction of Pompeii, the “ancient” town ([389]). This eruption is the only one observed over the first two centuries of the new era according to the Scaligerian chronology, qv in fig. 2.86. Let us quote the entire list of Vesuvius’ eruptions that became reflected in the chronicles of the last two alleged millennia (taken from page 28 of [389]). We have the Scaligerian Anno Domini datings before us: 79 A.D., 203, 472, 512, 685, 993, 1036, 1049, 1138, 1139, 1306, 1500, 1631, 1660, 1682, 1694, 1698, 1701, 1704, 1712, 1717, 1730, 1737, 1751, 1754, 1760, 1766, 1767, 1770, 1771, 1773, 1774, 1775, 1776, 1777, 1778, 1779, 1786, 1790, 1794, 1804, 1805, 1806, 1810, 1811, 1813, 1817, 1822, 1822, 1831, 1833, 1834, 1835, 1839, 1841, 1845, 1847 and 1847.

Fig. 2.86 The eruptions of Vesuvius according to the Scaligerian chronology. It is plainly visible that the two “ancient” eruptions, of 79 and 472 A.D., respectively (the ones that destroyed the “ancient” Pompeii) are most likely to be reflections of the eruptions that took place in 1138-1139 and 1500 across the 1053-year shift. Taken from [389], page

The following report of V. Klassovsky is of a great interest to us: “some scientists (N. Ignarra, Laporte-du-Theil. v. magasin encycloped. 1803. t. IV. P. 145 Sqg.) tried to prove that it had not been the 79 A.D. eruption of the Vesuvius that brought Pompeii to the condition it was discovered in at the end of the XIX century. Indeed, Suetonius and Cassius Dio testify that Emperor Titus gave orders to rebuild it forthright, and so Pompeii continued to exist as a town under Hadrian and the Antoninii; it can even be seen on the Peutinger Map (Tabula Peutingeriana), which is dated to the IV century. However, since there are no subsequent references to Pompeii anywhere, it is presumed that it was destroyed by the eruption of 471 the earliest” ([389], pages 28-29).

Thus, we find out that Pompeii may have been destroyed a great deal later than 79 A.D. – in the alleged years 471 or 472 A.D., or four centuries later. Now let us try and estimate whether these two “ancient” eruptions of the Vesuvius can be phantom reflections of their mediaeval originals misplaced due to the 1053-year shift.

■ *8b. Empire of the X-XIII century.* In fig. 2.86 one sees perfectly well that all three Vesuvius eruptions of the first alleged centuries of the new era (the ones dated to 79, 203 and 472 A.D.) are most likely to be phantom reflections of mediaeval eruptions dating to 1138-1139, 1306 and 1500 A.D. Thus, the “ancient” town of Pompeii had most probably been wiped out by the eruption of 1500 A.D. – in the beginning of the XVI century, that is. Its first partial destruction could have taken place in 1138-1139 A.D. Then both these eruptions “time-travelled” into the past as a result of the 1053-year shift and transformed into the eruptions of the alleged years 79 and 472 A.D. Let us point out that the 1138 eruption of Vesuvius had been an extremely powerful one ([544], Volume 2, page 106; also [389], page 28). It is reported that “Mount Vesuvius has been disgorging fire for 40 days” (quoting after [544], Volume 2, page 107). The chronicle of Falcone Beneventano dates this eruption to 1139. Let us point out that after a 1053-year shift forwards, 79 A.D. becomes 1132 A.D., which is a mere six years away from 1138 A.D. This discrepancy is infinitesimal considering the millenarian value of the chronological shift. Fig. 2.87 depicts the 1822 eruption of Vesuvius (an old engraving taken from [544], Volume 2, page 124, ill. 60).

Fig. 2.87 An engraving depicting the Vesuvius eruption of 1822. Taken from [\[544\]](#), Volume 2, page 124, ill. 60.

Commentary. In Chapter 1 of [Chron1](#) we already discussed the fact that the archaeological findings from the “ancient” Pompeii are amazingly similar to their mediaeval counterparts in style and nature. Everything fits perfectly. If the eruption of 1500 (or even that of 1671) is to blame for the fate of Pompeii, it makes perfect sense that the destroyed city was mediaeval. The fossilized dust was removed during excavations, unveiling the quotidian realities of an Italian town the way it had been in the end of the XV century A.D. One should hardly wonder that V. Klassovsky cannot refrain from making the following perplexed comment to the engravings included in his book entitled *A Systematic Description of Pompeii and the Artefacts Discovered There*: “The picture of a bronze saucepan from Herculaneum can be seen in engraving XIII, number eight; if we’re to compare it to the kind used nowadays, we shall discover the two to be completely identical, which is most curious in itself” ([389], page 238). Nothing curious here; the “ancient” inhabitants of Pompeii were using saucepans resembling modern ones towards the end of the XV century. We begin to realise why Rafael’s frescoes are so much like the ones found in Pompeii (see [Chron1](#), Chapter 1). Rafael and the “ancient” Pompeian artists had lived in the same epoch and the same country (Italy); thus, they all painted in a similar manner.

The famous astronomer Claudius Ptolemy is presumed to have lived in the II century A.D., or the epoch of the Second Roman Empire. In fig. 2.88 we can see a portrait of the “ancient” Ptolemy from a star chart by Albrecht Dürer dated to the alleged year 1515 ([\[515\]](#), page 185; also [\[90\]](#), page 9). Ptolemy’s “ancient” attire is most peculiar indeed!

For instance, he is wearing a silk hat, which hadn't been worn at any epoch preceding the XVII-XVIII century. Historians have naturally discovered this fact a long time ago, but tend to comment it with the utmost caution, rounding off rough chronological corners – for instance, they say that “one can see Ptolemy dressed in quite as strange a manner in the top right corner [of the map – A. F.]” ([515], page 187). A propos, modern historians are also irritated by how the “ancient” astronomer Aratus is represented in the top left corner of the map ([515], page 187) since it contradicts the consensual concept of “ancient clothing”.

Fig. 2.88 Fragment of a star chart drawn by Albrecht Dürer in the alleged year 1515. We see a portrait of the “ancient” Ptolemy who is supposed to have lived in the II century A.D. However, his attire cannot possibly predate the XVII century – mark the top hat on his head! Taken from [90], page 8.

Another question that arises in this respect concerns the real dating of Dürer's star chart. It appears that early XVI century is too premature a dating – no silk hats had existed at that time. Dürer's famous work isn't likely to predate the XVII century.

Let us now return to the time when the Holy Roman Empire of the X-XIII century was just being founded. We find out that yet another duplicate of the Trojan = Tarquinian = Gothic War wound up right here, in the X century. We shall linger on it for a short while.

6.3. Empire of the X-XIII century. The parallelism between the X century war and the “ancient” Trojan = Tarquinian = Gothic War

9) *Empire of the X-XIII century. Senatrix Marozia = the “ancient” characters Tullia/Lucretia, Julia Maesa and Amalasuntha.* The epoch in question is the X century,

the very dawn of the Holy Roman Empire. Scaligerian chronologers have placed another duplicate of the XIII century war here (the original of the “ancient” Trojan War, that is). We shall point out all the main parallels between the events in the X century Rome (presumably in Italy) and those of the Trojan = Tarquinian = Gothic War.

The duration of the period between 931 and 954 A.D. equals 23 years, which is rather close to the 26 years of the Gothic war that took place in the alleged VI century A.D.: 536-552. The “legend of a woman” plays an important part in the history of the Tarquinian = Gothic War; the woman in question is either Amalasuntha (the alleged VI century A.D.), Tullia/Lucretia from the same century, or Julia Maesa from the alleged III century A.D.

The X century duplicate of this scenario is the story of Marozia, the Roman Senatrix. Let us remind the reader that Titus Livy mentions a strong will for power among Tullia’s primary qualities ([\[482\]](#)); the Tarquinian coup in Rome had been her idea. Chronicles dated to the X century A.D. nowadays characterize Marozia in the same way, telling us that “two minor popes had come in the wake of John X; there aren’t any doubts about both of them being *creatures of Marozia, who had become omnipotent by that point*” ([196], Volume 3, page 240).

This story is most likely to duplicate the legend of the “ancient” Amalasuntha = Julia Maesa. Bear in mind that Amalasuntha had made her sons Amalaric and Athalaric Gothic kings of Rome, whereas in the X century Marozia handed power over to her son John XI and then to two other servitors of hers. Just as it had been in the “ancient” days of Amalasuntha = Julia Maesa, “she [Marozia – A. F.] became the de facto secular ruler of the city [Rome – A. F.], with power to appoint popes... thus came the time when the Church and all of Rome were tyrannized by a woman” ([196], Volume 3, page 240).

10) *Empire of the X-XIII century. Hugo, the X century King of Italy vs the “ancient” Tarquin the Proud.* We have already witnessed the “ancient” husband of the ambitious Tullia, Tarquin the Proud, become superimposed over the Goths of the alleged VI century A.D., as well as the Hohenstaufens of the XIII century A.D. Apparently, Hugo, the husband of Marozia, King of Italy, also happens to be a phantom reflection of the Hohenstaufen (Staufen) clan shifted backwards in time by roughly 333 years. Don’t forget the negative attitude of the “ancient” Titus Livy to Tarquin the Proud and his wife Tullia; we witness the chronicles dated to the X century A.D. to refer to Hugo with similar animosity. We learn the following of King Hugo: “a perfidious, avaricious and lecherous schemer, bold and lost to shame, ready to use any means to

further the borders of his Italian kingdom in the most unscrupulous manner imaginable ([196], Vol. 3, p. 241). As for Senatrix Marozia, we learn the following: “ambition made her send envoys to Hugo with the offer of her hand and power over Rome... her limitless greed for fame fed on the thought of changing the titles of *senatrix* and *patricia* for the royal crown” ([196], Vol. 3, p. 243).

11) *Empire of X-XIII century. The legend of “a woman wronged”*. Let us remind the reader that this legend plays a crucial role in the inchoation of the Trojan = Tarquinian = Gothic War (the rape of Helen in the Trojan War and Lucretia in the Tarquinian; the Gothic version of the alleged VI century tells us about the humiliation and incarceration of Amalasuntha. According to Titus Livy, this “harm inflicted upon a woman” led to a coup d’état, the exile of the kings from Rome and the subsequent formation of the Roman Republic. The same scheme is present in the chronicles dated to the X century nowadays.

The motif we encounter here is just the same – some woman was insulted during a marital rite. We learn of the following: “the scribes remain taciturn about the festivities that had accompanied this amazing wedding [of Marozia and King Hugo – A. F.]... however, an unanticipated political upheaval in Rome makes it impossible for Hugo to become crowned Emperor... certain of his imminent and utter triumph, Hugo [the double of the “ancient” Tarquin the Proud – A. F.] had adopted the manners of an arrogant suzerain, treating Roman aristocracy with the utmost scorn” ([196], Volume 3, page 245). The X century king Hugo is an outsider in Rome, as well as the “ancient” Tarquin.

Then King Hugo “mortally affronted his young stepson Alberic, who had been against his mother’s wedding, since it had stood in his own way” ([196], Volume 3, page 245). Thus, Alberic is a double of the “ancient” Valerius, the hero of the Tarquinian War. Even their names possess a slight similarity if we’re to consider the flexion of B and V.

Hugo insults Alberic mortally “by proxy of a woman”, likewise the “ancient” clan of the Tarquins, one of which had raped Lucretia and thus humiliated Valerius, the double of Alberic. Both duplicate versions emphasize the sexual undertones in this struggle for power.

The story dated to the X century nowadays informs us of the following details: “Insidious Hugo was already plotting to do away... with Alberic at the first opportunity... serving his stepfather as a page at the insistence of his mother, the youth had one day started to pour water over the king’s hands with resolved indexterity... and

the latter had struck him in the face” ([196], Volume 3, page 245).

12). *The Empire of the X-XIII century. The uprising in the X century Rome = the exile of the kings in the “ancient” Tarquinian War.* Going back to the history of the Tarquinian War, let us remind the reader that, according to Livy, the “humiliation of a woman” leads to a civil uprising in Rome. The X century scenario is just the same: “burning with desire for revenge, Alberic... had called upon the Romans and inspired them with a speech wherein he had made it clear for everyone what utter humiliation it was to obey a woman and allow... ill-mannered barbarians to be their rulers” ([196], Volume 3, page 245).

As we already know, the “ancient” Livy describes a similar situation, emphasizing the fact that the Tarquins had been of a foreign origin, which made their rule a disgrace for Rome. The following happened in the X century: “the Romans rose in indignation... the people grabbed whatever arms they had and... rushed to besiege the castle of St. Angelus, the residence of Hugo and Marozia. The king decided to flee, since he did not aspire to face out the siege” ([196], Volume 3, page 245). This is most probably a reflection of the event described by the “ancient” Titus Livy as the exile of the Tarquinian rulers from Rome. Both duplicates (Livy’s as well as the X century version) tell us of the king fleeing Rome and surviving the upheaval.

We learn some curious details concerning these events: “like a runaway galley-slave, he [King Hugo – A. F.] climbed across the wall using a rope... and hurried to the camp of his troops” ([196], Volume 3, page 245). The “ancient” Titus Livy tells us the exact same thing, reporting that the troops of the banished king Tarquin had been camped outside Rome. In the X century A.D. king Hugo “was forced to make his retreat with them, covered in dishonour... for he had lost his wife as well as the imperial crown” ([196], Volume 3, page 245).

Both duplicate versions that we have under study tell us that this event marks the end of the royal period in Rome; Titus Livy also tells us the “ancient” Valerius had become a de facto ruler of Rome with the aid of Brutus. We see the same motif in the X century: “the Romans managed to liberate themselves from the king, the emperor and the temporal power of the pope with just one blow, having claimed the city’s independence” ([196], Volume 3, page 245). According to the “ancient” Titus Livy, this is how the Roman Republic came into being. The parallelism that we observe here is a very explicit one.

Alberic was “pronounced ruler of Rome... his first action had been the incarceration

of his mother [Marozia – A. F.]” ([196], Volume 3, page 245). One should bear in mind the similarities in the Gothic War, namely, queen Amalasuntha thrown into prison, qv above. F. Gregorovius is perfectly correct to point out that “the masterminds of this uprising had been of noble birth, and thus Rome transformed into a republic for the patriciate” ([196], Volume 3, page 245). This is exactly how Livy describes the proclamation of the “ancient” republic.

Further we learn that “the revolution of 932 made away with the illegitimate power of a woman who abused the power of her gens... and her husbands, who had not been Roman [sic! – A. F.]” ([196], Volume 3, page 245). The “ancient” Titus Livy was telling us the same story: the Romans overthrew the power of Tarquin, a foreigner, and his hyper-ambitious wife Tanaquil. We see this parallelism with the Tarquinian war continue into the X century: “the exile of Hugo [or the Exile of the Kings in Livy’s rendition – A. F.] was the means used by the Romans to make a loud and clear statement that they would never accept foreign rule, neither royal nor imperial, and that the ruling power should be of a national origin... Rome transforms into a free secular state” ([196], Volume 3, page 246).

As is the case with “Livy’s ancient Rome”, the Republican senate “makes a sudden comeback” in the X century. We are surprised to discover the fact that “the historians of the IX and X century make numerous references to the Senate, likewise the documents of the epoch. Since the revival of the Roman Empire, when the titles of Emperor and Augustus were restored and even the post-consulate of the emperors made a comeback [cf. the “ancient” Rome – A. F.], memories of the old days became animated again... the word “Senate” was used often enough for us to encounter it among the decrees of some church council” ([196], Volume 3, page 247).

Therefore, the historians who deny “the effective functioning of the Senate” in mediaeval Rome have reasons to reconsider their point of view. We see all of the so-called “ancient institutions” present in mediaeval Rome – not as “vague recollections” of any sort, as we are told nowadays, but rather as real and valid structures of Roman power. The only question that remains concerns the geographical identity of Rome in question; as we already mentioned many a time, it is most likely that the city in question is the New Rome on the Bosphorus, or some other Rome – however, it could not have been the Italian Rome due to the nonexistence of the latter in the epochs preceding the XIV century (in its capacity of a capital, at least).

13) *The Empire of the X-XIII century. The X century Alberic = the “ancient”*

Valerius. According to Titus Livy, Publius Valerius, the leader of the Romans, becomes consul in the very first days of the “ancient” Roman republic. We observe the same in the X century: the Romans vest all power in Alberic: “having made him [Alberic – A. F.] a lifelong consul, the Romans have marked his exclusive powers in the new Roman Republic [sic! – A. F.] by the title of the Senator of All Romans” ([196], Volume 3, page 250). All of the abovementioned events follow the version of the “ancient” Titus Livy almost word for word.

14) *The Empire of the X-XIII Century. The demise of Alberic in the X century and the inauguration of his son Octavian*. “Ancient” history describes it as the death of Julius Caesar and the inauguration of his stepson Octavian Augustus. The motif of the Greek woman Helen, who had played an important role in that epoch, is prominent in the course of the Trojan War. The X century chronicles also emphasise the Greek connections of Alberic. It is said that “Alberic’s aspirations to the hand of a Greek princess had been frustrated... this marriage did not take place. The successes of the Greeks brought them closer to Rome day by day” ([196], Volume 3, page 255). The following events of “Alberic’s biography” – the wars with the banished king Hugo, the siege of Rome etc – are very similar to the respective events from the history of the Tarquinian War in the version of the “ancient” Titus Livy. We shall skip this material, since a list of all parallels would prove rather bulky, and the general concept of this particular parallelism is becoming quite clear, at any rate.

Alberic’s epoch in the X century is followed by that of his son Octavian. Bear in mind that the double of Alberic in the Second Roman Empire is none other but Julius Caesar. The following is told of the X century: “the temporal power vested in Alberic was inherited by his young son after the death of the father... we must... find the most honourable place amongst all mediaeval Romans for this “senator” [Alberic – A. F.]. The glory of Italy had become synonymous to his name in that epoch... he was worthy of being a Roman, and had deserved the title of Magnus [sic! – A. F.] well enough... the line of Alberic did not die with him and his son Octavian” [196], Volume 3, page 270. As we shall see below, this X century Octavian becomes identified as the famous Octavian Augustus from the Second Empire.

6.4. The “ancient” Second Roman Empire in the X-XII century A.D. and the XIII-XVII century A.D.

Apart from the parallelism mentioned above, the respective historical currents of both

the Second Empire and the Holy Roman Empire of the X-XIII century have three famous and powerful rulers at their very beginning. Lucius Sulla, Pompey Magnus and Julius Caesar constitute such a triad in the Second Empire; in the Holy Empire of the X-XIII century we see a similar trinity consisting of Otho I (The Great), Otho II (The Fierce), and Otho III (the Red, or Chlorus – compare to the Third Empire). Let us now study their respective “biographies”.

15a. *Second Empire*. The famous emperor Octavian Augustus from the alleged I century B.C. – the beginning of the I century A.D. Let us remind the reader that Octavian Augustus had been the adopted son of Julius Caesar, qv in [Chron2](#), Chapter 1. It has to be pointed out that a large number of “ancient” golden coinage minted under Octavian Augustus had reached our day. The numismatic catalogue [\[1142\]](#) dedicates several pages to the description of these coins ([\[1142\]](#), pages 44-46). As we shall witness, this “ancient Octavian” is also a prominent figure in the Scaligerian history of the alleged X century A.D.

■ 15b. *Empire of the X-XIII century*. The mediaeval Octavian from the X century A.D. The immediate predecessor of Otho I is Octavian, the son of Alberic. Bear in mind that the mediaeval Alberic is a double of the “ancient” Valerius, or Julius Caesar, qv above. The name Alberic (or Alveric) is somewhat similar to that of Valerius. F. Gregorovius tells us that “upon the demise of Alberic, his young son... Octavian became recognized as the legitimate ruler and senator of all Romans, with no objections from any part... he inherited full temporal power... no coins from Octavian’s epoch have survived until the present day, but it is certain that he had minted coins with his name and title engraved thereupon” ([196], Volume 3, page 278. Let us point out that “ancient” coins of the “ancient” Octavian Augustus had no problems with surviving until our age, qv above. Therefore, these golden coins were probably minted by the mediaeval Octavian in the alleged X century and subsequently thrown backwards in time, winding up in the phantom Second Empire and having thus effectively disappeared from the Middle Ages. And so, what we see in the numismatic catalogue that we are referring to is but a variety of mediaeval Octavian’s coins – the ones ascribed to the “ancient Octavian”.

16a. *Second Empire*. The “ancient” Octavian Augustus, stepson of Julius Caesar, had been 19 when he was crowned emperor in Rome. See [Chron2](#), Chapter 1.

■ 16b. *Empire of the X-XIII century*. Virtually the same is reported of the

mediaeval Octavian: “Octavian [son of Alberic, Julius Caesar’s double – A. F.] had hardly been 16 years of age when he became the ruler of Rome” ([196], Volume 3, page 278). The identification of the “ancient Octavian” as his mediaeval namesake that was made with the use of our empirico-statistical methods had been manifest in certain episodes before; an expert in the history of the “ancient” and mediaeval Rome of such magnitude as Gregorovius couldn’t fail to notice the parallelism in question. This is how he comments upon it: “pride and ambition made Alberic call his son Octavian, possibly harbouring the bold hope that his line would become imperial at some point” ([196], Volume 3, page 278).

17a. *Second Empire*. The “ancient” Octavian had received the title “Augustus” (The Holy). He had been both the temporal and the ecclesial leader of the Second Empire ([327]). This concurs well with the fact that his mediaeval double and namesake had occupied the Holy Papal See, as we shall witness below ([196], Volume 3, page 278).

■ 17b. *Empire of the X-XIII century*. “In autumn 955... the young ruler of the Romans becomes a pope. No one, excepting the Soractine scribe, mentions Octavian receiving any kind of theological education... Octavian had changed his emperor’s name to that of John XII” ([196], Volume 3, page 278). Also bear in mind that the “ancient” Octavian remained the temporal ruler of Rome after having received the title of Augustus (the Holy); the same is true for his mediaeval namesake, who remained the temporal ruler of Rome despite his holy papal title. “However, John’s [XII – A. F.] propensity for being a secular ruler was a lot greater than his willingness to take on ecclesiastical duties, and so his two natures – Octavian’s and John’s, were locked together in unequal struggle... Pope John XII... had given praises to the ancient gods” ([196], Volume 3, page 279). What we observe here is easily understandable. We see Gregorovius the historian run into multiple indications suggesting mediaeval Rome to be full of “anachronisms”, which makes him theorize about mediaeval Romans being extremely fond of “recollecting the antiquity” and “reviving ancient customs”.

18a. *Second Empire*. The “ancient” Octavian Augustus spreads the Roman influence over vast territories ([327]).

■ 18b. *Empire of the X-XIII century*. The mediaeval Octavian does the same. “We know little about the state of affairs in Rome in the first years of John’s

pontificate... the young man... being both the sovereign and the pope, decided to launch several daring projects and extend his power far into the South” ([196], Volume 3, page 279).

19a. *Second Empire*. The “ancient” Octavian Augustus had reigned for 37 years: 23 B.C. to 14 A.D., qv in *CHRON2*, Chapter 1. He was succeeded by Tiberius, who had ruled for 23 years between the alleged years 14 and 37 A.D.

■ 19b. *Empire of the X-XIII century*. The mediaeval Octavian soon hands power over to Otho I the Great, who succeeds Octavian in a peaceful manner and proceeds with making Rome a stronger state. Octavian crowns Otho I in the alleged year 962: “Imperial power was thus... handed over to a foreign house of Saxon kings. One of Charles’ greatest successors was crowned by a Roman, whose name had been Octavian – what a bizarre twist of fate!” – as we can see, Gregorovius remains perplexed ([196], Volume 3, pages 280-281). If this transfer of power had also given a new name to Otho I (that of Octavian, which is what some of the chroniclers believe), we get a very important reign length correspondence – Otho I had reigned for 37 years (936-973 A.D.) as a German king; the reign duration of his “ancient” double Octavian also equals 37 years, qv above. Furthermore, his successor, Otho II, had ruled for 23 years (960-983 A.D.), which equals the reign duration of his double, Emperor Tiberius, qv above.

20a. *Second Empire*. This empire fights large-scale wars in the East ([327]).

■ 20b. *Empire of the X-XIII century*. This is the epoch of the famous crusades. Once again, F. Gregorovius, being well aware of both the “ancient” and the mediaeval history of Rome, points out an obvious parallel: “these bicentenary military developments in Europe [the crusades – A. F.] were a very strong influence, *much like the Eastern Wars fought by the ancient Rome*” ([196], Volume 3, page 410).

21a. *Second Empire*. Lucius Sulla rules in Rome between the alleged years 82 and 78 B.C.; he had presumably been titled *Restitutor Urbis*, or “Restorer of the City (State)”. Lucius Aurelian, the first emperor of the Third Empire, is supposed to have possessed a similar title (see the parallelism described in [Chron2](#), Chapter 1). Therefore, we come across the title of “Restorer” in the early history of the Second Empire, likewise the Third, likewise the Holy Roman Empire of the X-XIII century

(Otho I had been titled similarly, qv above).

■ 21b. *The Habsburg (Nov-Gorod?) Empire*. A summary shift of 1386 years (1053 years + 333 years) identifies the Habsburg (Nov-Gorod?) Empire of the XIII-XVII century as the Second Roman Empire, qv in [Chron1](#), Chapter 6. This places the beginning of the “ancient Sulla’s reign” somewhere around 1304 A.D. The ruler that we see at the very beginning of the Habsburg Empire is Rudolf Habsburg (1273-1291). He is also known for his title of the “Restorer of the Empire” ([196], Volume 5, page 368). Scaligerian history therefore reports yet another “revival” of this sonorous title – however, these “revivals” are most likely to be of a mythical nature. Considering the shifts that we have discovered and discussed above, one sees several rulers with the same title of “Restorer” superimpose over each other and transform into the same king (from Nov-Gorod, or “New City”), who had founded the Empire at the end of the XIII – beginning of the XIV century A.D.

Commentary. The wrath of the XIII century Pope = the wrath of the “ancient” emperor Sulla. The parallelism between the Second Empire and the Habsburg Empire is so obvious that the historian F. Gregorovius could not fail to mention it in the following rather grandiloquent piece of commentary: “Palestrina [*Pale-Strana*, or Belaya Strana – the Slavic for “White Land”? – A. F.] surrendered to the pleas [of Pope Boniface – A. F.] Both cardinals... came dressed in funereal garments [in 1298 – A. F.]... and fell to the Pope’s feet... Palestrina and all of the fortifications... were surrendered instantly. Pope’s hatred for the mutineers... knew no limits. The punishment that he hastened to inflict upon Palestrina revealed his intentions. A strange fate poured the same cup of wrath over this city of fortune twice, with a long interval [one of 1386 years – A. F.]. After the capitulation of Praeneste, Sulla had levelled the town; 1400 years later [Gregorovius rounds 1386 off to 1400 – A. F.] the same town of Praeneste surrendered to the Pope, who had also stamped it out of existence with ancient Roman wrath” ([196], Volume 5, page 431).

In full accordance with the “ancient” events that were supposed to have taken place 1400 years earlier, “all of it ceased to exist in a mere couple of days... the ruins were ploughed over and salted. Boniface VIII apparently liked to emulate ancient Romans in his actions [theorizes Gregorovius – A. F.]” ([196], Volume 5, pages 432-433). The “emulated ancient Roman” in question is Sulla.

Therefore, according to the opinion of an eminent Scaligerite historian, the mediaeval Pope had been exceptionally well-read and fond of ancient history, trying to emulate the

“role models from the days of yore” in every which way. What we’re being told is that the pope artfully copied his own life from the “ancient books” – rising early in the morning just to open the “classics” on the right page and learn about the course of his actions for the day. All this bizarre and far-fetched explanatory activity becomes useless once we realise that what we see is but a manifestation of the chronological shift that has duplicated real mediaeval events and sent their copy into a distant epoch in the past (see fig. 2.89).

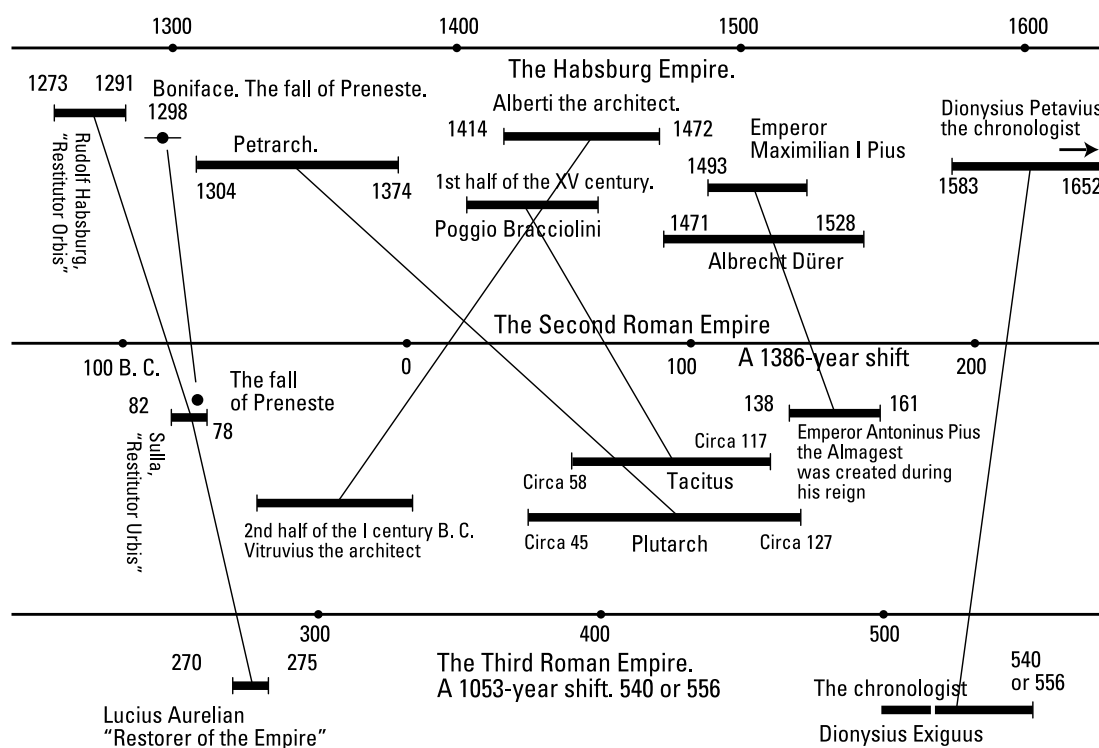

Fig. 2.89 Separate remarkable parallelisms between the Habsburg (Nov-Gorod?) Empire of the XIII-XVII century and the “ancient” Second = Third Roman Empire.

F. Gregorovius describes the end of the parallelism as follows: “he [Boniface – A. F.] had really destroyed one of Italy’s oldest cities, which had once perished in its ancient past... Boniface followed the example of Sulla, who had made a military colony settle on the site of the destroyed city, when he had ordered the wretched townsfolk... to build their new homes nearby. They built their huts upon a lowland” ([196], Volume 5, pages 432-433).

22a. *The Second Empire.* Ptolemy’s famous Almagest is supposed to have been written in the reign of Antoninus Pius, the Roman emperor who had reigned in the alleged years 138-161 A.D., qv in [ChronI](#), Chapter 1.

■ 22b. *The Habsburg (Nov-Gorod?) Empire*. The famous emperor Maximilian I reigns in 1493-1519 A.D. A shift of about 1386 years identifies his reign as that of the ancient Antoninus Pius (see fig. 2.89). Indeed, a summary shift of $1053 + 33 = 1386$ years places the “ancient” Antoninus Pius into the XVI century A.D., superimposed over the period of 1524-1547 A.D., which is close to the epoch of Maximilian I. Let us also remind the reader that it was in the reign of Maximilian I (1493-1519) and Maximilian II (1564-1576) that the publications of Ptolemy’s *Almagest* began – presumably “re-discovered at last” after many centuries of oblivion. The first Latin edition comes out in 1537, the Greek one – in 1538, the “translation” of the Trebizond edition is published in 1528 etc. Let us also recollect the fact that Maximilian’s name contains the formula Maximilian Kaiser Pius Augustus, qv in [Chron1](#), Chapter 6 (Dürer’s engravings). It turns out that the *Almagest* could really have been created in the XVI century A.D. “in the reign of Emperor Pius”, or Maximilian Pius, hence the reference to a “Pius” in the *Almagest*. Therefore, the XVI century author of the *Almagest* didn’t deceive anyone by the inclusion of the ruler regnant at the time of the observations. As we are beginning to realise, most of the latter took place under Maximilian I; however, some of the data – the star catalogue, for instance – could have been obtained from earlier works on astronomy – those dating to the XI-XV century A.D. See [Chron3](#), and also fig. 2.89.

23a. *The Second Empire*. The second half of the alleged I century A.D. is marked by the activity of the famous Vitruvius, “a Roman architect and engineer... the author of the tractate entitled *Ten Books on Architecture* containing a study of many issues pertinent to urbanism, engineering, technology and art, and encapsulating the entire body of Greek and Roman architectonic science” ([797], page 227). Modern scientists have made numerous references to the far-reaching parallels between the works of the “ancient Vitruvius” and the mediaeval architect Alberti ([\[18\]](#) and [\[544\]](#)).

■ 23b. *The Habsburg (Nov-Gorod?) Empire*. The famous Italian architect Leon Battista Alberti (1414-1471) lives and works in the XV century ([\[18\]](#), page 3). In Chapter 1 of [Chron1](#) we point out obvious parallels between his work and that of the “ancient” Vitruvius ([\[18\]](#) and [\[544\]](#)). In particular, Alberti writes a famous tractate in the XV century that happens to bear the very same name – *Ten Books on Architecture* ([\[18\]](#), page 50). It turns out that a shift of approximately 1386 years makes the epochs of Vitruvius and Alberti coincide for the most part, qv in fig. 2.89. Apparently, the

“ancient Roman architect Vitruvius” is merely a phantom reflection of the mediaeval Italian architect Alberti. Even the name “Vitruvius” contains what can be seen as traces of “Alberti” (or “Alverti”). Scaligerian history had created an ink-and-paper duplicate of Alberti and sent it 1400 years backwards in time, where it had transformed into “the great ancient scientist Vitruvius”, whilst the original remained in its due place. We did not compare their “biographies” in detail, which would be an interesting undertaking.

24a. *The Second Empire*. The famous Roman historian Tacitus is said to have been active in Rome around the alleged years 58-117 A.D. ([797], page 1304). Some of his books contain descriptions of “the ancient Rome”.

■ 24b. *The Habsburg (Nov-Gorod?) Empire*. In Chapter 7 of [Chronl](#) we were telling the readers about Poggio Bracciolini, a famous Renaissance writer who had lived in the first half of the XV century ([\[21\]](#), [\[1195\]](#) and [\[1379\]](#)). Scientific literature contains many rather explicit indications of the fact that Poggio himself had in fact written the “ancient œuvres of Tacitus” that he had “discovered” ([\[1195\]](#) and [\[1379\]](#)). As we understand now, the 1386-year shift does indeed superimpose the epoch of the “ancient Tacitus” over that of the mediaeval Poggio Bracciolini (see fig. 2.89). Ergo, what we observe here is most probably yet another case of what had happened to Vitruvius and Alberti – “Tacitus” is but an alias of the XV century writer Poggio Bracciolini, who had spawned a doppelgänger on the pages of the Scaligerian history – one that wound up in the alleged I century A.D. under the name of Tacitus, while the original remained in the XV century.

25a. *The Second Empire*. The famous “ancient” Greek writer and historian Plutarch is active in the alleged years 45-127 A.D. ([797], page 1012).

■ 25b. *The Habsburg (Nov-Gorod?) Empire*. The famous writer and poet Petrarch is active in Rome in the XIV century (1303-1374; see [797], page 993. In Chapter 7 of [Chronl](#) we entertained the idea that the “ancient Plutarch” might be a phantom reflection of the mediaeval Petrarch. In addition to those considerations, we discover that a shift of approximately 1386 years brings the two epochs close together, qv in fig. 2.89. By the way, this scheme demonstrates that Petrarch “predates” Plutarch on the time axis. According to another theory that we propose in the same chapter, the dating of Petrarch’s lifetime needs to be brought somewhat closer to our epoch.

26a. *The Second Empire*. We can call this empire “Holy” in the sense that all of its rulers, beginning with Octavian, bear the title “Augustus” – “Holy”.

■ 26b. *The Empire of the X-XIII century*. Its official name is “The Holy Roman Empire”, and it has been known as such ever since the XII century. Historians are of the opinion that this empire had been a “holy institution” ([459], Volume 1, page 153).

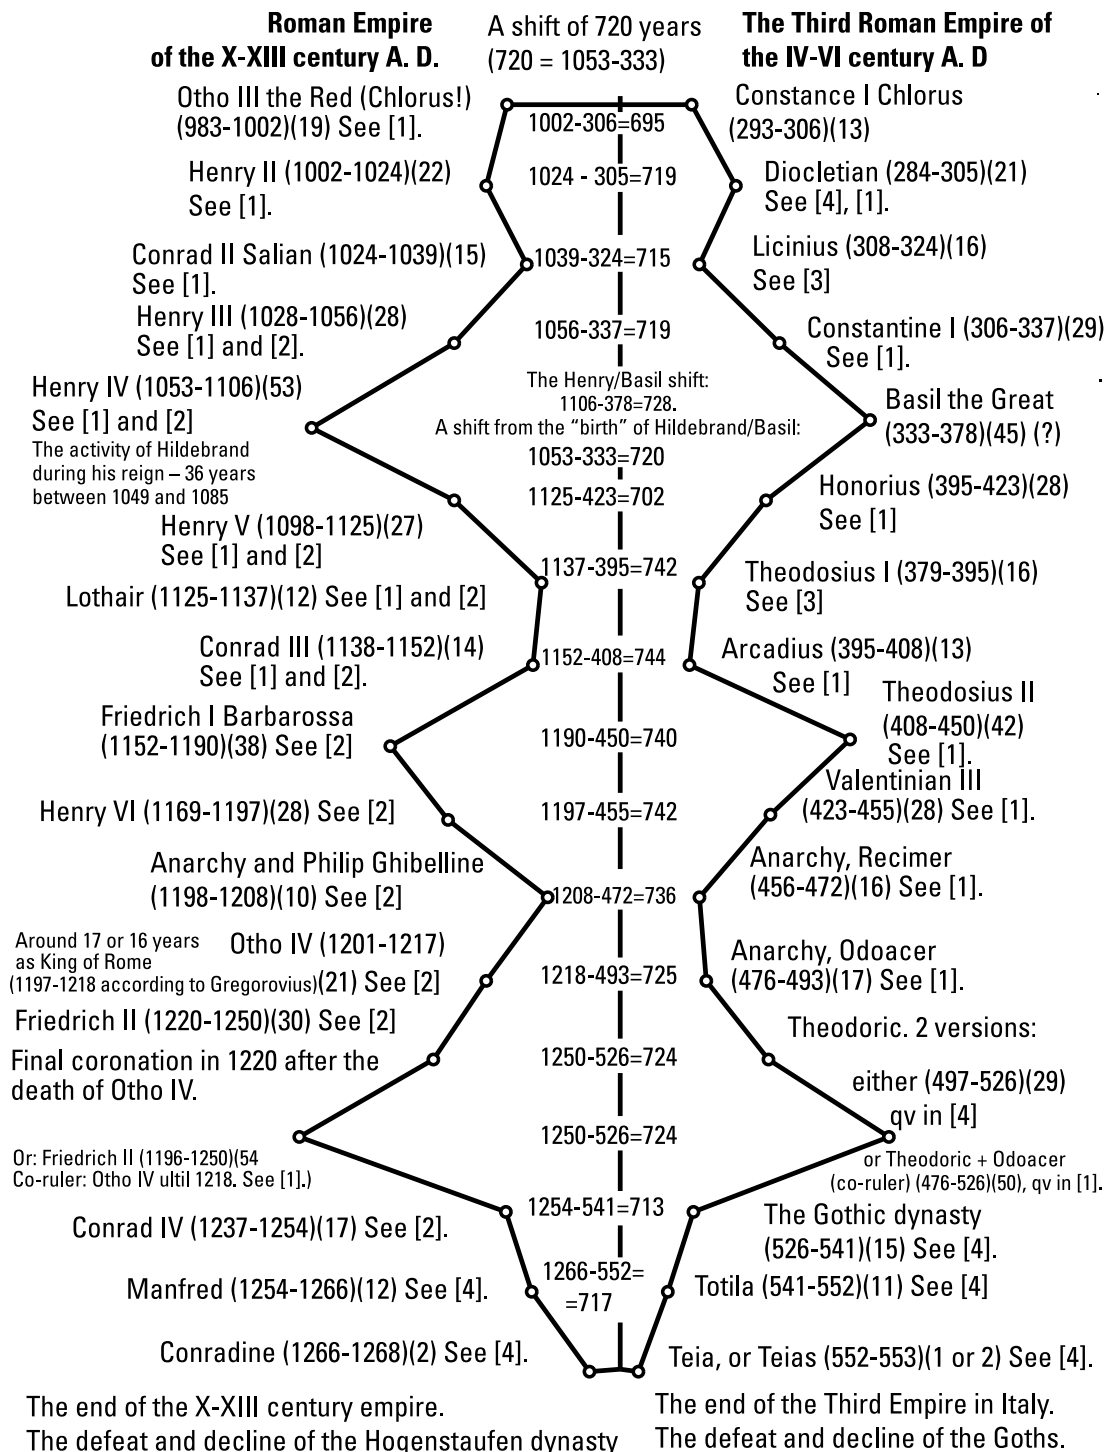

27a. *The Second Empire*. The “ancient” emperor Marcus Aurelius had reigned in the alleged years 161-180 A.D.

■ 27b. *The Empire of the X-XIII century*. A shift of approximately 1053 lifts Marcus Aurelius into the late XII century at the very least, and identifies him as Emperor Otho IV the Guelph (1198-1218). In Chapter 7 of [Chron1](#) we report that, according to certain mediaeval sources, the famous equestrian statue of Marcus Aurelius was made in the XII century and presumably erected in Rome ([196], Volume 4, page 568), comment 74. All of that notwithstanding, this statue is also considered “extremely ancient” – an artefact of the Second Empire, no less. It is one of the most famous “ancient” Roman relics. The explanation of this fact already presented itself to us: the “ancient Marcus Aurelius” is merely a reflection of Otho IV; therefore, his statue could not have been erected before the XII century, and its “journey backwards in time” is merely a consequence of the erroneous Scaligerian chronology.

6.5. Identifying the Third Roman Empire as the Holy Roman Empire of the X-XIII century as well as the Habsburg Empire of the XIV-XVII century. A 720-year shift and a 1053-year shift

In fig. 2.90 we see the already familiar parallelism between the Third Roman Empire of the alleged III-VI century A.D. and the Holy Roman Empire of the alleged X-XIII century A.D. The proximity coefficient here equals 2.3×10^{-10} , qv in [Chron1](#), Chapter 6. The superimposition is observed with a 720-year shift; the primary common points are as follows:

Average reign end shift equals 723 years, which is close to 720.

- [1] J. Blair, "Chronological Tables." Volumes 1 and 2. Moscow University Press, 1808-1809.
- [2] C. Bemont and G. Monod, "Histoire de l'Europe au Moyen Age." Petrograd, 1915.
- [3] R. Cagnat, Cours d'épigraphie latine. 4 ed. Paris, 1914.
- [4] F. Gregorovius, "History of Rome in the Middle Ages." St. Petersburg, 1902-1912.

Fig. 2.90 The parallelism between the "ancient" Third Roman Empire of the alleged III-VI century A.D. and the Holy Roman Empire of the alleged X-XIII century A.D.

1) *Empire of the X-XIII century. The mediaeval Frederick II = the “ancient” Theodoric.*

The end of Friedrich’s reign in the mediaeval Holy Roman Empire of the X-XIII century (namely, the alleged year 1250) coincides with the last reign year of Theodoric the Goth – 526 A.D. (after a 724-year shift).

2) *Empire of the X-XIII century. The mediaeval Henry = the “ancient” Valens.*

The mediaeval pair of Emperor Henry IV and “Hildebrand the Roman Pontifex” becomes identified as the “ancient” couple of Emperor Henry IV and St. Basil the Great, his famous contemporary. Bear in mind that the death of “Hildebrand” in 1085 coincides with that of St. Basil in the alleged year 378 after a 707-year shift, which is very close to 720 years, the average value of the shift.

3) *Empire of the X-XIII century. The mediaeval Otho III “the Red” = the “ancient” Constance Chlorus.*

Furthermore, the mediaeval emperor Otho III (“the Red”), who died in the alleged year 1002, can be identified as the “ancient” emperor Constance I Chlorus, the latter being the word for “ginger”. We thus get a correspondence of names; both these emperors, in turn, merge into the single figure of the “ancient” Julius Caesar from the Second Empire, qv in Chapter 1 of [Chron2](#). It would be interesting to find out whether or not Julius Caesar had ginger hair.

4) *Empire of the X-XIII century. The mediaeval Conrad IV = the “ancient” Gothic kings.*

The mediaeval emperor Conrad IV (Horde Khan?) from the Holy Roman Empire of the X-XIII century becomes superimposed over the “ancient” dynasty of male Gothic rulers from the Third Empire after the shift – he had ruled after the death of Theodoric the Goth in the alleged year 526 A.D. and until the death of the Gothic king Totila in the alleged year 541 A.D.

5) *Empire of the X-XIII Century. The mediaeval Manfred = the “ancient” Totila.*

The mediaeval Manfred is identified as the “ancient” Totila, whilst the mediaeval Conradin’s double is the “ancient” Teia. The average date shift here equals 723 years – very close to 720. Let us relate the parallelism between the respective declines of both

empires (the Third and the Holy).

6) *Empire of the X-XIII century. The mediaeval embroilment = the “ancient” strife.*

History of the Third Empire tells us that Rome had been cast in turmoil and anarchy in the alleged year 455 A.D., which is the epoch of Recimer and his minions (see [Chron2](#), Chapter 1). A shift of 720 years reveals to us the fact that Recimer also has a double in the Holy Empire of the X-XIII century: the reign of Philip the Ghibelline also ends in turmoil and anarchy. According to F. Gregorovius, “in 1198 the last visible remains of imperial power in Rome were finally wiped out” ([196], Volume 5, page 13).

A war breaks out, likewise in the Third Empire ([196], Volume 5, page 21). “The war broke out anew at the end of the same year 1199, when the strong man Pandulf from Subur became senator” ([196], Volume 5, page 23). It is possible that this mediaeval Subur (a native of Subur – possibly Siberia, or *Sever* – “the North”) became reflected in the “distant past” as Emperor Libius Severus (the alleged years 461-465 A.D.)

7) *Empire of the X-XIII century. Mediaeval anarchy = “ancient” anarchy.*

The following rulers are considered to have been principal figures in the epoch of the Third Empire’s decline (455-476 A.D.): Petronius Maximus, Avitus, Majorian, Recimer, Libius Severus, Anthemius (Procopius), Olybrius, Julius Nepos and Romulus Augustulus ([\[72\]](#)). 720 years later we observe a similar situation in the mediaeval Holy Roman Empire of the X-XIII century: “Rome was divided by the two opposing factions – the papists and the democrats... this violent urban conflict had been of a political nature” ([196], Volume 5, page 27).

Apart from the good concurrence of dates after a 720-year shift, we also see very conspicuous parallels between names: the “ancient” Severus = the mediaeval Subur; the “ancient” Petronius = the mediaeval Petrus; the “ancient” Recimer = the mediaeval Rainerius ([196], Volume 5, page 27).

8) *Empire of the X-XIII century. The mediaeval Otho IV = the “ancient” Odoacer.*

We proceed to discover the superimposition of the mediaeval Otho IV over the “ancient” Odoacer. Their reign durations concur with each other very well indeed, qv in fig. 2.90. Otto IV is considered to have been German, whereas Odoacer had been the leader of the Germanic Heruli. The name Odoacer (Odo + CR) may have meant “Otho

the Kaiser” or “Otho the Czar”. The “ancient” Odoacer had ruled in Rome; the mediaeval Otho IV was “declared king upon the Capitol Hill” ([196], Volume 5, page 52).

9) *Empire of the X-XIII century. The mediaeval reign of Otho IV = the “ancient” reign of Odoacer.*

The mediaeval Otho IV had reigned for 21 years as a German king: 1197-1218. His double, the “ancient” Odoacer, remained on the throne for 17 years (476-493 A.D.) The following fact is most curious: according to Volume 5 of [196], the mediaeval Otho IV was crowned King of Rome in 1201, which makes his “Roman reign” *exactly 17 years long*, 1201-1218, which coincides with the reign duration of the “ancient” Odoacer completely.

10) *Empire of the X-XIII century. Parallels in the respective reign ends of the mediaeval Otho IV and the ancient Odoacer.*

The end of the “ancient” Odoacer’s career was in close relation to the activity of Theodoric the Goth, who had succeeded Odoacer on the Roman throne. Theodoric must have been a great deal younger than Odoacer. The career of Otho IV in the Holy Roman Empire of the X-XIII century is also closely linked to the early activities of Frederick II, who had also been a great deal younger than Otho IV.

11) *Empire of the X-XIII century. Mediaeval feud = “ancient” vendetta.*

In the Third Empire Odoacer is at feud with Theodoric. As one should rightly expect, in the Holy Empire of the X-XIII century Otho IV also has a feud with Frederick II: “Otho... had a mortal foe in the heir to the Hohenstaufen estate... Frederick’s youthful figure lurking in the distance would never fail to make a strong impression” ([196], Volume 5, page 57).

12) *Empire of the X-XIII century. The mediaeval Frederick = the “ancient” Theodoric.*

The “ancient” king Theodoric had been a Goth by birth, but his life was committed to the Third Roman Empire. The end of his reign marks the outbreak of the Gothic War of the alleged VI century. Similar events take place 720 years later, in the Holy Roman Empire of the X-XIII century: “Frederick became alien to the German nation from his early childhood... he had once again bound the destinies of Italy and Germany together,

having immersed both nations... into a ceaseless struggle that would take over a century to die out” ([196], Volume 5, page 57). The epoch in question is the XIII century.

13) *Empire of the X-XIII century. The mediaeval Friedrich Gattin = the “ancient” Theodoric the Goth.*

One cannot fail to notice the obvious similarity of the names Theodoric and Frederick (Friedrich). The “ancient” Theodoric had been king of the Goths; the title of his double, the mediaeval Friedrich (or Frederick – however, the I and not the II) also contains the word Goth in the form Gattin, qv on his coins in [\[1435\]](#), No 26 (the table). Furthermore, the word “Gattin” is very similar to the word “Hittite” – and we have already discovered the superimposition of the mediaeval Goths over the “ancient” biblical Hittites. Therefore, Friedrich must have been known as a Goth or a Hittite in the Middle Ages. It would also be appropriate to remember the German city of Göttingen – its name is probably derived from “Hettin” and “Gens”, or “the Hittite Gens”.

14) *Empire of the X-XIII century. The two mediaeval Fredericks = the two “ancient” Tarquins. Events of the XII-XIV century A.D. on the pages of the Bible.*

We have seen the two Tarquinian rulers of the First Roman Empire described by the “ancient” Titus Livy: the kings Tarquin the Ancient and Tarquin the Proud. A similar pair is present in the dynastic current of the Holy Empire in the X-XIII century – namely, the emperors Frederick I and Frederick II.

We have already pointed out the parallelism between the “ancient” Judean and Israelite kingdoms, and the Third Roman Empire. However, since the Third Empire is but a reflection of the Holy Roman Empire (X-XIII century) and the Habsburg Empire (XIII-XVII century), the Biblical kingdoms must also be reflections of the same empires. This was discovered independently with the use of the dynastic parallelism method, qv related in [Chron1](#), Chapter 6; also see [Chron6](#) for more details. We shall just examine one of such parallel scenarios herein.

Above we have already given an account of our discovery that Frederick II can be identified as Theodoric the Goth. One also has to bear in mind that a number of mediaeval documents dating to the XVI century confuse Friedrich (Frederick) I Barbarossa and Frederick II. For instance, we learn that one of the legends about Frederick II “was transposed into the biography of Frederick I, year 1519” ([459], Volume 1, page 220). Owing to the fact that Frederick I Barbarossa (Ross the Barbarian?) and Frederick II became reflected in the phantom past as the “Tarquinian

pair”, there may be similar confusion in their respective “biographies”.

14a. *Empire of the X-XIII century*. Frederick II or Frederick I. Frederick I Barbarossa is a Roman and German emperor. He fights against Rome in 1167; his primary Roman opponent is Pope Alexander III ([196], Volume 4, page 483). Frederick I attacks Rome and suffers defeat ([196], Volume 4, pages 483-484). In fig. 2.91 we can see a mediaeval picture dating from the alleged year 1188 A.D. that portrays Frederick Barbarossa ([304], Volume 2, pages 294-295).

Fig. 2.91 Frederick Barbarossa dressed as a crusader. A miniature by an anonymous Bavarian clergyman, circa 1188. An exact copy from the original kept in the Library of Vatican. Taken from [304], Volume 2, pages 294-295.

■ 14b. *The Third Roman Empire*. Theodoric the Goth. He happens to be the ruler of both Rome and the Gothic Kingdom. Theodoric wages war on the New Rome; his troops are led by Vitalian. The main opponent of Theodoric is the Eastern Roman regent Anastasius, ruler of the New Rome. Vitalian leads Theodoric’s army against New Rome, but sustains a defeat.

■ ■ 14c. *The Bible*. II Kings. King Sennacherib. Sennacherib is the king of Assyria. As we have demonstrated above, Assyrians merge with the Goths, P-Russians, Germans or Russians. Sennacherib attacks Jerusalem, which once again becomes identified as the New Rome, or Constantinople. Sennacherib’s enemy is Hezekiah, king of Judah, whom we have already identified as Emperor Anastasius, qv in [Chron1](#), Chapter 6. Sennacherib launches an unsuccessful assault against Rome (II Kings 19:35).

14'a. *Empire of the X-XIII century*. This defeat of Emperor Frederick I Barbarossa (Ross the Barbarian?) is a well-known event in the history of the Middle Ages, described in mediaeval chronicles in the following manner (according to modern historians, the chronicle in question refers to the Bible, which presumably already existed at that time, and draws parallels with Biblical events): “And the Lord sent an angel, which cut off all mighty men of valour, and the leaders and captains in the camp of the king of Assyria. So he returned with shame of face to his own land.” (II Chronicles 32:31). Gregorovius insists that “such is the imagery that Thomas of Canterbury weaves when he congratulates Alexander III [presumably the Pope – A. F.] with the retreat of Sennacherib, whose army was destroyed by the Lord... nearly all of the chroniclers [in their rendition of Frederick’s rout – A. F.] speak of divine retribution” ([196], Volume 4, page 496, comment 89).

■ ■ 14'c. This is how the famous legend of Sennacherib, king of Assyria, and his defeat, is told by the Bible: “And it came to pass that night [when Sennacherib the Assyrian besieged Jerusalem – A. F.], that the angel of the Lord went out, and smote in the camp of the Assyrians an hundred fourscore and five thousand: and when they arose early in the morning, behold, they were all dead corpses. So Sennacherib king of Assyria departed, and went and returned, and dwelt at Nineveh” (II Kings 19:35-36).

Commentary. Nowadays historians try to convince us that the mediaeval chroniclers deliberately employed the “ancient” Biblical imagery due to the Bible’s long-term existence as a source of great authority that it had been customary to refer to, which is presumably the very reason why mediaeval scribes would often use archaic Biblical language to describe the events of their own epoch, disguising the contemporaneity in an “ancient Biblical attire”. Our results demonstrate that the reverse is more likely to have been the reality. Only parts of the Bible had existed back then, qv in [Chron1](#), Chapter 6; its entire bulk was created around that very epoch, the XI-XVI century. Therefore, what we see is not a case of chroniclers referring to the Bible, but rather that of assorted mediaeval chronicle fragments comprising the final canon of the Bible, which was created relatively recently – in the epoch of the XV-XVI century.

We shall conclude with some details pertinent to the abovementioned famous event (allegedly dating to the XII century A.D. – the defeat of Frederick Barbarossa, or possibly Ross the Barbarian, which would then become reflected in the second book of

the Kings as the defeat of Sennacherib, king of Assyria (Russia?). F. Gregorovius relates the contents of mediaeval chronicles in the following manner: “Rome became the second Jerusalem, with emperor Frederick playing the part of the loathsome Sennacherib. On 2 August [of the alleged year 1167 – A.D.] dark clouds erupted over the city in a thunderstorm; the malaria, which is so perilous here in August, assumed the semblance of plague. The elite of the invincible army died a honourless death; equestrians, infantry and sword-bearers alike would fall ill and perish, often unexpectedly, riding or walking along a street... Frederick lost his finest heroes in just seven days... death claimed a great multitude of hoi polloi and aristoi alike. Rome suffered from the plague just as much... the city hadn’t faced afflictions this horrendous for centuries... the Germans were gripped by panic; they were saying that the Lord poured his anger over them for attacking a holy city... the emperor was forced to break camp in despair already on 6 August; his army of ghostlike warriors set on their way back... more than 2000 of his people had died en route” ([196], Volume 4, page 484).

15) *Empire of the X-XIII century. The parallelism between the Roman campaigns of the mediaeval Otho IV and the “ancient” Odoacer.*

Likewise the “ancient” Odoacer, the mediaeval Otho IV the Guelph was “crowned king [of Germany – A. F.]... it had been declared that Otho would set forth against Rome” ([196], Volume 5, page 58). In full accordance with the scenario, the “ancient” Odoacer launches a campaign against Rome and conquers the city. We see history repeat itself in 720 years, when Otto IV gathers a great army in 1209 and conquers Rome after a successful campaign, becoming crowned king of Rome as a result. However, “the Senate and the armed citizens held the Capitol hill... the decisive battle took place in Leonine city; both sides sustained heavy casualties; finally, Otho managed to smite the opposition and become King and Emperor of Rome, conquering the entire Italy subsequently” ([196], Volume 5, page 66). Thus, the conquest of Italy by Otho in the Middle Ages became reflected as the Italian conquest of the “ancient” Odoacer after a shift of roughly 720 years backwards.

16) *Empire of the X-XIII century. The mediaeval Otho I = the mediaeval Otho IV.*

Actually, the 333-year shift is also manifest here. Indeed, 1209, the year Otho IV conquers Italy, becomes the year 976 after a shift of 333 years backwards. It is significant that the conquest of Italy by Otho I falls over this very year – more precisely, the period between 962 and 965. Otho I also conquers all of Italy; thus, certain

biographical fragments pertinent to Otho I may reflect passages from a more recent “biography” of Otho IV.

17) *Empire of the X-XIII century. The mediaeval Otto IV = the “ancient” Odoacer.*

The Pope summons young Frederick II to Italy so that he could assist him with getting rid of Otho IV ([196], Volume 5, page 66).

The “ancient reflection” of this event is a similar appeal of the Byzantine emperor Zeno to Theodoric the Goth – to lead the Gothic troops to Italy and rule there instead of Odoacer. We re-emphasize the superimposition of the mediaeval Hohenstaufen dynasty over the “ancient” *Goths*. In [Chron5](#) we also point out the parallel between the Goths and the nations of Gog and Magog – the Tartars and Mongols, in other words.

6.6. War of the XIII century as the original reflected in the “ancient” Trojan = Tarquinian = Gothic War

18) *Empire of the X-XIII century. The mediaeval war of the XIII century = the “ancient” Trojan = Tarquinian = Gothic War.*

Bear in mind that the Gothic War began when the hostile Greek troops had disembarked in Sicily. The Trojan version reflected this as the invasion of the “ancient” Greeks onto Isle Tenedos. We observe the same in the XIII century: Frederick II, the young king of Sicily in the Middle Ages, initiates an all-out war ([196], Volume 5, page 74).

His main ally was Anselm von Justingen ([196], Volume 5, page 71). We instantly recognize the “ancient” Justinian in this hero, the contemporary of the “ancient” Theodoric the Goth and the double of Frederick II. The Trojan = Gothic War is a crucial event in the “ancient” history; its original is the war of the XIII century A.D., of which we learn that “the moment that he [Pope Innocent – A. F.] had offered the King of Sicily [Frederick II – A. F.] to capture the Roman Crown had been one of the most fatal ones in the entire history of papacy. It had led to the struggle that proved destructive for both the church and the empire, and eventually the domination of the House of Anjou as well... as well as the “Avignon captivity” ([196], Volume 5, page 75). Below we shall see that the mediaeval “Avignon captivity” is the double of the “ancient” Babylonian captivity of the Judeans described in the Bible.

19) *Empire of the X-XIII century. The mediaeval couple of Otho IV and Frederick = the “ancient” couple of Odoacer and Theodoric.*

In 1212 Frederick II enters Rome as king, and becomes the de facto co-ruler of Otho IV, who hadn't been stripped of his rank yet. We see a carbon copy of this very situation in the "ancient" Third Empire, where Theodoric and Odoacer had ruled jointly for a while (see [Chron2](#), Chapter 1). Then Theodoric the Goth defeated Odoacer the German in the Third Empire; we see the same happen in the Holy Empire of the X-XIII century: "after his triumph over the wretched enemy [Otho IV – A. F.], whose glory was tarnished on 27 July 1214 after the Battle of Bouvines, Frederick II became crowned... in Aachen" ([196], Volume 5, page 78).

20) *Empire of the X-XIII century. The XIII century succession = the "ancient" succession.*

Theodoric proceeds to concentrate all power in his hands in the alleged year 493, after the death of Odoacer in the Third Empire. A similar scenario develops in the Holy Empire of the X-XIII century: Frederick II inherits absolute power in 1218, after the death of Otho IV, the double of the "ancient" Odoacer. The dates (1218 and 493) are 725 years apart, which is close to the 720-year value of the shift.

21) *Empire of the X-XIII century. The XIII century reforms = the "ancient" reforms.*

In 1220 Frederick II gives Rome a constitution and instigates serious reforms ([196], Volume 5, page 97). This activity resembles the legislation reforms of the "ancient" Theodoric a great deal (see [Chron2](#), Chapter 1). Just like the "ancient" kingdom of the Ostrogoths, the mediaeval Italian state of Friedrich II is also called a kingdom ([196], Volume 5, page 104).

22) *Empire of the X-XIII century. Parallels between the Middle Ages and the antiquity that F. Gregorovius could not fail to notice.*

The parallelism between the "ancient" Third Empire and the mediaeval Holy Roman Empire of the X-XIII century is conspicuous enough to have been commented upon by several historians in a variety of contexts. F. Gregorovius, for instance, writes that "in the Middle Ages, Viterbo had played the same role for the Romans as Veas in the antiquity... the Roman populace [in the middle of the XIII century – A. F.] was riding a new wave of inspiration; just as it had been done in the distant days of Camillus and Coriolanus [the epoch of the "ancient" Tarquinian War, according to Livy – A. F.], they set forth to conquer Tuscia and Latium... the battlefields would once again see Roman

banners bearing the ancient initials S.P.Q.R. against a golden-red field, as well as the national army of Roman citizens and their allies from vassal cities led by senators” ([196], Volume 5, pages 126-127). Gregorovius is also perplexed by the fact that “it is amazing how... the Romans recollected the Roman customs, having put up border stones with the initials S.P.Q.R. to mark the boundaries of Roman jurisdiction” ([196], Volume 5, pages 129-130).

23) *Empire of the X-XIII century. The mediaeval Roman colours = the “ancient” Roman colours.*

The official colours of the “ancient” Rome are considered to have been red and gold, qv above. However, we find out that the official colours of the mediaeval papal Rome had been the same: “red and gold remain the colours of the city of Rome until this day. It has been so since times immemorial, and the colours of the church had been the same... only in early XIX century the popes adopted white and gold as the ecclesial colours” ([196], Vol. 5, p. 141, comment 34).

24) *Empire of the X-XIII century. The XIII century titles = the “ancient” titles.*

We proceed to find out that “right about this time [in 1236 – A. F.], the Roman aristocracy had added another title to the ones already in use, one of ancient origins – Romans of noble birth have started calling themselves proconsuls of the Romans upon the occupation of a high rank in the city council, without so much as a shade of self-irony”, as Gregorovius tell us in amazement. “The ancient title of Consul Romanorum... had still been in use by that time” ([196], Volume 5, page 148).

We hear the voice of the “antiquity” ring loud and clear from the pages of mediaeval documents. To continue with quoting, “the loot taken at Milan was put up for demonstration on the Capitol hill, upon the *hastily erected ancient columns*” ([196], Vol. 5, p. 151).

25) *Empire of the X-XIII century. The mediaeval Peter de Vineis = the “ancient” Boetius.*

Let us reiterate that F. Gregorovius with his extensive knowledge of the Roman history keeps pointing out the parallels between the “antiquity” and the Middle Ages, which can be explained well by the chronological shifts that we have discovered. For instance, he writes that “the death of Peter de Vineis, the famous capuchin citizen, cast a black shadow over the life of the great emperor [Frederick – A. F.], just like the death

of Boetius had been the harbinger of Theodoric's demise [sic! – A. F.]. Both of these German kings [the mediaeval Frederick II and the “ancient” Theodoric – A. F.] resemble each other in what concerns the end of their lives as well as the fast and tragic decline of their gentes” ([196], Volume 5, pages 202-203).

Both the mediaeval Vineis and the “ancient” Boetius fell prey to the emperor's suspiciousness ([196], Volume 5, page 202). Kohlraush also compares Theodoric the Goth to Frederick II in [\[415\]](#), praising their wisdom and religious tolerance, among other things.

26) Empire of the X-XIII century. The XIII century Frederick II = the “ancient” Theodoric the Goth.

Kohlraush points out the following in his story of Frederick II: “he hadn't been of great utility to Germany because of his partiality to Italy... a great many Germans would follow the Hohenstaufens to Italy” ([\[415\]](#), Volume 1, page 309). We observe a similar process in the “ancient” Third Empire – namely, the “hoards of Goths” that fill Italy. Titus Livy reports the same telling us about the advent of the “ancient” Tarquins to Italy.

The “ancient” Theodoric dies a natural death, just like the mediaeval Frederick II. Both of them act as the last rulers of Italy before the outbreak of a disastrous war. One of the reign duration versions for Theodoric the Goth is 29 years (the alleged years 497-526 – see version #2 in [Chron2](#), Chapter 1). The Roman reign of Frederick II lasted 30 years. He was crowned in 1220 and died in 1250 ([\[5\]](#)). Reign durations are similar.

27) Empire of the X-XIII century. Frederick II as the “Pharaoh” in the XIII century.

F. Gregorovius refers to a number of ancient documents telling us that “Innocent IV had seen his great opponent [Frederick II – A. F.] as the very antichrist, or the *Pharaoh*” ([\[25\]](#), Volume 5, page 205). The term “Pharaoh” that appears here corresponds perfectly to the superimposition of the mediaeval epoch that we have under consideration presently over the Biblical description of the Trojan = Tarquinian = Gothic War, qv in [Chron2](#), Chapter 1.

When certain ancient documents use the word “Pharaoh” for referring to Frederick II, they confirm the parallelism between the mediaeval Roman history and the Biblical history of Israel and Judea. Frederick II had really been a pharaoh. However, we must also note that all these documents – papal epistles and the like – were edited in the XVII-XVIII century, when historians had already been of the opinion that the XIII

century war and the Biblical war with the pharaoh were two unrelated events. Therefore, the entire Biblical terminology was declared to be “referring to deep antiquity” in mediaeval documents, notwithstanding the fact that it had really referred to mediaeval contemporaneity. Another detail that drew our attention was that the name Innocent may have originally sounded as “John the Khan”.

28) *The X-XIII century Empire. Beginning of the XIII century war as the original of the Trojan = Tarquinian = Gothic War.*

The primary parallelisms with the “antiquity” are as follows. The mediaeval Conrad IV can be identified as the “ancient” group of Gothic kings from the alleged VI century: Amalaric + Athalaric + Theodahad + Vittigis + Uriah + Hildebald, their summary reigns adding up to the period between the alleged years 526 and 541 A.D.

Further on, we discover that the mediaeval Manfred = the “ancient” Totila, the mediaeval Conradin = the “ancient” Teias (Teia), the mediaeval Charles of Anjou = the “ancient” Narses, and the mediaeval Innocent = the “ancient” Justinian.

Thus, the reign of Conrad IV (1237-1254) becomes superimposed over the dynasty of the Gothic kings (excluding queen Amalasuntha) that had reigned in the alleged years 526-541 A.D. A comparison of durations gives us 17 and 15 years, respectively – almost equal values. In 1252 Conrad IV invades Italy, starting one of the greatest wars in European history, which would immerse the entire continent into the vortex of chaos for many a decade” ([196], Volume 5, page 213).

“The barons swore fealty to him... all cities up to Naples acknowledged his power” ([196], Volume 5, page 213). In the Gothic War of the alleged VI century, the ascension of the Goths to the Roman throne in 526-541 coincides with Justinian, Belisarius and Narses turning their attention to Italy and beginning an invasion. We see the same happen in the XIII century: “the achievements of Frederick’s sons [or, as we now understand, Theodoric’s “ancient Goths” – A. F.] made Innocent [John the Khan? – A. F.] set about the plan that was conceived a while back in Lyon... he decided to hand this kingdom over... to a foreign prince; this démarche proved fatal for Italy [a war began – A. F.]... he offered the crown of Sicily to Charles of Anjou, the brother of the French king” ([196], Volume 5, page 214).

29) *Empire of the X-XIII century. Identifying certain mediaeval characters as their “ancient” doubles.*

The mediaeval Charles of Anjou can therefore be identified as the “ancient”

Belisarius/Narses. Bear in mind that Narses the commander-in-chief acts as a successor of Belisarius in the Gothic War of the alleged VI century. Innocent [John the Khan?] becomes identified as emperor Justinian – “the just”.

If we’re to reverse the unvocalized root of Conrad’s name (CNRD), we shall get DRNC – or the already well-familiar TRNK – Trojans/Franks/Turks/Tartars. The name Conrad can also be a reference to “Horde-Khan”, or the Khan of the Horde. Also, the title of the mediaeval Manfred von Tarent (see [196], Volume 5) transcribes as TRNT unvocalized. It is likely to be yet another modification of the name TRQN which is already known quite well to us. Thus, the names of the two key leaders of the Hohenstaufen dynasty (the Gog dynasty?) that appeared on the historical arena after the death of Frederick II are distinctly similar to the name TRQN. A propos, the successor of Manfred and the one to end the war is Conradin, whose unvocalized name also gives a version of TRNK reversed. The name Conradin might also stand for “Khan-Horde”, “*KHAN ORDYNskiy*” (“Khan of the Horde”) or “*Khan Ratniy*” (“The Warlord Khan”).

30) *Empire of the X-XIII century. The XIII century Manfred = the “ancient” Totila.*

Conrad IV dies in 1254 “lamenting his fate and the misery of the empire whose decline he had foreseen” ([196], Volume 5, page 216). He is succeeded by the famous hero Manfred – the double of the “ancient” Gothic king Totila. Bear in mind that Totila had reigned for 11 years in 541-552. Manfred had ruled for 12 years, 1254 (the year Conrad IV died) to 1266, the year of his death on the battlefield. The same fate befalls his “ancient” double Totila (see [Chron2](#), Chapter 1). Thus, we see that the durations of the parallel reigns (11 and 12 years, respectively) concur well with each other.

31) *Empire of the X-XIII century. Brancalone in the XIII century and the “ancient” Goths.*

Before the very death of Conrad IV, temporal power in Rome is inherited by Senator Brancalone (BRNC + Leo?). This mediaeval Roman ruler had been an ally of Frederick II: “he has taken part in the Lombardian War fighting on the side of Frederick” ([196], Volume 5, page 226). Brancalone is a foreigner – not of Roman birth, which makes him similar to the “ancient” Goths.

“When the foreign senator arrived in the city that had called him, he was given a honourable welcome [just like the “ancient” Goths that had ruled in Rome after Theodoric – A. F.]... this had been the first time [since the alleged VI century – A. F.]

that the cream of the urban magistracy had consisted of foreigners exclusively” ([196], Volume 5, page 233). It is reported that “the spirit of the ancients... was reborn in this great citizen of Bologna [Brancalone – A. F.]” ([196], Volume 5, page 252).

It is most peculiar that there are no traces of Brancalone’s activities left anywhere in the Italian Rome – there are neither inscriptions nor monuments of any sort ([196], Volume 5). One is only right to wonder whether it is in fact true that the events in question took place in the city of Rome in Italy. Could it be that the chronicles were referring to an altogether different city – the New Rome on the Bosphorus, for instance?

32) Empire of the X-XIII century. Brancalone and Manfred in the XIII century = the “ancient” Goths.

The enemies of Conrad and Manfred (the doubles of the “ancient” TRQN clan and Totila) in the XIII century war are the Pope and his ally, Charles of Anjou. The Pope is the “master of Rome”, and thus can be regarded as the “primary ancient king” of the Trojan = Gothic War. The Pope attempts to drive Manfred out of Italy ([196], Volume 5). The “ancient” Justinian was doing the very same thing in the alleged VI century, chasing the Goths away from Italy. Troy suddenly surfaces in many ancient chronicles in the context of this mediaeval war – particularly the references to Naples, or the New City. We learn that “the legate fled Troy; his army was scattered, and he hurried to Naples” ([196], Volume 5, page 238). Brancalone in Rome and Manfred in Sicily enter into a pact, and face the “Pope/King” united, just like the “ancient” Goths.

33) Empire of the X-XIII century. Galeana/Helen in the XIII century = the “ancient” Helen.

The wife of the mediaeval Brancalone was called Galeana; her name is evidently similar to that of the Trojan Helen. Indeed, Helen (Helena) may well have been transcribed as Gelena or Galeana. Apart from that, there was a “real Helen” in the XIII century war – the wife of Manfred, a key historical figure of the epoch ([196], Volume 5, page 274). Moreover, this mediaeval Helen turns out to have been “a daughter of the despot of Epirus” ([196], Volume 5, page 174), which makes her Greek – likewise the “ancient” Trojan Helen.

34) Empire of the X-XIII century. The destructive war of the XIII century = the destructive Trojan War.

In the XIII century Italy was cast into utter devastation. For example, it is reported

that in 1257 more than 140 fortified towers were destroyed in Rome ([196], Volume 5, page 250); the city in question is most likely to have been the New Rome on the Bosphorus. The war had dire consequences for Germany as well: “exhausted by Italian wars [of mid-XIII century – A. F.], Germany drifted into a state of inner corruption and impuissance, which the old empire never truly emerged from again” ([196], Volume 5, page 267).

35) *Empire of the X-XIII century. The XIII century Charles of Anjou = the “ancient” Belisarius/Narses.*

In the Gothic war of the alleged VI century, the warlord Belisarius/Narses invades Italy from a foreign territory; the scenario “recurs” in about 720 years, when the Pope “made Italy open for a foreign ruler yet again, who had come filled with greed and whose victory eradicated the national mentality” in the XIII century ([196], Volume 5, page 276).

Charles of Anjou was rather unexpectedly elected senator in Rome; he is supposed to have come from France as the leader of the French army. We see yet another superimposition of the French (PRS) over the “ancient Persians” (PRS once again).

Let us remind the reader that in the “ancient” Gothic War the Byzantine army of the Roman Greeks invaded Sicily first, qv above. The mediaeval invasion of the XIII century began similarly – Charles of Anjou launched a campaign against Sicily, which had been the domain of Manfred, the double of the “ancient” Goth Totila. We learn the following: “the Sicilian campaign of Charles of Anjou ranks amongst the boldest and most victorious undertakings of the crusaders in that epoch” ([196], Volume 5, page 286). In 1266 Charles of Anjou becomes crowned King of Sicily. Once again, F. Gregorovius confirms the existence of a chronological shift without even being aware, pointing out the parallel that corresponds to the results of our research ideally. The text of Gregorovius deserves to be cited in its fullness:

“The sinister figure of Charles of Anjou enters the ancient arena that had seen many a battle between the Romanic and the Germanic nations just like Narses, whilst Manfred became the tragic representation of Totila. History made a cycle [sic! – A. F.] – although the balance of powers had been different, the actual scenario was virtually the same – the Pope summoning foreign invaders to Italy in order to liberate it from the German rule. The Swabian dynasty [of Frederick and the Conradines – A. F.] fell just like its Gothic predecessor. The amazing decline of both kingdoms and their heroes marks history by a double tragedy on the same classical arena, the second tragedy being

a twin of the first” ([196], Volume 5, page 287).

It has to be mentioned yet again that all the parallels pointed out by F. Gregorovius are explained perfectly by the system of chronological shifts discovered by the authors inside the “Scaligerian textbook”.

36) *The reasons why “King of Anjou” may have been read as “Narses”.*

The discovered superimposition of the mediaeval Charles of Anjou over the “ancient” Narses is unexpectedly confirmed by a comparative study of how these names were written.

The name Charles used to mean “king”, which is plainly visible on Charlemagne’s coins, for instance. On the XIII century coins we also see the name Charles transcribed as Karolus or Carolus ([196], Volume 5, page 296, comment 42) - “The King”, in other words. Therefore, the name Charles of Anjou may have simply meant “King of Anjou”, or Caesar (Cesar) D’Anjou; a shortened version would transcribe as Cesar-An; it obviously transforms into Narasec when read back to front, after the Hebraic or Arabic manner – virtually the same as “Narses”.

Therefore, some of the chroniclers may well have turned Charles of Anjou into Narses having reversed his name or vice versa. It goes without saying that the consideration in question is of a hypothetical nature and neither confirms nor disproves anything per se; however, in the row of consecutive parallelisms that we observe over a rather lengthy time period, it becomes worth something.

Let us conclude with the observation concerning Charles of Anjou being characterized as “a cold and taciturn tyrant” ([196], Volume 5, page 314) – in exactly the same terms as his “ancient” double Narses.

37) *The “exile of the kings” in the XIII century = the “ancient” exile of the kings.*

Bear in mind that in the Gothic War of the alleged VI century Belisarius captures Rome and banishes the Gothic kings that reign there ([695]). This event is identical to the exile of the kings described by Titus Livy ([\[482\]](#)). We see the same happen in the XIII century. Charles of Anjou, the double of the “ancient” Belisarius/Narses, captures the city of Rome: “his escapade of mad daring was accompanied by blind luck” ([196], Volume 5, page 287).

Charles of Anjou encounters no opposition in his invasion of Rome; his troops arrive from both the sea and dry land – the same happens in the VI century, qv in [196], Volume 5, pages 286-287. This “exile of the kings” from the XIII century Rome takes

place in a relatively peaceful manner, without excessive bloodshed. The same is reported by Livy in his rendition of the Tarquinian War, ([482]) as well as the history of the Gothic War by Procopius ([695]). For instance, according to Procopius, Belisarius entered Rome peacefully, already after the departure of the Gothic troops, qv above. The troops of Charles were met with similar exultation in the XIII century Rome.

38) *Empire of the X-XIII century. The “poverty” of Charles of Anjou in the XIII century = the poverty of the “ancient” Belisarius/Valerius.*

History of the alleged VI century characterizes Belisarius/Narses as a fortunate military leader. The same is told about the XIII century Charles of Anjou ([196], Volume 5, page 288). The motif of the “poverty” that befell Belisarius/Valerius is emphasized in the history of the Gothic War dating to the alleged VI century A.D. and the Tarquinian War of the alleged VI century B.C.

A similar scenario is constantly discussed in the chronicles referring to Charles of Anjou. Mark that the actual motif of a great hero being poverty-stricken is unique in itself, and its resurgence after many centuries cannot fail to draw our attention. We learn that “the Count of Anjou arrives in Rome empty-handed” ([196], Volume 5, page 288). As the XIII century war progressed, there were more references to the poverty of Charles, such as “Manfred... was well aware of just how great a need for money was experienced by Charles in Rome... it was seldom that an enterprise as great would be undertaken with such sparse funds... the poverty of Charles had been great, and his debts were numerous...” ([196], Volume 5, page 300). The lamentable financial condition of Charles of Anjou is described on several pages of [196], Volume 5 – 300 to 304.

39) *The XIII century quarrel with the Pope = the “ancient” quarrel with the “King of Kings”.*

The quarrel between Belisarius/Valerius/Achilles and the “main royalty” is paid a lot of attention in chronicles relating the events of the Gothic War (the alleged VI century A.D.), the Tarquinian War (the alleged VI century B.C.) and the Trojan War (the alleged XIII century B.C.), qv above. A similar event takes place in the XIII century.

What we see here is a somewhat odd quarrel between the Pope and Charles of Anjou, which is supposed to have happened “because of a house [sic!]” ([196], Volume 5, page 289). And it was precisely that, “a dwelling-place”, which served as reason for Valerius being accused of treason (see above). The XIII century events unfurled as

follows: Charles of Anjou, upon his arrival in Rome, “had occupied quarters in Lateran without giving it a second thought” ([196], Volume 5, page 289). This had infuriated the pope, which led to a quarrel. Despite the fact that Charles had found a different residence eventually, animosity prevailed in his interactions with the pontiff, since both had suspected each other of harbouring ambitions to seize absolute power. This opposition becomes particularly pronounced towards the end of the XIII century war ([196], Volume 5, page 303). We have witnessed the same happen in the “ancient” biographies of Narses, Valerius and Achilles.

40) *Empire of the X-XIII century. The XIII century letter to the Romans = the “ancient” letter to the Romans.*

Narses was appointed vice-regent of Italy in the Gothic War of the alleged VI century, whereas his double, Charles of Anjou, received the right of “temporary rule with terms defined in the agreement” ([196], Volume 5, page 290). The situations are similar.

Furthermore, the chronicles of both the Gothic War and the Tarquinian War tell us that the king who had been banished from Rome addressed an admonitory epistle to the Romans, *qv* above. This missive is discussed in detail by the chroniclers of both duplicate wars, and deemed extremely important - Titus Livy and Procopius even quote its content. The same thing happens in the XIII century. Manfred, the double of the Goths and the Tarquins, sends a letter to the Romans. The second chapter of the 10th book from Volume 5 of [196] begins with a special paragraph entitled “Manfred’s epistle to the Romans” ([196], Volume 5, 298). Manfred’s missive is similar to its “ancient” duplicates from the Gothic and the Tarquinian versions.

41) *Empire of the X-XIII century. The XIII century Battle of Troy = the “ancient” Battle of Troy.*

The final phase of the Gothic War in the alleged VI century is marked by the brilliant victories of Belisarius and Narses; the XIII century war ends similarly.

We learn that “the conquest of Charles had been nothing but... endless scenes of disruption, misery and death. This campaign is distinguished by the rampancy and the ferocity of the French [PRS = Persians or P-Russians – A. F.]... the French started with assaulting the Cyclopean castle of Arce that stood on a steep slope and was considered an impregnable fortress [successfully – A. F.]... the entire vicinage was shaken by so unanticipated an event: 32 fortresses capitulated to Charles” ([196], Volume 5, page

305).

The fall of the New City = Naples = Troy signifies the culmination of the Trojan = Gothic War. We see the same events recur in the XIII century: the fierce battle of Beneventes and the New City (Naples, which is located in the vicinity of Beneventes) taken. The famous Italian city of Troy is located nearby (it exists to this day); we find out that “the Greeks had built a fortified town not far from Beneventes [the epoch in question is mediaeval – A. F.] and named it after the immortal city of Troy” ([196], Volume 4, page 20). Apparently, this name appeared in Italy as recently as the XIII century, when the entire country was occupied by the troops of the king known to modern historians as Charles of Anjou. Then the events of the XIII century Trojan War were copied into the Italian chronicles; their epicentre had originally been in the New City = the New Rome on the Bosphorus. We can thus compile the following parallelism table:

a. The Trojan version of the alleged XIII century B.C.: 1) The battle of Troy. 2) The fall of Troy.

■ *b.* The Gothic version of the alleged VI century A.D.: 1) The New City (Naples) captured. 2) The final battle of Naples (New City). The death of Totila, King of the Goths.

■ ■ *c.* The war of the X-XIII century A.D.:

1. The battle of Beneventes (in the vicinity of Troy and the New City, or Naples).
2. The fall of Beneventes and the New City. The death of Manfred (the double of Totila, King of the Goths).

42) *Fierce battles of the XIII century war = the “ancient” Battle of Troy.*

Let us provide a brief rendition of the final phase of the XIII century war, since it had most probably served as the original for all the “ancient” wars – the Gothic, the Trojan and the Tarquinian. However, we must re-emphasize that the Scaligerian rendition of this war known to us today is very likely to contain severe distortions, the first of them being the transfer of the key events from the New Rome on the Bosphorus to Italy, which had not possessed any sort of capital in Rome at that epoch.

Manfred, the double of Totila the Goth, “hastened to move his troops to Beneventes in order to block the passage to Naples [New City – A. F.] for Charles and engage in battle with the latter” ([196], Volume 5, page 307). The fall of the New City (Naples =

Troy) is considered a great and tragic event in the “ancient” history of the Gothic War and the Trojan War, likewise the final battle at the walls of the city. We are told the same about the XIII century war: “each of the parties had 25.000 people maximum. It took several hours to bring the long and terrible war between the church and the empire, as well as the Romanic and Germanic peoples, to its final conclusion on a two-by-twice battlefield” ([196], Volume 5, page 309).

The looting and the destruction of the “ancient” Troy = New City after its fall is emphasized in both the Gothic and the Trojan version; the destruction of Beneventes is described in similar terms ([196], Volume 5, page 313). After that, Charles of Anjou, the double of Belisarius = Valerius = Achilles “entered Naples triumphant... this was the advent of the French [PRS, or P-Russian – A. F.] tyranny” ([196], Volume 5, page 315).

43) *Empire of the X-XIII century. The death of young Manfred in the XIII century = the demise of young Totila in the alleged VI century.*

The double of Manfred – Totila, King of the Goths, dies in the last battle of the Gothic War – the battle of Naples, or the New City. The Goths are defeated.

The very same situation repeats in the XIII century: “the valiant Germans, [the army of Manfred – A. F.] the last representatives of the German nation that ceased to exist with Frederick II, had fought and fallen as doomed heroes, just like the ancient Goths” – Gregorovius doesn’t hesitate to point out the parallel in [196], Vol. 5, p. 310. Manfred is killed in this battle, and becomes a legendary hero of the XIII century (*ibid*).

Bear in mind that Totila, King of the Goths also dies a young man (see [196], Volume 1, and above) – likewise Manfred, his double: “Manfred died at 34; he had been as gallant as Totila in life and death alike. Just like this Gothic hero, whose brief life was full of glory, had restored the empire of Theodoric, Manfred made the Italian empire of Friedrich rise from the ruins and... fell prey to the luck of a foreign invader armed by the Pope” ([196], Volume 5, page 312).

Gregorovius is perfectly correct to point out the parallels between the “ancient” Totila and the XIII century Manfred as well as the “ancient” Theodoric, the XIII century Frederick II, and their respective empires.

We thus see that certain experienced historians would constantly refer to the most obvious parallels between the “antiquity” and the Middle Ages in a variety of contexts. However, they were forced to interpret them as either chance occurrences, or strange cyclic phenomena, trusting the Scaligerian history and possessing no objective dating

methods; either that, or they would ignore the multitude of such facts altogether. Either stance is easy to understand: they had no comprehension of the general picture of chronological shifts that spawn all such parallels.

44) *Empire of the X-XIII century. The tragic fate of the XIII century Helen = the tragic fate of the “ancient” Helen.*

A brief rendition of Helen’s biography in the history of the Trojan War is as follows: beauty – bride – war – death (see above and in [\[851\]](#)).

The very same scheme can be applied to the life of one of her originals, namely, Helen, the wife of Manfred in the XIII century. “The victor [Charles of Anjou – A. F.] had been a cold and taciturn tyrant. Helen, the young and beautiful wife of Manfred... fled... abandoned by the barons in her misery, she arrived in Trani, where she was welcomed with splendorous festivities as a princess in 1259” ([196], Volume 5, page 314).

Thus, we see the mediaeval town of Trani – or Troy, in other words, and so one can say that true history does in fact reach us through the documents of the Middle Ages, their thorough editing and processing by the Scaligerites in the XVII-XVIII century notwithstanding. Let us remind the reader that Helen had received a grandiose welcome in Troy, where she came with Paris (P-Russ?) as a Greek princess.

The fate of the “ancient” Helen was tragic: death, qv above and in [\[851\]](#). The very same thing happens in the XIII century: “Helen had died after five years of imprisonment [she was handed over to the mercenary cavalry of Charles of Anjou – A. F.]... her daughter Beatrice remained incarcerated for eighteen years in a fortress... in Naples” ([196], Volume 5, page 314). We already know the legend of the incarceration and death of a queen from the history of the Gothic War (Queen Amalasuntha, “the instigator of the war”). Let us point out that the old documents concerning Helen and Manfred are kept in Naples ([196], Volume 5, page 326, comment 37). It would be most interesting to study them now, from an altogether new viewpoint, since they are bound to contain a large amount of valuable data.

45) *Empire of the X-XIII century. Young Conradin succeeding Manfred in the XIII century = young Teias succeeding Totila in the “ancient” Gothic War.*

Let us remind the reader that the history of the Gothic War of the alleged VI century A.D. contains a very remarkable final episode – the story of the brief reign of Teias (Teia), the young king of the Goths who had succeeded Totila. Teia had reigned for two

years maximum – in 552-553; he died on the battlefield, and his death had decided the final outcome of the entire Gothic War.

The XIII century prototype of the “ancient” Teia is most probably the famous young hero Conradin (Horde Khan?), the last representative of the dying dynasty (presumably German). His brief career is practically identical to that of the “ancient” Teia. Conradin had been only 14 years of age when Manfred, the original of Totila, died. Gregorovius tells us the following: “political history knows very few such... cases as the destiny of this youth” ([196], Volume 5, p. 322). The “ancient” Teia had ruled for a year or two, allegedly in 552-553; the mediaeval Conradin’s reign length also equals 2 years (1266-1268, A.D., qv in [196], Volume 5, page 340). Their reign durations coincide.

46) Empire of the X-XIII century. The beheading of Conradin in the XIII century = the decapitation of the “ancient” Teia.

In 1268 Conradin (Horde Khan?) led his troops forth in an attempt to reclaim the crown of Manfred, the double of the “ancient” Totila. However, he was defeated by the army of Charles of Anjou ([196], Volume 5, pages 341-342). The “ancient” reflection of this event is the rout of Teia’s army in the battle with Narses in the alleged VI century.

An important detail of the “ancient” Gothic War is the decapitation of Teia the Goth. This episode is the only one of this kind in the entire history of the war, and a lot of symbolic meaning is attached thereto. We see the same happen in the XIII century: Conradin was beheaded in Naples (the New City, which figures as the double of Troy yet again) in 1268 ([196], Volume 5, page 348). This episode finalizes the history of the Gothic dynasty in Italy, whereas its double marks the end of the Swabian dynasty, which had “reached its final demise claiming Conradin as the last victim” ([196], Volume 5, page 349-350).

We shall conclude with the following detail of the parallelism that pertains to a different shift, the 333-year one. It identifies the Habsburg Empire as the Empire of the X-XIII century: “it is known that Conradin was executed in Naples... the marble statue of the last Hohenstaufen is kept in the church... it was erected by Maximilian II the Bavarian, and the remains of the wretched Swabian prince are buried under its pedestal” ([196], Volume 5, page 360, comment 66). Pay attention to the fact that a 333-year shift backwards transposes Maximilian II (1564-1576) into the period of 1231-1243, which is very close to Conradin’s epoch (the alleged years 1266-1268). The discrepancy is minute, considering the summary length of the empires compared – a

mere 25 years. It would be interesting to study the history of this statue, especially bearing in mind that Conradin had been from Bavaria, just like Maximilian II ([196], Volume 5, page 322).

47) *Empire of the X-XIII century. The death of Charles of Anjou in the XIII century = the death of the “ancient” Belisarius/Narses.*

The further biography of Charles is largely parallel to the final period of the military leader Belisarius/Narses in the alleged VI century. The quarrel between the Pope and Charles of Anjou develops despite their alliance in the struggle against the Conrads (Horde Khans?) in the XIII century. Charles of Anjou falls into disfavour, just like Belisarius, his “ancient” double. After that, Charles becomes “stripped of senatorial power” ([196], Volume 5, page 316).

The “ancient” reflection of this event (which took place in 1266) must be the legend of Valerius = Belisarius = Achilles falling from grace and losing power. It has to be emphasized that the “disfavour of Charles” preceded the final defeat of the Swabian dynasty in the XIII century. In exactly the same manner, the “ancient” disgrace of Belisarius (the Great King?) began before the final defeat of the Goths in the alleged VI century. The parallel continues; one is to remember that Belisarius = Valerius was exculpated. Similarly, in the XIII century the Pope restores the influence of Charles after the disfavour. “He had even appointed the king [Charles – A. F] *paciarius*” ([196], Volume 5, 330). As a matter of fact, the senatorial palace in Rome still contains a statue of Charles of Anjou – or, as we understand now, the symbolic representation of Belisarius/Narses = Valerius = Achilles.

48) *Empire of the X-XIII century. The equestrian statue in the XIII century Naples and the “ancient” Trojan horse (aqueduct).*

The famous tale of the Trojan horse, or aqueduct, is known to us from the history of the Trojan – Gothic War, *qv* above. We could not find its complete reflection in the XIII century; however, we learn of an odd occurrence that deserves to be mentioned here. We have already discovered the siege of the New City (Naples) to be the duplicate of the siege of Troy. And so, it turns out that “there was a curse on Conrad [in the XIII century – the Horde Khan? - A. F.]... which didn’t stop him from conquering Naples; however, the Neapolitans have hated him ever since his order to put a rein on the old equestrian statue that stood on the city square and was revered as a political halidom” ([415], Volume 1, page 309).

Let us emphasize that the statue in question was that of a horse and not of a mounted person; therefore, the New City had a statue of a horse, most probably without a rider, standing on the city square – moreover, the statue was considered a political halidom of the city! This very circumstance is far from typical, and therefore draws our attention instantly. Indeed, does one see a statue of a horse without a rider on many city squares? It is most likely that what we see is yet another distorted version of the legend of the Trojan Horse – the one that the besieged Trojans are supposed to have brought into the city and mounted in the middle of a square.

One needn't get the impression that Kohlrausch, the author of the book that we are quoting from, mentions equestrian statues on every page – far from it. The entire first volume of his book, the one that deals with the history of the “ancient” and mediaeval Germany and Italy, only contains two references to a “horse statue” - the first one being to the Italian equestrian statue of the alleged VI century A.D., no less; the second – to the “political halidom” of the XIII century Naples (New City) that we were discussing above ([\[415\]](#), Volume 1, pages 166 and 309). It is significant that the first such reference should be made to the VI century A.D. - the epoch that the Gothic War is dated to nowadays.

49) *The Habsburg (Nov-Gorod?) Empire. Dionysius Petavius of the XVI-XVII century = the “ancient” Dionysius Exiguus.*

A 1053-year shift backwards identifies Dionysius Petavius, the famous chronologist, as his phantom colleague and namesake Dionysius Exiguus, who had lived in the alleged VI century A.D. and presumably died in 540 or 556 (see fig. 2.89). We already discussed the parallelism between these two characters in Chapter 6 of [Chron1](#), providing a table to illustrate it. Bear in mind that “*petavius*” is the Gallicized version of the name “little” (*petit*).

As we are beginning to understand, the falsification of ancient history and the introduction of the erroneous chronology are the fault of the school of J. Scaliger and D. Petavius; therefore, it shouldn't surprise us that the parallelism in the “Scaligerian history textbook” ends with none other but Dionysius Petavius.

Furthermore, his phantom duplicate, “Dionysius Exiguus” from the alleged VI century had calculated the date of Christ's birth as preceding his own time by 560 years and declared it the beginning of the “new era”. If we are to count 560 years backwards from the epoch of Dionysius Petavius, we shall come up with roughly the year 1050 A.D. Now, Petavius had lived in 1583-1652; therefore, the epoch that we come up with falls

on the middle of the XI century, which is the time when Jesus Christ had lived, according to the mediaeval tradition that we managed to reconstruct (one that contains a centenarian error). The character identified as Jesus had really lived in the XII century, qv in our book entitled *King of the Slavs*.

Therefore, Scaligerian history is more or less correct (in a way) when it tells us that Christ had been born some 500 years before Dionysius Exiguus. It just has to be elaborated that *under said character we have to understand the real chronologist Dionysius Petavius, who had died in 1652*. If we are to subtract roughly 500 years from this date, we shall come up with the middle of the XII century as the epoch when Christ had lived.

50) *The Habsburg (Nov-Gorod?) Empire. The orders of the Franciscans and the Dominicans.*

In 1534 Ignatius Loyola founded the famous monastic order of the Jesuits – “The Society of Jesus” (*Societas Jesu*), qv in [797], page 476. The order was officially established in 1540. This organization is considered to have been “a tool in the hands of the Counter-Reformation” ([797], page 476). A shift of 333 years backwards superimposes the foundation of the Jesuit order over that of the Dominican order around 1220, approximately 1215 ([797], page 406), as well as the foundation of the Franciscan order around the same time, in 1223 (the alleged years 1207–1220–1223). Ignatius Loyola dies in 1556, which becomes 1223 after a 333-year shift.

It is therefore possible that the Franciscan and the Dominican orders were but other names of the Jesuit order founded in the XVI century A.D. – its reflections, as it were.

As we are told nowadays, the struggle against the Reformation was defined as one of the Jesuit order’s primary objectives. It is also presumed that the Dominicans took charge of the Inquisition as early as the alleged year 1232 ([797], page 406).

Nowadays, “Dominicans” translates as “God’s Hounds” – however, the name may also be a derivative of the Slavic “*Dom Khana*” – “The Khan’s House”, or maybe “*Domini Khan*” – “The Divine Khan”. The actual word “order” may also be derived from the word “Horde”, which is considered to be of a “Tartar-Mongol” origin nowadays.

HISTORY: FICTION OR SCIENCE?

THE ISSUE WITH RUSSIAN HISTORY

About the authors

Overview of the e-Series

From the publisher

Foreword

Introduction

1. General considerations
2. Our conception in brief
3. The true identity of Mongolia and the Tartar and Mongol invasion.
The Cossacks and the Golden Horde
4. Batu-Khan was known as the Great Prince
5. The Romanovs, the Zakharyins and the Yuryins. Their role in
Russian chronography

PART ONE: Russian chronicles and the Millerian-Romanovian version of Russian history

1. The first attempts to write down the history of the ancient Russia
 - 1.1. The XVI-XVII century and the edict of Aleksey Mikhailovich
 - 1.2. The XVIII century: Miller
 - 1.3. Brief corollaries
2. Consensual version of Russian history and its genesis. The reasons why
all the founders of the Russian historical school were foreign
3. The Radzivilovskaya chronicle from Königsberg as the primary source
of the *Povest Vremennyh Let*
 - 3.1. The origins of the chronicle's most important copies
 - 3.2. The numeration of the chronicle's pages and the "bull's head"
watermark
4. Forged fragments of the *Radzivilovskaya Letopis* – the copy that served

as basis for the *Povest Vremennyh Let*

- 4.1. Publications of the *Radzivilovskaya Letopis*
- 4.2. History of the copy known as the *Radzivilovskaya Letopis*
- 4.3. A description of the chronicle
- 4.4. Story of a forgery. The mysterious “extra” page in the *Povest Vremennyh Let*
- 4.5. Who could have planted a page with the “Norman” theory into the *Povest Vremennyh Let*?
- 4.6. How the “scientific” Norman theory got dethroned and declared antiscientific
- 4.7. Having planted a page into the chronicle, the hoaxer prepared space for another, soon to be “fortunately found”. The chronology page of the *Radzivilovskaya Letopis*
- 4.8. The “Academic Moscow Copy” of the *Povest Vremennyh Let*
- 4.9. Other signs of forgery in the *Radzivilovskaya Letopis*
- 4.10. What is the chronicle that served as the original for the *Radzivilovskaya* chronicle, also known as the Königsberg chronicle?
- 4.11. Which city was the capital of the Polyane = Poles: Kiev or Smolensk?
- 4.12. The arrival of Peter in Königsberg
- 4.13. A brief summary of our analysis of the *Radzivilovskaya* chronicle

5. Other chronicles that describe the epochs before the XIII century

6. The publication rate of the Russian chronicles remains the same as time goes on

7. The traditional scheme of the ancient Russian history

- 7.1. The first period: from times immemorial to the middle of the IX century A.D.
- 7.2. The second period: from the middle of the IX century to the middle of the XII – the Kiev Russia starting with Ryurik and ending with Yuri Dolgoroukiy (of Rostov)
- 7.3. The third period: the Russia of Vladimir and Suzdal, starting with

the middle of the XII century and ending with Batu-Khan's conquest in 1237

7.4. The fourth period: the yoke of the Tartars and the Mongols, starting with the battle of Sit in 1238 and ending with the 1481 "Ougra opposition", which is considered to mark the "official end of the Great Yoke" nowadays

7.5. The fifth period: the Moscow Russia starting with Ivan III and ending with the Great Strife, or the enthronement of the Romanovs in 1613

7.6. The sixth period: dynasty of the Romanovs

PART TWO: The two chronological shifts inherent in the history of Russia

8. A general scheme of the parallelism

9. A brief description of the 100-year shift manifest in Russian history

10. A 400-year shift in Russian history and the resulting dynastic parallelism

What mainstream historians say about the New Chronology?

Bibliography

Introduction

1. General considerations

1) We must warn the reader that the ancient and mediaeval history known to us today (including that of Russia) is the furthest thing from obvious and self-implied – it is extremely vague and convoluted. In general, history of the epochs that predate the XV-XVI century and the invention of the printing press is anything but accounts of real events based on, and implied by, authentic ancient documents. On the contrary, historical events that predate the XVI-XVII century in their consensual version came into existence courtesy of historians and chronologists – several generations of those, in fact. They all attempted to reconstruct the events of the past. However, the resulting picture is hardly indubitable. And yet most of us are certain that reconstruction of past events is rather easy in principle, believing that it suffices to take a chronicle and translate it into the modern language. The only complications that may arise presumably concern details of minor importance and little else. This is what the school course of history makes us assume. Sadly, this is not the case.

2) History known to us nowadays is written history – based on written documents, in other words. All of them have been edited, revised, recompiled etc for a very long time. Some of the things are written in stone – however, these morsels of information only begin to make sense after the entire edifice of chronology is already constructed – and chronicles are the main construction material of history.

When we say that Brutus killed Caesar with a sword, the only thing it means is that some written source that managed to reach our time says so, and nothing but! The issue of just how faithfully documented history reflects real events is very complex and requires a special study. It is really a problem posed by the philosophy of history rather than documented history per se.

Readers are prone to thinking that nowadays we have chronicles written by the contemporaries of Genghis-Khan and eyewitnesses of the events that took place in his epoch. This isn't so. Nowadays we're most likely to have a rather late version at our disposal, one that postdates the actual events by several centuries.

It goes without saying that written documents reflect some sort of reality. However, one and the same real event could be reflected in a multitude of written documents – and very differently so; at times the difference is so great that the first impression one gets precludes one from believing the two to be different reflections of the same event. Therefore, phrases like “such-and-such historical figure is a duplicate of another character” that the reader shall encounter in the present book by no means imply the existence of two real characters, one of which is the doppelganger of another. This would make no sense whatsoever, obviously enough.

We are referring to an altogether different phenomenon – namely, the fact that our “history textbook” may contain several reflections of the same real character – Genghis-Khan, for instance. These reflections will have different names and be ascribed to different epochs. However, the person in question only became “duplicated” on paper and not in reality; as for the issue of just when and where a given person had lived, it is anything but easy. Another extremely contentious issue is that of a person's real name. The ancients would often have a multitude of names and nicknames; furthermore, they would receive new ones once they made their way into chronicles – names that their contemporaries had never used. Many factors may have come into play here – errors, confusion and distortions in translation. In the present work we do not envisage it as our goal to find out the exact names used by the contemporaries of historical figures for referring to the latter.

3) In one's study of written history, one must always bear in mind that words in general and names of people or places in particular may have attained different meanings with time. The name “Mongolia” is an

excellent example; we shall relate this in more detail below. Furthermore, many geographical names would migrate to new longitudes and latitudes with time. Geographical maps and the names inscribed thereupon have only become more or less uniform with the invention of the printing press, which made it feasible to produce many identical copies of the same map for the practical purposes of seafaring, learning etc. Before that epoch, each map had been unique, and usually at odds with other maps to some extent.

Characters that we're accustomed to consider "ancient" nowadays are frequently manifest in mediaeval maps as mediaeval heroes. Even historians recognize this rather noteworthy tendency, writing that "ancient characters are drawn on maps as mediaeval townsmen and knights" ([\[953\]](#), page 21).

Ancient texts would often transcribe names without vocalizations – no vowels at all, just the consonant root. Back in those days vocalizations would be added by the reader from memory. This would be especially manifest in Arabic languages, where virtually all the vowel sounds are memorized, and subject to a certain degree of randomness. And seeing how Arabic letters were used for some other languages besides Arabic in the Middle Ages, vowels would frequently become dropped in those languages as well, even if they had originally been more or less constant. Obviously enough, names were the first to be affected by this process.

Quite naturally, with the course of time the vowels would become confused for one another, forgotten or replaced with other vowels. Consonants set down in writing demonstrate higher stability. For instance, we may recollect that many ancient texts frequently allude to the "Greek Faith". However, it is possible that the word Greece is but a derivative of the name Horus, or Christos (Christ). In this case, the "Greek Faith" is nothing other than the Christian faith.

Russian history is naturally in close relation to global history. All kinds of chronological and geographical shifts one might find in Russian history invariably lead to the discovery of similar problems in history of other

countries. The reader must let go of the opinion that ancient history rests upon an immutable foundation – it appears that chronological problems do exist in history of Rome, Byzantium, Italy and Egypt. They are of an even graver nature than the problems of Russian history. See [Chron1](#), [Chron2](#) and [Chron3](#) for further reference.

4) The authors are naturally interested in the history of the ancient Russia, the Russian Empire and its closest neighbours the most. The knowledge of Russian history as a whole is extremely important and affects the very foundation of world civilization, and therefore its most crucial moments are to be studied with the utmost care and attention. Nowadays we are well familiar with numerous examples of how often certain historical facts become distorted to suit passing political trends. In [Chron1](#), [Chron2](#) and [Chron3](#) we have exposed a great many cases when such distortions became rigidified as indisputable truths that migrated from textbook to textbook. One must invest a gigantic amount of labour into “chiselling off later glazing” in order to pour light onto the true nature of the ancient events.

Historical distortions are unacceptable in any state’s history – as for the authors’ very own native history, the investigation needs to be conducted with the utmost clarity, and we have to opt for a completely unbiased approach. No authority can be recognized as such in these matters.

Why do we have to mention all of the above? The reason is that the consensual chronology of Russian history is full of grave contradictions. They were initially pointed out by Nikolai Morozov ([\[547\]](#)). However, our analysis demonstrates that he wasn’t even aware of the actual scale of the problem.

Russian history is considered to be relatively “young” by many historians nowadays, who compare it to the “old cultures” – Rome, Greece etc. However, in [Chron1](#), [Chron2](#) and [Chron3](#) we demonstrated that all of these “ancient chronologies” need to be made significantly shorter. It is most likely that the “old cultures” need to be shifted forwards, into the interval between the XI and the XVII century a.d. The consensual history

of the X-XIII century is a product of collation and “summarization” of the real events dating from the epoch in question (which was described rather sparsely in the surviving documents) and the duplicates of events from the more eventful epoch of the XIII-XVII century. We are naturally referring to the amount of surviving accounts of events rather than eventfulness per se. The immutable period in history begins with the XVII century a.d.

It is presumed that documented Russian history begins with the IX-X century a.d. This means that about 300 years of its chronology fall over the “duplicate danger zone”. Our accumulated experience in this field leads us to the expectation of a chronological shift here, which will move some of the events forwards, into the epoch of the XIV-XVII century a.d. This expectation is fulfilled by the authors’ discovery of a 400-year shift, which had first become manifest in the statistical volume analysis of the ancient texts (see [Chron1](#), Chapter 5:2), and was later discovered independently in our study of dynastic parallelisms, q.v. below.

5) We occasionally point out certain linguistic parallels and unexpected phonetic similarities between the ancient names encountered in various chronicles. Let us emphasise that such parallels are by no means presumed to prove anything at all; we merely allude to them in order to demonstrate that unvocalized ancient texts could be read in a great variety of ways. Nevertheless, such parallels are usually explained by our reconstruction quite well.

In the present introduction we shall give a brief outline of the main problems inherent in the Russian chronology and suggest our new conception thereof, which is radically different from both the Scaligerian-Romanovian version and N. A. Morozov’s reconstruction ([\[547\]](#)). In the chapters to follow we shall be providing an account of our systematic analysis of Russian history.

2. Our conception in brief

We shall encapsulate our hypothetic conception immediately, without preparing the readers for it in any special way. Such narration style might

seem to be insufficiently convincing; nevertheless, we suggest that the readers should carry on reading instead of jumping to any conclusions. Factual data to validate our theory shall be presented in the following chapters.

Let us pay attention to the following facts, which we find very odd. However, this oddness is only based on consensual chronology and the version of ancient Russian history that we learnt in school. It turns out that a change in chronology eliminates a great many oddities and puts things into a more logical perspective.

One of the key moments in the history of the ancient Russia is the so-called “Mongol and Tartar yoke”. The Horde is presumed to have originated from the Far East, China or Mongolia, conquered a great many countries, enslaved all of Russia, and moved further westwards, reaching Egypt and establishing the Mameluke dynasty there. However, this version contains many inconsistencies even within the framework of Scaligerian history, and they are more or less well known.

We shall begin with the following observation. Had Russia been conquered from either the East or the West, there should be surviving accounts of conflicts between the invaders and the Cossacks who had lived near the western borders of Russia, as well as the lower Volga and Don regions. One must note that school history textbooks say that the Cossack troops only appeared in the XVII century – presumably formed from yeomen who had escaped and settled on the banks of the Don. However, historians themselves are well aware of the fact that the Cossack State of Don had existed as early as in the XVI century, with independent legislation and a history of its very own. Furthermore, it turns out that the origins of the Cossack history date to the XII-XIII century. See [\[183\]](#), for instance, as well as Sukhorukov’s publication by the name of “The History of the Don Troops”, Don magazine, 1989.

Thus, the Horde, wherever it came from, would inevitably move upwards along the Volga and attack the Cossack states – and yet there are no records of this anywhere. Why would this be? The natural hypothesis

can be formulated as follows: the Horde didn't fight the Cossacks because the Cossacks were a part of the Horde. This hypothesis is backed by some substantial argumentation in the book of A. A. Gordeyev ([\[183\]](#)). In his attempt to fit the hypothesis into the consensual Millerian version of Russian history, Gordeyev was forced to assume that the Tartar and Mongol Horde had taken to Russian ways very rapidly, and the Cossacks, or the warriors of the Horde, gradually turned Russian ethnically as well.

Our primary hypothesis (or, rather, one of our primary hypotheses) is as follows: the Cossack troops weren't merely a part of the Horde, but also the regular army of the Russian state. In other words, the Horde was Russian from the very start. "Horde" ("*Orda*") is the old Russian word for regular army. Later terms "*voysko*" and "*voin*" ("army" and "warrior", respectively) are Church Slavonic in origin, and not Old Russian. They were only introduced in the XVII century. The old names were "*orda*" (horde or army), "*kazak*" (Cossack) and *khan*.

The terminology would alter eventually. A propos, as recently as in the XIX century, the words "czar" and "khan" were interchangeable in Russian folk sayings; this becomes obvious from the numerous examples that one finds in Dahl's dictionary (such as "wherever the khan (czar) may go, the horde (or "the folk") will follow" etc). See [\[223\]](#) for further reference (the "*orda*" entry).

By the way, the famous town of Semikarakorsk still exists in the Don region, and there's also a village called Khanskaya in the Kuban. Let us remind the reader that the birthplace of Genghis-Khan is supposed to have been called Karakorum ([\[1078\]](#), Volume 1, pages 227-228).

According to the rather desperately-sounding hypothesis that our brave scholars have put forth, "the Erdinidsu monastery, founded in 1585 [several centuries later than Genghis-Khan had lived – Auth.] was erected upon the ruins of Karakorum" ([\[1078\]](#), Volume 1, page 228).

The name Karakorum can however be encountered in the Don region. For instance, in the map entitled "The Southern Part of the Great Russia" dating from 1720, the entire Cossack region of Don is called "The Lesser

Tartaria”; we also see a river by the name of Semi Karak here, one of Don’s tributaries on the left-hand side. The full name of the map reads as follows: “Tabula Geographica qua Russiae Magnae Pontus Euxinus. Johan Baptist Homann. Nürnberg, ca 1720. The name Karak is therefore found in the area of the Cossack = Tartar Don. The name Karakorum may simply have meant “the Karak area”.

Furthermore, in the map of Russia dating from 1670 (Tabula Russia vulgo Moscovia, Frederik de Wit, Amsterdam, ca 1670) we find a town called Semikorkor in this very region, near the Don. On yet another map, one that dates from 1736 (Theatre de la Guerre sur les Frontieres de Russie de Turquie, Reiner & Joshua Ottens, Amsterdam, 1736) one of Don’s tributaries bears the name of Semi Korokor. The authors have seen all of these maps personally, at the exhibition of old maps of Russia that took place in February 1999 in a private collection museum affiliated with the A. S. Pushkin Museum in Moscow.

Thus, we see several versions of the name Korokor in the Don region – in the name of a town and in that of a river. A Romanised version of the name could have had the suffix “*um*” at the end, which would transform the Cossack name of Korokor into Korokorum – the famous birthplace of the Conqueror of the World. In this case, the great conqueror Genghis-Khan was born in the Cossack town of Korokor near Semi Korokor, the tributary of Don.

Let us return to the issue of the Horde. According to our hypothesis, the Horde had borne no relation to any foreign conquering armies, but rather was the regular army of the Eastern Russia, an integral part of the ancient Russian state. Furthermore, the period of the “Tartar and Mongol yoke” is nothing but the time of military rule in Russia, when the commander-in-chief, or the Khan, effectively functioned as the king (czar); cities were governed by princes, who weren’t part of the army but collected taxes in order to support it. The ancient Russian state can therefore be regarded as a united Empire, where professional soldiers were a separate stratum of society and called themselves the Horde; other strata had no military

formations of their own. We are of the opinion that the so-called “raids of the Tartars” were nothing but repressive actions against the areas of Russia that would refuse to pay taxes for one reason or another. The mutineers were punished by the regular Russian army. Typically, the prince would leave the town before such a raid.

3. The true identity of Mongolia and the Tartar and Mongol invasion. The Cossacks and the Golden Horde

Let us contemplate the etymology of the word Mongolia. It may have derived from the Russian word *mnogo* (a lot, a mass – of people etc), or the words *mosch*, *mog* (a possible precursor of the word “Magog”) and *mogoushchestvo*, translating as “might (noun)”, “could, was able to” and “power”, respectively. N. A. Morozov voiced the theory that the word “Mongolia” stemmed from the Greek word “Megalion”, or The Great One. However, the Greek word may just as well be a derivative of the Slavic “*mog*” and “*mnogo*”. In fig. 0.1 one sees a photograph of the ancient inlay from the Chora church in Istanbul. We see the word “Mongolia” spelt as “*Mugulion*” – virtually the same as Megalion, see fig. 0.2. Eastern Russia is still known as the Greater Russia, or *Velikorossiya*. According to our hypothesis, the “Mongolian” Empire is but another name for the Great Empire, or the mediaeval Russia.

Fig. 0.1. Mosaic from the Church of the Holy Saviour in Chora, Istanbul. Dated to the XIV century. We see “Melania the Nun, Queen of the Mongols”, according to the legend

that we see above her head. The word “Mongolia” is written in Greek as “Mugulion”, or “Megalion”, which translates as “The Great”. This confirms the hypothesis that the words “Mongolia” and “Megalion” are derived from the Russian word “*mnogo*” (“many”), or “*mnogo*” + “*vel*” (“great”). Taken from [\[1207\]](#).

Fig. 0.2. Mosaic from the Church of the Holy Saviour in Chora, Istanbul. A fragment.

Is there any evidence that could back this hypothesis? There is, and a substantial amount of evidence at that. Let us see what the Western sources tell us about the so-called “Mongol and Tartar invasion”.

“The notes of the Hungarian king and a letter to the Pope that mentions Russian troops as part of Batu-Khan’s army serve as evidence of the latter’s structure and composition” ([\[183\]](#), Volume 1, page 31).

“Batu-Khan founded a number of military settlements on the right bank of the Dnepr for the purposes of observation and protection of the frontiers; they were populated by the inhabitants of Russian principalities ... there were lots of Russians among the borderland settlers on the Terek line as well ... the governing system created by the Golden Horde was implemented and maintained by the Russians predominantly” ([\[183\]](#), Volume 1, page 40-42).

Furthermore, it appears that “Russia was made a province of the Mongolian empire and became known as the Tartaro-Mongolia” ([\[183\]](#), Volume 1, page 35). Could it be that Tartaro-Mongolia was simply another name of Russia, or the Great Empire (Mongolia) whose population partially consisted of Muslims, or Tartars – just as we witness to be the case nowadays.

The more mediaeval sources are brought to our attention, the more we learn and understand once we break free from the confines of consensual historical paradigm as reflected in textbooks, complete with vivid imagery

of the “Mongolian conquest”. For instance, it turns out that “at the very dawn of the Horde’s existence, [the very first days, mind you! – Auth.] an Orthodox church was built in the Khan’s headquarters. As military settlements were founded, Orthodox churches were built everywhere, all across the territory governed by the Horde, with the clergy called thereto and Metropolitan Cyril relocated to Kiev from Novgorod, thus completing the restoration of the pan-Russian ecclesiastical hierarchy” ([\[183\]](#), Volume 1, page 36).

Let us stop and reflect for a moment. All of the above is very odd indeed from the consensual point of view. Indeed, a Mongolian conqueror (who most probably didn’t even speak Russian, let alone share the Russian faith) builds Orthodox temples, which must be thoroughly alien to him, all across the newly conquered empire, and the Russian Metropolitan moves to Kiev as soon as the city is taken by Batu-Khan the “Mongolian”!

Our explanation is as follows. A foreign invasion is nothing but a fantasy. What we see is the Russian military government (a.k.a. “The Horde”) taking care of typical domestic affairs, such as the construction of imperial institutions. All of these events are perfectly typical for a developing state.

To quote from L. N. Gumilev:

“Let us take the veil of confusion away from our eyes and consider the situation in Russia during the epoch of the yoke. Firstly, every principality retained its boundaries and territorial integrity. Secondly, all institutes of administrative government consisted of Russians throughout the entire territory of the empire. Thirdly, every principality had an army of its own. Finally – and this may be the most important fact, the Horde destroyed no churches and demonstrated great religious tolerance, which is characteristic for such states. It is a fact that the Orthodox religion was supported in every which way. The church and the clergy were completely freed from all taxes and contributions. Apart from that, one of the Khan’s decrees declared that whoever dared to slander the Orthodox faith was to be executed with no right of appeal” ([\[214\]](#), pages 265-266).

We also learn that the Russian system of communication that had existed until the end of the XIX century – the coachmen service, was created by the Mongols. Coachmen were known as *yamshchiki*, and the very word is of a Mongolian origin: “there were stables with up to 400 horses along all the lines separated by 25-verst intervals [1 verst = 3.500 feet or 1.06 km] ... there were ferries and boats on every river; these were also run by the Russians... Russian chroniclers stopped keeping chronicles when the Mongols had come, which is why all information concerning the internal structure of the Golden Horde comes from foreigners travelling through its lands” ([\[183\]](#), Volume 1, page 42).

In fig 0.3 we see a *paize*, or a token used by the representatives of the Horde’s governing structures in Russia. The word is apparently related to the Slavic *poyti* (“to go”), and possibly a precursor of the Russian word *pogon* (meaning “shoulder-strap”, among other things.) Even in Romanovian Russia, one needed a document called “*pogonnaya gramota*” in order to travel along the state-owned communication lines on state-owned horses”. In figs 0.4 and 0.5 we see two other “Mongolian” *paize* found in Siberia and the Dnepr region.

Fig. 0.3. Païza, a token of the Horde’s power in Russia. In its top part we see an octagonal star, which is a Christian symbol. It is likely that the modern military shoulder straps with stars upon them are related to the “Mongolian” païza. Taken from [\[331\]](#), Volume 1, page 78.

Fig. 0.4. A “Mongolian” paiza discovered in Siberia. Taken from [\[1078\]](#), Volume 1, inset between pages 352-353.

Fig. 0.5. A “Mongolian” paiza discovered in the vicinity of the Dnepr in 1845. Taken from [\[1078\]](#), Volume 1, inset between pages 352-353.

We see that foreigners describe the Golden Horde as a Russian state. Russians don't describe it at all, for some reason, relating the most mundane things instead – built churches, weddings etc, as if they were “completely unaware” of their country being conquered and their lands made part of a gigantic foreign empire, with new and exotic systems of communications, ferries etc introduced all over the country. It is presumed

that foreigners didn't mention Russia during the time of the "Mongolian" conquest, since the country "had changed its name to Tartaro-Mongolia" ([183], Volume 1, page 35).

We are of the following opinion: "Tartaro-Mongolia" is a foreign term that was in use before the XVI century. From the XVI-XVII century and on, foreigners started to call Russia "Moscovia", having simultaneously stopped making references to "Mongolia". However, the territory of the Russian empire and even a somewhat larger area had remained known as "the Great Tartaria (Grande Tartarie)" among the Western cartographers up until the XVIII century. There are a great many such maps in existence. One of them, which we find very representative, can be seen in fig. 0.6. It is a French map from the Atlas of the Prince of Orange, dated to the XVIII century ([1018]).

Fig. 0.6. A map of Asia dating from the XVIII century. We see the Asian part of Russia referred to as "The Great Tartary" on this map; the country comprises Korea as well as parts of China, Pakistan and India. The name "Russian Empire" is altogether missing.

According to our reconstruction, the name Great Tartary had once been used by foreigners for referring to the Great Russia. As we can see, the cartographers from the Western Europe had remembered this fact up until the XVIII century. Taken from a

French atlas ([\[1018\]](#)).

We may encounter references to the invasion of the Tartars and the Mongols being reflected in Russian chronicles as counter-argumentation. The actual age of those chronicles shall be discussed below; the analysis of the latter demonstrates that the surviving chronicles were written or edited in the Romanovian epoch. Actually, historians have still got enough problems with chronicles as they are. For instance, G. M. Prokhorov, the famous researcher, writes the following: “the analysis of the Lavrentyevskaya chronicle (dating from 1337) demonstrated that the authors of the chronicle replaced pages 153-164 with new pages, some of them repeatedly. This interval includes all the data concerning the conquest of Russia by the Tartars and the Mongols” ([\[699\]](#), page 77).

According to what A. A. Gordeyev tells us, “historians remain silent about the historical evidence of the Cossacks amongst the ranks of the Golden Horde’s army, as well as the Muscovite armies of the princely predecessors of Ivan the Terrible” ([\[183\]](#), Volume 1, page 8).

Further also: “the very name ‘Cossacks’ referred to the light cavalry that comprised a part of the Golden Horde’s army” ([\[183\]](#), Volume 1, page 16).

The Russian word for Cossack (*kazak*) may be derived from the words “*skok*” and “*skakat*” used for referring to horseback-riding.

Let us now consider the figure of the famous Batu-Khan. After the “conquest” of Russia by Batu-Khan, “the clergy was exempted from paying taxes; this also covered ecclesiastical possessions and the populace in the church’s charge. Yaroslav Vsevolodovich, Prince of Suzdal, was made First Prince of the Russian Principalities by the Mongols” ([\[183\]](#), Volume 1, page 33).

Shortly afterwards, “prince Yaroslav had been summoned to Batu-Khan’s headquarters and sent to Karakorum in Mongolia, where the Great Khan was to be elected... Batu-Khan didn’t go to Mongolia himself, sending Prince Yaroslav as his representative [in other words, Batu-Khan didn’t care enough about the elections of the Great Khan to attend them

personally – Auth.]. The sojourn of the Russian prince in Mongolia was described by Plano Carpini” ([\[183\]](#), Volume 1, page 33).

Thus, Plano Carpini is telling us that the Russian Prince Yaroslav went to represent Batu-Khan at the Great Khan’s elections for some bizarre reason. Could it be that the hypothesis about Batu-Khan sending Yaroslav in his stead was invented by modern historians with the sole purpose of making Carpini’s evidence concur with the obvious necessity of Batu-Khan’s presence at the elections of the Great Khan?

What we see here is merely documental evidence testifying to the fact that Batu-Khan is none other than the Russian prince Yaroslav. This is also confirmed by the fact that Alexander Nevsky, the son of Yaroslav, had also been the “adopted” son of Batu-Khan, according to historians! Once again we witness the two figures to be identical (Yaroslav = Batu-Khan). In general, it has to be said that “Batu” (“*Batyi*” in Russian) may be a form of the word “*batya*”, or “father”. A Cossack military commander is still called a “*batka*” (“father”, “dad” etc). Thus, Batu-Khan = the Cossack *batka* = Russian prince. Similar names are found in the *bylini*, or the Russian heroic epos – two of them are called “Vassily Kazimirovich Takes the Tribute Money to Batey Bateyevich” and “Vassily Ignatievich and Batyga” ([\[112\]](#)).

We are also told that “having conquered the northern Russian principalities, Batu-Khan placed his troops everywhere, together with his representatives (called the *baskaks*) whose function was to bring 1/10 part of property and the populace to the Khan” ([\[183\]](#), Volume 1, page 29). Our commentary is as follows.

It is a known fact that “the Tartar tribute is a tenth of the whole”. However, foreign invasion has got nothing to do with this. The Orthodox Church had always claimed the tribute called *desyatina* – literally, “tenth part”. As we have seen, a tenth part of Russian population was drafted in order to maintain the ranks of the Russian army, or the Horde. This is perfectly natural, given that the Horde was the name of the regular Russian army that never got disbanded and took care of border patrol, warfare etc;

they would obviously have neither time nor opportunity for planting and harvesting crops, or indeed supporting themselves independently in general. Furthermore, agriculture had remained strictly forbidden for the Cossacks up until the XVII century. This is a well-known fact, and also a very natural one for a regular army. This is mentioned by Pougachyov in his *Notes on Russian History* and Gordeyev in [\[183\]](#), Volume 1, page 36. Therefore, the Horde had to draft every tenth member of the population as regular Russian army, and demand the ten per cent contribution in supplies and provision.

Furthermore, a regular army is constantly on the move, and requires depots for the storage of provision, weapons and ammunition. Therefore, a system of depots must have existed on the territory of Russia. One of the most commonly-used Russian words for “depot” (or “storage facility”) is *saray*. Military leaders, or khans, needed headquarters, which would normally be located right next to these depots. What do we see? The word “*saray*” surfaces very frequently in history of the “Golden Horde of the Tartars and the Mongols” – the word is often encountered in Russian toponymy. Many towns and cities have the root SAR as part of their name, especially in the Volga region. Indeed, we see Saratov, Saransk, Cheboksary, Tsaritsyn (Sar + Tsyn) here, as well as the episcopal town of Zaisk in the Ryazan region of Russia and Zaisk in the West of Russia. All of them are large towns and cities, some of them also capitals of autonomous regions.

One may also recollect Sarajevo, the famous Balkan city. We often encounter the word Saray in old Russian and mediaeval Turkish toponymy.

We proceed to find out that “Sultan Selim wrote the following to the Khan of the Crimea [presumably in the early XVI century – Auth.]: ‘I heard about your intentions to wage war against the land of the Muscovites – beware; do not dare to attack the Muscovites, since they are great allies of ours ... if you do, we shall raid your lands’. Sultan Seliman who ascended to the Turkish throne in 1521 confirmed these intentions and

forbade campaigns against the Muscovites... Russia and Turkey exchanged embassies and ambassadors [in the XVI century – Auth.]” ([\[183\]](#), Volume 1, pages 161-163).

The relations between Russia and Turkey were severed already in the XVIII century.

One might wonder about the dislocation of the Russian troops when they fought the Tartars and the Mongols who had “raided Russia”? Right where the Russian “army of resistance” would congregate, as it turns out – for instance, in 1252 Andrei, Prince of Vladimir and Suzdal set forth from Vladimir to fight the Tartars and met them at river Klyazma, right outside the city gates of Vladimir! All the battles against the Tartars that were fought in the XVI century took place near Moscow, or near river Oka the furthest. One might find it odd that Russian troops always have a mile or two to go, whilst the Tartars have to cover hundreds of miles. However, our reconstruction explains all of the above – as the regular Russian army, the Horde was used for punitive expeditions against disobedient subject. It would naturally approach the rebellious town that tried to oppose the military government.

4. Batu-Khan was known as the Great Prince

We are accustomed to believe that the Tartar governors used to call themselves Khans, whereas the Russians were Great Princes. This stereotype is a very common one. However, we must quote rather noteworthy evidence from the part of Tatishchev, who tells us that the Tartar ambassadors called their ruler Batu-Khan Great Prince: “We were sent by the Great Prince Batu” ([\[832\]](#), Part 2, page 231). Tatishchev is rather embarrassed by the above, and tries to explain this title by telling us that Batu-Khan had not yet been a Khan back in those days. However, this is of minor importance to us. The thing that does matter is the fact that a Tartar governor was called Great Prince.

5. The Romanovs, the Zakharyins and the Yuryins. Their role

in Russian chronography

Let us conclude the present introduction with an important question which needs to be answered before one can understand why the Russian history that we got used to from our schooldays had “suddenly” turned out incorrect. Who would distort the true history of Russia, and when did this happen?

In 1605, the Great Turmoil began in Russia. 1613 marks a watershed in Russian history – the throne was taken by the pro-Western dynasty of the Romanovs, the Zakharyins and the Yuryins. They are responsible for the “draft version” of the contemporary Russian history; this happened under Czar Mikhail and Patriarch Philaret, possibly later. We shall present our reconstruction of the Great Turmoil in the chapters to follow.

The Cossack Horde was banished from Moscovia under the Romanovs, the Zakharyins and the Yuryins. Its banishment symbolizes the end of the old Russian dynasty. The remnants of the old Empire’s resisting army, or the Horde, were chased away from the centre of the Muscovite kingdom. As a result, nowadays we see Cossack regions at the periphery of Russia and not the centre. All these regions are legacy of the Russian “Mongolian” Horde. Kazakhstan, for instance, can be interpreted as *Kazak-Stan*, which translates as “Cossack Camp” or “Cossack Region”; alternatively, the name may have derived from *Kazak s Tana* or Cossacks from the Don.

One may well wonder how the professional regular army of the Horde could have lost the civil war. This issue is indeed of great importance. One may theorize at length about this; we hope that the present book will help the future researchers of the Russian history to find the answer.

The defeat of Razin and later Pugachyov is the final defeat of the Horde. After this military success, the Romanovs edited official documents and declared the Horde “foreign”, “evil” and “an invader on the Russian land”. In the minds of their descendants the Horde was transformed into a hostile foreign invasion force and moved to the far and mysterious Orient to boot; this is how Mongolia (Megalion, or The Great, or the Russian Empire)

transformed into an Eastern country. A propos, something similar happened to Siberia, which had moved there from the banks of Volga.

When the Romanovs came to power, they tried to erase as much of the old Russian history as they could. The historians of the Romanovian epoch received explicit or implicit orders to refrain from digging too deep. This was a mortal danger – they must have remembered the fate of Viskovatiy, q.v. below.

Our own impression of the works published by the XVIII-XIX century historians confirms this idea. They circumnavigate all rough corners and instinctively shun the very obvious parallels, questions and oddities. This point of view makes the books of Solovyov, Kluchevskiy and other historians of this epoch seem to be the most evasive of all – for instance, their laborious attempts to read the name “Kulichkovo field” as “Kuchkovo field” followed by lengthy hypothesising about the existence of mythical boyars by the name of Kuchki that the field had allegedly got its name from ([\[284\]](#); see also [Chron4](#), Chapter 6).

It is a known fact that the genealogical chronicles were burnt in the reign of Fyodor Alekseyevich, the older brother of Peter the Great and his precursor – this happened in Moscow in 1682, q.v. in [\[193\]](#), page 26). Our point of view is as follows: the Romanovs were destroying the real ancient genealogy in order to make place for their new dynasty. The “ranks from Ryurik” that have survived until the present and cited in M. V. Lomonosov’s *Complete Works* must have appeared later than that.

Let us point out a curious fact. During their entire history the Romanovs took brides from the same geographical region – Holstein-Gottorp near the city of Lübeck. It is known that the inhabitants of this part of Northern Germany are of Russian descent, q.v. in Herberstein’s book ([\[161\]](#), page 60).

It is obvious that the ascension of the Romanovs must have been declared to serve the country’s greater good during their reign. Although the duchy of Holstein had once been populated by Russians, they had lost a great part of their Russian populace starting with the XVII century. In

general, the Romanovian policy was purely Teutonic for the most part, and their governing methods pro-Western. For instance, the *oprichnina* period between 1563 and 1572, when the Zakharyins and the Romanovs became the de facto rulers, is the time that the first mentions of religious persecution date back to. The Muslims and the Judeans who refused to convert to Christianity were destroyed. We know of no such occurrences in any earlier epoch of Russian history. Russia had adhered to the old “Mongolian” and Turkish principle of religious tolerance.

The reign of the first Romanovs – Mikhail, Aleksei and Fyodor Alekseyevich is characterized by mass burnings of books, destruction of archives, ecclesiastical schism and campaigns against the Cossacks, or the Horde. More or less well-documented Russian history begins with the reign of Peter I Romanov. His epoch was preceded by a time of strife, turmoil and civil war, with the Cossacks (the Horde) being the main enemy; they had settled in the Don area by that time. This is also the epoch that the beginning of agricultural activity in the Cossack regions dates to; it had been forbidden for them before that. We must also point out that the Romanovs had made lots of efforts to prove to the Westerners that the point of view about Stepan Razin being of royal blood, rather popular in the West, was “perfectly untrue”. Western sources call him Rex, or King. However, it is known that a certain “prince Aleksei” was part of Razin’s entourage, q.v. in [Chron4](#), Chapter 9:4. Apparently, the epoch of Razin, the entire XVII and even the XVIII century is the epoch when the Romanovs had fought against the old dynasty, which was backed by the Horde and its Cossacks.

After the fall of the Romanovs in 1917, the spell of taciturnity ended. Indeed, many excellent works on ancient Russian history began to appear, written by Russian emigrants, exposing numerous oddities, which had remained hidden for a long time. For instance, the book by A. A. Gordeyev that we occasionally quote had first been published in the West; its Russian publication took place fairly recently. Of course, nowadays it is considered *mauvais ton* to mention the Romanovs in a critical context.

However, scientific research cannot be limited by political considerations.
The plaster is coming off, revealing parts of the original ancient artwork.

PART ONE

Russian chronicles and the Millerian-Romanovian version of Russian history

1.

The first attempts to write down the history of the ancient Russia

A good overview of the attempts to put Russian history down in writing is given by V. O. Klyuchevskiy ([\[396\]](#), pages 187-196). The facts that he relates aren't known to a very wide audience, yet they are very interesting indeed. We shall cite them here according to Klyuchevskiy's account.

1.1. The XVI-XVII century and the edict of Aleksey Mikhailovich

It is known that the origins of Russian history date to the XVIII century, and that it was written by Tatishchev, Miller and Schlezer. What did people know about the Kiev Russia before them? Virtually nothing, as it turns out. Nevertheless, it is known that Russians were demonstrating an interest in their ancient history already in the XVI-XVII century.

According to V. O. Klyuchevskiy, “the initial idea of studying our history collectively predates Schlezer by a great many years ... the XVI century is particularly prominent in this respect, since it was the chronographical heyday ... a great many individual chronicles were compiled into extensive and comprehensive works with detailed tables of contents and genealogical tables of Russian and Lithuanian rulers... We are beginning to see signs of historical criticism in the chronographical narrative, there are attempts of making it correspond to a methodical plan and even of introducing certain well-known political ideas into it... A gigantic collection of chronicles is compiled, beginning with the legend of Vladimir Monomakh crowned as the Byzantine emperor” ([\[396\]](#), page 188).

Apparently, the version of Russian history that began with Vladimir

Monomakh was created around this time. We shall consider the process of its creation in the chapters to follow; for the meantime, let us just note that the early Kiev Russia, or Russian history before Vladimir Monomakh, appears to have been excluded from this version.

This was followed by a spell of inactivity ending around the middle of the XVII century, when “on 3 November 1657 King Aleksey Mikhailovich gave orders to create a special bureau known as the Chronicle Office and appoint a clerk named Koudryavtsev to “write down the royal orders and ranks, starting with the Great King Fyodor Ivanovich” – in other words, the clerk was to continue the Book of Ranks (Stepennaya Kniga), which ended at the reign of Ivan the Terrible. The head of the new bureau was supposed to be assisted by two scriveners and six minor officials...

This “historiographical commission”, for want of a better word, had faced a great many problems with establishing itself; when it finally happened, the historiographers moved into a cramped and squalid wooden hut, which they had to share with convicts and their guards. One finds this to be at odds with the royal edict. There were no minor officials appointed at all; the Ambassadorial Bureau also firmly refused to provide the commission with any paper. The search for sources had been a truly arduous task ... [Koudryavtsev] would address one bureau after another, always getting the answer that there were no books available except for the regular clerical documentation, despite the fact that some very useful documents and manuscripts were found there later on...

Around the end of 1658 the Czar himself had turned his historiographer’s attention to an important archive of historical documents – the Patriarchal Library. Koudryavtsev got hold of the library catalogue and pointed out the manuscripts that he needed. However ... the royal order remained unfulfilled once again ... the Patriarchal bureau responded that there were “no records available” with the information on the patriarchs, metropolitans and bishops from the reign of Fyodor Ivanovich and on. None of the other offices and bureaus bothered with giving Koudryavtsev any response at all, despite his numerous reports...

When Koudryavtsev was being relieved of his office in the beginning of 1659, there were no fruits of his historiographical labours of 16 months to be found anywhere. His successor marked that “the Chronicle bureau didn’t even begin to fulfil the royal order”. Even the old Book of Ranks, which the bureau had been supposed to continue, was missing, and none of the officials had any idea of how it ended or what could be written in the new chapters. However, the second clerk didn’t manage to get any work done, either” ([396], pages 189-190).

All of the above leads us to the following obvious conclusions:

1. The first records of royal orders to “begin the writing of historical chronicles” date to the middle of the XVII century – the reign of Aleksey Mikhailovich Romanov.
2. The persons responsible for the fulfilment of this order didn’t manage to find any records covering so much as the last century of Russian history.
3. The disappearance of the famous Book of Ranks is very odd indeed.
4. The working conditions created for this first historiographical commission mysteriously failed to correspond with the status of the latter. The royal edict was de facto sabotaged!

It appears that V. O. Klyuchevskiy was right in his observation that “neither the minds of the Muscovites, *nor the documents* they’d had at their disposal in that epoch ... were ready for a task such as this one” ([396], pages 189-190).

Of course, Klyuchevskiy appears to refer to the sources dating to the late XVI – early XVII century exclusively, or the documents of the epoch that preceded the reign of Aleksey Mikhailovich immediately. The conclusion he makes is that these documents appeared already after Aleksey Mikhailovich. In this case, it makes sense to assume that if the commission failed to have found any documents of the XVI-XVII century, the situation with earlier epochs was even worse. One may well wonder about whether the “large compilation of chronicles” with renditions of

historical events starting with the reign of Vladimir Monomakh had really existed in Koudryavtsev's epoch, likewise the "Book of the Czars" describing the epoch of Ivan the Terrible. Could they have been written, or at least heavily edited, already after Koudryavtsev's time?

Apparently, we are fortunate enough to have stumbled upon the very time when most "ancient" Russian chronicles were created. Even the famous *Povest Vremennyh Let* ("Chronicle of Years Passed") is most likely to have been created a while later, q.v. below. Nowadays it is extremely difficult to say what real historical evidence all these "ancient" chronicles-to-be were based upon. Such evidence must have existed in the epoch we are concerned with presently, yet most of them must have perished before our day. Nowadays the only means of studying the pre-Romanovian history is the distorting prism of the chronicles that were written or edited already after the epoch of Koudryavtsev.

We must jump ahead and tell the reader that a number of ancient documents dating from the XV-XVI century have nevertheless reached our epoch – edicts, contracts, printed books, ecclesiastical sources etc. However, their detailed study reveals an altogether different picture of Russian history than the one taught in schools nowadays. The latter owes its existence to the edict of Aleksey Mikhailovich and the works of the XVIII century historians – Tatishchev, Bayer, Miller and Schlezer. We shall discuss this in more detail below.

1.2. The XVIII century: Miller

After telling us about the clerk Koudryavtsev, Klyuchevskiy skips Tatishchev and proceeds to tell us about Miller, whose historical research commenced in the epoch of Yelizaveta Petrovna. Let us enquire about the reason why Klyuchevskiy fails to mention Tatishchev. After all, the latter had lived in the epoch of Peter the Great – earlier than Yelizaveta Petrovna, that is. It is common knowledge that Tatishchev was the first Russian historian. Why would Klyuchevskiy decide to omit him? It appears that he was perfectly right in doing so.

The matter is that Tatishchev's book entitled *Russian History from the Earliest Days to Czar Mikhail* was first published after the death of Tatishchev – by none other than Miller! Therefore, the first version of Russian history was made public by Miller, a German, q.v. below. Let us quote another passage from Klyuchevskiy:

“Let us travel to the epoch of Empress Yelizaveta and the first years of her reign. It was in those days that Gerhard Friedrich Miller, a foreign scientist, was involved in laborious research of Russian history, working at the Academy of Sciences. He spent almost ten years travelling all over Siberia and studying local archives. He had covered more than thirty thousand verst, and brought a tremendous bulk of copied documents to St. Petersburg in 1743” ([\[396\]](#), page 191). Miller is known as one of the founders of the Russian historical school, together with Bayer and Schlezer.

Let us sum up:

1. Miller was the first to have published the complete version of Russian history in the very form that is known to us today.
2. It is very odd that Miller should bring historical documents “from Siberia” – not even the documents themselves, but rather handwritten copies that he had made himself. Does that mean he could find no old chronicles anywhere in Moscow or St. Petersburg – or, indeed, central Russia in general. Isn't this a replay of the scenario with the edict of Aleksey Mikhailovich, when his own clerk could find no historical sources anywhere in the capital?
3. Starting with Miller and onwards, the consensual version of Russian history has remained virtually immutable. Therefore, later renditions done by Karamzin, Solovyov, Klyuchevskiy and others are of little interest to us in this respect. In reality, they were all processing Miller's materials.

1.3. Brief corollaries

The consensual version of ancient Russian history was created in the middle of the XVIII century and based on sources that were either written or edited in the late XVII – early XVIII century. Apparently, the time between the end of the XVII century and the middle of the XVIII is the very epoch when the modern version of Russian history was created. In other words, Russian history in its present form came to existence in the epoch of Peter the Great, Anna Ioannovna and Yelizaveta Petrovna. After the publication of Karamzin's *History*, this version became widely known (only a select few had been familiar with it before). It eventually became introduced into the school course of history.

Our analysis demonstrates this version of Russian history to be erroneous. See more about this in the following chapters.

2.

Consensual version of Russian history and its genesis. The reasons why all the founders of the Russian historical school were foreign

Above we have followed Klyuchevskiy's account of the first steps in the creation of Russian history. Let us remind the reader of the following facts:

1. The XVI century was the heyday of historiography. The chronicles of the epoch apparently began with the legend of Vladimir Monomakh being crowned as the Byzantine emperor.
2. Bear in mind that on 3 November 1657 Czar Aleksey Mikhailovich gave orders for clerk Koudryavtsev to continue the Book of Ranks, which ended abruptly at the reign of Ivan the Terrible. Koudryavtsev couldn't fulfil the royal order, since he *couldn't find any suitable sources* in either the royal or the Patriarchal library. He hadn't even managed to find the very Book of Ranks that he was supposed to continue.

In this case, how can it be true that in 1672 "the Ambassadorial bureau had prepared the "Great Stately Book, or the Roots of the Russian Rulers" (also known as the Titular Book, q.v. in [\[473\]](#), page 8)? This book had contained *portraits* of Great Princes and Czars, starting with Ryurik and ending with Aleksey Mikhailovich, all placed in chronological sequence. Let us consider the above more attentively. No century-old documents could be found anywhere, yet the book contained a portrait of Ryurik, presumably 800 years old.

This is the same time when a great many private genealogical books were verified and processed ([\[473\]](#), page 8). They were compiled into a

single official source – “The Royal Book of Genealogy”. The official Romanovian version of Russian history appears to have been created around the same time; it is for a good reason that its first printed version, the so-called “Synopsis”, came out in 1674.

Next came the publication of the “Velvet Book”, which contained the genealogical trees of the Russian boyars and aristocracy ([\[473\]](#), page 8). This coincides with the period when books were widely confiscated for “correction”, as a result of Patriarch Nikon’s reforms.

The confiscation of books continued under Peter the Great. One must pay attention to the following important fact: on 16 February 1722, “Peter the Great addressed all churches and monasteries with the following decree. They were to “send all chronicles and chronographical materials that had been in their possession to the Muscovite Sinod, on parchment and paper alike”; it was forbidden to keep anything back. It was also promised that said materials would be returned after copying. Simultaneously, the Sinod received orders to send representatives to all parts, who would study and collect these chronicles” ([\[979\]](#), page 58). This must have been another purge of Russian libraries undertaken by the Romanovs, its goal being the destruction of all Russian historical sources. One may well wonder whether Peter had really kept his promise to “return the handwritten originals” to faraway monasteries and contended himself with the copies? We find this to be most doubtful indeed.

It is common knowledge that the consensual “scientific” version of Russian history can be traced back to Tatishchev, Schlezer, Miller and Bayer, who had all lived in the second half of the XVIII century. We shall give a brief rendition of their biographies.

Tatishchev, Vassily Nikitich – 1686-1750, Russian historian and state official. In 1720-1722 and 1734-1737 he had managed the state-owned factories in the Ural region; this was followed by the period of his Astrakhan governorship, 1741-1745 ([\[797\]](#), page 1303). However, it turns out that the exact nature of his writings, or indeed the very fact of his authorship, are an issue of the utmost obscurity, q.v.

below as well as in [\[832\]](#) and [\[979\]](#). Tatishchev's portrait can be seen in fig. 1.1.

Fig. 1.1. V. T. Tatishchev. Engraving by A. Osipov, the XVIII century. Taken from [\[331\]](#), Volume 1, page 359. See also page 64.

Bayer, Gottlieb Siegfried – 1694-1738, German historian and philologist, member of the St. Petersburg Academy in 1725-1738, the “author of the pseudo-scientific Norman theory” ([\[797\]](#), page 100). His 12-year sojourn in Russia notwithstanding, he had never learnt the Russian language ([\[979\]](#), page 4). V. O. Klyuchevskiy wrote the following about Bayer and Miller: “The learned foreign academicians were forced to tackle the [Varangian – *Auth.*] issue ... their familiarity with the Russian language and ... its historical sources had been poor or nonexistent... Bayer ... was ignorant of the fact that ... the Synopsis had never actually been a chronicle” ([\[396\]](#), page 120).

Let us explain that the Synopsis is the first published version of the Romanovian history of Russia. It has got nothing in common with a chronicle, and was compiled to serve as a textbook of Russian history. The fact that Bayer couldn't tell it apart from a chronicle tells us volumes about his familiarity with Russian historical sources.

Miller, Gerhard Friedrich – 1705-1783. German historian. He came to Russia in 1725. Miller had “collected a great number of copied documents [one wonders about the fate of the originals – *Auth.*] on Russian history (the so-called Miller's

portfolios)” – see [\[797\]](#), page 803.

Schlezer, Augustus Ludwig – 1735-1800. German historian and philologist. Remained in Russian service between 1761 and 1767. He became a honorary foreign member of the St. Petersburg Academy of Sciences in 1769, having returned to Germany in 1768 ([\[797\]](#), page 1511). He was the first researcher of the original of the oldest Russian chronicle – the *Radzivilovskaya Letopis*, or the famous *Povest Vremennyh Let* ([\[715\]](#), Volume 2, page 7; see below).

It has to be said that it makes sense to exclude Tatishchev from the list of the first Russian historians due to the fact that his *History*, presumably written before Miller, had vanished. Tatishchev’s *Drafts* published by Miller remain the only written materials under Tatishchev’s name that we have at our disposal. See below and in [\[832\]](#).

Despite all this, already in the XX century, after the revolution of 1917, historians had found a number of manuscripts in private archives, which they suggested to be versions of the “real” Tatishchev’s *History*. However, historians themselves concede that all these copies are done in different handwriting. Tatishchev is supposed to have “edited” them, and possibly written several minor passages ([\[832\]](#), Volume 1, pages 59-70).

The creation of Tatishchev’s *History* and the reasons why he failed to have published it are documented in Schlezer’s memoirs ([\[979\]](#); see also [\[832\]](#)). We are informed of the following: “V. N. Tatishchev ... had received a copy of Nestor from Peter’s own archive in 1719 [a copy of the *Radzivilovskaya* chronicle manufactured for Peter the Great in Königsberg – *Auth.*], which he immediately copied for himself ... in 1720... Tatishchev was sent to Siberia ... where he found an old copy of Nestor in the possession of some old-believer. He was completely flabbergasted by the discovery that this copy was drastically different from the previous one. Like yours truly, he was of the opinion that there had only been one Nestor and a single chronicle” ([\[979\]](#), pages 52-53).

This opinion eventually “manifested as truth”, since nowadays all we have in our possession is but a single text describing the history of the

ancient Russia – the *Povest Vremennyh Let*. Other sources, including the old originals, were apparently destroyed or concealed.

Let us proceed with quoting:

“Tatishchev eventually managed to collect ten copies. He used them, as well as other versions he learnt of, to compile the eleventh ... in 1739 he brought it from Astrakhan to St. Petersburg... He demonstrated the manuscript to a number of persons; however, instead of encouragement and support, he would encounter bizarre objections and receive advice to keep well away from this endeavour” ([979], pages 52-53).

Shortly after that, Tatishchev fell under suspicion of being a freethinker and a heretic. We are told that “he was careless enough to have voiced a number of daring considerations, which could lead to an even more dangerous suspicion of political heresy. This is doubtlessly the reason why the fruit of his two decades of labour wasn’t published in 1740” ([979], page 54). Tatishchev tried to get his work published in England afterwards, but to no avail ([979], page 54).

Thus, the work of Tatishchev was lost and subsequently published by Miller in accordance with unidentified manuscripts. It is presumed that Miller published this very lost oeuvre written by Tatishchev using the “drafts” of the latter ([832], Volume 1, page 54).

“Miller writes about ... the ‘poor copy’ that was at his disposal ... and pledges having been unable to correct the numerous ‘slips of the pen’ that the chronicle presumably contained... In his foreword to the first volume Miller also mentions his editorship of Tatishchev’s text... All the subsequent criticisms of Miller were nothing but reiterations of what he was saying in these forewords, since none his critics ever came across the manuscripts [Tatishchev’s] used by Miller, nor indeed any other manuscripts of Tatishchev’s *History*; even the first ones [allegedly used by Miller – *Auth.*] disappeared and remain undiscovered until this day” ([832], Volume 1, page 56).

Further in [832], Volume 1, page 56). In other words, Tatishchev’s

comments to Miller's publication contradict the text.

Moreover, Miller's publication of Tatishchev's work doesn't contain the first part of his oeuvre for some reason, one that describes Russian history before Ryurik. "Tatishchev's text of the first part of *The Russian History* was omitted from the manuscript dating to 1746, where it was replaced ... by a brief account of this part's contents" ([832], Volume 1, page 59).

One cannot help pointing out that Tatishchev found *Povest Vremennyh Let* to be anything but trustworthy – its first part, at the very least. The manuscripts ascribed to him (the ones found in the private archives in the XX century) tell us explicitly that "the monk Nestor didn't know much of the old Russian Princes" ([832], Volume 1, page 108). The information he did find reliable came from the manuscripts and folk tales declared preposterous by modern historians. Apparently, Tatishchev managed to understand a great deal more of Russian history than he was "supposed to". His book was apparently destroyed, and the author declared a heretic; nevertheless, his name was cynically used post mortem.

The modern commentator writes the following in his attempt to find an "excuse" for Tatishchev:

"Can we really blame a historian who lived in the first part of the XVIII century for having believed the *Ioakimovskaya Chronicle*, when even in our days there are authors who rake through the fable-like tales of Artynov from Rostov searching for reflections of real events dating almost from the times of Kiev Russia?" ([832], Volume 1, page 51).

Finally, let us point out a vivid detail that makes our suspicions even more valid and demonstrates just how quickly the situation with Russian historical materials could change in the XVIII century. It turns out that "Tatishchev had used the very materials that didn't survive until our day" ([832], Volume 1, page 53).

How did Tatishchev manage to choose the very sources for his work that would "mysteriously" perish shortly afterwards?

Here is a possible explanation. Apparently, Tatishchev had used the

sources of the XIV-XVI century, which pertained to the history of Siberia and the Volga region, as well as “the archives from Kazan and Astrakhan which haven’t reached our time” ([\[832\]](#), Volume 1, page 53).

We are of the opinion that these archives were simply destroyed in the XVIII century, already after Tatishchev. As we understand today, the XIV-XVI century sources from the Volga region and Siberia must have related the true history of Russia-Horde. Even after the first purges of the archives by the Romanovs, some information must have remained there.

The archives contradicted Scaligerian and Romanovian history, and were therefore eradicated completely.

Let us now turn to the figure of the Professor of History and the official historiographer of the St. Petersburg Academy of Sciences – G. F. Miller, who had received an order to write the history of Russia. He also didn’t manage to find any historical sources in the capitals and thus had to undertake a journey through provincial Russia in 1733-1743. His itinerary lay through Siberia, which means that the chronicles that Russian history is based on nowadays were presumably “brought” from those parts. Nevertheless, it is commonly known that they possess distinctive stylistic characteristics of the Russian South-West.

After his return from Siberia, Miller was given the position of a historiographer. However, when he entered the service, he had to swear non-disclosure of what we would call classified information nowadays. This is what Schlezer tells us: “Miller was talking about secrets of the State, ones that must be made known to someone involved in the creation of Russian historiography; however, such a person would have to enter State service for life... Back then I wasn’t aware of the fact that Miller made this mistake himself ... denying himself ... the opportunity of a discharge” ([\[979\]](#), page 76).

A. L. Schlezer was hired by Miller as a private tutor for his children and also invited to take part in Miller’s historical and geographical research. This is what Schlezer writes about the archive of Russian chronicles that was at Miller’s disposal in his memoirs:

“The Kiev chronicle of Father Feodosiy and the anonymous chronicle of the XIII century ... would be of the greatest utility if they were published ... since ... [they] describe the history of the most important rulers and princes, and also inform us of great land acquisitions from the ancient times” ([979], page 46).

Schlezer refused to give the oath of non-disclosure, and therefore didn't receive access to Miller's archives. The chronicles edited by Schlezer were found by the latter in the archives of the Academy of Sciences.

All of this means that the conception of Russian history that we're accustomed to nowadays is of a very late origin. Apart from that, it turns out that the modern version of Russian history was created by foreigners exclusively. Modern historians demagogically use the name of Tatishchev, the first Russian historian, to “defend themselves”, as it were – after all, the first one *was* Russian, wasn't he? The fact that Tatishchev's work was in fact lost and then reconstructed by Miller from unidentified manuscripts is mentioned very seldom.

The atmosphere of the Romanovian-Millerian school of history was captured well by S. M. Stroyev, who wrote:

“These volumes betray signs of numerous efforts, all of them pursuing the same goal: to prove, validate, confirm and propagate the same postulations and the same hypotheses – only collective and prolonged works of all the scientists that worked in this field could make those hypotheses look like the kind of truth that would cater to the ambitions of researchers and readers alike ... one's objections aren't met by counter-argumentation, but rather get buried under a pile of names under the assumption that they will secure taciturnity out of respect for the authority of said names” ([774], page 3-4).

Our analysis of Russian history, which discovered the gravest errors in the version of Bayer/ Miller/ Schlezer, leads us to an altogether different opinion of their entire “scientific work”. The latter may be partially explained by the fact that Russia had been under a dominant foreign influence in that epoch, which was instigated by the Romanovs, which

means that the distortion of the true Russian history in the version of Schlezer/ Miller/ Bayer can be easily explained as one of the most important ideological objectives of the Romanovs themselves as a dynasty. The German professors simply carried out the order, and quite conscientiously at that. Had the orders been different, they would have written something else.

One is perfectly right to enquire about Russian historians and their whereabouts in that epoch. Why was the Russian history written by foreigners? Are there any other European countries where the history of the State would be written by foreigners exclusively?

The most commonly suggested answer is known quite well – Russian science is presumed to have been in a rudimentary state back in that epoch, therefore one had to rely on the enlightened Germans. We are of a different opinion. It is most likely that after the Tatishchev debacle, the Romanovs decided that foreigners would handle secrets of the State that concerned Russian history better, being more obedient, unfamiliar with the language and unattached to Russian history emotionally.

M. V. Lomonosov was one of Miller's principal opponents. He had claimed that the Slavs had a history, which was just as long as that of any other nation, and backed his claim with a number of sources. He wrote the following in his *Brief Chronicle*, basing it on the works of the "ancient" authors:

"In the beginning of the sixth century from Christ the name of the Slavs had spread far and wide; not only did Thracia, Macedonia, Istria and Dalmatia fear the might of their nation – they had played an important part in the very decline of the Roman Empire" ([\[493\]](#), page 53).

In the early XIX century, a new "sceptical" school of Russian historians emerged. It was led by Professor M. T. Kachenovskiy. The essence of the contentious issues was encapsulated well in the preface to P. Boutkov's book that was eloquently enough entitled *The Defence of Nestor's Chronicle from the Slander of the Sceptics* ([\[109\]](#)).

According to the sceptics, the ancient Russian chronicles were “an eclectic mixture of real facts and myths based on distant repercussions of historical events found in folk tales, as well as forgery, unauthorised apocrypha, and the application of foreign events to Russia. In other words, the sceptics want us to think of Rurik, Askold, Dir and Oleg as of myths, and also to limit what we know of Igor, Olga, Svyatoslav, Vladimir and Yaroslav to what foreigners tell us of these rulers, simultaneously refusing to date the epoch of our Northern Slavic migration and the foundation of Novgorod to an earlier period than the first half of the XII century” ([109], pages ii-iii).

Jumping ahead, we may as well mention that the reconstruction of Russian history that we suggest provides a perfect explanation of the fact that the Russian sceptics who had criticized the Millerian-Romanovian version of history were insisting on the Slavs being an ancient nation, quoting “ancient” sources as proof, on the one hand, and vehemently resisted the arbitrary extra age ascribed to Russian history on the other. This contradiction stems from great chronological shifts inherent in the entire edifice of Scaligerian history; it disappears completely as soon as we move the “ancient” history into the Middle Ages, as per our reconstruction.

Let us conclude the present paragraph with another quotation, which demonstrates that the deliberate destruction of the Old Russian sources continued well into the XVIII and even the XIX century. It refers to the manuscript archive of the Spaso-Yaroslavskiy Monastery:

“Among the manuscripts that were kept in the library of the monastery there were ... three chronicles of a secular nature – namely, historical works: two *Paleias* and the famous *Spaso-Yaroslavskiy Khronograph*. All of them ... disappeared from the Spasskaya Library around the middle of the XVIII and in the XIX century” ([400], page 76).

3.

The Radzivilovskaya chronicle from Königsberg as the primary source of the Povest Vremennyh Let

3.1. The origins of the chronicle's most important copies

The modern version of the ancient Russian history was initially based on a single chronicle – the *Radzivilovskaya Letopis*. This is what historians themselves are telling us in a very straightforward manner, calling this copy the oldest Russian chronicle ([\[716\]](#), page 3).

Let us turn to the fundamental multi-volume edition entitled *The Complete Collection of Russian Chronicles* published by the USSR Academy of Sciences. In the foreword to its 38th volume the historian Y. S. Lourie informs us of the fact that “the Radzivilovskaya Letopis is the oldest chronicle to have reached our time” ([\[716\]](#), page 3).

We must instantly note that this chronicle looks like a standard handwritten book, with pages made of paper and a XVIII century binding, q.v. in [\[715\]](#), as well as fig. 1.2. This isn't an archaic scroll of parchment like the ones that artists frequently portray the Russian chroniclers with.

Fig. 1.2. The Radzivilovskaya Chronicle: a general view. We see a typical book of the XVII – early XVIII century. Taken from [\[715\]](#).

We know the following about the *Radzivilovskaya* chronicle (according to [\[716\]](#), pages 3-4):

1. The copy of the chronicle that we have at our disposal nowadays is presumed the oldest to have reached our age, q.v. in [\[716\]](#), page 3. It dates from the alleged XV century. It is presumed that the chronicle describes historical events that took place in Russia from the earliest days and up until the alleged year 1206, which is where it ends abruptly.
2. It is the very Radzivilovskaya chronicle that the entire modern concept of the history of Kiev Russia is based upon. This concept was born in the XVIII century.
3. The Radzivilovskaya chronicle becomes known and introduced into scientific circulation in the early XVIII century. We find the following passage in [\[716\]](#), page 4).
4. Just one of the chronicle's copies is dated to the XV century – this is the actual *Radzivilovskaya Letopis* as it is known to us today.
5. There are other copies of the same chronicle in existence – however, they all date from the XVIII century, thus being substantially more

recent in their origins. Historians presume them to be copies of the XV-century *Radzivilovskaya Letopis*.

We must note right away that the intermediate copies of the Radzivilovskaya chronicle didn't reach us for some reason – where are the copies made in the XVI-XVII century?

3.2. The numeration of the chronicle's pages and the “bull's head” watermark

Let us study the copy of the Radzivilovskaya chronicle that dates from the alleged XV century. For this purpose we shall turn to the description of the manuscript that is given in the *Complete Collection of Russian Chronicles* ([\[716\]](#)). It turns out that this copy has distinctive marks that betray a more recent origin – namely, the XVIII century. Therefore, the “oldest copy” of the *Povest Vremennyh Let* that we have at our disposal was made around the same time as its so-called “copies” – or, in other words, the copies that were made around the same epoch, the XVIII century.

Take a close look at how the pages of the chronicle are numbered. We see two kinds of numeration at once – Arabic and Church Slavonic. The latter is presumed to have been the original predating the Arabic numeration by a long period of time. It is written that “one finds the old Cyrillic numeration in the bottom right corner of every page” ([\[716\]](#), page 3).

Furthermore, it is presumed that the Church Slavonic numeration was present in the chronicle from the very manufacture – nothing extraordinary about it, since a published chronicle should contain page numeration.

However, we immediately encounter the following amazing comment of the modern commentator: “The Church Slavonic numeration was made after the loss of two pages from the chronicle... Furthermore, some of the pages at the end of the book were put in the wrong order before the numeration ([\[715\]](#)). Therefore, both numerations were introduced after the

book had already been bound – otherwise the misplaced pages would be restored to their correct places before the binding. Seeing as how the chronicle still exists in this form, it must have only been bound once – when it was created.

Furthermore, we learn that “the three first pages of the chronicle are marked with the Roman letters a, b and c” ([\[716\]](#), page 3), and also that these pages are dated to the XVIII century by the watermarks that they contain (*ibid*). Could this mean that the entire manuscript was written and bound in the XVIII century? It is possible that the manuscript was created just before it was shown to Peter, and specifically for this purpose – see more on this below. In fig. 1.3 one can see page *a*. It is the first page in the chronicle. By the way, it begins from a foreword in German.

chronology of the sources used for reference and identification of old handwriting styles and watermarks. Any change in the source chronology will immediately affect the entire system of palaeographical and watermark-based dating.

In other words, in order to date written sources by handwriting style and/or watermarks, one needs reference materials, which are presumed to contain the correct datings. Newly found texts are dated by the watermarks they contain, which ties them to the reference materials used for past datings. If these prove incorrect, other datings are also likely to be erroneous.

Moreover, it is possible that stocks of XVI-XVII century paper were used in the XVIII century in order to create manuscripts that would “look old”. Also, the “bull’s head” watermark found on the sheets of the chronicle and the variations thereof could be used by the factory that made paper in the XVI, the XVII and the XVIII century – especially seeing how historians themselves date the first three pages to the XVIII century using the same general principle – the watermark method.

N. A. Morozov had apparently been correct in his opinion that the copy of the Radzivilovskaya Letopis brought by Peter the Great served as the base for all the other copies of the Povest Vremennyh Let. He wrote that “after the seven-year war had broken out, our Academy of Sciences purchased the Königsberg original in 1760 and published it six years later in St. Petersburg – in 1767 ... this is the true origin of the Russian chronicles, and should someone care to tell me that Nikon’s manuscript had existed before Peter, I shall require proof of this declaration” ([\[547\]](#)).

4.

Forged fragments of the *Radzivilovskaya Letopis* – the copy that served as basis for the *Povest* *Vremennyh Let*

4.1. Publications of the *Radzivilovskaya Letopis*

Historians write that “The Radzivilovskaya Letopis is one of the most important chronographical sources of the pre-Mongolian epoch ... this chronicle is the oldest to have survived until our day; its text ends with the beginning of the XIII century” ([\[716\]](#), page 3).

We proceed to learn of the following important circumstance: “The Radzivilovskaya Letopis hadn’t come out as an academic publication” until 1989 ([\[716\]](#), page 3).

It was as late as 1989 that the 38th Volume of the *Complete Collection of Russian Chronicles* was published, which contained the *Radzivilovskaya Letopis*.

4.2. History of the copy known as the *Radzivilovskaya Letopis*

According to the historical overview of the information we have about the copy known as the *Radzivilovskaya Chronicle* that one can find published in [\[715\]](#), Volume 2, page 6).

However, historians tell us that the origins of the copy can presumably be traced to the mid-XVII century; however, every mention of the chronicle that predates the alleged year 1711 is based on considerations of an indirect nature, which is made obvious by the description given in [\[715\]](#), Volume 2, page 5).

After that, in 1758, during the Seven-Year War with Prussia (1756-1763), Königsberg was taken by the Russians once again. The

Radzivilovskaya Letopis was brought to Russia and given to the library of the Academy of Sciences, where it remains until the present day ([715], Volume 2, page 3).

“When the original became property of the Academy’s library in 1761 ... its study was conducted by A. L. Schlezer, Professor of History who had just arrived from Germany” ([715], Volume 2, page 7).

The Russian edition was presumably in preparation, but never got published. It had “remained unfinished and was destroyed in the fire of 1812” ([715], Volume 2, page 7). This seems rather odd – the destruction is most likely to have simply been ascribed to “the evil French invaders”.

Next we learn that, for some bizarre reason, “the original of the *Radzivilovskaya Chronicle* came into the private possession of N. M. Mouravyov, the Secret Counsellor ... in 1814, after the death of Mouravyov, the chronicle was taken by A. N. Olenin, the famous archaeographer and the director of the Imperial Public Library, who would refuse to return it to the Academy of Sciences despite the demands of the latter” ([715], Volume 2, page 7).

It would be interesting to know just why Olenin refused to return the manuscript. This story is rather abstruse; the manuscript had already been prepared for publication “owing to the labours of A. I. Yermolayev, a keeper of the Public Library” ([715], Volume 2, page 7). Instead of publishing, Olenin asked the Academy of Sciences for three thousand roubles, presumably to make the edition a more expensive one. His request was complied with – he did receive the money. Nevertheless, he kept holding the manuscript back. This publication never took place.

We learn nothing of how the manuscript was returned to the library of the Academy of Sciences from [715]. Nevertheless, this is a very important moment – after all, the chronicle in question is the oldest known Russian chronicle, and one that never got published at that.

Apart from that, we are confronted with a very important issue – namely, the fate of the chronicle during the time when it was kept in private collections. We shall provide our hypothetical reconstruction

thereof below.

4.3. A description of the chronicle

Let us now turn to the academic description of the *Radzivilovskaya Chronicle*. We learn the following: “The manuscript consists of 32 sections, 28 of which contain 8 pages, with two more 6-page section (pages 1-6 and 242-247), one 10-page section (pages 232-241) and one 4-page section (pages 248-251)” ([716], page 4).

This academic description of the chronicle makes the initial impression of being precise and is supposed to give us an idea of which sections constitute the manuscript. It should tell us about the pages that comprise a section, each one of them being a spread, or a single sheet of paper. Several such spreads form a section, and several sections add up to a book. As a rule, there are an equal number of sheets in every section – in the present case, the standard number is four spreads, or eight pages. Having studied the structure of the sections that the *Radzivilovskaya Chronicle* consists of, A. A. Shakhmatov tells us the following: “it is obvious that each section should contain eight pages” ([967], page 4).

However, as we have seen, due to an error in the binding of the chronicle, some of the pages ended up in different section; as a result, there are sections of 4, 6 and 10 pages at the end of the book.

The first section of the book stands alone; although it consists of a mere 6 pages rather than 8, or is undersized, we see no oversized sections anywhere near; it is followed by standard 8-page sections that constitute most of the book. Where are the missing two sheets from the first section?

4.4. Story of a forgery. The mysterious “extra” page in the *Povest Vremennyh Let*

Let us pay close attention to the following strange circumstance. According to the academic description, the manuscript consists of sections, each of which has an even number of pages 4, 6 or 10, q.v. above.

Therefore, the total number of the pages in the chronicle must be even. However, the first page is numbered 1, and the last one 251 – we are talking about Arabic numeration here, which contains no gaps or glitches. The book turns out to contain an odd number of pages; this becomes quite obvious from the photocopy of the chronicle ([\[715\]](#)).

The implication of the above is that one of the sections contains an odd “extra” page, which may have been put there later – or, alternatively, that one of the pages got lost, whereas the other part of the spread remained. In this case, we must find a gap in the narrative, which will definitely be manifest, unless the lost page was the first or the last one in the book – for instance, the foreword or the table of contents.

And so we see that the *Radzivilovskaya Letopis* contains omissions or insets. Why does the academic description tell us nothing about this fact? This description keeps strangely silent about the exact location of the odd page, as well as whether it is a single such page (strictly speaking, there may be an indefinite random odd amount of such pages which hasn’t been estimated).

Let us mark that this incompleteness of description renders the latter void of practical utility, since it is easy enough to understand that the location of the odd page will affect the distribution of other pages across the spreads, it becomes unclear which page numbers mark the end of one section and the beginning of another etc. If the description of a chronicle’s section cannot answer such questions, it becomes rather useless.

We shall try and find the location of the mysterious odd page, as well as the information written thereupon. The very fact that the academic description remains taciturn about it spurs our interest.

A simple calculation demonstrates that the odd sheet should be somewhere in the first or the second section. Indeed, the first section consists of 6 pages, followed by 28 8-page sections, the 30th section of 10 pages etc. We know that the number of the first page in the 10th section is 232. Therefore, the first 29 sections contain 231 pages. The number is an odd one, which means that the odd page should be somewhere in the first

29 sections.

However, there is nothing to arouse our suspicion in sections 3-28; each of them contains 8 full pages, and they're in a good condition. According to photographs from [\[715\]](#), all the spreads are whole, and none of them fell apart.

This isn't the case with the first two sections – almost every spread found there fell apart into two separate pages, which makes this part of the manuscript particularly suspicious.

Can we claim the odd page to be located here? Apparently, yes. Fortunately, the manuscript also contains remnants of the old section numeration in addition to the numerated sheets; this is common for old books – the first page of every section was numbered.

A. A. Shakhmatov writes that “the ancient count of sections remains; however, most of the Church Slavonic numeric markings made in the bottom margins were cut off when the book was bound. The first surviving marking is the figure of 5 [the Church Slavonic “e” – *Auth.*] is found on page 32 [33 in Church Slavonic numeration – *Auth.*], the second, number 9 [Church Slavonic “phita” – *Auth.*] – on the 64th [65th in Church Slavonic numeration – *Auth.*] etc. It is obvious that each section consisted of 8 pages” ([\[967\]](#), page 4).

Thus, the 33rd page in Church Slavonic numeration falls over the beginning of the 5th section. Page 65 in Church Slavonic numeration falls over the 1st page of the 9th section, and so on. The implication is that every section, including the first, had once contained eight pages, and the last page of every section had possessed a number divisible by eight in Church Slavonic numeration.

Let us turn to the actual chronicle. The page with the Church Slavonic number of 8 is simply absent from the chronicle. The page numbered 16 is present, but it is the fifteenth page of the manuscript *de facto*. At the same time, its number must make it the last page of the second section, or the sixteenth page of the manuscript. Consequently, a page is missing from one of the first two sections.

However, according to the academic description, the first section contains exactly 6 pages. It turns out that two pages are missing – yet we have seen that the first two sections combined lack a single page; could this mean that two pages were lost and one inserted? Maybe. At any rate, we have localized the part of the chronicle with obvious signs of alterations. It is the first two sections.

Let us take a look at the chronicle. In fig. 1.4 we see a diagram that refers to the condition of the Arabic and the Church Slavonic numeration in the first two sections of the *Radzivilovskaya Letopis*. The Arabic numeration is in the first line, and the Church Slavonic in the second. The third line refers to signs of wear affecting the Church Slavonic numeration, or traces of changes in the latter. If an Arabic or Church Slavonic number is missing from a page, it is indicated in the respective cell.

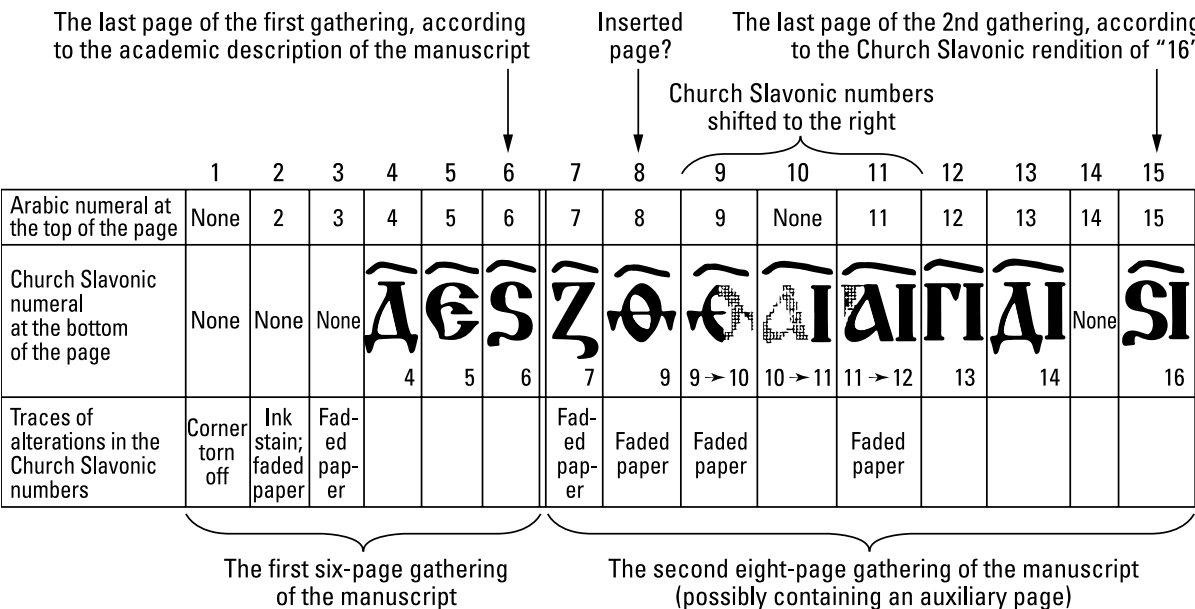

Fig. 1.4. A scheme of the alterations introduced in the numeration of the first and the second gathering of the *Radzivilovskaya* chronicle. The first row indicates the Arabic numeration, the second – its Church Slavonic equivalent, and the third refers to traces of alterations affecting the Church Slavonic numeration. Missing Arabic and Church Slavonic numerals are represented by the word “none”.

Once we studied the Church Slavonic numeration of the first two sections attentively, it turned out that the numbers of three pages (10, 11 and 12 in Church Slavonic numeration) must have been retouched by someone – namely, made greater by a factor of one. Their previous Church Slavonic numbers had been 9, 10 and 11, respectively, q.v. in the photocopy from [\[715\]](#).

In fig. 1.5 we demonstrate how this was done; this is most obvious from the page with the Church Slavonic number 12, q.v. in fig. 1.6. One needs to write “bi” in order to transcribe the number 12 in Church Slavonic; the chronicle page in question was numbered “ai”, or 11. Someone had drawn two lines on the Church Slavonic “a”, which made it resemble “b”. This retouching was done in a rather sloppy manner, and is therefore very difficult to overlook ([\[715\]](#)).

Fig. 1.5. Falsified page numbers in the *Radzivilovskaya Chronicle*.

Fig. 1.6. Slavonic number on the eleventh page of the *Radzivilovskaya Chronicle*. It stands for “twelve”. An obvious forgery. Taken from [\[715\]](#).

In figs. 1.7-1.10 one sees the Church Slavonic numbers on pages 7, 9, 10 (formerly 9) and 11 (formerly 10). It is perfectly obvious that something

wasn't quite right with the numbers of the pages. They must have been altered several time; one can clearly see traces of retouching.

Fig. 1.7. Slavonic number on the seventh page of the Radzivilovskaya Chronicle. Taken from [\[715\]](#).

Fig. 1.8. Slavonic number on the eighth page of the Radzivilovskaya Chronicle. It stands for “nine”. A forgery. Taken from [\[715\]](#).

Fig. 1.9. Slavonic number on the ninth page of the Radzivilovskaya Chronicle. It stands for “ten”. A forgery. Taken from [\[715\]](#).

Fig. 1.10. Slavonic number on the tenth page of the Radzivilovskaya Chronicle. It stands for “eleven”. A forgery. Taken from [\[715\]](#).

On the first page of the three the Church Slavonic figure of ten, or “i”, was obviously “manufactured” from the Church Slavonic figure of nine that used to be here before – the “phita”, which had simply lost its entire right side. However, one can clearly see the remains of its horizontal line, q.v. in fig. 1.8. Changing 10 for 11 in the second page of the three was hardly a problem – one would simply have to add the numeric letter “a”. This is why the Church Slavonic number on page 11 looks clean.

We see that the Church Slavonic numeration of three pages was shifted forward by a value of one, making place for the Church Slavonic figure of nine, which we shall consider below.

However, in case of such a numerical shift one would expect to see two pages with the Church Slavonic number of 12 – the original, and the one “converted” from 11, whereas in reality we only have the latter. Where did the other one go?

The “extra” page with the original Church Slavonic figure of twelve is most likely to have been removed; we see a gap in the narrative where it used to be. Indeed, the page with the Church Slavonic number of 12 begins with a miniated (red, done in cinnabar) letter of the new sentence. Yet the last sentence of the previous page (number 12 after the alterations were introduced, and originally 11) isn’t finished – it ends abruptly.

Of course, the person who had torn the page out tried to make the gap in the narrative as inconspicuous as possible; still, making it impossible to notice turned out impossible. This is why the modern commentators point out this strange place; they are forced to write that the letter was miniated by mistake: “The manuscript ... contains a red led letter that was miniated by mistake” ([\[716\]](#), page 18, see the commentary to the beginning of the page with the Arabic number of 12, or page 13 in the Church Slavonic numeration.

Let us linger here for a while. First of all let us remind the readers who

are compelled to study the photocopy from [\[715\]](#) themselves that the full stop mark in the chronicle plays the part of a modern comma. The modern full stop that marks the end of a sentence looks like three triangular points in most cases. Apart from that, the beginning of every new sentence is marked by a red (miniated) letter.

Let us take a look at page 11 in Arabic numeration, where someone had changed the Church Slavonic number for 12.

The text at the end of the page followed by the gap that we are referring two ends with the words “the reign of Leon, son of Vassily, who had also called himself Leo, and his brother Alexander, who had reigned...” ([\[715\]](#), the page with the Arabic number 11, reverse. Next we find a comma.

The next page after the gap (12 in Arabic numeration and 13 in Church Slavonic) begins with a list of dates: “In such-and-such year” etc.

Whoever was responsible for the forgery must have thought this place convenient for bridging the gap. His presumption had been that the words “had reigned” can be linked with the beginning of the Church Slavonic page 13, which would give us a more or less proper-sounding sentence as a result – “had reigned in the year” etc.

However, this would require declaring the first miniated letter to have been highlighted in red by mistake – and, possibly, altering some parts of the text, which is the only way in which a proper sentence could appear.

The gap was thus bridged, albeit poorly – however, whoever was responsible for the forgery didn’t care much about which page to remove; a minimal disturbance of the narrative was the only criterion, which is why this page had been chosen.

The main objective of the forgery was to make place for the page with the Church Slavonic number 9. The previous page 9 was transformed into page 10 to make space, q.v. below.

Thus, it appears as though we found the place in the chronicle where somebody had planted an extra page. It is the page with the Church Slavonic number 9 and the Arabic number 8.

It has to be noted that this page is immediately conspicuous, since its

part of a spread q, v in figs. 1.11 and 1.12)

1.11. The eighth page of the Radzivilovskaya chronicle (an insert). Front
Taken from [\[715\]](#), page 8.

Fig. 1.12. The eighth page of the Radzivilovskaya chronicle (an insert). Reverse. Taken from [715], page 8, reverse.

Moreover, we find a later note attached to one of its missing corners, which tells us that the page in question should be numbered 9 and not 8; this note is making a reference to a book that came out in 1764, which is therefore the earliest date that the note could be written (see fig. 1.13).

Fig. 1.13. The lettering glued to the missing upper corner of the eighth page of the Radzivilovskaya Chronicle. Taken from [\[715\]](#).

Let us proceed to read this eighth page. What shall we find here? Why would someone prepare a place for this page and insert it into the book? Was it necessary to discuss it at this great a length?

4.5. Who could have planted a page with the “Norman” theory into the *Povest Vremennyh Let*?

What we find in this page is the story about the Varangians summoned to govern Russia, no less – the basis of the famous Norman theory, in other words. Basically, the Slavophiles and the Occidentalists had argued about this very page for the duration of the entire XIX century. If we are to remove this page from the chronicle, the Norman theory shall immediately vanish. Rurik shall become the first Prince of Russia – and one who came from Rostov at that.

However, the planted page mentions the Ladoga lake, which rather conveniently indicates that the first capital of Rurik was somewhere in the Pskov region, amidst the swamps.

If we are to remove this page, we shall see that the geographical roots of Rurik and his brothers can be traced to the Volga region – namely, Beloozero, Rostov and Novgorod; no sign of the Pskov region. As we shall explain in the chapters to follow, the name Novgorod was used for referring to Yaroslavl on the Volga. The meaning of the above shall be

made even clearer by the chapters to follow.

Corollary. By having planted the page with the Church Slavonic number 9 in the book (Arabic number 8), the falsifier had provided a base for two fundamental hoaxes at once:

- *First hoax.* The alleged summoning of the princes from the North-West, which was later transformed into modern Scandinavia. This was clearly done for the benefit of the Romanovs, since their dynasty came from the North-West – Pskov and Lithuania.
- *Second hoax.* Novgorod the Great was allegedly located in the Pskov region near Ladoga. This served as the a posteriori “validation” of what had already been a *fait accompli* as a political action – the false transfer of the Great Novgorod upon the Volga to the Pskov Region. This served as the “chronographical basis” for depriving Yaroslavl of its former name, that of the Great Novgorod.

It becomes clear why the academic description of the *Radzivilovskaya Letopis* ([\[715\]](#)) is strangely silent about the section with the odd page. This is most likely to be the section with the “Norman” page, or some odd page right next to it – and traces of forgery and mystification surrounding the page in question also make it fall under suspicion.

This criminal fact must have been made known to as few people as possible in the Romanovian epoch – just imagine the XIX century Slavophiles learning of the fact that the notorious Norman theory in its Romanovian version, one that they had battled against with such vehemence, was based on a single suspicious page, and possibly a *planted* one at that. The scientific circles would have gone amok.

However, we have already seen that no “strangers” were allowed to access the original of the manuscript – only “trusted persons”, or those who were prepared to keep silent. It becomes clear why now.

It would make sense to remind the reader of the strange story with the dispute between the Academy of Sciences and A. N. Olenin, the

archaeographer and the director of the Imperial Public Library who would obstinately refuse to return the manuscript to the Academy. He is supposed to have “intended to publish it”, and, according to A. A. Shakhmatov, “asked the Academy for three thousand roubles; the request was complied with. The outcome of Olenin’s endeavour remains unknown, as well as the reasons why the publication of the *Radzivilovskaya Chronicle* had stopped... In 1818, S. Ouvarov, the new president of the Conference, enquired about this ... the conference replied that ‘it could not be held responsible for the delay in publication, which resulted from the fact that Mr. Olenin was greatly occupied and involved in numerous affairs’” ([967], pages 15-16).

So, Mr. Olenin was too busy and had no time for explanations – yet he did take the money, and a hefty sum at that - three thousand roubles. Why didn’t he publish anything? What was happening to the manuscript? As we realise now, it is most likely that the “incorrect” pages were being replaced by the “correct” ones.

4.6. How the “scientific” Norman theory got dethroned and declared antiscientific

As we already mentioned, the authorship of the “scientific Norman theory” belongs to Bayer ([797], page 100). Today we already understand that this “theory” was based on blatant misinterpretation aided by artful falsification of real historical facts. The real Russian Prince (or Khan) called Ryurik, also known as the Great Prince Georgiy Danilovich according to our reconstruction, whose another double is Genghis-Khan – the founder of the cyclopean Great = “Mongolian” Empire and the first one to unite the numerous Russian principalities, was declared foreign and a native of the modern Scandinavia. (We demonstrate it in “The Origins of Russia as the Horde” that the image of Ryurik incorporates data pertaining to the Trojan King Aeneas, who fled from the burning city of Troy (or Czar-grad) in the early XIII century and came to Russia.)

The Great Novgorod = Yaroslavl, which had once been the capital of Ryurik (or, rather, his brother and successor Ivan Kalita = Batu-Khan), was moved (on maps) into the swampy wilderness of the Pskov region, closer to Scandinavia – the alleged “homeland” of Ryurik.

The general plot of this “theory” must have been invented by the first Romanovs. However, a scientist was required for transforming this political theory into a “scientific” one – someone who would prove it with the aid of “old documents”.

Such a scientist was found. It might have been Bayer, which is what the Encyclopaedia is telling us ([\[797\]](#), page 100). Yet the creation of the “scientific basis” for this theory, or the insertion of the “Norman page”, must be credited to Schlezer, who had worked with the actual *Radzivilovskaya Letopis*, or one of his predecessors. The Romanovian academic science had been defending the Norman theory for many years to follow – Miller, Karamzin, Solovyov, Klyuchevskiy etc, Lomonosov’s attempt to refute the theory long forgotten ([\[493\]](#)). However, after the fall of the Romanovs, the necessity to keep the “theory” alive became obsolete, and it transformed from “scientific” into “antiscientific” without too much publicity. It appears as though the Russian historians took an unbiased look at the chronicle and discovered that the page with the “Norman theory” was in fact an inset.

In general, the whole section in question turns out to consist of overlapping fragments predominantly – Academician B. A. Rybakov is perfectly correct to note that “one cannot help noticing the lack of thematic and even grammatical correlation between certain fragments [the ones that Rybakov had divided the first section into – *Auth.*]... Each one of said fragments fails to demonstrate any kind of logical connexions with the preceding fragment, nor does any of the fragments constitute a finished whole by itself. The eclectic terminology also attracts one’s attention instantly” ([\[753\]](#), pages 129-130).

B. A. Rybakov found gaps, anachronisms and shifts in the very first section ([\[753\]](#), page 120). There was no opportunity of discussing any of

them openly in the time of the Romanovs. However, the “work methods” used by the founders of the Russian historical science that were summoned by the Romanovs from Germany in the XVIII century (arbitrary insets and so on) are usually omitted from the texts of the modern commentators. It isn’t just a question of the “Norman theory” – the entire foundation of the Russian history was shaped in the pro-Romanovian way by these German “founding fathers”; their involvement in the numerous forgeries will inevitably cast a shadow of suspicion over their entire body of work, or the basics of the Russian history itself.

Nowadays we can easily understand the true reasons why the publication of the *Radzivilovskaya Letopis* had been delayed in this odd a manner and for so long; the first edition of 1767 wasn’t based on the original, but rather the copy made for Peter the Great in 1716 ([967], page 14). According to A. A. Shakhmatov, this edition even accounted for pencil markings in Peter’s copy; he claims that it wasn’t a scientific edition at all, since the latter had a priori allowed for numerous corrections, sizeable insertions etc. ([967], pages 13-14).

The next publication only took place in 1902! It was a photomechanical replica of the manuscript, already detailed enough for the discovery of the forgeries mentioned above. However, public interest in the “Norman theory” and Russian history in general had dwindled by that time, and no one would care to dig up old manuscripts in order to disprove Miller’s version, which had already become consensual and backed by the voluminous academic publication of Solovyov, Klyuchevskiy and other “specialists in the field of Russian history”.

Another 87 years passed by. The *Radzivilovskaya Letopis* finally became published in the *Complete Collection of Russian Chronicles*. This happened in 1989, when Russian history had already been long past the turmoil and the disputes with the Slavophiles. The Norman theory was declared antiscientific – in Russia, at least. No more obstacles for publication.

The 1989 edition came out without stirring any controversy whatsoever,

and an excellent colour photocopy of the chronicle was published in 1995 ([715]). This can truly be seen as an important event in academic life; nowadays everyone can witness the fact that the *Radzivilovskaya Letopis* contains phenomena even more fascinating than the inset with the “Norman page”. We shall be discussing them shortly.

4.7. Having planted a page into the chronicle, the hoaxer prepared space for another, soon to be “fortunately found.”

The chronology page of the *Radzivilovskaya Letopis*

There is a peculiar note attached to one of the missing corners of the “Norman page” ([715]). According to several embarrassed comments, the handwriting it is written in dates to one of the three following epochs:

- the late XVIII century ([716], page 15, comment “x-x”),
- the XIX century ([715], Volume 2, page 22),
- the XX century ([715], Volume 2, page 22).

The note tells us the following: “this place is preceded by a missing page” ([716], page 3).

And so we have an anonymous commentator who is kind enough to tell us about a whole page that is missing from the book. Let us examine the text of the *Radzivilovskaya Letopis* ([715]) and see what we can find there. Oddly enough, there is no gap in the narrative; the preceding page ends with an explicit full stop, which is transcribed as three triangular dots in the chronicle. The last sentence in this page is complete.

As for the next page, it begins with a red miniated letter, which marks a new sentence. This sentence can be considered to continue the previous one – there is no gap of any kind in the narrative. See for yourselves – both the end of the page and the beginning of the next one are cited below.

“They have found the Khazars dwelling in these hills, and the Khazars said: ‘You must pay us tribute’. The Polyane pondered this, and each

house gave a sword. Upon seeing this, the Bulgars realised they could provide no resistance, and implored to be baptised, conceding to surrender to the Greeks. The king had baptised their prince, and all their nobility, and made peace with the Bulgarians” ([\[715\]](#), Volume 2, pages 22-23).

Where is the gap in the narrative? One sees no missing pages anywhere – what we have in front of us is coherent text. Nevertheless, a certain complaisant hand writes that some page is presumably missing from this part of the book. This page was “finally found”, courtesy of Schlezer and his “scientific” school. Its contents have been included in all the editions of the *Povest Vremennyh Let* ever since, the photocopy ([\[716\]](#)). What do we see on this page?

We see nothing short of the entire chronology of the ancient Russian history and the way it relates to the global chronology, which is why we are calling this “subsequently discovered” page the “chronology page”.

The page informs us of the following, in particular: “In the year 6360 of the 8th indiction, the reign of Mikhail began, and the land became known as the Russian land. We possess knowledge of this fact, since the Russian army had come to Czar-Grad under this ruler, as [the name of the author one expects to find here is missing for some reason – *Auth.*] writes in his Greek chronicle; therefore, let us begin henceforth, and use the following numbers:

- 2242 years passed between Adam and the Deluge;
- 1082 years between the Deluge and Abraham;
- 430 years between Abraham and the Exodus of Moses;
- 601 years between Moses and David;
- 448 years between David, as well as the beginning of Solomon’s reign, and Jerusalem falling captive;
- 318 years between the captivity and Alexander;
- 333 years between Alexander and the Nativity of Christ;
- 318 years between the Nativity and Constantine;
- another 452 years stand between Constantine and this Mikhail,

- 29 years passed between the first year of this Mikhail's reign and the first year of Oleg, the Russian prince;
- 31 years between the first year of Oleg, who reigned in Kiev, and the first year of Igor;
- 83 years between the first year of Igor and the first year of Svyatoslav;
- 28 years between the first year of Svyatoslav and the first year of Yaropolk;
- Yaropolk had reigned for 8 years;
- Vladimir had reigned for 27 years;
- Yaroslav had reigned for 40 years;
- thus, we have 85 years between the deaths of Svyatoslav and Yaroslav;
- a further 60 years passed between the deaths of Yaroslav and Svyatopolk" ([\[716\]](#), page 15).

What we see related here is the entire chronology of the Kiev Russia in relation to its chronology of Byzantium and Rome.

If we are to remove this page, the Russian chronology of the *Povest Vremennyh Let* becomes suspended in the thin air, losing its connexions with the global Scaligerian history. This leaves room for all kinds of interpretation – such as different versions of reading the dates found in the chronicle.

The hoaxers were perfectly aware of just how important this “missing” page would be for someone faced by the task of creating the chronology of the Russian history. It was therefore treated with a great deal more care and attention than the “Norman page”; the latter must have been planted in the book rather haphazardly, with the task of making heads or tails of Rurik's origin left to the Romanovs as the interested party.

As for chronology, the task proved to be a great deal more serious; this is becoming more and more obvious to us today. The issue at hand was that of falsifying global history, and not just that of Russia. Apparently,

Schlezer and his XVIII century colleagues were well aware of this, remembering the labours it took to introduce the Scaligerian chronology and concept of history and knowing them to be an arbitrary version, propagated by force and still recent in that epoch.

Therefore, there had been no hurry with the “chronology page” – the hoaxers simply prepared space for it, making the sly margin announcement concerning the missing page. Could another chronicle (the so-called *Moskovsko-Akademicheskaya Letopis*, or the “Academic Moscow Chronicle”) have been manufactured with the whole purpose of justifying the “missing” page? It is contained therein – possibly to preclude anyone from declaring it apocryphal.

4.8. The “Academic Moscow Copy” of the *Povest Vremennyh Let*

The doubtless relation between the next copy of the *Povest Vremennyh Let* that was discovered (the so-called “Academic Moscow Copy”) with the one known as the *Radzivilovskaya Letopis* was mentioned by Academician A. A. Shakhmatov. He wrote that “the similarity between large and continuous parts of the two had led me to the initial hypothesis about the first part of the *Moskovsko-Akademicheskaya Letopis* being ... but a copy of the *Radzivilovskaya Letopis*” ([967], page 44).

Shakhmatov was absolutely right. However, he must have subsequently become aware of the danger inherent in this postulation ([967], page 45). It would automatically mean that the *Radzivilovskaya Letopis* was the prototype of the *Moskovsko-Akademicheskaya Letopis*, and that there were numerous errors and “corrections” in the latter, such as the abovementioned “chronology page”.

The implication is that someone had “touched up” the *Radzivilovskaya Letopis*. When did that happen? Could it be the XVIII century? Apparently, Shakhmatov was well aware of the fact that this presumption casts a shadow of suspicion over the *Moskovsko-Akademicheskaya*

Letopis – a copy including later falsifications.

Furthermore, one learns that “the *Moskovsko-Akademicheskaya Letopis* is suspicious at any rate – for instance, the fact that it possesses distinctive characteristics of a copy made from an illustrated original (the actual chronicle hasn’t got any illustrations in it)” ([967], page 46). The example cited by Shakhmatov implies that the miniatures contained in the illustrated original were the same as the ones in the copy known as the *Radzivilovskaya Letopis*. Moreover, we learn that “the *Moskovsko-Akademicheskaya Letopis* confuses the sequence of events in the exact same manner ... as the *Radzivilovskaya Letopis*” ([967], page 46). In other words, it was copied from the latter – complete with the mistakes in pagination introduced randomly in the process of binding!

At the same time, the chronicle in question contains “many insertions and corrections”.

Our opinion is that all the subsequent full copies of the *Povest Vremennyh Let* that repeat the *Radzivilovskaya Letopis* almost word for word date from the eighteenth century and not any earlier – their authorship is most likely to be credited to Schlezer and his colleagues.

4.9. Other signs of forgery in the *Radzivilovskaya Letopis*

It turns out that the first eight pages of the manuscript that relate the very beginning of Russian history – the chronology, the origins of the Russian tribes, the foundation of Novgorod and Kiev etc, either contain no numeration whatsoever, or have it indicated in obviously different styles. Moreover, these pages are odd, meaning that they don’t fit into the folding of the section, q.v. in [715].

One gets the impression that this part of the chronicle was “corrected” by someone, which is also implied by B. A. Rybakov’s research. By the way, Rybakov bases his corollaries on the analysis of text exclusively, neither mentioning the odd pages, nor the gaps in numeration. Yet what he states in re the introductory part of the chronicle being an assortment of odd and poorly put together passages of a fragmentary nature is in perfect

correspondence with the fact that the first section of the manuscript is indeed a collection of individual pages, with distinct marks of corrections present in the Church Slavonic numeration. These figures are absent in half of the cases, q.v. in [\[715\]](#).

It appears as though the first part of the Radzivilovskaya chronicle was subjected to heavy editing in the second half of the XVIII century, when the forgery of Russian history had already been a fait accompli courtesy of Miller, Schlezer, Bayer et al. The barebones version of their “scientific” theory was structured in accordance with the Romanovian court version of the XVIII century (in order for the latter to receive validation “from the position of the scientific avant-garde”, as it were); however, some of the details would subsequently undergo substantial modification. This must be why the “original source” needed to be edited upon the completion of the entire body of work.

4.10. What is the chronicle that served as the original for the *Radzivilovskaya* chronicle, also known as the Königsberg chronicle?

Historians themselves claim the Radzivilovskaya chronicle to be a copy of a long-lost ancient original – miniatures as well as the text:

“All the researchers are of the same opinion about the fact that the illustrators of the *Radzivilovskaya Letopis* were copying illustrations that predated their time” ([\[715\]](#), Volume 2, page 5).

We are being told explicitly that the Königsberg copy, or the actual *Radzivilovskaya Letopis*, was manufactured in the early XVIII century. The original’s identity is of the utmost interest to us.

The research of the miniatures contained in the manuscript led the experts to the opinion that the *Radzivilovskaya Letopis* is a copy of a certain chronicle originating from Smolensk and dated to the XV century ([\[715\]](#), Volume 2, page 300). This doesn’t contradict what we were saying

above – on the contrary, it makes the general picture somewhat clearer.

Our hypothesis is as follows. Some chronicle was indeed written in the XV century; it contained the descriptions of XV century events contemporary to the creation of the manuscript – in particular, the famous dispute of the epoch between Smolensk, or Western Russia = Lithuania = the White Horde = Byelorussia and the Golden Horde = Velikorossiya, or the Great Russia, whose centre had remained in the Volga region. Moscow would become capital a lot later.

This chronicle wound up in Königsberg, where it had served as the prototype of the *Radzivilovskaya Letopis*, also known as the Königsberg copy. The copy was naturally far from exact. The scribes introduced a new chronology thereinto, as well as the new interpretation of the Russian history – already understood in the Romanovian spirit; the Romanovs had been rulers of Russia for a century in that epoch, after all. If the manufacturers of the copy were indeed trying to please Peter, they must have introduced political considerations of some sort into the chronicle.

The implication is that the *Radzivilovskaya Letopis* must have been based on the real events of Russian history, which were seriously distorted by the editors of the XVII-XVIII century.

4.11. Which city was the capital of the Polyane = Poles: Kiev or Smolensk?

One mustn't overlook the fact that historians themselves are of the opinion that some of the miniatures contained in the *Radzivilovskaya* chronicle depict Smolensk as the centre (or the capital) – see [\[715\]](#), Volume 2, page 304.

The question mark belongs to the historians themselves, since the city of Smolensk could in no way have been a capital around that time, since the epoch in question is the very dawn of the Kiev Russia. The foundation of Kiev is still in process – yet, lo and behold, we already have a capital in Smolensk!

This isn't the only miniature that ascribes excessive importance to Smolensk, according to the modern commentators, who are irritated by this fact to a great extent ([\[715\]](#), Volume 2, page 300).

Au contraire, we find nothing surprising about this. As we shall discuss below, Smolensk had really been the capital of the White Horde. This is why one of the miniatures draws it together with Novgorod and Kiev – the respective capitals of the Golden Horde and the Blue Horde ([\[715\]](#), Volume 2, page 300).

Poland (or the Polyane tribe) was part of this very White Horde in the XV century, which must be why the *Radzivilovskaya Letopis* ended up in Königsberg. The manuscript was therefore written from the position of the Polyane, or the Poles.

As for the Golden Horde, it is called Bulgaria, or Volgaria – “region of the river Volga”; the entire beginning of the chronicle is concerned with the struggle between the Polyane and the Bulgarians. The text is telling us that the Polyane come from Kiev; however, the miniatures betray their Smolensk origins. It is possible that when the text had been edited for the *Radzivilovskaya Letopis*, many references to Smolensk were replaced by those to Kiev; however, the more succinct indications that one finds in the miniatures were left unnoticed, and the necessity to alter a few illustrations didn't occur to the editors. Nowadays researchers notice the discrepancies between the text and the illustrations and shake their heads in confusion.

4.12. The arrival of Peter in Königsberg

It is possible that the *Radzivilovskaya Letopis* was prepared specifically for the arrival of Peter the Great in Königsberg in 1711, who had seen it before. After that it has transformed into the primary source of knowledge on the Russian history.

In general, the manuscript bears distinct marks of being unfinished and written against a tight deadline ([\[715\]](#), Volume 2, page 5). This is particularly obvious in comparison with the excellent miniatures from the Litsevoy Svod. The two schools of art are obviously very different from

each other.

Apparently, apart from the deadline, the Königsberg artists were affected by the need to copy a style that was alien and only vaguely familiar to them.

The incomplete nature of the *Radzivilovskaya Letopis* is especially manifest in the fact that the red miniated letters are missing from every single page that follows page 107, with the sole exception of page 118 ([\[716\]](#), page 4). One gets the impression that the final stages of the chronicle's manufacture were greatly affected by the hurry factor, and the chronicle was left unfinished for some reason. The work was interrupted when it had been going full steam, and never resumed. Even the miniated letters were omitted, let alone the signs of coarse corrections in the miniatures.

We are of the opinion that this is easily explained. The Königsberg artists were in a hurry to have the chronicle ready for Peter's arrival in Königsberg. Such situations usually mean hectic work. Peter was approaching the city, and the miniatures had still looked rather raw; some irate official commanded the artists to hurry up and paint the capital letters red in the beginning of the chronicle at least, since the latter had to be presented to Peter at once, and the lack of the miniated letters would look conspicuous.

The artists only got as far as the 107th page; the miniature was left unfinished and coarse, possibly bound immediately, with nobody to notice the fact that the paper used in this process had had a new type of watermarks upon it; those betrayed its XVIII century origin. The chronicle must have been given to Peter some thirty minutes after its completion.

The chronicle caught Peter's attention and ignited his interest at once, and he demanded a copy. The original had no longer been of any use to anyone, with the manufacture of the copy having become a new priority. It was abandoned.

How was anyone to know that the war with Russia would begin in 50 years, which would result in Königsberg captured, and the priceless

“ancient” original triumphantly claimed as a Russian trophy? Had the Königsberg hoaxers foreseen this, they would have certainly painted every single capital letter red.

4.13. A brief summary of our analysis of the *Radzivilovskaya Chronicle*

We are therefore of the opinion that the history of the “most ancient” *Radzivilovskaya Chronicle* is as follows. It was manufactured in Königsberg in the early XVIII century, apparently in preparation for the arrival of Peter the Great, right before it. Some really old chronicle of the XV-XVI century must have been used as a prototype; however, this ancient copy had undergone a substantial transformation before it became the *Radzivilovskaya Chronicle*. The old original was destroyed.

The Königsberg “Nestors” of the XVIII century were adhering to the Romanovian version of the old Russian history for the most part, as related in the official Synopsis dating from the middle of the XVII century. Their goal had been the creation – or, rather, the forgery of the missing original source, the presumably ancient chronicle that would confirm the Romanovian version of Russian history. Peter had approved of the Königsberg chronicle, and the *Radzivilovskaya Chronicle* has been known as the “oldest Russian chronicle” ever since. The original source that would serve as foundation for the entire edifice of Russian history finally came into existence.

However, the foundations of court Romanovian history aren’t limited to the chronicle in question; the Romanovs invited foreign professors of history in order to make their version “conform to international standards” – Bayer, Schlezer, Miller and others. The latter carried out their order and dutifully wrote the “cosmetic” version of the Romanovian history that would meet the stipulations of the historical science of that epoch. The Romanovian “court” version had undergone its transformation into a “scientific” one.

Apparently, when the German professors were approaching the completion of their work, they conscientiously decided to “correct” the original source, and therefore some of the pages were planted in the chronicle, and others removed therefrom. Special attention was naturally paid to the “Norman” and the “chronological” pages. Apparently, these pages needed to be re-written or even written from scratch in order to correspond to their new version; consider the process equivalent to putting the final layer of varnish on the product.

However, numerous signs of corrections remained in the *Radzivilovskaya Letopis*; this could lead to many unwanted questions. Therefore, the original had to be kept further away from prying eyes. Its publication took place a whole century later, when everyone had already forgotten about the taboo.

5.

Other chronicles that describe the epochs before the XIII century

Apart from the *Radzivilovskaya Letopis*, we have several other copies of ancient Russian chronicles at our disposal to date. The following ones are considered the most important:

- the Lavrentyevskaya Letopis,
- the Ipatyevskaya Letopis,
- the Academic Moscow Chronicle (also known as the Troitse-Sergievskiy copy),
- the Novgorodskaya Letopis,
- the Chronograph of Pereyasavl-Suzdalskiy, also known as the Archive Chronograph or the Judean Chronograph.

There are many other chronicles whose first part describes the Kiev Russia, or spans the historical periods before the alleged XIII century. However, it turns out that all the copies known to us nowadays that contain descriptions of this epoch somewhere in the beginning are variants of the *Povest Vremennyh Let* – or the *Radzivilovskaya Letopis*, in other words.

A detailed comparison of the existing copies of the *Povest Vremennyh Let* was made by N. A. Morozov ([\[547\]](#)). All of these copies turned out virtually identical, which had been known before. However, Morozov came to the conclusion that we feel obliged to cite herein:

“Apart from minor stylistic corrections ... the main body of text is virtually the same, notwithstanding the fact that the three copies were ‘discovered’ at a great distance from each other: the *Radzivilovskaya Letopis* was found in Königsberg, the *Lavrentyevskaya Letopis* – presumably in Suzdal, and the *Troitse-Sergievskiy*

copy was discovered in the Province of Moscow. If all of them are copies of the same older original that predated the invention of the printing press, one must think that said original was common for the entire territory between Königsberg and the Province of Vladimir or even a vaster one, which makes it a mystery how the surviving copies, being distant in territory and in relation to one another, fail to contain substantially greater textual alterations. One must therefore come to the conclusion that both the anonymous scribe responsible for the *Troitse-Sergievskiy* chronicle and Lavrentiy, the monk from Suzdal, were using the popular edition of 1767; thus, the texts date from the end of the XVIII century, a short while before their discovery by the laborious searchers of ancient chronicles like Moussin-Pushkin ... this explains the fact that none of them stops at 1206, which is the case with the *Radzivilovskaya Letopis*, but rather carries on with relating the chronology of the events ... and so we discover that the further sequence of events in one of the copies isn't repeated in any of the others ... not a single common word, which is quite normal for independent records of one and the same event" ([\[547\]](#)).

Above we cite another observation in favour of Morozov's opinion – apparently, all the copies of the *Povest Vremennyh Let* known to us today were written on the same kind of paper with identical watermarks – the “bull's head” and the variations thereof. It appears that they all came out of the same workshop. Could it have been the one in Königsberg?

We come to the three following conclusions.

1. Nowadays we have but a single text at our disposal that describes the events of the ancient Russian history before 1206. Let us remind the reader that this oldest epoch in the history of Russia is known as that of the Kiev Russia. In the Millerian version, the ancient Kiev lost its status of a capital after Batu-Khan had captured it in 1238.
2. This text exists in copies that are unlikely to predate the XVIII century, which is when it became known. The important thing is that the Russian sources that predate this time contain no references to the *Povest Vremennyh Let* whatsoever; apparently, this text had still been unknown in the beginning of the XVII century.

3. 3) All the copies of the *Povest Vremennyh Let* were apparently written around the same time (late XVII or the XVIII century), and in the same geographical location to boot.

6.

The publication rate of the Russian chronicles remains the same as time goes on

The publication of the *Complete Collection of Russian Chronicles* began as early as in 1841 ([797], page 1028). 24 volumes were published over the course of the 80 years that had passed between 1841 and 1921. This was followed by a 27-year break; then, in 1949, the publication had resumed. The last volume in the series to date is the 39th. Fantastic publication speed, isn't it?

Despite the fact that the publication has been going on for over 150 years, many Russian chronicles haven't been published yet – for instant, the *Karamzinskaya Letopis* from Novgorod, q.v. in [634], page 540.

The grandiose compilation of chronicles known as the *Litsevoy Letopisniy Svod*, usually dated to the XVI century, was only published in 2006. Its volume amounts to 9000 pages. It spans the period between the Genesis and 1567 ([797], page 718). In particular, it contains sixteen thousand excellent miniatures, many of which are often reproduced. There are many references to the *Litsevoy Svod* – and yet not a single complete edition in existence to predate 2006! The illustrations were available to the public, but not the text.

The facsimile edition of the *Litsevoy Svod* was published by the Akteon publishing house in Moscow as a result of it being discussed at length by a large number of people. This was an event of paramount importance.

A propos, the *Radzivilovskaya Letopis*, presumably the oldest one, was published as late as 1989 – in the 38th volume of the *Complete Collection*. Bear in mind that the publication of the series began in 1841!

What could possibly be the reason for such bizarre procrastination in the publication of the Russian chronicles? Judging by the publication speed of

the *Complete Collection*, we shall have to wait until the year 3000 to see printed copies of all the other Russian chronicles that remain unpublished to this day.

Let us mention another thing about the *Litsevoy Svod*. Below we shall demonstrate that some of the allegedly “ancient” Russian chronicles are most likely to have been created in the XVIII century. This fact makes us reconsider the *Litsevoy Svod* as seen in the context of other Russian chronicles. It may have been created in the XVII century, thus being the first version of the Russian history written at the order of the Romanovs. In this case it is one of the earliest chronicles to have survived until our day, rather than one of the more recent ones – see chapters 8 and 9.

7.

The traditional scheme of the ancient Russian history

In this referential section we shall remind the reader of the chronology and the primary landmarks of the ancient Russian history in the version suggested by Miller and his colleagues. We shall be citing their datings herein; our own datings, as given in the chapters to follow, shall be substantially different.

7.1. The first period: from times immemorial to the middle of the IX century A.D.

The *Povest Vremennyh Let* begins with a short section that relates Biblical history, starting with the deluge and ending with the Byzantine emperor Michael. Nowadays this emperor is supposed to have reigned in the middle of the IX century A. D. This brief introductory part of the chronicle hardly gives us any information concerning the history of Russia at all.

7.2. The second period: from the middle of the IX century to the middle of the XII – the Kiev Russia starting with Rurik and ending with Yuri Dolgoroukiy (of Rostov)

This is the epoch of the Great Princes who had ruled the Kiev Russia, q.v. in the *Radzivilovskaya Chronicle* ([\[362\]](#)).

We are of the opinion that the existence of numerous discrepancies between various sources – namely, different reign durations, occasionally also different names specified by different chronicles, gaps in dynastic sequences and a general lack of consensus in the descriptions of riots and civil disturbances, should be telling us that we are dealing with genuine ancient documents primarily. They have naturally undergone heavy editing

in the XVII-XVIII century, but nevertheless relate real historical events. Had Russian history been a mere fantasy of Miller and his colleagues, they would have streamlined it and avoided such obvious discrepancies. All of it leaves one with the hope that we can yet reconstruct the true Russian history from the chronicles available to date.

- *Ryurik*, 862-879, reigned for 17 years, capital in Novgorod the Great (Velikiy Novgorod).
- *Igor*, 879-945 or 912-945, reigned for 66 or 33 years, capital in Kiev since 882.
- *Oleg*, 879-912, reigned for 33 years, capital in Kiev.
- *Olga*, 945-955 or 945-969, reigned for 10 or 24 years, capital in Kiev.
- *Svyatoslav*, 945-972 or 964-972, reigned for 27 or 8 years, capital in Kiev. Transferred the capital to Pereyaslavl. Let us point out the lacuna in the chronicle that spans the years 955-964; it is unclear whether it had been Olga's or Svyatoslav's reign. Hence the different reign durations.
- *Oleg II* in 972, reigned for 1 year, capital in the land of the Drevlyane (Ovrouch?).
- *Yaropolk*, 972-980, reigned for 8 years, capital in Kiev. Prince of Velikiy Novgorod before 980.
- *Boris* in 1015, reigned for 1 year, capital in Murom.
- *Gleb* in 1015, reigned for 1 year, capital in Vladimir.
- *Svyatopolk*, 1015-1019, reigned for 4 years, capital in Kiev.
- *Yaroslav (= Georgiy) the Wise*, 1019-1054, reigned for 35 years. Prince of Velikiy Novgorod before 1019, moved to Kiev thereafter.
- *Mstislav Khrabriy (the Brave)* in 1035, reigned for 1 year, capital in Tmutarakan. It must be said that according to the XVI century sources described in [\[183\]](#), Volume 2, page 28, Tmutarakan used to be another name of Astrakhan. Certain historians are still trying to find the famous Tmutarakan – these efforts are quite futile, since the learned scholars are searching in the wrong place.

- *Izyaslav (= Dmitriy)*, 1054-1078, reigned for 24 years, capital in Kiev.
- *Vsevolod*, 1078-1093, reigned for 14 years, capital in Kiev. Originally a Prince of Pereyaslavl; his reign was preceded by that of his brother Izyaslav, which is considered to have been a time of embroilment and strife. The years of Vsevolod's reign could therefore have been counted from the date of Yaroslav's death. In this case, his reign covers the 39-year period between 1054 and 1093.
- *Svyatopolk (= Mikhail)*, 1093-1113, reigned for 20 years, capital in Kiev.
- *Vladimir Monomakh*, 1113-1125, reigned for 12 years; alternatively, 1093-1125, in which case his reign duration shall equal 32 years. Capital in Kiev.
- *Mstislav*, 1125-1132, reigned for 7 years, capital in Kiev.
- *Yaropolk*, 1132-1139, reigned for 7 years, capital in Kiev.
- *Vsevolod*, 1139-1146, reigned for 7 years, capital in Kiev. Igor in 1146, reigned for 1 year, capital in Kiev.
- *Izyaslav*, 1146-1155, reigned for 8 years, capital in Kiev.
- *Youri (= Georgiy) Dolgoroukiy*, starting with the death of his father in 1125 or with 1148, the year when he was crowned Great Prince in Kiev ([\[716\]](#), page 117). Alternatively, he could have come to power in 1155, at the end of Izyaslav's reign, and reigned until 1157. We get three versions of his reign duration as a result – 30 years, 9 years or 2 years. The main version is the 9-year one: starting with the beginning of his reign in Kiev and until the actual end of his reign. The capital is Rostov originally, and then Kiev; next it gets transferred to Suzdal.
- *Andrei Bogolyubskiy*, 1157-1174, reigned for 17 years, or 1169-1174 and a 5-year reign, accordingly. Here 1169 is the year when Andrei had conquered Kiev; his capital was in Suzdal or Vladimir. It is presumed that the capital was transferred elsewhere from Kiev in his reign.

Commentary. Up until the conquest of Kiev by Andrei, the city had been

the capital of the following Great Princes, which can be regarded as his co-rulers:

- *Izyaslav Dadidovich*, 1157-1159, reigned for 2 years, capital in Kiev.
- *Rostislav Mikhail*, 1159-1167, reigned for 8 years, capital in Kiev.
- *Mstislav Izyaslavich*, 1167-1169, reigned for 2 years, capital in Kiev.

This epoch is only known to us in the rendition of the *Povest Vremennyh Let*. Nowadays Kiev (the modern city on the Dnepr) is presumed to have been the capital of the state. The epoch of Kiev Russia ends with the transfer of the capital to Suzdal first, and then to Vladimir – under Youri Dolgoroukiy and Andrei Bogolyubskiy. This happens in the middle of the alleged XII century. The circumstances of the transfer of the capital from Kiev to Vladimir are described differently in various chronicles, with several datings of said events specified. The transfer is credited to Youri Dolgoroukiy in some cases, and to Andrei Bogolyubskiy in others. Youri Dolgoroukiy is also said to have founded Moscow in the alleged year 1147.

7.3. The third period: the Russia of Vladimir and Suzdal, starting with the middle of the XII century and ending with Batu-Khan's conquest in 1237

- *Mikhail*, 1174-1176, reigned for 2 years, capital in Vladimir.
- *Vsevolod "Bolshoye Gnezdo" ("The Great Nest")*, 1176-1212, reigned for 36 years, capital in Vladimir.
- *Georgiy*, 1212-1216, reigned for 4 years, capitals in Vladimir and Suzdal.
- *Mstislav of Novgorod*, reigned from 1212 according to [\[362\]](#), Volume 1, page 103. His reign duration therefore equals 7 years.
- *Constantine*, 1212-1219, reigned for 7 years, capitals in Yaroslavl and Rostov before 1216, Vladimir and Suzdal after that.
- *Youri (= Georgiy)*, 1219-1237, reigned for 18 years ([\[36\]](#), page 30).

Capital in Vladimir.

Once again, the beginning of this epoch is only known to us in the version of the *Povest Vremennyh Let*; the sequence of events related therein ends with 1206 – a few years before Batu-Khan's invasion, that is. The last year covered by the chronicles is in close proximity to the fall of Constantinople in 1204; however, this famous event is absent from the *Povest Vremennyh Let* for some reason. This omission is very odd indeed, since this chronicle pays a lot of attention to Byzantine events. We shall get back to this later.

The end of the third period is marked by the well-known “collation” of two different groups of Russian chronicles. Some of them cease their narration here, whereas others only start with this epoch. There are a few chronicles that don't interrupt at this point formally – the *Arkhangelogorodskiy Letopisets*, for instance; however, some of the chronicles manifest a chronological shift here, q.v. below. For instance, the *Oustyuzhskiy Letopisets* of Lev Vologdin, compiled in 1765, survived in its original form; there are also 22 copies of this chronicle kept in the archives of Moscow, St. Petersburg, Kiev and Oustyug Velikiy ([\[36\]](#), page 8). All of the editions (the original as well as the copies) contain “wrong” A.D. datings for the entire interval between 1267 and 1398. The rate of the chronological shift accumulated, amounting to a hundred years by 1398 – namely, the chronicle refers to 1398 instead of 1299, which is the “correct” dating. This year is reflected in a large fragment of text; after that, the chronicle leaps to 1415, and the chronological shift disappears. Thus, according to the Romanovian-Millerian chronology of the manuscript, the latter contains a gap between 1299 and 1415. Apparently, Lev Vologdin, a priest of the Uspenskaya Cathedral in Velikiy Oustyug, was still poorly familiar with the consensual chronology of the Russian history, which had still been “polished” by Miller in St. Petersburg.

The fact that the gap in Vologdin's chronicle is a centenarian one has an explanation, which will be related in detail below.

7.4. The fourth period: the yoke of the Tartars and the Mongols, starting with the battle of Sit in 1238 and ending with the 1481 “Ougra opposition”, which is considered to mark the “official end of the Great Yoke” nowadays

- *Batu-Khan* from 1238 and on.
- *Yaroslav Vsevolodovich*, 1238-1248, reigned for 10 years, capital in Vladimir. Came from Novgorod ([\[145\]](#), he had reigned in 1237-1247 (10 years altogether).
- *Svyatoslav Vsevolodovich*, 1248-1249, reigned for 1 year, capital in Vladimir ([\[145\]](#), page 165. He ruled in Suzdal between 1252 and 1262, after the capture of Suzdal by Nevruy, q.v. below.
- *Lacuna* or *Nevruy Saltan*, 1252-1259, reigned for 7 years ([\[36\]](#)).
- *Alexander Vassilyevich of Novgorod*, 1259-1264, reigned for 5 years ([\[36\]](#), page 70). This character might be a duplicate of Alexander Nevskiy for all we know, in which case Yaroslav’s alias “Vassily” really stands for “Basileus”, or “King”. It turns out that the *Arkhangelogorodskiy Letopisets* doesn’t mention Alexander Yaroslavich (Nevskiy!) at all, telling us about Alexander Vassilyevich instead – this must be the same person as Alexander Nevskiy. The latter is considered to have been a stepson of Batu-Khan; the *Arkhangelogorodskiy Letopisets*, on the other hand, refers to Alexander Nevskiy as to an actual son of Batu-Khan, whom we already identified as Yaroslav, q.v. below. Other sources collate the reigns of Nevruy and Alexander, suggesting that the latter had reigned in Suzdal all the while.

Could “Nevruy” be the “Tartar” name of Nevskiy? For instance, we have discovered that Batu-Khan was merely the “Tartar” name of Yaroslav. The *Vologodskiy Letopisets*, for instance, is telling us about Alexander Nevruy who came from the Horde when it relates the events of 1294. According to the text, this Alexander Nevruy (Nevskiy?) had presided over the council

of the Princes and been in charge of the division of principalities. One must note that the names NEV-ruy and NEV-skiy only differ in suffixes; also bear in mind that Nevruy was known as “Saltan”, or simply “Sultan”! The next event mentioned in [\[145\]](#) after the 1294 assembly of the Princes led by Alexander Nevruy is the death of “Fyodor, the Great Prince of Yaroslavl and Smolensk” in 1299. This prince must be yet another double of Alexander Nevruy, since the assembly didn’t appoint any other prince. Fyodor, the Great Prince of Yaroslavl and Smolensk, is a well-known prince who was canonized as a saint, q.v. in the Russian Orthodox monthly books of psalms under 19 September and 5 March (old style). This must be another reflection of Alexander Nevskiy.

- *Mikhail Khrabriy (The Brave) of Kostroma*, 1249-1250, reigned for 1 year ([\[36\]](#)), capital in Vladimir.
- *Andrei of Suzdal*, 1250-1252, reigned for 2 years ([\[36\]](#)), capital in Vladimir.
- *Yaroslav of Tver*, 1263-1272, reigned for 9 years according to [\[36\]](#).
- *Mikhail Yaroslavich*, 1267-1272, reigned for 5 years according to [\[36\]](#). Some of the other chronicles don’t mention him at all.
- *Vassily I of Kostroma* with his sons *Boris* and *Gleb* ([\[362\]](#) – 4 years, that is. Capital in Vladimir.
- *Dmitriy I of Pereyasavl*, 1276-1294, reigned for 18 years according to [\[145\]](#), page 165.
- *Andrei Gorodetskiy*, 1294-1304, reigned for 10 years according to [\[36\]](#), which mentions Ivan Kalita as the next Great Prince to have succeeded Andrei in 1328.
- *Mikhail Svyatoi (The Holy)*, Prince of Tver and Vladimir, 1304-1319, reigned for 6 years according to [\[145\]](#). Capital in Vladimir.
- *Youri of Moscow (Moskovskiy)*, Uzbek-Khan’s son-in-law, 1319-1325, reigned for 6 years according to [\[36\]](#) Youri isn’t called the Great Prince.
- *Dmitriy of Vladimir the Bodeful-Eyed (“Groznye Ochi”)*, 1325-1326,

reigned for 1 year according to [\[145\]](#).

- *Alexander*, 1326-1328, reigned for two years with his capital in Vladimir, according to [\[145\]](#).

The title of the Great Prince goes over to the Muscovite princes, beginning with Ivan I Kalita.

- *Ivan Danilovich Kalita the 1st* – 1328-1340, reigned for 12 years according to [\[145\]](#) we find two datings marking the possible beginning of his reign – 1322 and 1328. The beginning of his reign as the Great Prince is indicated as 1328 the second time. The capital is in Moscow. Actually, the name Kalita is most likely to be a derivative of “Caliph” or “Khalif”, which is a well-known title. Bear in mind the flexion of T and Ph (phita).
- *Simeon Gordiy (The Proud)*, 1340-1353, reigned for 13 years according to [\[145\]](#). Capital in Moscow.
- *Ivan II Krotkiy (or Krasniy)* – “*The Humble*” or “*The Red*”, 1353-1359, reigned for 6 years according to [\[145\]](#), between 1354 and 1359. Capital in Moscow.
- *Dmitriy of Suzdal*, 1359-1363, reigned for 4 years according to [\[145\]](#). Capital in Moscow.
- *Dmitriy Ivanovich Donskoi*, 1363-1389, reigned for 26 years according to [\[145\]](#). Capital in Moscow.
- *Vassily I Dmitrievich*, 1389-1425, reigned for 36 years according to [\[145\]](#), with his capital in Moscow.
- *Youri Dmitrievich*, 1425-1434, reigned for 9 years according to [\[145\]](#), pages 169-170. Capital in Moscow.
- *Vassily II Tyomniy (The Dark)*, 1425-1462 according to [\[365\]](#) specify his reign as 1450-1462.
- *Dmitriy Shemyaka the Cross-Eyed (“Kosoi”)*, 1446-1450, reigned for 4 years according to [\[362\]](#), his reign spans the years between 1445 and 1450.

Formally, the independence of Russia from the Horde begins with the reign of the next ruler, Ivan III. The “Great Yoke” of the Mongols and the Tartars ends. This dating is however of an arbitrary nature.

The epoch between Ivan Kalita and Ivan III is a very special period in Russian history, which we shall discuss in detail below.

It is presumed that Russia had lost independence in this epoch, transforming into the “Mongol Tartaria” in the eyes of the foreigners.

Let us jump ahead and share our opinion that this very epoch opens the most important period in the entire history of Russia (Horde); earlier epochs are most likely to be phantom reflections of the XIV-XVI century, and are obscured by impenetrable tenebrosity for the most part. We can virtually say nothing at all about the real history of Russia before the XIII century.

7.5. The fifth period: the Moscow Russia starting with Ivan III and ending with the Great Strife, or the enthronement of the Romanovs in 1613

- *Ivan III Vassilyevich the Great*, 1462-1505 (according to [\[36\]](#) dates the end of his reign to 1507. His son and co-ruler is Ivan Ivanovich Molodoi (The Young, or The Junior), 1471-1490 – 19 years altogether ([\[794\]](#), page 158). Moscow is the capital.
- *Vassily III*, also known as Ivan = Varlaam = Gavriil ([\[145\]](#), he reigned in 1507-1534.
- *Youri Ivanovich*, 1533, reigned for 1 year according to [\[776\]](#). The capital is Moscow.
- *Yelena Glinskaya + Ivan Ovchina*, 1533-1538, reigned for 5 years according to [\[775\]](#), with their capital in Moscow.
- The *Semiboyarshchina*, or the Reign of the Seven Boyars (the Guardian Council) – 1538-1547, 9 years altogether according to [\[775\]](#). Moscow is the capital.
- *Ivan IV the Terrible (Grozniy)*, 1533-1584, reigned for 51 years

according to [\[775\]](#); capital in Moscow.

- *Simeon Beckboulatovich*, 1575-1576, reigned for 1 year according to [\[775\]](#) with his capital in Moscow. The alleged “co-ruler” of Ivan the Terrible.
- *Fyodor Ioannovich*, 1584-1598, reigned for 14 years according to [\[362\]](#). Capital in Moscow.
- *Boris Fyodorovich Godunov*, 1598-1605, reigned for 7 years according to [\[362\]](#). Capital in Moscow.
- *Fyodor Borisovich*, 1605, reigned for 1 year according to [\[362\]](#). Capital in Moscow.
- *Dmitriy Ivanovich*, or the so-called “*False Dmitriy*” (“*Lzhedmitriy*”), 1605-1610, reigned for 5 years with his capital in Moscow first, and then Tushino. He was presumably killed in 1606; however, in the very same year Dmitriy comes to power again – historians are of the opinion that this second Dmitriy was a different person ([\[436\]](#), pages 362-363). This is why we indicate Dmitriy’s reign as ending with his murder in 1610; one may also consider this period to be “the sum of the two Dmitriys”.
- *Vassily Shouyskiy*, 1606-1610, reigned for 4 years according to [\[362\]](#). Capital in Moscow.
- The *Great Strife*, 1610-1613, lasted for three years.

According to our hypothesis, the epoch between Ivan III and the Great Strife is the primary source for all the phantom duplicates inherent in Russian history and dated to the epochs before the XIV century. All the epochs in question and a rough scheme of chronological duplicates in Russian history can be seen in the illustrations at the beginning of the next chapter.

7.6. The sixth period: dynasty of the Romanovs

What we have here is a radical change of dynasty; the new ruling dynasty of the Romanovs comes to power. The first king of the dynasty is Mikhail

Romanov, 1613-1645. We shall refrain from listing the other Romanovs herein, since Russian history of the Romanovian epoch is already beyond our concern; that is the epoch when the consensual version of the ancient Russian history was created.

PART TWO

The two chronological shifts inherent in the history of Russia

8.

A general scheme of the parallelism

In the present chapter we shall relate the statistical parallelism between the dynasties of the Russian rulers that we discovered in the course of our research, as a result of applying the methods of ancient dynasty analysis that we have already used extensively, q.v. in [Chron1](#) and [Chron2](#).

The consensual version of the Romanovian-Millerian “Russian history textbook” is represented schematically in fig. 2.1.

Fig. 2.1. A chronological scheme of Russian history in its Scaligerian and Millerian version.

In fig. 2.2 one sees the real construction of this “textbook” unravelled by our research and the primary chronological shifts present therein, whereas fig. 2.3 represents a very general scheme of Russian chronology in our reconstruction.

Fig. 2.2. The structure of the shifts inherent in the erroneous chronology of the Russian history. The Scaligerian and Millerian “Russian history textbook” is compiled of three different versions of a single chronicle.

Fig. 2.3. A general chronological scheme of the Russian history after the rectification of the errors inherent in the Scaligerian and Millerian version. Our reconstruction.

In fig. 2.4 we see the scheme of the 400-year parallelism inherent in Russian history as discussed below. The formal empirico-statistical result of our research is presented in figs. 2.1-2.6.

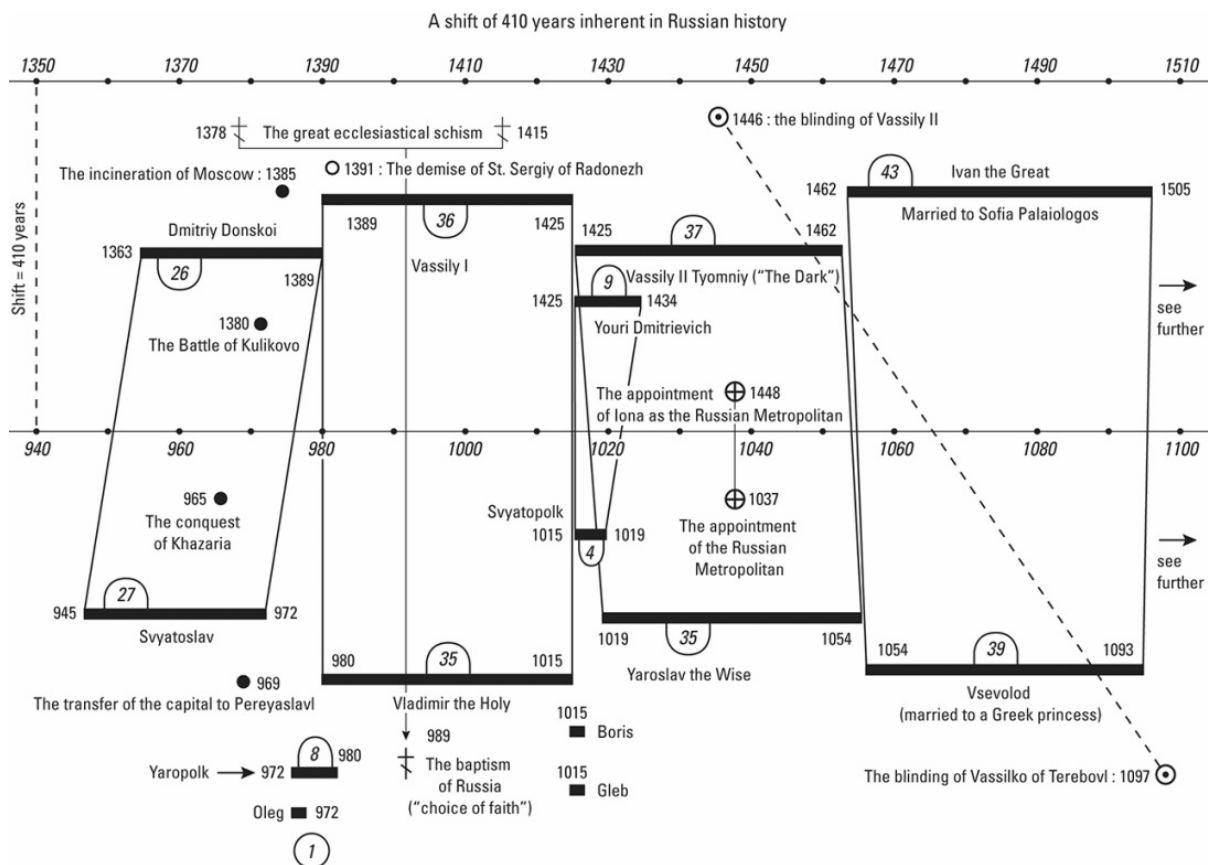

Fig. 2.4. A chronological shift of 410 years inherent in Russian history in its Millerian and Scaligerian version. First part of the parallelism.

Fig. 2.5. A chronological shift of 410 years inherent in Russian history in its Millerian and Scaligerian version. Second part of the parallelism.

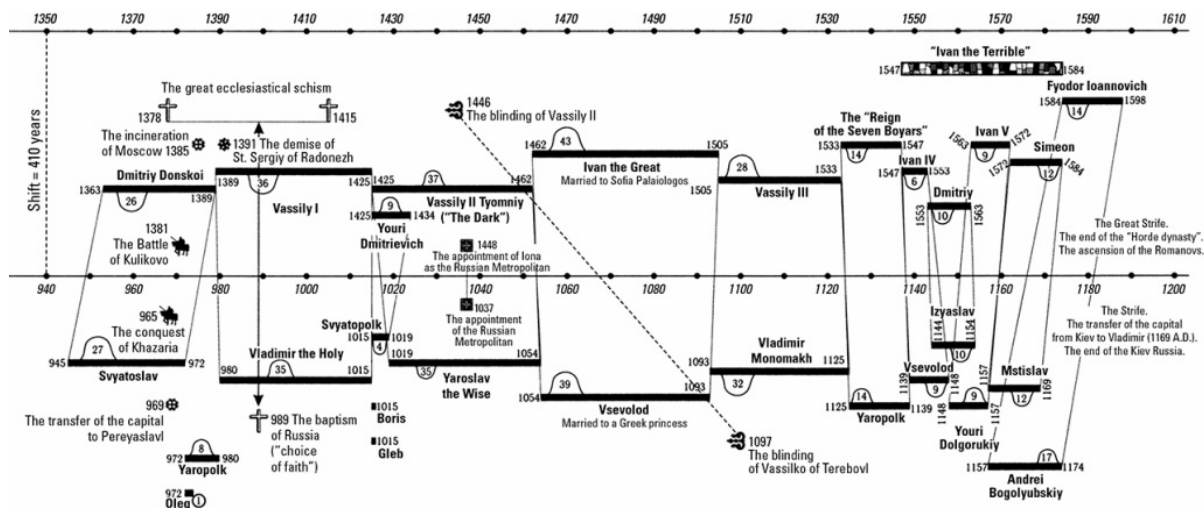

Fig. 2.6. The general view of the chronological shift of 410 years inherent in Russian history.

1. The period between 1300 and 1600 served as the original for the

ancient and mediaeval history of Russia.

2. The period between the middle of the IX and the beginning of the XIII century is a phantom duplicate of the above.
3. The period between 1200 and 1600 is a “sum” of the two chronicles, the first one being the original that spans the period between 1300 and 1600, and the second – the very same original, but shifted backwards by some 100 years. The superimposition of the two chronicles gives us the 1200-1600 chronicle extended by a 100 years.

The entire period between 1327 and 1600 is referred to as “the Moscow Russia” in modern textbooks; however, according to our reconstruction, this name only applies to the end of this epoch. We have discovered the period of the XIV-XVI century to contain the originals of all three epochs that Russian history is divided into nowadays:

- the ancient Kiev Russia,
- the ancient Vladimir Russia,
- the mediaeval Moscow Russia.

Below we cite comparative tables of events for the discovered dynastical parallelisms inherent in the history of Russia. It has to be said that the events listed below are related in accordance with the consensual Millerian version as opposed to our reconstruction; nevertheless, we occasionally refer to the results described in detail in [Chron4](#), which we expect the readers to be familiar with for a more fundamental understanding of the tables and their content.

9.

A brief description of the 100-year shift manifest in Russian history

a = Russian history of the XIV century.

■ *b* = Russian history of the XIII century.

1*a* = *The XIV century*. Takhta-Khan, 1291-1313, reigned for 22 years, and Daniel of Moscow, 1281-1303, reigned for 22 years.

■ 1*b* = *The XIII century*. Genghis-Khan, the alleged years 1205-1227, reigned for 22 years, and Vsevolod Bolshoye Gnezdo, the alleged years 1176-1212, reigned for 36 years.

1.1*a*. *The XIV century*. Daniel of Moscow is the founder of the Muscovite dynasty. His reign was followed by the conflict between the princes of Moscow and Tver.

■ 1.1*b*. *The XIII century*. Vsevolod Bolshoye Gnezdo is the founder of a dynasty, succeeded by his sons and their offspring. His very name translates as “The Great Nest” and refers to his foundation of the Vladimir-Suzdal dynasty.

2*a*. *The XIV century*. Uzbek-Khan, 1312-1340, reigned for 28 years, and Mikhail, 1304-1319, reigned for 15 years. Next we have Youri, 1319-1328, with a reign duration of 9 years, followed by Ivan I Kalita, or Caliph (Khalif), who had reigned for 12 years between 1328 and 1340.

■ 2*b* = *The XIII century*. Batu-Khan (the name Batu relates to the Russian dialect forms of the word “father” – *batya* and *batka*), 1227-1255, reigned for 18 years, and Constantine, 1212-1219, reigned for 7 years. After that we see Youri’s 18-year reign in the alleged years 1219-

1237, followed by the 8-year reign of Yaroslav Vsevolodovich (1238-1246).

2.1a. *The XIV century.* Unlike his predecessors, Uzbek-Khan left a significant mark in Russian history, having become a relation of Youri the Muscovite (the latter was his son-in-law). It is presumed that Uzbek-Khan had been greatly influenced by Ivan Kalita (Caliph), who remained in the Horde all the time; another presumption is that the power of the Muscovite princes was entirely based on the military potential of the Horde, which is the only reason why they could unite and conquer the entire Russia ([\[435\]](#), pages 189-190).

■ 2.1b. *The XIII century.* Batu-Khan conquers Russia, which marks the beginning of the Tartar rule in Russia. The Tartars had presumably ruled by proxy of the Great Princes of Vladimir. Batu-Khan made Yaroslav Vsevolodovich prince, and became his relation, since Alexander Nevskiy, the son of Yaroslav, became Batu-Khans adopted son. Batu-Khan had helped the princes of Vladimir to conquer the whole of Russia; prior to that, other independent princes and principalities had also existed. The title of the Great Prince of Kiev also ceased to exist around that time. The dynasty of the Kiev princes ended with the conquest of Kiev by Batu-Khan.

2.2a. *The XIV century.* This is the end of the Vladimir-Suzdal dynasty of Yaroslav Vsevolodovich, the son of Vsevolod Bolshoye Gnezdo, and also the beginning of the new Moscow dynasty.

■ 2.2b. *The XIII century.* This period marks the end of the Kiev dynasty of Yaroslav the Wise, which is also the end of the Kiev Russia. Next we have the Vladimir-Suzdal period as well as the “yoke of the Tartars and the Mongols”.

3a. *The XIV century.* Chanibek-Khan, 1341-1357, reigned for 16

years, and Simeon Gordiy (“the Proud”), 1340-1353, reigned for 13 years.

■ *3b. The XIII century.* Berke-Khan, the alleged years 1255-1266, reigned for 11 years, and Alexander Nevskiy, the alleged years 1252-1263, reigned for 11 years.

3.1a. The XIV century. The reign of Simeon is the time of the conflict between Pskov and the Germans from Livonia. Prince Alexander Vsevolodovich (whose “origins remain unknown to us”, according to Karamzin, q.v. in [\[362\]](#), Volume 4, page 157), appears in Pskov around the same time. This prince defeated the Germans and laid the entire South-East of Livonia waste. This took place in 1342; we see a good parallelism with the deeds of Alexander Nevskiy.

■ *3.1b. The XIII century.* The most famous deed of Alexander Nevskiy is presumed to be the defeat of the Livonian knights on the Choudskoye Lake in the alleged year 1242. The Livonians are assumed to have been a German military order. Alexander set forth to fight the Livonians from Pskov, q.v. in [\[435\]](#), pages 162-164. Bear in mind that Alexander Nevskiy is a descendant of Vsevolod Bolshoye Gnezdo (his grandson, to be precise), and can therefore be referred to as “Vsevolodovich”, or “descendant of Vsevolod”. What we see is a manifestation of the chronological shift that equals 100 years in this case.

3.2a. The XIV century. After this victory, prince Alexander leaves Pskov. “The natives of Pskov implored him to return, but to no avail ... their pleas to the Novgorod government to provide them with a local ruler and an army were also in vain” ([\[362\]](#), Volume 4, page 157).

■ *3.2b. The XIII century.* Shortly after the victory the relationship between the people of Novgorod and Alexander deteriorates, and the latter moves to Pereyaslavl ([\[435\]](#), page 164).

3.3a. *The XIV century*. The dispute between Simeon and Novgorod. The people of Novgorod had bound Simeon in chains and declared to him that the city should elect princes autonomously and tolerate no alien rulers. Simeon reacted by preparing his army for the battle. The townsfolk called to arms as well, and a military conflict was escaped very narrowly. However, the commonality revolted, supported Simeon and had some of the boyars banished, with one of their number, and a very distinguished boyar, at that, killed ([362], Volume 4, pages 155-156). The dispute had ended, and Simeon disbanded the army.

■ 3.3b. *The XIII century*. The dispute between Alexander Nevskiy and the city of Novgorod ranks among his most important biographical episodes; the denizens of the city banished his son Vassily in a humiliating fashion, and the situation was approaching the stage of an armed conflict. Alexander had tried to take Novgorod by force, but the city capitulated, having demoted the vicegerent Ananiya in 1255 ([362], Volume 4, pages 45-47).

Commentary. In general, Simeon's reign was characterised by wars waged against Novgorod and Pskov by the Swedes and the Germans, according to N. A. Karamzin ([362], Volume 4, pages 163 and 158). Alexander Nevskiy's reign is marked by similar events, and famous for his wars with the Livonian order and disputes with Novgorod primarily. The relations between the Horde and Alexander, likewise Simeon, are described in the same words; both knights were known as pillars of the Khan's power and frequent visitors in the Horde, where they were considered figures of great authority.

4a. *The XIV century*. The embroilment of 1359-1381. 25 khans had reigned over these 22 years.

■ 4b. *The XIII century*. Mentutenir-Khan (possibly Mengutimur-Khan), the alleged years 1266-1291, reigned for 25 years. Strife and

struggle between the sons of Alexander Nevskiy in 1281-1328 (according to [\[649\]](#), pages 18-19, 32-34 and 53), which equals 47 years, or, alternatively, in 1299-1328, 29 reign years altogether starting with the death of Fyodor, Great Prince of Yaroslavl and Smolensk, and ending with Ivan Kalita.

5a. *The XIV century.* Tokhtamysh-Khan, 1381-1395, reigned for 14 years; in his reign we see Mamai the warlord and Dmitriy Donskoi (1363-1389), who had reigned for 26 years. Tokhtamysh-Khan defeated Mamai in 1381.

■ 5b. Takhta-Khan, the alleged years 1291-1313, reigned for 22 years, and Nogai the military leader, defeated by the khan in the alleged year 1299. Takhta-Khan is accompanied by Dmitriy of Pereyaslavl, 1276-1295.

Commentary. Apart from the parallelisms between events, we see a distinct similarity between how the names sound:

- *Takhta-mysh* = *Takhta*,
- *Mamai* = *Nogai*,
- *Dmitriy* of Don (or Donskoi) = *Dmitriy* of Pereyaslavl (or Pereyaslavskiy).

5.1a. *The XIV century.* Mamai is the “custodian” of the khans; he was the de facto ruler who could enthrone khans. Tokhtamysh-Khan defeated Mamai.

■ 5.1b. *The XIII century.* Nogai is the fiduciary of the small Takhta-Khan. When Takhta had grown up, he crushed Nogai. Nogai had also possessed the power to enthrone the Khans, and would “keep making their power more and more nominal” ([\[362\]](#), Vol. 4, Chapters 5-6).

5.2a. *The XIV century.* Mamai is a military leader of high rank ([\[216\]](#),

page 159).

■ 5.2b. *The XIII century*. Nogai is also a top military leader ([216], page 137).

5.3a. *The XIV century*. Mamai usurps power ([216], page 159).

■ 5.3b. *The XIII century*. Nogai also usurps power ([216], page 137).

5.4a. *The XIV century*. Mamai becomes a leader of a “pro-Western political party” in the Horde ([216], page 159).

■ 5.4b. *The XIII century*. Nogai rules over the Western parts of the Horde ([216], page 137).

5.5a. *The XIV century*. Mamai’s army consisted of Osetians, the Cherkesi, the Polovtsy and the natives of Crimea, q.v. in [216], pages 160-165.

■ 5.5b. *The XIII century*. The main contingent of Nogai’s army is characterised as the natives of the steppes adjacent to the Black Sea and the Northern Crimea, see [216], page 137.

5.6a. *The XIV century*. Mamai is defeated by the Russian troops that fought alongside the Tartars from Siberia and the Volga region ([216], pages 162-163).

■ 5.6b. *The XIII century*. Nogai is defeated by the Tartars from the Volga region supported by the Russian army, as well as the Tartars from Siberia and Central Asia ([216], page 138).

5.7a. *The XIV century*. Tokhtamysh-Khan defeated Mamai in alliance with Dmitriy Donskoi, a Russian prince.

■ 5.7b. *The XIII century*. Takhta-Khan defeats Nogai in alliance with Andrei Aleksandrovich, a Russian prince ([216], page 137).

10.

A 400-year shift in Russian history and the resulting dynastic parallelism

The second chronological shift inherent in Russian history amounts to roughly 410 years and comprises the following two epochs:

1. The epoch between 945 and 1174, or the so-called Kiev Russia – starting with Great Prince Svyatoslav and ending with the transfer of the capital under Andrei Bogolyubskiy.
2. The epoch between 1363 and 1598. It is referred to as the “Moscow Russia”; it begins with the Great Prince Dmitriy Donskoi and ends with the Czar Fyodor Ivanovich.

For the cases with several variants of a single king’s reign, we only cite the one that corresponds with the parallelism the best. However, there are few such variants, and all of them are rather close to each other in general. We also omit references to sources herein, since all of them were already indicated above. The formal aspects of our empirico-statistical methods as used in the discovery of dynastic parallelisms and the principles of comparison applied to the latter are related in [Chron1](#) and [Chron2](#). A demonstrative graphical representation of the dynastic parallelism discussed herein is given in fig. 2.4.

Bear in mind that the comparative tables cited herein make references to results related in the chapters to follow; they contain our brief commentary of certain episodes that comprise the parallelism, and indications of the most interesting coincidences in the description of historical events one is traditionally accustomed to deem separated from each other by several centuries, which duplicate each other nonetheless, as estimated by our mathematical methods.

The beginning of the Kiev Russia dynasty, by which we understand the epoch of Ryurik, Olga and Oleg, is usually said to predate 945. The next series of dynastic founders (Ivan Kalita, Simeon the Proud and Ivan the Humble (or the Red), comes before 1363. The early XIV century must therefore be the very springhead of the Russian history. We are referring to Georgiy Danilovich, followed by Ivan Danilovich Kalita, his brother (1318 or 1328-1340). Ivan Kalita = Caliph = Khalif is the double of Batu-Khan, also known as Uzbek-Khan, Yaroslav Vsevolodovich and Yaroslav the Wise. He was also known as Georgiy-Yaroslav, q.v. in the epistle to the Swedish king written by “Ivan the Terrible” ([\[639\]](#), page 136).

a = The Kiev Russia.

■ *b = The Moscow Russia.*

1a. The Kiev Russia. The legendary founders of the dynasty – Ryurik, Oleg and Olga. The alleged years 862-955.

■ *1b. Russia-Horde.* The founders of the real dynasty – Georgiy Danilovich, his brother Ivan Kalita = Caliph or Khalif, Simeon the Proud and Ivan the Humble (or the Red) in the alleged years 1318-1359.

Commentary to 1b. There is another shift inherent in the history of Russia – a centenarian one, q.v. discussed above. It superimposes the founders of the real dynasty (see 1b) over the beginning of the Great = “Mongolian” invasion. This superimposition is constructed in the following manner:

- a. Yaroslav Vsevolodovich, aka Batu-Khan, 1238-1248 = Ivan Kalita (Caliph), aka Uzbek-Khan, 1328-1340.
- b. Alexander Nevskiy, 1252-1263 = Simeon the Proud (“Gordiy”), 1340-1353.
- c. Yaroslav of Tver, 1262-1272 = Ivan the Humble (“Krotkiy”), 1353-1359.

- d. Vassily I of Kostroma, 1272-1276 = Dmitriy of Suzdal, 1359-1363.
 - e. Dmitriy I of Pereyaslavl, 1276-1294 = Dmitriy Donskoi, 1363-1389.
-

2a. *The Kiev Russia*. Svyatoslav, 945-972, reigned for 27 years.

■ 2b. *Russia-Horde*. Dmitriy Donskoi, 1363-1389, reigned for 26 years. Their reign durations are in good correspondence.

2.1a. *The Kiev Russia*. The transfer of the capital to Pereyaslavl in 969.

■ 2.1b. *Russia-Horde*. Pereyaslavl is captured by Holgerd, while Dmitriy lays the foundations of the Moscow Kremlin and its walls in 1368. This date corresponds to the real foundation of Moscow in our reconstruction. However, Moscow isn't yet a capital at this point, and Kremlin won't be built until the XVI century – see below ([Chron4](#), Chapter 6) and in [Chron6](#).

3a. *The Kiev Russia*. Vladimir, 980-1015, reigned for 35 years.

■ 3b. *Russia-Horde*. Vassily I, 1389-1425, reigned for 36 years. Their reign durations correspond to each other very well.

3.1a. *The Kiev Russia*. The famous baptism of Russia in 989.

■ 3.1b. *Russia-Horde*. The reign of Vassily I is known as the period of the so-called Great Schism (1378-1415), which is when virtually every country in the world was faced with “the choice of faith”.

Commentary to 3.1. According to our reconstruction, the early XV century was the time of religious discord and confessional granulation in the countries of Europe and Asia. The custom of baptising brides into a different confession dates to this very epoch, as well as religious disputes in general and the use of the word *latinstvo* (literally “Latinry”, which refers to the Unionist leanings of the Orthodox populace in the West of

Russia – Lithuania in particular). Russian chronicles contain no prior memory of any substantial religious contentions, which was duly noted by N. A. Morozov ([\[547\]](#)).

The ensuing Union of 1439, which had temporarily united the Byzantine Church with its Roman counterpart, would lead to the severance of relations between Constantinople and Russia; the latter had refused to recognize the union. It is presumed that the Russian Church became independent around that time, q.v. below. See [Chron6](#) for our discussion of the legend about the “baptism in the Dnepr” and its possible original.

4a. *The Kiev Russia*. Svyatopolk, 1015-1019, reigned for 4 years.

■ 4b. *Russia-Horde*. Youri Dmitrievich, 1425-1431, reigned for 6 years with intermissions. There is a good correspondence between the reign durations of the two.

4.1a. *The Kiev Russia*. Power struggle and the death of Svyatopolk, presumably an usurper.

■ 4.1b. *Russia-Horde*. Youri Dmitrievich had been forced to struggle for power all his life; he was deposed a number of times, but kept returning. He was the alleged usurper of power in the time of Vassily I.

5a. *The Kiev Russia*. Yaroslav the Wise, 1019-1054, reigned for 35 years.

■ 5b. *Russia-Horde*. Vassily II the Dark (Tyomniy), 1425-1462, reigned for 37 years. Their reign durations are in good correspondence with each other.

5.1a. *The Kiev Russia*. In the alleged year 1037 Yaroslav founds the Russian archdiocese, which is independent from Constantinople. This is where the de facto history of the Russian Church begins; chronicles leave one with the impression that “there had been an absence of

events” prior to that ([\[372\]](#)). This is the time of the Russian Archdeacons (Metropolitans), who had presumably been Greek before.

■ 5.1b. *Russia-Horde*. In 1448 the Russian Metropolitan Iona is appointed without the consent of Constantinople; such appointments had been the prerogative of the latter up until then. The Russian Church severs all ties with the Unionist Church or Constantinople; it is presumed that the former has been independent from the latter ever since ([\[372\]](#)).

5.2a. *The Kiev Russia*. In 1097, Vassilko, Prince of Terebovl, was blinded in the course of the fratricidal war between the children of Yaroslav.

■ 5.2b. *Russia-Horde*. Vassily II the Dark (Tyomniy) was blinded. We have a very obvious parallelism between the names (Vassily = Vassilko), as well events (both have been blinded). See below for more extensive commentary.

5.3a. *The Kiev Russia*. The name is Vassilko. Blinded.

■ 5.3b. *Russia-Horde*. The name is Vassily. Blinded.

5.4a. *The Kiev Russia*. Vassilko is presumably a prince.

■ 5.4b. *Russia-Horde*. Vassily is presumably a Great Prince.

5.5a. *The Kiev Russia*. The conspiracy against Vassilko is masterminded by Svyatopolk, the Great Prince of Kiev.

■ 5.5b. *Russia-Horde*. The leader of the plot against Vassily is Boris, the Great Prince of Tver.

5.6a. *The Kiev Russia*. The blinding was preceded by the council of the princes “where they signed a truce” ([\[632\]](#), page 248). Both princes kissed a cross in order to demonstrate their good faith.

■ 5.6b. *Russia-Horde*. Vassily reminds the plotter about the recent truce and the kissing of the cross before the blinding: “For we have both kissed the Holy Cross ... and sworn ourselves brothers ... and, verily, one guardeth not against one’s brother” ([\[635\]](#), page 508).

5.7a. *The Kiev Russia*. We have a plot here led by David, Prince of Vladimir.

■ 5.7b. *Russia-Horde*. Also a plot, actually led by Prince Dmitriy Shemyaka.

5.8a. *The Kiev Russia*. Svyatopolk, the Great Prince of Kiev, takes no part in the actions of the cabal, which is emphasised in the chronicle.

■ 5.8b. *Russia-Horde*. Boris, the Great Prince of Tver and the leader of the conspiracy, doesn’t take part in the plot as it is carried out, either ([\[635\]](#), page 504).

5.9a. *The Kiev Russia*. Svyatopolk repents, and eventually sets forth to fight against David ([\[632\]](#), page 260).

■ 5.9b. *Russia-Horde*. It is none other but Boris of Tver who later helps Vassily II to regain his throne in Moscow ([\[635\]](#)).

5.10a. *The Kiev Russia*. Vassilko is accused of striving to deprive Svyatopolk of his throne ([\[632\]](#), page 248).

■ 5.10b. *Russia-Horde*. Vassily II is accused of plotting to become the Prince of Tver ([\[635\]](#), page 504).

5.11a. *The Kiev Russia*. Despite the fact that the plot is led by Great Prince Svyatopolk himself, the plotters “tremble in terror” ([\[632\]](#), page 250). This is somewhat odd; apparently, the Great Prince must mastermind a plot only to dethrone some perfectly insignificant “Prince Vassilko”.

■ 5.11b. *Russia-Horde*. The conspiracy turns out as one against the monarch himself. The plotters are trying to exonerate themselves: “Prince Ivan has told him: ‘Sire, if we wish you ill, may this ill befall ourselves as well, but we are doing it for the sake of Christianity and the tribute that you must pay to the Tartars, which they will cut down ... upon seeing this’ ” ([635], page 509).

Commentary. For some reason, chronicles are anything but eloquent when it comes to Terebovl, the town where Vassilko had ruled. The only time we see this town mentioned in a chronicle is the legend about the blinding of Prince Vassilko. If this town had really been of such importance, why don’t any chronicles mention it in any other context? On the other hand, we know the story of Vassilko the Terebovlian to be a phantom duplicate of real events surrounding an attempted coup d’état in Tver. Could the “town of Terebovl” be a corrupted reference to the city of Tver that became recorded in chronicles in this form? The sounds B and V often transform into one another in the course of flexion, in which case the unvocalized root of the name is virtually the same – TRB vs. TVR.

5.12a. *The Kiev Russia*. Prior to his blinding, Vassilko had come to a monastery to pay his dues to the halidoms concealed therein; after that he was summoned to Kiev and got blinded ([632], page 250).

■ 5.12b. *Russia-Horde*. Vassily II was captured in the Troitskiy monastery, where he had come to pray at the ossuary of St. Sergiy. He was taken to Moscow and subsequently blinded ([635], pages 508-510).

5.13a. *The Kiev Russia*. Vassilko was forewarned, but refused to believe, saying: “How could it be they want to slay me? We have kissed the cross together and made peace; whosoever breaks it shall go against the cross and the rest of us” ([632], page 250).

■ 5.13b. *Russia-Horde*. Vassily II had received a warning about the plot in preparation, but refused to believe it: “They want to confuse us. I

have kissed the cross together with my brothers; how can this be true?” ([635], page 506).

5.14a. *The Kiev Russia*. The Prince’s cabal had left the princely dwelling so as not to participate in the actual blinding, which is when Vassilko was seized by the servants ([632], page 250).

■ 5.14b. *Russia-Horde*. Prince Ivan of Mozhaysk, the capturer of Vassily II, had also left the church so as not to participate in the blinding personally right before the servants laid their hands on Vassily ([635], page 508).

5.15a. *The Kiev Russia*. Vassilko was incarcerated and blinded the next day after a lengthy counsel ([632], page 152). Then he got transferred to Vladimir for his subsequent imprisonment.

■ 5.15b. *Russia-Horde*. Vassily II was taken to Moscow on Monday and blinded on Wednesday ([635], page 511); after that, he was sent prisoner to Ouglich.

5.16a. *The Kiev Russia*. The blinding of Vassilko leads to a civil unrest; however, the war comes to a halt just as it starts ([632], page 254).

■ 5.16b. *Russia-Horde*. A strife begins after the blinding of Vassily II; however, it fails to evolve into a full-scale war and ends shortly ([635], pages 513-514).

5.17a. *The Kiev Russia*. The chronicle contains a detailed account of how Svyatopolk and David conferred with the blinded Vassilko in their attempts to nip the war in the bud. They promised Vassilko freedom for assistance, as well as a new domain to rule over – however, the domain in question is not the town of Terebovl, which is emphasised in the chronicle ([632], page 258).

■ 5.17b. *Russia-Horde*. Prince Shemyaka had made the decision to set Vassily II free and to give him Vologda as a new domain ([\[635\]](#), page 514). It is clear that Shemyaka didn't have a single intention of returning Vassily to his rightful ex-domain of Moscow, since he had seized the throne for himself; however, the phantom reflection of this episode in the history of the Kiev Russia looks rather odd – indeed, what could possibly have been the problem with letting Vassilko have his old insignificant domain back so as to stop the war?

5.18a. *The Kiev Russia*. A war begins.

■ 5.18b. *Russia-Horde*. Here we also have the beginning of a war.

5.19a. *The Kiev Russia*. David proves incapable of resistance and flees without fighting.

■ 5.19b. *Russia-Horde*. Shemyaka fled the battlefield as soon as the war began.

5.20a. *The Kiev Russia*. The siege of Vsevolozh and the slaughter of its inhabitants. David isn't in the city. Next we see him under siege in Vladimir.

■ 5.20b. *Russia-Horde*. The capture of Moscow and the punishment of the boyars held responsible. The plotters are absent from Moscow. Next comes the siege of Ouglich.

5.21a. *The Kiev Russia*. The Great Prince Svyatopolk chased David away to Poland ([\[632\]](#), page 260).

■ 5.21b. *Russia-Horde*. Shemyaka fled to Galich, towards the Polish border ([\[36\]](#), page 88).

5.22a. *The Kiev Russia*. Wars against David. David returns to Vladimir a couple of times, but eventually dies in Dorogobouzh ([\[632\]](#),

pages 262-265).

■ 5.22b. *Russia-Horde*. Shemyaka rules over Oustyug for a while, but the troops of Vassily II chase him out. Died in Novgorod, presumably poisoned ([35], pages 88-89).

5.23a. *The Kiev Russia*. The story about the blinding of Vassilko is considered an independent piece of narration introduced into the *Povest Vremennyh Let* apocryphally ([632], page 448).

■ 5.23b. *Russia-Horde*. There is a separate literary work in existence entitled *Story of the Blinding of Vassily II*.

5.24a. *The Kiev Russia*. The narrative text in question is credited to a certain Vassily ([632], page 448).

■ 5.24b. *Russia-Horde*. It is assumed that the *Story* was dictated by Vassily II himself ([635], page 593).

6a. *The Kiev Russia*. Vsevolod, 1054-1093, reigned for 39 years.

■ 6b. *Russia-Horde*. Ivan III, 1462-1505, reigned for 43 years. We see the two reign durations to be in good correspondence with each other.

6.1a. *The Kiev Russia*. Vsevolod was married to a Greek princess; the first mention of the famous “Monomakh’s Hat” is associated with his reign; he presumably received it from the King of the Greeks “as a ransom”, according to the legend. Nowadays the legend in question is naturally presumed “erroneous”, since there had allegedly been no large-scale campaigns against Constantinople in Vsevolod’s reign. The Greek emperor who had given him the hat was called Constantine Monomakh, hence the name.

■ 6.1b. *Russia-Horde*. Ivan III is married to Sophia Palaiologos, the Greek princess. He introduces such attributes of royal power as the orb

and Monomakh's hat. This hat is drawn on the head of Metropolitan Iona as represented in an icon; it distinguishes him from the rest of the Muscovite metropolitans. In 1453 Constantinople falls into the hands of the Ottomans, or the Atamans, whose troops set forth from Russia (see [Chron5](#) for more details). The legend of "the ransom" as related above instantly becomes understandable.

7a. *The Kiev Russia*. Vladimir Monomakh, 1093-1125, reigned for 32 years. He was baptised Vassily ([\[632\]](#), page 392).

■ 7b. *Russia-Horde*. Vassily III, 1505-1533, reigned for 28 years. Note the coinciding names and the good correspondence between their reign durations.

7.1a. *The Kiev Russia*. Vladimir Monomakh was the son of a Greek princess, which is emphasised by his actual nickname. Vladimir Monomakh would be drawn wearing Monomakh's Hat and holding a royal orb; he was called "Czar".

■ 7.1b. *Russia-Horde*. Vassily III is the son of a Greek princess who used to wear Monomakh's Hat and was often drawn wearing it.

8a. *The Kiev Russia*. The two brothers Mstislav and Yaropolk, 1125-1139, reigned for 14 years.

■ 8b. *Russia-Horde*. The Reign of the Seven Boyars (Semiboyarshchina), 1533-1547, lasted for 14 years. We see a good correspondence in the reign durations.

9a. *The Kiev Russia*. Vsevolod, 1139-1146, reigned for 7 years.

■ 9b. *Russia-Horde*. Ivan IV, 1547-1553, died in 1557, reigned for 6 or 10 years. This is the first part of the period known as the reign of the "Terrible King" (see Chapter 8 for details). The durations of these reigns are rather similar.

10a. *The Kiev Russia*. Izyaslav, 1146-1155, reigned for 9 years.

■ 10b. *Russia-Horde*. Dmitriy, an infant, 1553-1563, reigned for 10 years. This is the second part of the period known as the reign of the “Terrible King”. The reign durations correlate with each other well.

11a. *The Kiev Russia*. Youri Dolgoroukiy, 1148-1157, reigned for 9 years.

■ 11b. *Russia-Horde*. Ivan, an adolescent, together with the Zakharyins, the Yourievs and the *oprichnina* terror of 1563-1572, 9 years altogether. This is the third part of the period known as the reign of the “Terrible King”. The reign durations are in good correspondence.

12a. *The Kiev Russia*. Izyaslav Davydovich + Mstislav Izyaslavich, 1157-1169, reigned for 12 years in Kiev. Next came a period of civil unrest, marking the end of Kiev as a capital. This pair of rulers (father and son) appears to comprise a separate short dynasty of their own.

■ 12b. *Russia-Horde*. Simeon-Ivan, 1572-1584, reigned for 12 years. This is the fourth and final part of the period known as the reign of the “Terrible King’s” reign, and we notice a good correspondence between the reign durations.

13a. *The Kiev Russia*. Andrei Bogolyubskiy, 1157-1174, reigned for 17 years. The end of the Kiev Russia.

■ 13b. *Russia-Horde*. Fyodor Ioannovich (Ivanovich), 1484-1498, reigned for 14 years. His reign was followed by the famous strife of the XVI century. This is the end of the Yaroslavichi dynasty (the descendants of Yaroslav). The reign durations are in good concurrence. However, this is where the biographical parallelism ends. As we demonstrate in the “King of the Slavs”, the biography of Andrei Bogolyubskiy, or Andronicus Comnene, the Constantinople emperor,

served as the basis for the Evangelical rendition of the life of Christ.

Commentary. The shift of dates equals 350 years here and not 400; nevertheless, the blinding of Prince Vassilko of Terebovl is an obvious duplicate of the blinding of Great Prince Vassily II. Bear in mind that the chronicle pays a great deal of attention to this event for some reason, despite the fact that Prince Vassilko of Terebovl isn't famous for any actions at all. Moreover, the *Povest Vremennyh Let* even interrupts its brief annual narration here, and devotes a whole four pages and nineteen illustrations to the “blinding of Vassilko” ([\[635\]](#), pages 504-521).

Our motion forward along the historical timeline of the Moscow Russia has brought us to the epoch when the power in the state was seized by the Romanovs. Let us jump ahead and relate our reconstruction of this epoch in brief.

Fyodor was succeeded by Boris Godunov; the XVII-XX century historians describe him as an old and experienced politician who had enjoyed a great influence even in the time of Ivan the Terrible. He is presumed to have been the de facto ruler of the country on behalf of Fyodor Ioannovich over the 14 years of the latter's reign. Our analysis also demonstrates that the biography of Godunov became seriously distorted under the Romanovs, q.v. in [Chron4](#), Chapter 9.

According to our reconstruction, Czar Boris (“Godunov”) had been a very young man – miles away from his Romanovian image of the “old and seasoned politician”, which belongs to an altogether different prototype, namely, his maternal uncle by the name of Dmitriy Godunov. According to our reconstruction, the latter had been the brother of Irina Godunova, the wife of Czar Fyodor Ioannovich. Queen Irina was therefore the mother of Boris “Godunov”, and not his sister, which makes Boris Fyodorovich “Godunov” the most likely candidate for the lawful son and heir of the

previous Czar, Fyodor Ivanovich. This means that he had died at a much earlier age than it is presumed by the adherents of the Millerian-Romanovian history. A propos, this explains the strange fact that his heir, Fyodor Borisovich, had still been an infant guarded by his mother at the time of Boris's death.

It is common knowledge that a great civil unrest began in the reign of Boris "Godunov". Dmitriy Godunov, old and experienced in court affairs, had already been dead by that time; according to our reconstruction, the throne was occupied by the young king Boris "Godunov" at the time. This is when we see the advent of another contender to the royal title – Prince Dmitriy, the so-called "False Dmitriy" (*Lzhedmitriy*).

Romanovian historians declared him an impostor who had borne no relation to the royal family whatsoever; however, our reconstruction makes it likely that he had been the son of one of the previous Czars – namely, Ivan Ivanovich, therefore a rightful claimant. Our hypothesis makes Czar Ivan Ivanovich one of the several Czars that became collated into a single figure of "Ivan the Terrible" by later Romanovian historians, q.v. in [Chron4](#), Chapter 8. The "False Dmitriy-to-be" was raised in the family of the Zakharyins-Romanovs, who were the rulers during this period. Ivan Ivanovich was subsequently dethroned and had accompanied Czar Ivan-Simeon; his death came in 1581, q.v. in [Chron4](#), Chapter 8.

Further events unfurled in the following manner. Prince Dmitriy = "The False Dmitriy" had attempted to seize the throne; the attempt was successful. Although Dmitriy had suffered defeat in open military confrontation, he must have had allies in Moscow, since Czar Boris "Godunov" had apparently been poisoned (died as he stood up from the table). Therefore, Dmitriy's enthronement is a result of the boyar conspiracy. The boyars had killed the infant monarch Fyodor Borisovich and his mother, letting Dmitriy into Moscow. We agree with the standard version for the most part in this particular instance.

It is presumed that about a year after his enthronement, Dmitriy got killed as a result of yet another boyar conspiracy organised by Vassily

Shouyskiy, who makes himself Czar.

However, we are of the opinion that Dmitriy had really managed to survive; his re-appearance is considered to have been the advent of another “False Dmitriy” by the modern historians – the so-called “Thief from Tushino”, after the name of his royal residence. By the way, some of the most distinguished boyars had been members of his court. He got killed eventually.

The Zakharyins-Romanovs had originally supported Dmitriy, but betrayed him after his first enthronement, declaring their support of Shouyskiy. Filaret Nikitich Romanov was chosen Patriarch in the camp of the “impostor”, despite the fact that there had already been a living patriarch by the name of Iov in Moscow. After the death of Dmitriy, the civil war raged on even harder; the Polish troops had remained in Moscow for a long time.

When the Poles were finally ousted, the Romanovs succeeded in making Mikhail Romanov Czar. The circumstances of this election are very obscure indeed, likewise the entire reign of this ruler. Let us simply point out that Filaret was made Patriarch twice, the second time already after the election of Mikhail. Someone must have tried to hush up his alliance with Dmitriy, but to no avail; thus, Filaret’s first Patriarchal election is a well-known fact ([\[372\]](#)).

It is easy to understand why the Romanovs became supporters of the version about “prince Dmitriy being an impostor” when they had come to power, despite their having been in the camp of his supporters initially. They may even be the authors of this version! The supporters of Czar Boris (“Godunov”) may have accused Dmitriy of having been a “renegade priest”, or someone who had given monastic vows and broken them – this would invalidate a person’s claims to the throne in their opinion. They would have no reasons to doubt his being a prince; it is a well-known fact that Dmitriy’s mother, Maria Nagaya, confessed to her motherhood several times, with many people present. It is usually presumed that she made a denouncement after the murder of Dmitriy; however, her real words testify

to the opposite ([\[372\]](#)). However, declaring Dmitriy an impostor was vital for the Romanovs, since Dmitriy's four-year-old son had still been alive when Mikhail Romanov was elected – the lawful heir to the throne, unlike the Romanovs.

On the other hand, the supporters of Boris “Godunov” would hardly benefit from planting this rumour, seeing as how Boris had been a perfectly legitimate ruler and heir to the throne with no reasons to accuse Dmitriy of being an impostor. Having come to power, the Romanovs started to use the name Godunov for referring to Boris (his mother's maiden name). They also ascribed to him a political ploy of their very own, namely, spread the rumour that Dmitriy was called impostor by Boris himself. They also removed all possible obstacles to the throne, having disposed of the young son of “the impostor Dmitriy”, and, possibly, of Czar Dmitriy Ivanovich himself, q.v. in [Chron4](#), Chapter 9.

Despite the fact that the four-year-old prince had really been the rightful heir to the throne, he was hanged on the Spasskiye Gates; his death was thus made known to the general public ([\[436\]](#), page 778).

PART ONE

Our hypothesis

1. Russia and the Horde

1.1. Different points of view

Let us remind the reader that there are two different viewpoints that concern the interactions between Russia and the Horde.

The first one was introduced by the XVIII century historians (Miller, Bayer and Schlezer); that is the very version that is taught in schools nowadays. According to this version, the entire state of Russia, originally populated by the Slavs, fell into the hands of foreign invaders (the Mongols and the Tartars) in the first half of the XIII century; they presumably came from the faraway steppes where one finds Mongolia nowadays. Let us remind the readers right away that the state of Mongolia was formed as late as in the XX century. Its level of technical and military development remains rather low to this very day. This can hardly be regarded as solid argumentation, but these days one finds it next to impossible to imagine that this country had been one of the most powerful aggressors in the Middle Ages, an empire that had conquered “half of the world”, whose influence had reached as far as Egypt and Western Europe. One can only assume that this powerful empire had degraded in some strange way. Scaligerian history offers us lots of similar examples: kingdom of Babylon fallen into oblivion, the decline of the Roman Empire, mediaeval Europe sliding into barbarism and ignorance in the dark Middle Ages and so on.

However, there is another point of view. The matter is that the consensual theory about the Mongolian conquest and the Mongolian yoke isn't supported by any Russian source whatsoever, which doesn't preclude anyone from teaching it in schools and refer to Russian chronicles for support. Some historians were of the opinion that Russia and the Horde had been two independent states that co-existed around the same time as empires equal in their power, whose balance of forces would shift one

way or another over the course of time. The famous historian L. N. Gumilev, for instance, used to write about it ([\[211\]](#)).

We find it needless to cite Gumilev's argumentation herein – interested readers can study his works themselves. We must however note that we strongly disagree with his so-called “passionarity theory”. His opinion is that this mysterious passionarity results in cyclic recurrence of historical events. However, this “cyclic recurrence” is of a phantom nature and results from the errors inherent in the Scaligerian chronology. Nevertheless, Gumilev must be credited with having been the first one to declare openly that the theory of the Mongol and Tartar yoke in Russia in its consensual Millerian version isn't based on any documental information whatsoever, since neither Russian, nor foreign historical sources confirm it in any way at all. In particular, Gumilev made a very reasonable observation in one of his public lectures that were read in the USSR AS Kurchatov Institute of Atomic Energy in particular and attended by one of the authors in the early 80's, namely, that the entire theory of the Mongol and Tartar yoke in Russia dates to the XVIII century; its authors had been foreign (Bayer, Miller and Schlezer), and they tailored their theory to fit the popular theories about the alleged “slavish origins of the Russians”.

History of the Cossacks by A. A. Gordeyev ([\[183\]](#)) can also be regarded as an important contribution into the analysis of the relations between Russia and the Horde. Gordeyev demonstrated that the predecessors of the Russian Cossacks had once been part of the “Tartar and Mongol” army, basing his research on the Western European descriptions of Mongolia and on a number of Russian sources.

Our own study of historical sources, Russian as well as foreign, has brought us to the conclusion that both Gumilev and Gordeyev were on the right track; however, they didn't manage to comprehend the issue in question in its entirety.

1.2. Our hypothesis formulated in brief

The key to the mysteries of Russian history is the simple fact that *the Mediaeval Mongolia and Russia were really the same state*. In particular, we are referring to the following hypothesis of ours.

1) The mediaeval Mongolia was a multinational state whose borders had initially been the same as those of the Russian Empire. *Russia has never been conquered by any foreign invaders*. The original population of Russia consisted of the same ethnic groups as one finds inhabiting its territory to this day – the Russians, the Tartars etc.

2) The very name “Mongolia” (or “Mogolia”) is likely to be a derivative of the Russian word for “many” (*mnogo*), which is also related to such Russian words as *mnogo*, *moshch*, *mog* and *mnozhestvo* (“many”, “might”, a past tense form of the verb “can” and “multitude”, respectively). Alternatively, it may be a derivative of the Greek word *megalion*, or “the great”, according to N. M. Karamzin and a number of other authors; however, it is possible that the word *megalion* also derives from the Slavic word *mnogo*. We don’t find the names “Mongolia” or “Mogolia” in any Russian historical sources – however, said sources often mention “The Great Russia”. It is a known fact that foreigners had used the word “Mongolia” for referring to Russia. We are of the opinion that this name is merely a translation of the Russian word for “great”.

Linguists consider the term “*Velikorossiya*” (or “*Velikaya Rossiya*”) to be a carbon copy of the Greek formula “*Mega Rossiya*”. The *Etymological Dictionary of the Russian Language* by M. Fasmer, for instance, tells us that the term “The Great Russia” (“Μεγαλη Ρωσσια”) was coined by the Constantinople patriarchy ([\[866\]](#), Volume 1, page 289). However, the origins of the word may just as well be Russian. At any rate, what we see is that the old Greek name for Russia used to begin with the word “Mega” – a possible derivative of the Russian words *mog*, *moshch* and *mnogo* as mentioned above. They may have transformed into “Mogolia” and then “Mongolia” over the course of time.

3) The so-called “yoke of the Tartars and the Mongols” is a wrong definition of a specific period in Russian history when the entire

population of the country was separated into two primary strata – the civil population ruled by the Princes, and the Horde (or the regular army) ruled by military commanders (Russians, Tartars etc). The Horde had obeyed the power of the Czar, or the Khan, who was also the head of the state. There were therefore two active administrations in Russia during that period: military (functioning within the Horde), and civil (local).

4) It is a commonly known fact that Russia had once paid tribute to the Horde – a tenth of all property and a tenth of all populace. Nowadays it is presumed to prove Russia's dependent position under the yoke of the Tartars. We are of the opinion that this tribute should really be called a tax paid by the people in order to keep a regular army, aka the Horde, twined with the obligatory recruitment of young people. Cossacks would get drafted in childhood and never return home; this recruitment was the very “tribute of blood” that had allegedly been paid to the Tartars by the Russians. This practice had also existed in Turkey up until the XVII century, being a far cry from the “tribute paid to the conqueror by an enslaved nation”. The Empire used to keep a regular army in this manner; refusal to pay would naturally ensue punitive expeditions sent to the rebellious regions. These expeditions are what historians present as “Tartar raids” nowadays; they would obviously lead to violent excesses and executions at times.

5) The so-called “conquest of Russia by the Mongols and the Tartars” is of a figmental nature. Nobody had conquered Russia – the phenomenon known under the name of the “yoke” nowadays had really been an internal process that involved the consolidation of Russian principalities and the aggrandizement of the Khans' (Czars') power. We shall discuss this “conquest”, or unification, of Russia that took place in the XIV century below.

6) The remnants of the regular Russian army (Horde) have survived until our day, still known under the name of the Cossacks. The opinion of certain historians that the Cossack troops consisted of serfs who either ran away or were deported to the Don region in the XVI-XVII century quite

simply doesn't hold water. In the XVII century the Cossacks lived all across Russia – the sources that date to the epoch in question mention Cossacks from the regions of Yaik, Don, Volga ([\[183\]](#), Volume 2, pages 53 and 80), then Terek, Dnepr, Zaporozhye and Meshchera ([\[183\]](#), Volume 2, page 76), Pskov ([\[84\]](#), page 73), Ryazan ([\[362\]](#), Volume 5, Chapter 4, page 230; also [\[363\]](#), Volume 5, page 215), as well as city Cossacks, or ones residing in cities ([\[183\]](#) and [\[436\]](#)). One also finds mentions of Cossacks from the Horde, the Azov region, the Nogai Steppe etc ([\[362\]](#), Volume 5, page 231).

We must inform the reader that, according to *The Cossack Dictionary and Handbook* ([\[347\]](#), see under “The Zaporozhye Cossacks”), the Dnepr or Zaporozhye Cossacks were known as the Horde Cossacks before the XVI century. Furthermore, “the Lower Zaporozhye was known as the *yurt* (homeland) of the Crimean Cossacks” ([\[347\]](#), page 257). This once again confirms our hypothesis that the Cossacks (whose actual name might derive of the Russian word “*skakat*”, “to ride”) were the regular army of the Mongolian Horde. Also, the word *yurt* translates as “dwelling”, “homeland” etc; Cossacks frequently used the word in the names of their settlements and encampments. The Mongolian word *yurt* may a possible derivative of “*orda*” or “*rod*” (“horde” and “clan” or “genus”, respectively); it is a Cossack term. One sees the it in such sentences as “the Zaporozhye Cossacks didn't let their former interamnian *yurt* between Dnepr and Bug fall into the hands of the Turks ... apparently, the governorship of Crimea didn't consider the severance of official duty bond with its Cossacks in the Horde to be a sufficient reason for depriving them of their old *yurt*” ([\[347\]](#), page 256).

We could also try to find out about the Cossacks mentioned by N. M. Karamzin. It would be expedient to use the name index compiled by P. M. Stroyev for this purpose ([\[362\]](#), Volume 4, page 323). We find the following:

Cossacks from Dnepr, the Cherkasses from Kanev, Cossacks from the Lesser Russia, the Zaporozhye, Don, Volga, Meshchera, Gorodetsk (also

known as Kasimovtsy), the Horde, the Azov Region, the Nogai Steppe, Terek, Yaik and Perekop ([347], page 254), Belgorod (ibid.) and the cities. Nowadays there are Tartars in the Nogai and the Kasim regions – could Karamzin have called them Cossacks? Apparently, the two words were synonymous in the Middle Ages, by and large.

It appears that “as late as in the end of the XVI century, the Zaporozhye Cossacks had still seen no reason to be hostile towards their neighbours and past allies. The Cossacks had left the Khans, since the latter had been falling under the Turkish influence. The two parties had initially coexisted peacefully; the Cossacks would even take part in the competition between the political parties at the Crimean court ... however, the influence of the Turks over the Khans had become too great, and the former kinship with the Cossacks was forgotten ... the Cossacks were finding it more difficult with the year to deal with the Khans; however, the final severance wouldn't follow until much later” ([347], page 256).

7) The royal dynasty of Ivan Kalita (Caliph) regnant in the XIV-XVI century is the dynasty of the Horde's Czar Khans, and can therefore be called the Horde dynasty. This is the term used by the authors of the present book; we must however reiterate that it had been a Russian dynasty and not a foreign one.

8) The unique Horde period in history of Russia spans the XIII-XVI century, ending with the Great Strife of the early XVII century. The last ruler of this dynasty had been the Czar-Khan Boris “Godunov”.

9) The Great Strife and the civil war of the early XVII century ended with the ascension of a principally new dynasty – the Romanovs, who came from the West of Russia – allegedly, from Pskov. The old dynasty had been defeated in the civil war of the XVII century; this signifies the end of the Horde epoch. However, some remnants of the Horde had existed as independent states up until the XVIII century. The last one had been conquered by the Romanovs in the war with “Pougachev”. A new epoch began in the XVII century; the one that had preceded it became declared the “famous Great Yoke of the Mongols and the Tartars”.

Scaligerian-Millerian history misdates this change of epochs to the end of the XV century.

10) The new dynasty of the Romanovs needed to strengthen its authority, since other descendants of the old Horde dynasty had still existed and made claims for the throne. The Khans of Crimea and other surviving descendants of the Horde Czars from the Cossack clans must have been among them. The Romanovian dynasty was therefore faced with the necessity of presenting the Khans as the historical enemies of Russia; this resulted in the creation of the historical theory about the military opposition between Russia and the Horde, or the Russians and the Tartars. Romanovs and their tame historians have declared the Horde dynasty of the Russian Czars alien and “Tartar”. This has changed the entire concept of the Horde epoch in ancient Russian history; the Romanovs have planted the “enemy figure” – a foe that needed to be crushed. Thus, having altered no actual historical facts, they have greatly distorted the role of the Horde in Russian history.

11) The Tartars have naturally been one of the ethnic groups living in Russia, as is the case today. However, the contraposition of the Russians and the Tartars as two opposing forces, the latter the victors and the former, the defeated party, is an “invention” of later historians introduced in the XVII-XVIII century. They were the ones who had distorted Russian history and thought up the scenario of “Slavic Russia” conquered by the “Tartar Horde”.

12) The famous White Horde can be identified as the White Russia, or Byelorussia. A propos, this name had implied a much greater territory than that of the modern Byelorussia; the entire Moscovia was known as the White Russia in the XV-XVI century, for example ([\[758\]](#), page 64). This might be the reason why the Czar in Moscow had been known as the White Czar. The Volga region had been the domain of the Golden Horde; it had also been known as Siberia in those days, hence the name of Simbirsk, a town on the Volga. The third most important Horde was known as the Blue Horde; its territories had included the modern Ukraine

and the Crimea. The toponymy of the name might have something to do with “Blue Waters”, cf. the name of river Sinyukha (“The Blue”), a tributary of the Southern Bug ([\[347\]](#), page 257).

13) The distortion of the old Russian history had led to several geographical shifts that concerned a number of well-known mediaeval names. In particular, Mongolia had travelled a long way to the East, and the peoples inhabiting the territory in question were “designated to be Mongolian”. Historians remain convinced about the fact that modern Mongolians descended from the very same Mongols that had conquered the entire Europe and Egypt in the Middle Ages. However, insofar as we know, there wasn’t a single ancient chronicle found anywhere in Mongolia that would mention the expansion campaign of the Great Batu-Khan and his conquest of a land called Russia far in the West. The name of Siberia had followed Mongolia eastwards.

The readers must become accustomed to the uncommon concept that geographical names would drift from place to place in the Middle Ages; this process had only stopped with the invention of the printing press and the mass production of uniform books and maps, which had naturally led to the “solidification” of the names used for nations, cities, rivers and mountains. This process had more or less finished by the XVII-XVIII century, when the prototypes of the modern textbooks were published.

We shall stop here for a short while; the key elements of our hypothesis about Mongolia and Russia-Horde being a single state in the XIII-XVI century. Let us turn to the documents now.

2. The origins of the Mongols and the Tartars

2.1. Ethnic composition of the Mongolian troops

Western documents contain direct indications that the name “Tartars” had once been used for referring to the Russians. For instance:

“Roussillon’s documents often mention ‘White Tartars’ alongside the ‘Yellow Tartars’. The names of the ‘White Tartars’ (Loukiya, Marfa, Maria, Katerina and so forth) betray their Slavic origins” ([674], page 40).

We find out that even before the “conquest” of Russia, “the Mongolian troops contained a number of Russians led by their chieftain Plaskinya” ([183], Volume 1, page 22).

“Rashed ad-Din mentions that Tokhta-Khan’s army had included ‘Russian, Cherkassian, Kipchakian, Majarian and other regiments’. The same author tells us that it was a Russian horseman from Tokhta-Khan’s army who had wounded Nogai in the battle of 1300... Al-Omari, the Arabic author, reports that ‘the sultans of this country have armies of Cherkasses, Russians and Yasses’” ([674], pages 40-41).

It is known that the Russian Princes accompanied by their troops used to be part of the Tartar army, no less ([674], page 42). “A. N. Nasonov had been of the opinion that already in the first years of the Great Yoke, the *darougi* (“Mongolian” troop leaders) had been recruiting Russians from the ranks of the populace governed by a local *baskak* (governor-general)” ([674], page 42).

Let us point out the obvious similarity between the words “*darougi*” and “*drougi*” or “*drouzhinniki*” – this is how the elite troops of the Princes were called in the Russian army. They would obviously be in charge of recruiting new soldiers – which makes them likely to be identified as the “Mongolian” *darougi*.

Historians are of the opinion that the participation of the Russians in the Tartar army had been of a compulsory character – however, they still admit that “the obligatory service in the Tartar army must have happened at the initial phase; further on, Russians participated as mercenaries” ([674], page 43).

Ibn-Batouta tells us “there were many Russians in Saray Berk” ([674], page 45). Furthermore, “Russians had constituted the majority of the Golden Horde’s military personnel and workforce in general” ([183], Volume 1, page 39).

Let us reflect for a moment and imagine just how nonsensical the entire situation is. The Mongolian victors arm their “Russian slaves”, who serve in the army of the invaders without any qualms whatsoever, and “constitute its majority” on top of that. Bear in mind that the Russians had presumably just been defeated in an open battle. Even in Scaligerian history we don’t see any examples of masters arming slaves; the victorious party would, on the contrary, seize all the weapons of the defeated enemy. In all known cases of former enemies serving in the armies of their conquerors, the former had been a puny minority, which would naturally be considered untrustworthy.

What do we learn about the composition of Batu-Khan’s troops? Let us quote:

“Batu-Khan’s army was described in the reminiscences of the Hungarian king and his letter to the Pope... The king had written the following: ‘When the entire land of Hungary was devastated after the plague-like invasion of the Mongols, all sorts of infidel tribes had gathered round it like wolves around a sheep-fold – Russians, Brodniki from the East [a Slavic tribe from the Azov region – Transl.], Bulgarians and other heretics from the South’” ([183], Volume 1, page 31).

Let us ask a simple question: where are the Mongols? The king mentions Slavic tribes exclusively – the Russians, the Brodniki and the Bulgarians. If we are to translate the word “Mongol” from the King’s missive, we shall end up with the invasion of “the great (Mongol = Megalion) tribes from

the East” as mentioned above. We can therefore recommend the readers to translate the word “Mongol” into “the great” upon encounter, which shall leave us with a reasonable and understandable text with no mention of faraway invaders from a distant land near the Chinese border. A propos, none of the documents contain a single reference to China.

“The borders [of Mongolia – *Auth.*] needed to be guarded against Poland, Lithuania and Hungary in the West. Batu-Khan had founded military settlements for the observation and protection of borders; the settlers had formerly been residents of Russian principalities... These settlements had guarded the entire territory of the Horde from the West. More military settlements were founded in the neighbouring Mongolian *uluses* (principalities) of the Great Khan and the Khan of Central Asia; they were located along the banks of Terek and Yaik ... among the Terek settlers there were Russians, tribes from the Northern Caucasus, Cherkasses from Pyatigorsk and the Alanians... The strongest line of defence ... was needed to be built on the west bank of the Don ... and in the North-Western principalities, the so-called *Chervonniy Yar* ... this region became the new homeland of a large group of ethnic Russians... There were lines of postal communication between Saray, the capital, and faraway provinces in every direction, their length reaching thousands and thousands of miles ... there were yamy [courier stations – *Transl.*] every 25 verst [1 verst = 3500 ft. – *Transl.*] ... there were boat and ferry services on every river, run by the Russians ... the Mongols had no historians of their own” ([\[183\]](#), Volume 1, pages 41-42).

The word yama gave birth to the word *yamshchik* (courier). This postal communication system had existed until the end of the XIX century, and only became obsolete with the introduction of railroads.

One can therefore see that the Russians had occupied key positions everywhere in the Golden Horde, or the Mongolian state, controlling roads and communications. Where were the Mongols? Giving orders, as historians are telling us? In that case, why weren't they overthrown by their armed slaves, who had also constituted the majority of the Mongolian army, controlled roads, ferries and so on? This appears very odd indeed.

Wouldn't it make more sense to assume that the description in question relates the state of affairs in Russia, which hadn't been conquered by any invaders whatsoever?

Plano Carpini doesn't mention a single Mongolian governor in the account of his visit to Kiev, presumably recently conquered by the Mongols. Vladimir Yeikovich remained the local military commander, which is the position that he had occupied before Batu-Khan's conquest ([\[183\]](#), Volume 1, page 42). The first Tartars were seen by Carpini when he had already passed Kanev. We learn of Russians occupying positions of power as well; Mongolians transform into ephemeral apparitions that no one ever sees.

2.2. How many Mongols were there? Mongols as seen by contemporaries. Mongolian and Russian attire of the epoch under study

History textbooks as used in schools are trying to convince us that the Mongols and the Tartars had been wild nomadic peoples with no literacy, who have swarmed the entire Russia and arrived from somewhere near the Chinese border on horses. It is presumed that there were "lots and lots" of these invaders. On the other hand, modern historians report things that contradict this point of view totally. The Tartars and the Mongols only occupy the top governing positions in their army; besides, there are "few of them" – the majority is Russian, qv above. It becomes perfectly unclear just how a handful of savages on horses could have conquered large civilized countries up to Egypt and made the inhabitants of said countries part of their army.

Let us turn to the records left by the contemporaries of the Mongols. Gordeyev gives a good overview of references to Mongols from the Western sources in [\[183\]](#).

"In 1252-1253 William Rubricus, envoy of Louis IX, was passing through Crimea accompanied by his entourage, on his way from Constantinople. He had paid a

visit to Batu-Khan's camp and proceeded onwards into Mongolia. He recorded the following impressions of the Lower Don region: 'Russian settlements permeate the entire Tartaria; the Russians have mixed with the Tartars and taken to their customs, likewise garments and lifestyle... The kind of headdress worn by the local women is similar to what the French women wear; the hems of dresses are decorated with fur – ermine, squirrel and otter. Men wear kaftans and other short-skirted attire, with lambskin hats on their heads; ... all the communications in this vast country are served by the Russians, they are at every river ferry' ” ([\[183\]](#), Volume 1, pages 52-53).

We must point it out to the reader that Rubricus visited Russia a mere 15 years after it was conquered by the Mongols. Weren't the Russians a little too quick in mixing with the Mongols and adopting their way of clothing, which they preserved until the very beginning of the XX century, likewise the customs and the way of life in general? One mustn't think that this "Tartar attire" was much different from what the Westerners wore. According to Rubricus, who hails from the Western Europe, "Russian women wear jewellery on their heads, just like ours, and adorn the hems of their dresses with ermine and other kinds of fur" ([\[363\]](#), Volume 5, Chapter 4, comment 400). N. M. Karamzin tells us directly that "the XIII century travellers couldn't even distinguish between the clothes worn in Russia and in the West" ([\[363\]](#), Volume 5, Chapter 4, page 210).

3. The “Tartar and Mongol conquest” and the Orthodox Church

As we mentioned in the Introduction, historians report the following:

“At the very dawn of the Horde’s existence, an Orthodox church was built in the Khan’s headquarters. As military settlements were founded, Orthodox churches were built everywhere, all across the territory governed by the Horde, with the clergy called thereto and Metropolitan Cyril relocated to Kiev from Novgorod, thus completing the restoration of the pan-Russian ecclesiastical hierarchy... Russian Princes were divided into Great Princes, Princes and Vice-Princes; there were also the Ulus Prince [Urus = Russia? – Auth.], the Horde Prince, the Tartar Prince, the Prince of Roads and the Prince of Folk... The Metropolitan had been given a great many privileges by the Mongolians – while the power of a prince was limited to his principality, the Metropolitan’s had been recognized in every Russian principality, including the tribes living in the steppes, or the actual domains of the nomadic *uluses*” ([\[183\]](#), Volume 1, page 37).

Our commentary is as follows: such actions from the part of the Mongol invaders, pagans to the very core, according to Scaligerian-Millerian history, is most bizarre indeed. The position of the Orthodox Church is even harder to understand, since it has always urged the people to resist the invaders, which is a known fact insofar as the veracious historical period is concerned. The Mongols are the single exception – they have received the support of the Orthodox church from the very beginning of the conquest. Metropolitan Cyril comes to join Batu-Khan in occupied Kiev from Novgorod, which had not even been conquered at that time, according to historians. Our opponents will definitely start telling us about the corruption that reigned in the Russian church, and that the entire nation, princes, common folk and all, were either bought or broken. Basically, this is the core of the concept introduced by the XVIII century

historians and shared by their successors. We think this highly unlikely.

We suggest a different approach to Russian history. It suffices to translate the word “Mongol” as “the great” – this instantly eliminates all absurdities, leaving us with quotidian realities of a normal state (and a great one, at that).

Fig. 3.1. Russian prisoners taken to the Horde. Old miniature from a Hungarian chronicle dated to 1488. One can instantly notice that the Mongols who take the prisoners away to the Horde are wearing Cossack hats. They also have distinctly Slavic faces and long beards. Apart from that, they are also wearing Russian clothes – long kaftans, boots and so on. The prisoners are wearing Western European clothes – knee-long clothes, shoes etc; we see no beards on their faces. Had this miniature been painted today, the Mongols would be depicted as typical Asians, and the Russian would look just like the “Mongols” from this miniature. However, the old artist had not yet known the Romanovian version about the “Tartar and Mongol yoke” in Russia, and simply-mindedly drawn whatever he saw in reality. Taken from [\[89\]](#), inset after page 128.

The hypothesis about the Mongols originating from the borderlands of the faraway China appears to be a rather late one. The mediaeval Hungarian author of the miniature one sees in fig. 3.1, for instance, draws the “Mongols” that lead captives to the Horde as Slavic characters dressed in Russian clothes, whereas their captives look distinctly European. The “Mongolian” conquerors have only been drawn “in the Chinese fashion” since the introduction of the theory about the “Mongol and Tartar Yoke”

(qv in the XVIII century drawing shown in fig. 3.2).

Fig. 3.2. A Mongolian warrior as imagined by the historians of today who reconstruct the image from Chinese artwork. Old Chinese miniature; taken from [\[89\]](#), inset after page 128.

According to N. M. Karamzin, “the Tartar supremacy resulted in the ... ascension of the Russian clergy into prominence, the multiplication of monasteries and church lands – the latter neither paid taxes to the Prince, nor to the Horde, and flourished” ([\[363\]](#), Volume 5, Chapter 4, page 208; also [\[362\]](#), Volume 5, Chapter 4, page 223). Furthermore, “only a few of the monasteries that exist until this day have been founded before or after the Tartars; most of them date to their epoch” ([\[363\]](#), Volume 5, Chapter 4).

We see that most Russian monasteries were founded in the epoch of the “Mongolian” conquest. This is understandable; many Cossacks would take the vows after discharge from military service. This has been customary as recently as in the XVII century ([\[183\]](#)). Since the Cossacks were the military power of the Horde, the construction of many monasteries in the epoch of the Horde is perfectly natural from the point of the view of the state as well; the veterans needed and deserved rest. The monasteries were therefore very wealthy and exempt from taxes ([\[363\]](#), Volume 5, columns 208-209; also [\[362\]](#), Volume 5, Chapter 4, column 223). They even had the right of tax-free trade (*ibid.*).

4. Cossacks and the Horde

4.1. The Cossacks were the regular army of Russia (Horde)

Let us reiterate: the Cossacks had constituted the armed force of the Horde, or the “Mongolian” (Great) Empire. As we demonstrate herein, it is for this very reason that the Cossacks had lived all across the country and not just in the borderlands; the latter has been the case from the XVIII century and on. As the civil polity changed, the Cossack lands that lay adjacent to the border of the empire had kept their initial military character to a greater extent. Hence the frontier geography of the Cossack settlements, which marked the borders of the Russian Empire in the XIX-XX century. As for the Cossacks who had lived in the country, those have either lost their martial culture eventually, or been edged out towards the borderlands, blending themselves with the inhabitants of the frontier settlements. This process must have started around the time of the Great Strife and the wars of the XVII-XVIII century, in particular – the ones fought against Razin and Pougachov, when the Horde dynasty, whose power relied on the Cossack troops, was deposed. Nevertheless, certain representatives of the old Horde dynasty had still remained amidst the Cossacks, with claims for the throne to make.

The wars with Razin and Pougachov had really been attempts to restore the former Horde dynasty in Russia (see [Chron4](#), Chapter 12 for more on the war with Pougachov). The documents that we have at our disposal nowadays imply that Stepan Timofeyevich Razin is likely to have been a person of noble birth and not a simple Cossack. The very fact that his name as written in documents contains a patronymic with a “-vich” is a hint all by itself – this form had been reserved for the most distinguished people in that epoch. There is foreign documental evidence in existence that refers to Razin as to the king of Astrakhan and Kazan ([\[101\]](#), page 329). In figs. 3.3, 3.4 and 3.5 one sees a German engraving of 1671

depicting Razin. We see a turban on his head, no less (see fig. 3.4). And this is by no means a blunder from the part of the artist or a fashion of the “simple Cossacks” – Great Princes of Russia and their courtiers used to wear turbans as well, qv in the two mediaeval engravings in figs. 3.6, 3.7 and 3.8 depicting the reception of foreign envoys in Russia. We see the Great Prince and his entourage in large turbans – likewise the Turkish sultans and their servitors (see fig. 3.9, for instance).

Fig. 3.3. Old German engraving of 1671 depicting Stepan Timofeyevich Razin wearing a ceremonial turban. The custom of wearing a turban had been shared by Russia and Turkey. An engraving from the annex to the “Hamburger Zeitung” of 1671. Taken from [\[550\]](#), page 134.

Fig. 3.4. A fragment of an engraving dating to 1671. Turban on the head of S. T. Razin.

Taken from [\[550\]](#), page 134.
